ABBREVIATIONS

The titles of subjects, which are printed first in bold type, have been abbreviated within each article to the initial letter or letters.

ac., acre(s).
 agric., agricultural.
 ambas., ambassador(s).
 Amer., American.
 anct., ancient.
 ann., annual.
 arron., arrondissement.
 A.-S., Anglo-Saxon.
 A.V., Authorised Version.
 b., born.
 Biog. Dic., Biographical Dictionary.
 bor., borough.
 bp., birthplace.
 Brit., British.
 C., Centigrade.
 c., about.
 cap., capital.
 cf., compare.
 co., county.
 com., commune.
 cub. ft., cubic feet.
 d., died.
 Dan., Danish.
 dept., department.
 dist., district.
 div., division.
 E., east; eastern.
 eccles., ecclesiastical.
 ed., edition; edited.
 e.g., for example.
 Ency. Brit., Encyclopædia Britannica.
 Eng., English.
 estab., established; establishment.
 F., Fahrenheit.
 fl., flourished.
 fort. tn., fortified town.
 Fr., French.
 ft., feet.
 Ger., German.
 Gk., Greek.
 gov., government.
 Heb., Hebrew.
 hist., history.
 horticult., horticultural.
 h.p., horse-power.
 hr., hour.
 i.e., that is.
 in., inch(es).
 inhab., inhabitant(s).

is., island(s).
 It., Italian.
 Jap., Japanese.
 jour., journal.
 Lat., Latin.
 lat., latitude.
 lb., pound(s).
 l. b., left bank.
 long., longitude.
 m., mile(s).
 manuf., manufacture.
 min., minute(s).
 mrkt. tn., market town.
 MS., manuscript.
 mt., mount; mountain.
 N., north; northern.
 N.T., New Testament.
 O.E., Old English.
 O.F., Old French.
 O.T., Old Testament.
 oz., ounce(s).
 par., parish.
 parl., parliamentary.
 pop., population.
 prin., principal.
 prof., professor.
 prov., province; provincial.
 pub., published; publication.
 q.v., which see.
 R., riv., river.
 r. b., right bank.
 Rom., Roman.
 R.V., Revised Version.
 S., south; southern.
 sec., second(s).
 sev., several.
 Sp., Spanish.
 sp. gr., specific gravity.
 sq. m., square mile(s).
 temp., temperature.
 ter., territory.
 tn., town.
 trans., translated; translation.
 trib., tributary.
 univ., university.
 urb., urban.
 vil., village.
 vol., volume.
 W., west; western.
 Wm., William.
 yd., yard.

The article ABBREVIATIONS contains a list of those in general use.
See also ABBREVIATION (music) and ELEMENTS (chemical symbols).

Balanoglossus (Gk. *βαλανος*, gland; *γλῶσσα*, tongue), the typical genus of the *Balanoglossidae* of the class *Enteropneusta*. It has a worm-like, elongated body, breathes by means of gill-slits, and bears in the anterior region a curiously shaped proboscis which serves as an organ of locomotion. It inhabits the sand of various seas, and about 10 species are known.

Balanophoraceæ, an order of parasitic dicotyledons comprising many tropical species. The chief genus is *Balanophora*, which consists of 11 species growing in India.

Balantia (Gk. *βαλάντιον*, bag or pouch), the generic name given by the Ger. naturalist Illiger to those marsupials commonly called phalangers (*q.v.*).

Balanus (Gk. *βαλανος*, acorn, gland), the scientific name by which is indicated the barnacle (*q.v.*) or acorn-shell (*q.v.*).

Balacan, or **Baloang**, tn. in the prov. of La Union, Luzon, Philippines, 22 m. N. of San Fernando; pop. 27,000.

Balard, Antoine Jérôme (1802-76), Fr. chemist, was *b.* at Montpellier, and *d.* in Paris. He became prof. of chem. in his native tn., and in 1826 he discovered bromine (*q.v.*). In 1844 he was elected member of the Academy of Sciences, and in 1851 was appointed prof. of chem. in the College of France.

Balaruc, or **Balaruc-les-Bains**, vil. near the tn. of Frontignan, in the dept. of Hérault, France, celebrated for its hot sulphur springs, near the border of the Étang de Thau. Opposite the baths there is an isolated rock, called Rocairals or Roquerol, the base of which is covered with mussels and other shell-fish. Pop. 1800.

Balashov, tn. in region of, and 125 m. W. of Saratov, Russia, on the l. b. of the Khoper, a trib. of the Don. An agric. dist. Pop. 23,000.

Balasinor, dist. of India situated in Gujarat, Bombay. Area, 189 sq. m.; pop. 40,000.

Balasore, or **Balasor**: 1. Dist. of Orissa, India, on the bay of Bengal. Rice, jute, and oil seed are produced. Area, 2068 sq. m.; pop. 980,000. 2. Tn., cap. of the dist. of B., on the Burabullung R., 16 m. from its mouth. It was the first Eng. settlement in E. India (1642), and afterwards the seat of factories belonging to the Portuguese, Dutch, and Danes in succession. The Danes sold their interest to the Eng. in 1846. It has dry docks and a coasting trade. Pop. 21,300. 3. Peak, 6762 ft. high, in the W. Ghats, Malabar dist., Madras, India.

Balas Ruby, term used to designate the rose-red varieties of spinel (*q.v.*). It occurs as crystals, softer than those of the oriental ruby, a much more valuable stone. They are found chiefly in India.

Balassa, Count Valentin (1551-94), Hungarian poet, wrote Lat. poems and some popular lyrics in his own tongue for which he invented a new metre. He fell at the storming of Gran, fighting against the Turks.

Balassa-Gyarmat, cap. of Nograd, Hungary, 40 m. N.N.E. of Budapest; pop. 11,000.

Balata, juice or latex obtained from *Minusops balata*, the bullet or bully tree, belonging to the same order, Sapotaceæ, as the Malay gutta-percha tree (or *Dichopsta*). B. is used as an inferior substitute for caoutchouc and gutta-percha, but the presence of resin in the latex renders it useless for electrical purposes. It is used for belting, on account of its strength. The B.-tree grows in the W. Indies, S. America, and in Guiana.

Balaton, lake in Hungary, S. of the Bakony Wald, 55 m. S.W. of Budapest. The S. shore is bordered by marshy plains and downs. It is the largest lake in central Europe, 48 m. long and 7½-10 m. broad, area 266 sq. m. Many streams fall into the lake, and with the beauty of its scenery, especially near the Tibany peninsula, it became a popular bathing and fishing resort. It was the scene of desperate fighting during the Russian invasion of Hungary in 1944. See EASTERN FRONT, or RUSSO-GERMAN CAMPAIGNS, IN SECOND WORLD WAR.

Balausta, fruit of the pomegranate; in appearance a golden colour, about the size of an ordinary orange, and the rind is thick, enclosing numerous seeds, each embedded separately in pulp surrounded by a cell-wall. This pulp is in reality the outer layers of the seed-coats, and it is employed in the manuf. of cooling drinks.

Balayan, seaport of the is. of Luzon, Philippines, in the prov. of Batangas. It is situated 30 m. N.W. of Batangas, and at the N.W. end of the bay of B., which is deep, but open to southerly winds. Mt. B. (alt. about 2675 ft.) is 3 m. to the N.E. Pop. 25,000.

Balbec, see BAALBEK.

Balbi, Adriano (1782-1848), It. geographer and statistician, *b.* at Venice; became prof. of geography at Murano on the publication in 1808 of his *Survey of Political Geography*. In 1813 he was appointed to the customs at Venice. His best-known works were *Atlas ethnographique du globe*, 1826, and the *Abbrégé de géographie*, 1832. His son, Eugenio (1812-84), ed. his writings, 1841, and was also a geographer.

Balbinus, Decimus Cælius Calvinus (A.D. 237-38), Rom. emperor. On the death of the two Gordians in Africa, B. and Maximus (Clodius Pupienus) were chosen joint emperors to continue the opposition to the usurping Emperor

Maximinus, then with the army in Pannonia. Their powers were equal, and each bore the titles of pontifex maximus and princeps senatus. Maximinus invaded Italy, but was assassinated by his soldiers at Aquileia. On the approaching departure of Maximus against the Persians and of B. against the Goths, the Praetorian guard, adherents of the dead Maximinus, put the two emperors to death. B. had gained some reputation as a poet and orator, and both he and his colleague were of the highest rank and character in the senate.

Balbo, Count Cesare (1789-1853), It. statesman and man of letters, was b. at Turin. Napoleon Bonaparte created him auditor to the Council of State at the age of 18 by reason of his great business capacity, and when the peace of Vienna gave the provs. of Illyria to France in 1812 he was appointed to the commission which managed the affairs of that country. He vacated his appointment on the fall of Napoleon, and busied himself with literary pursuits, his *Speranze d'Italia* (Italy's Hopes) making him an international reputation. This work greatly hampered the Republican party under Mazzini.

Balbo, Italo (1896-1940), It. marshal and airman, b. in Quartesana, Ferrara. As a youth he did some newspaper work before entering the army in the First World War, serving in an Alpine regiment. By 1920 he had become a Fascist and was organising 'flying squadrons,' which made attacks on Communists and Socialists. In these affairs he once raised 3000 men for the capture of Ravenna from the Communists and twice besieged Parma in 1922. Mussolini put him in charge of the Blackshirt Militia, and in the 'March on Rome,' Oct. 1922, B. was one of the quadrumvirs who led the Fascists. In the Fascist regime he became under-secretary of national economy; but his chief work was the regeneration of the It. air force, which he lifted out of mediocrity to the point of challenging comparison with any other in Europe. Led many spectacular flights, including 1000-m. non-stop flight in 1928 with 9 machines from Rome to Hornchurch, Essex; a flight in 1930 with 12 machines across the Atlantic to S. America; a flight round the W. Mediterranean with 61 machines; a flight of 36 bombers to Odessa; and, in 1933, with 26 machines he flew from Italy to Chicago, 2 machines being lost. In 1929 he was appointed air minister, a post which Mussolini had been occupying himself. Promoted to marshal 1933. In Nov. of that year Mussolini took over the Air Ministry and made B. governor-general of Libya, the general assumption being that Mussolini was jealous of his popularity and wanted to exile him. In Libya B. built farm-houses for the colonists and fortifications to offset the Fr. fortified line in Tunis. He was killed at Tobruk (which he had converted into a strong air and naval base) in June 1940, together with 9 other occupants of a plane which crashed there. The Brit. Foreign Office denied

the It. announcement that he had fallen in action against the R.A.F., and it was freely said that his machine had been deliberately shot down by the Its. themselves. Picturesque, dynamic, full of ambition, and with courage bordering on recklessness, he was always to the fore. Friendly to Britain, it is probable that he was against Mussolini's declaration of war against that country, and striking tributes to his memory were paid by the R.A.F. at Tobruk in the shape of wreaths dropped by planes.

Balboa, the monetary unit of the republic of Panama. It is of the same size and fineness as the U.S.A. silver dollar, but is maintained equivalent to the gold dollar.

Balboa Heights, the headquarters of the administrative organisation known as the Panama Canal.

Balboa, Vasco Nuñez de (1475-1517), Portuguese discoverer and adventurer who settled a colony at Santa Maria in the gulf of Darien in 1513. He subsequently marched across the isthmus of Darien and discovered the Pacific Ocean. He was superseded in his command, but at length was appointed lieutenant-governor of the countries on the Pacific coast, and married the daughter of Pedrarias Dávila, his successor at Darien. But he was accused of disloyalty, and put to death by Pedrarias.

Balbriggan, seaport in co. Dublin, Eire, 22 m. N.E. of the cap. It became known for its hosiery and woollen manufactured articles, and there is a linen trade; pop. 2300.

Balbus, Lucius Cornelius, Rom. soldier, native of Gades (Cadiz), in Spain. He served under Pompeius in the war against Sertorius, for which he received Rom. citizenship. He was prosecuted on a charge of illegal assumption of the citizenship, and was defended by Cicero and acquitted. He looked after Caesar's property during the Gallic campaigns. In 40 B.C. under Octavius (afterwards the Emperor Augustus) he was made a consul.

Balcarras, see CRAWFORD AND BALCARRES, EARLS OF.

Balchen, Sir John (1670-1744), Brit. naval officer. He first served in the W. Indies, then in the N. Sea, 1703-5, and on the coast of Guinea, 1705. He was twice captured by the Fr.—when he was in command of the *Chester*, 1707, and when in command of the *Gloucester*, 1709. He again served in the W. Indies, 1715-16, and in the Baltic, 1719-27. In 1728 he was appointed rear-admiral, in 1734 vice-admiral, in 1743 admiral, and 1744 governor of Greenwich Hospital. He was lost with his ship off Alderney, Oct. 1744.

Balche, Bulgaria, see BALTJIK.

Balcony, railed gallery in front of a window. That it was not always placed before a casement is proved by its origin, as it was built out from the sides of fortified places to enable the defenders to throw stones and boiling liquid on the besiegers. Its introduction in dwelling houses dates from the early part of the fifteenth century. It, in origin, it soon became popular in Spain and the Mediterranean countries.

Baldachin: 1. Canopy which is erected over an eccles. altar. It is an ornate structure, generally made of marble or silver. In ant. times it was known as the ciborium, from the circumstance that the consecrated bread was kept beneath it. 2. In its domestic sense the term is employed to distinguish any prominence over doorways, windows, or even canopied beds. The term has also been used to describe the canopy held over an E. potentate to shield him from the sun.

Baldassaro de Belgoloso, see BALTA-SARINI.

Bald Buzzard, see OSPREY.

Balder, Norse god of light, son of Odin and Frigg, and husband of Nanna. He may be described as the Scandinavian Apollo. The gods were aware that if evil happened to him it would be the signal for their overthrow, and therefore Frigg laid every object, quick and dead, under an obligation to refrain from offering him hurt. Loki, the god of evil, however, discovered that this oath had not been administered to the mistletoe plant, which was considered to be too young and weak to hurt any one, and, profiting from the omission, he threw a sprig of it at B., who fell down dead. Hel, goddess of the dead, offered to restore him to animation provided all things wept for him. But Loki refused to do so, and B. was lost. The B. myth is considered by some authorities to be a remnant of tree-worship, by others a myth of ritual origin, but it is probably a sun-myth, the slaughter of the luminary by the malevolent powers of winter. Again the mistletoe alluded to may not have been intended to describe the plant, but a magic sword, *Mistelleinn*, the origin of the name of which is totally different from that of the plant, which is unknown in Iceland, whence the oldest known form of the myth comes. *See F. Kauffmann, Balder: Mythos und Sage, Strasburg, 1902.*

Baldi, Bernardino, It. author, b. at Urbino in 1553, of a noble family. He wrote a number of works in prose and verse, the greater part of which have remained unedited. Among those pub. are a poem on navigation, and sev. eclogues. Of his prose works there are sev. Dialogues. He also compiled a short chronicle of all the mathematicians known from Euphorbus down to his own time; and he pub. 2 Lat. works on Vitruvius.

Baldi, Lazzaro (1623 or 1624-1703), It. painter and engraver. He studied under Cortona at Rome, and became a clever imitator of that master. His works include: at Rome, 'Annunciation' in the church of St. Marcel; 'The Virgin, St. Catherine, and St. Bridget,' in the church of Santa Maria della Pace; and at Florence, 'St. John, the Evangelist,' in the basilica of St. John Lateran.

Baldinuoli, Filippo (c. 1624-c. 1696), It. author. He pub. a work on the hist. of the painters from Cimabue (1260) to 1670 (1681-88, 1767-74); and a hist. of the most celebrated engravers and their work (1686).

Baldivia, see VALDIVIA.

Baldmoney, see MEUM.

Baldness, absence of hair upon the scalp, which may be a sign of old age or may be congenital. Senile B. (*calvities* or *calvitium*) is much more common in men than in women. Until the prime of life is passed, new hairs grow to replace the dead ones that fall out daily; it is not till failure in the nutrition of the scalp occurs that B. begins. Congenital B. (*hypotrichosis congenita*) usually gives place in time and with treatment to a natural growth of hair, but may last through life. B. that is not senile or congenital is generally due to ill health, though it may be hereditary. Pre-senile B. or premature alopecia in men may be due to wearing tight leather bands inside the hat or closely fitting waterproof and cloth caps. It may also be due to seborrhoeic eczema, the characteristic of which is extreme scurfiness of the scalp. Nervous complaints, anaemia, child-bearing, and favus are all said to be causes of B. *Alopecia areata* (B. in patches) often attacks young persons, and is liable to be mistaken for ringworm. Any stimulating treatment, such as massage, and the use of electricity, promotes growth of the hair. Salt water, precipitated sulphur, and ointment of mercury are applied to check B., but attention to the general health and occasional use of iron tonics are helpful.

Baldock, tn. in Hertfordshire, with a fourteenth-century church. Hosiery manuf., malting, and brewing are the staple trades. Pop. 5,600.

Baldovinetti, Alessio (1427-99), It. painter, b. at Florence. Most of our knowledge of him depends on Vasari, who states that he was the son of a rich merchant, but soon abandoned his father's calling for art and probably studied under Uccelli. From what is known of him, it is evident that B. was one of the most eminent of the early masters of the Florentine renaissance, though his extant work shows a want of harmony in colouring, while his figures, generally drawn from common life, are somewhat unpleasant. But in the representation of details, whether in woods, buildings, trees, etc., he had real merits and he was famous for his extensive views of landscape backgrounds. Of his pictures the best known are an 'Enthroned Virgin and Child' with six saints, now in Florence; his own portrait in the Bergamo gallery; 'The Nativity'—a large fresco in the cloisters of the Santa Annunziata (1460)—and some panels representing the Holy Trinity for the altar of the church of Santa Trinita and now in the Florentine Academy. He d. at Florence.

Baldrey, Joshua Kirby (1754-1828), Eng. engraver and draughtsman. His works consisted of portraits after Reynolds, which were exhibited in the Academy in 1793 and 1794; religious subjects as 'The Finding of Moses' (1785), after Salvator Rosa; classical subjects as 'Diana,' after Carlo Maratti; his *chef-d'œuvre* is the E. window of King's College Chapel, Cambridge. In 1818 he pub. a work on the windows of that chapel.

Baldric (O.F. *baudret*, a belt). broad

belt, often of ornate design, worn in the Middle Ages across the body from shoulder to waist diagonally, used for supporting a quiver, bugle, or even a sword.

Balducci, Francesco (1600-42), It. poet, b. at Palermo. His *Rime* estab. his reputation as an anacreontic poet, and he also wrote *Canzoni siciliane*.

Baldung, Hans (c. 1470-1545), called also Hans Grün, Ger. painter and wood-engraver, the contemporary and friend of Albrecht Dürer. He was b. at Gmünd, in Swabia, but lived chiefly in Switzerland, at Strasburg, and its neighbourhood. His woodcuts are variously signed H. B., H. B. G., and H. G. As a painter he was little inferior to Albrecht Dürer in expression, colouring, or finish.

Baldwin, name of sev. cities, townships, and post-vils. of N. America. It is also the name of a co. of Alabama, which is bounded on the S. by the gulf of Mexico and has Daphne for its cap. Pop. 20,730.

Baldwin (d. 1190), archbishop of Canterbury during the reigns of Henry II. and Richard I. Having entered holy orders, he was made archdeacon of Exeter, but the secular duties of that office were distasteful to him, and he became a monk in the Cistercian abbey of Ford, Devonshire, of which he was elected abbot within a year. In 1180 he was promoted to the bishopric of Worcester. In 1184 Henry II. removed him to the see of Canterbury, in spite of the opposition of the monks. In 1186 B. seized certain offerings paid to the convent in order to build a church and monastery for secular priests at Ilkington; but the monks appealed to Rome, and he was obliged to desist. In 1189 he crowned Richard, king at Westminster and attended the king's council when his natural brother Geoffrey was promoted from the see of Lincoln to that of York. B. successfully asserted the pre-eminence of the see of Canterbury, forbidding the bishops of England to receive consecration from any other than the archbishop of Canterbury. Having made a visitation in Wales, preaching the crusade, B. took the cross and followed Richard to the Holy Land in the company of Hubert, bishop of Salisbury, and Ranulf Glanville (1190). He d. at Acre in the same year. B. wrote *De Sacramento Altaris* and other treatises of the same nature. His works are contained in the *Bibliotheca Patrum Cisterciensium*, 1662. Consult W. F. Hook's *Lives of Archbishops of Canterbury*, vol. II.

Baldwin (d. 1098), an abbot and physician. He became monk of St. Denys; prior of Liberau, Alsace; abbot of St. Edmund's; and physician to Edward the Confessor and to William the Conqueror.

Baldwin, the name given to the counts of the house of Flanders. The countship was founded by B. I., Bras de fer (Iron Arm). He married Judith, the daughter of Charles the Bald, without her father's knowledge, which brought about war between Flanders and Aquitaine. He d. in 879 at Arras.

Baldwin II., his son, married Alfrith, the daughter of King Alfred of England. He d. in 919.

Baldwin III., 'of the handsome beard' (d. 1034), enlarged his ters. by seizing Valenciennes, the is. of Walcheren, and other parts of Zealand.

Baldwin IV., 'le Debonnaire,' was guardian to Phillip, the young king of France, during his minority, 1060-67. B. married his daughter Matilda to William of Normandy, whom he accompanied to England on the Conquest. He d. in 1067 and was buried at Lille. Five other Bs. succeeded to the countship, the most important being B. IX., who became first Lat. emperor of Constantinople.

Baldwin I. (1171-1206), first Lat. emperor of Constantinople, b. at Valenciennes. He joined the fourth crusade in 1200 as count of Hainaut and Flanders, and took part in the capture of Constantinople on behalf of Alexius, son of Isaac II., emperor of Constantinople, against his uncle, the usurper, Alexius Angelus. Alexius was unable to keep his promises with regard to payment, and in consequence was murdered and Constantinople was sacked. B. was chosen emperor and crowned in 1204. The Gks., with the aid of the Bulgarians, massacred the Lat. in Thrace; B. laid siege to Adrianople, but was defeated and taken prisoner by John, king of Bulgaria, 1205, and d. in captivity, 1206.

Baldwin II. (1217-73), the son of Peter II. (de Courtenay) and nephew of B. I., succeeded as emperor of Constantinople in 1228, but was not crowned till 1239, John of Brienne, his father-in-law, acting as regent during his minority. In 1261 he was driven out of his cap. by Michael Paleologus, ruler of Nicæa, and took refuge in Italy.

Baldwin I. (1058-1118), king of Jerusalem, son of Eustace, count of Bouillon, and of Ida of Lorraine. He accompanied his two elder brothers, Godfrey and Eustace, to the first crusade in 1096, and took Tarsus in Cilicia. He there quarrelled with Tancred, the Norman, about precedence, and retired to Edessa, where he was proclaimed lord and assumed the title of count of Edessa. On the death of Godfrey, 1100, he was called to succeed him in Jerusalem. He became protector of the Holy Sepulchre, and assumed the regal title, which his brother had refused, and was crowned on Christmas Day, 1100. He carried on continual warfare against the Turks; he conquered Cesarea, Ashdod, and Jaffa, 1101, Tripoli, 1103, Acre, 1103, Sidon, 1111, and Ascalon finally surrendered in 1112. See Tasso's *Jerusalem* (canto I.) for brief portraits of B. and his brother Godfrey. Fulcher, B.'s chaplain, is the chief authority for the events of his life in *Historia Hierosolymitana*.

Baldwin II., du Bourg, count of Edessa, succeeded his cousin B. I. as king of Jerusalem, where he reigned from 1118 to 1131. During his reign Tyre was taken, and the military and religious order of the Templars was instituted for the defence of the Holy Land. He renounced the throne in favour of his son-in-law, Foulques of

Anjou, in 1131, and retired to the monastery of the Holy Sepulchre.

Baldwin III. (1129-62), succeeded his father, Foulques of Anjou, king of Jerusalem, in 1143. Under his reign the Christians lost Edessa, which was taken by storm in 1145 by Zenghi, Turkish prince of Aleppo and father of the famous Nur-eddin, or Nureddin. B. had to struggle during the greater part of his reign with the power and abilities of Nur-eddin. Louis VII. of France and Conrad III., emperor of Germany, joined B.'s forces in an attempt upon Damascus, in which they failed. After his death the Christian kings soon began to lose their power in the E. He was succeeded by his brother Amalric or Amaury, who *d.* in 1173.

Baldwin IV., the Loper, son of Amalric, reigned as king of Jerusalem from 1173 to 1184, when he signed in favour of B. V., son of his sister Sibylla, and a child of six years old. He *d.* a few months after his uncle in 1186.

Baldwin, Evelyn Briggs (1862-1933), Amer. Arctic explorer, *b.* at Springfield, Missouri. He accompanied Peary on the N. Greenland expedition as meteorologist, 1893-94, and acted in a similar capacity as second in command of Walter Wellman's polar expedition to Franz Josef Land, 1903-9. He discovered and explored Graham Bell Land, 1899, and organised the B.-Ziegler polar expedition, 1901-2. He built and named Fort McKinley. He pub. sev. meteorological reports, and wrote *Search for the North Pole, Franz Josef Land, and North Greenland Expedition*.

Baldwin, James Mark (1861-1934), Amer. psychologist, *b.* at Columbia, S. Carolina. In 1897 he was awarded the gold medal of the Royal Academy of Science of Denmark. He was Herbert Spencer lecturer at Oxford, 1915-16, and Harvard lecturer to Fr. provincial univ., 1915. Lecturer at École des Hautes Études Sociales in 1918, he was its prof., 1919. His publications include *Handbook of Psychology*, 2 vols., 1888; *Social and Ethical Interpretations*, 4th ed., 1907; *Mental Development of the Child and the Race*, 3rd ed., 1907; *Darwin and the Humanities*, 1909; *The Individual and Society*, 1910; *History of Psychology*, 1913; *Genetic Theory of Reality*, 1915.

Baldwin of Bewdley, Stanley, first Earl (1867-1947), Eng. statesman, created earl in 1937; Prime Minister and First Lord of the Treasury, 1923-24, 1924-29, and 1935-1937; Lord Privy Seal, 1932-34; Lord President of the Council, 1931-35. He was *b.* at Bewdley, Worcestershire, Aug. 3, 1867, being son of Alfred B. (1841-1908), and having had for great-grandfather James Macdonald, Irish Wesleyan minister—another of whose great-grandsons was Rudyard Kipling. There was also an early Quaker element in his ancestry. At Stourport, the Bs. had an iron-founding business dating from the beginning of the nineteenth century, and B.'s father sat in Parliament for West Worcestershire from 1892 till his death. B. was educated at Harrow, where he was fairly industrious; at Trinity College,

Cambridge, in his own words, he learnt nothing. At one period he had thoughts of becoming an Anglican clergyman; but he joined his father as partner when he came of age, and for 20 years devoted himself to the business. On his father's death, B., who had in 1906 unsuccessfully contested Kidderminster, succeeded to the seat in Parliament—now called the Bewdley div.—which he kept until he received a peerage. 'For eight years,' said *The Times*, 'he was an unobtrusive back-bencher—everybody liked him; but when he entered

EARL BALDWIN

his fiftieth year in the middle of the war, no speculation would have seemed more wildly improbable than his elevation to the premiership within six years.' When the second Coalition Gov. was formed under Lloyd George, Bonar Law became chancellor of the exchequer, and B. was appointed his parl. private secretary in Jan. 1917. A few months later he was financial secretary to the Treasury; he was the only person on the Treasury bench of that time with a voice and delivery that pleased the press gallery. For a time he shared his office with Sir Hardman Lever. From Apr. 2, 1921, he was president of the Board of Trade. As the time for a general election approached in 1922, B. became dissatisfied with the Coalition, and even thought of retiring from public life. The majority of the Conservative ministers wished the Coalition to continue; and, at a party meeting at the Carlton Club in that year, Mr. (later Sir) Austen Chamberlain, the lord privy seal, spoke in that sense. The

leading speech in opposition was B.'s: it swayed the meeting; the Coalition was condemned; the election gave the Conservatives a clear majority; and the Bonar Law Gov., already formed, met Parliament with B. as chancellor of the exchequer. His most prominent action while in this office was his visit to Washington in Jan. 1923 with Mr. (later Lord) Norman—the governor of the Bank of England—to settle the funding of the debt of £978,000,000 to the U.S.A. The chief difficulty here was the rate of interest, and B. and Mr. Norman left without settling it. B., however, agreed to recommend terms which would extinguish the debt in 62 years at the rate of 3 per cent for the first 10 years and 3½ per cent thereafter. In parliament he upheld the Amer. proposals, which were accepted.

In May 1923 Bonar Law retired through ill health, and B.—who, six months before, was hardly known to the greater part of the public—became Prime Minister at the age of 56. During the early years of his first premiership B. attained to an almost unprecedented position of authority as the leader and spokesman of the nation. He visited Paris in Sept., and saw the Fr. President and Prime Minister—there being severe tension on account of the occupation of the Ruhr. In Oct., at the Imperial Conference, and also at the Conservative party's conference at Plymouth in 1923, B.'s utterances marked the renewal of that party's move towards Protection. The Gov. having been weakened by the Bonar Law policy of 'tranquillity,' a general election was held in Dec., and the Conservatives lost their clear majority. B. paid no more attention than did Asquith to the *Daily Mail's* adjurations to form an 'anti-Socialist' bloc; he was defeated in the Commons Jan. 21, 1924, and resigned next day. The Labour Gov. that followed fell on Oct. 8, over the Campbell prosecution question: B.'s management secured their defeat. Then followed the 'Zinoviev' election: the Conservatives came back with a large majority, and Winston Churchill, crossing the floor once more, became B.'s chancellor of the exchequer. B. immediately declared that 'safeguarding' would not be used as a wedge to introduce Protection in this parliament. Difficulties in the coal trade in July 1925 were postponed for nine months by B.'s agreeing to subsidise the industry with not less than £10,000,000. At the end of that period, the subsidy (£23,000,000) being exhausted, matters stood exactly as they had been at its beginning, and the general strike (q.v.) of May 1926 took place—the foremost figure in Gov. action being, not the Prime Minister, but Mr. Churchill. As regards the coal-mines, B. immediately brought in a Bill to suspend the Seven Hours Day Act. He also pledged the Gov. to deal with the problem of the House of Lords in that parliament; but his Gov. never did—its one proposal (which would have made the Upper Chamber independent even of the royal prerogative) being dropped almost

as soon as announced (June 1927). The same year, B. paid a visit to Canada—addressing audiences at Montreal, Ottawa, Toronto, Fort Erie, Calgary, Regina, Winnipeg, and St. John (New Brunswick). A wide extension of women's franchise, strongly opposed by Conservative newspapers, was passed in 1928. In 1929 there was passed an Act abolishing poor law guardians, and relieving agric. land entirely, and land occupied for industrial purposes partially, from rates. In this year also B. went to the country on an extension-of-safeguarding programme; and at the general election of May 30 his party sustained a heavy defeat, and he resigned—the Labour party taking office again, though without a clear majority. He was elected rector of St. Andrews Univ., May 1930. In 1931 he took office as lord president of the Council in the National Gov. formed by Ramsay MacDonald. In July 1932 he headed the Brit. Gov.'s delegation to the Imperial Economic Conference in Ottawa (see OTTAWA ECONOMIC CONFERENCE). On MacDonald's resignation in 1935, B. took his place as Prime Minister. In his Indian policy he was taunted by Mr. Churchill with splitting the Tory party, but he pursued his course and secured sufficient support for a Bill framed on the general lines of the Joint Committee's Report (see INDIA, History). The Bill (Government of India Bill, 1935) received the Royal Assent on Aug. 22, 1935, and B. had again triumphed, for the Tory party had escaped a split and the National Gov. was prepared to make a united appeal for a new vote of confidence. But B.'s personal triumph was short-lived, for within a month thereafter the Hoare-Laval Pact (q.v.) for settling the Abyssinian war by the cession of Ethiopian ter. to Italy was concluded in Paris, and the swift reaction of Brit. public opinion inflicted upon B. the greatest humiliation of his career, the pact being regarded as a betrayal of the League of Nations. B. felt that he was not at the time free to expose the relatively defenceless position of the country, a position which might well have been put to the test had Britain tried to implement a 'sanctions' war against Mussolini. Some thought that B. should have resigned in company with his foreign secretary (Hoare), but such a step, within a month of a general election, would have raised grave issues at home and abroad. Popular support of the League and 'collective security,' however, had its effect at the general election, which was fought chiefly on the issue of Brit. foreign policy in the Italo-Abyssinian conflict, as well as on rearmament, and B. was returned with a majority of nearly 250. It was about the middle of 1935, in this atmosphere of the use of 'economic sanctions,' that B. began gradually to emphasise the increasing menace of air attack and to prepare the nation for a policy of rearmament. But it is doubtless evident that he did not realise how little time there was in a world ruled by force and destined to be disrupted by the aggression of totalitarian states. A more daring leader would have

challenged the powerful pacific elements in the country and so widened the margin between survival and disaster which, when war did come, was to prove so perilously narrow. It fell to him, in the midst of preoccupations with grave international problems, to advise King Edward VIII. on the constitutional position arising out of his proposed marriage. In the event King Edward abdicated (Dec. 1936). B.'s Cabinet took the precaution of drafting a Bill cited as 'His Majesty's Declaration of Abdication Bill,' and it was B. who laid the measure before Parliament. Towards the Sp. Civil war B. pursued a policy of non-intervention, which, however, resulted in handicapping the Sp. republicans and enabling Gen. Franco's insurgents to reap the full benefit of the substantial aid in forces and munitions from Germany and Italy. B. retired from an active part in politics in 1937, being granted an earldom in the same year. D. at his home near Stourport-on-Severn, Dec. 14, 1947. It has been justly said of B. that no man can be Prime Minister of England 3 times without possessing great qualities. Perhaps his chief title to enduring fame is that he could impose his character upon the mind of Parliament and the nation for as long as 15 years. He had sweetness of temper and magnanimity, but was prone to inertia and only too conscious of his indolence. Britain's unpreparedness for war was blamed on him alone; posterity will be more just, but it is certain that a man who was thrice Prime Minister between the Fr. occupation of the Ruhr (q.v.) and the visit of Neville Chamberlain to Munich (see MUNICH PACT) will have to bear a large share.

Publications: *Classics and the Plain Man and On England and Other Addresses*, 1926; *Our Inheritance* (speeches), 1928; *The Torch of Freedom* (speeches), 1935; *Service of our Lives*, 1937; *Interpreter of England*, 1939. See Wickham Steed, *The Real Stanley Baldwin*, 1930.

Baldwin, William (fl. 1547), wrote poetical and other works, and also acted as a clergyman and schoolmaster. He managed theatrical performances for the courts of Edward VI. and Mary, and ed. *Mirror for Magistrates*, 1559.

Bale, package or certain quantity of goods or merchandise, packed up in cloth and tightly corded or hooped and marked and numbered so as to correspond with the marks and numbers in bills of lading for identification purposes. Specifically, a bale of cotton, weighing 500 lb. (Amer. cotton) or 700 lb. (Egyptian cotton), and other fixed weights for various other commodities.

Bale, see BASEL.

Bale, John (1495-1563), Irish prelate, b. at Cove in Suffolk, and entered Jesus College, Cambridge, 1514. In 1529 he became prior of the Carmelites of Ipswich. Soon after this date he adopted the principles of Protestantism, and wrote in its defence. In consequence Edward VI. made him bishop of Ossory, 1552, but on the accession of Mary he was forced to escape, first to Holland and then to

Switzerland. On his return to England he was made a prebendary of Canterbury by Queen Elizabeth. He d. at Canterbury, and was buried in the cathedral. His fame rests on his contributions to early Eng. drama, notably *Kinge Johan*, which is a link between the morality plays and Elizabethan historical drama. He also wrote the first literary hist. of England in Lat., 1548, and one or two autobiographical pieces. His select works were pub. by the Parker Society, 1849.

Baleario Isles, group of is. lying off the E. coast of Spain in the Mediterranean, the prin. of which are Majorca, Minorca, Iviza, Cabrera, and Formentera. They comprise a prov. of Spain, and have an area of 1860 sq. m. with a pop. of about 377,000. The cap. is Palma, around which the olive is successfully cultivated, its growth forming one of the staple industries of the is. About an equal number of the inhab. are engaged in the anchovy and sardine fisheries. In the second century B.C. the is. were annexed by Rome, whose armies they joined in large numbers as slingers, in which method of warfare they were especially skilful. In the first quarter of the fifth century the group was overrun by the Vandals, and subsequently passed under Arab dominion in the eighth century. It became a prov. of Aragon in 1343. In the Sp. Civil war, 1936-39, It. naval forces co-operated here with Franco's forces against the Republicans. See F. Chamberlin, *The Balearics and their Peoples*, 1927.

Balechou, Jean Jacques (1715-64), Fr. engraver. His works are still valued and sought for by collectors.

Balen, Hendrik van (1560-1632), Flemish historical painter, and the first master of Van Dyck and Snyders, b. at Antwerp. He studied under Adam van Oort, and later at Rome.

Balestra, Antonio, It. painter, b. at Verona in 1666. He was brought up as a merchant, but before his twenty-first year he was studying painting under Bellucci at Venice. He afterwards studied under Maratta at Rome, and he eventually painted much more in the style of the Rom. than of the Venetian; he, however, combined the chief beauties of Venetian colour with the characteristic correctness and solidity of design of the Rom. school, and is regarded as one of the most able painters of his time. He d. in 1734 or 1740.

Balfe, Michael William (1808-70), Irish singer and composer, b. in Dublin, and early showed great talent, acting as conductor of the Drury Lane orchestra in 1824, when only 16. After an It. training he settled down to the task of composing operas. His first Eng. opera, *The Siege of Rochelle* (1835), ran for 8 months, but it was his *Bohemian Girl*, produced in 1843, that brought him prominently before the public. In 1845 he was appointed conductor of the It. Opera, Covent Garden, and in 1857 produced *The Rose of Castile*. Later he staged *Satanella*, *Blanche de Nevers*, *The Puritan's*

Daughter, and *The Sleeping Queen*, none of which, however, repeated the success of his *Bohemian Girl*. He may be classed as of the school of Rossini and Auber.

Balfour, Alexander Hugh Bruce, Lord Balfour of Burleigh (1849-1921), Scottish nobleman, of the family name of Bruce, was educated at Loretto, Eton, and Oriel College, Oxford. He was created sixth Baron B. of Burleigh in 1869. The title had originally been bestowed upon his ancestor, Sir James B., in 1607, but the fifth baron having been implicated in the Jacobite rising of 1715, the title was attained. He married Lady Katherine Hamilton-Gordon, sister of the seventh earl of Aberdeen. He was a Conservative, and was secretary for Scotland, with a seat in the Cabinet, from 1895 to 1903. He always took an active and useful part in political, educational, and social reform movements. Some of his addresses have been pub., such as *Education of Neglected and Destitute Children*, *Higher Education in Scotland*. He also wrote *The Rise and Development of Presbyterianism in Scotland*, 1911.

Balfour, Arthur James, first Earl (1848-1930), Eng. statesman and philosopher. P.C., F.R.S., D.L. of Lothian, M.P. for the City of London 1906-22. He was b. on July 25, 1848, being the eldest son of James Maitland B. of Whittingham and the Lady Blanche Gascoigne Cecil, the second daughter of the second marquess of Salisbury. He was thus descended from one of the most anct. families of Scotland and allied also to one of the greatest political families in England. He was educated at Eton and proceeded from there to Cambridge, where he entered Trinity College and took his master's degree. In 1874 he commenced his long political career by being returned as the member for Hertford in the Conservative interest; this constituency he continued to represent until 1885, when he was returned for E. Manchester. In 1878 he became private secretary to his uncle, the marquess of Salisbury, who, on the resignation of Lord Derby, had become foreign secretary. In his capacity as private secretary B. accompanied Lords Beaconsfield and Salisbury to the Berlin congress, where he received his first lesson in international politics in the settlement of the affairs of Russia and Turkey. About the same time, however, he pub. his famous philosophic treatise, *A Defence of a Philosophy Doubt* (1879). This raised his literary reputation and left no doubt but that if he cared to devote himself to literature he would soon establish a considerable reputation. During the years which followed he devoted himself equally to politics and study. In 1880, on the accession to power of the Liberal Gov., he was released from his secretarial duties and became a member of the Fourth party. The other members of this party were Lord Randolph Churchill, Sir Henry Drummond Wolff, and Sir John Gorst. During the first half of this decade he was regarded as the scion of a noble house who played with politics because it was the tradition of his house to do so, and

many considered that his health was too uncertain to admit of his taking an active part in politics. On the occasions on which he spoke his speeches were noted not for their oratory or eloquence, but for their academic qualities. With the beginning of Lord Salisbury's first administration B.'s active official career began. In 1885 he became president of the Local Gov. Board, but this office he did not hold long, as the first Salisbury administration came to an end at the beginning of 1886.

Topical Press

EARL BALFOUR

The second Salisbury administration, formed in the July of 1886, saw B.'s appointment to the chief secretaryship of Scotland and a seat in the Cabinet. In the early part of 1887 one of those accidents of politics raised him to a position in which he astonished his critics and gained for himself a great and lasting reputation as a man of character and a firm statesman. In that year Sir Michael Hicks-Beach (later Viscount St. Aldwyn) resigned the chief secretaryship of Ireland owing to an affection of the eyes. The political world was astonished by the appointment of B. to the vacant position and the opposition jeered at the appointment of a man whom they regarded as a *flâneur*. This was B.'s first great appointment, and by the work which he did there, by the firmness with which he suppressed crime, by the tenacity with which he clung to his policy, he made himself the most prominent of Conservative statesmen, the most loved and respected by his adherents, the most hated but at the same time the most respected by his opponents, the

Nationalists. The days of 'Bloody Balfour' have not yet been forgotten nor forgiven.

The criticism which had been levelled against him was quickly silenced on the debates which followed the Crimes Bill and the Irish Land Bill. His work covers one of the most exciting periods of Irish hist., and in the face of open outrage, in the face of threats and insults, B. proceeded with his work, which consisted of the pacification and good gov. of Ireland. How far he was successful is a question which is settled variously according to the bias of varying authorities; it remains to be said that he reduced crime enormously in Ireland, but the criticism that he turned Ireland into an armed camp cannot be altogether denied. That he was helped by events cannot be denied; the Parnell Commission, followed by the O'Shea divorce case, which led to the downfall of Parnell and the break up of the Irish party, must have aided him considerably. In 1891, on the death of H. W. Smith, he became first lord of the Treasury and leader of the House of Commons. During his first tenure of this post, he introduced a local gov. Bill for Ireland, which was withdrawn just before the dissolution of 1892, a dissolution which led to the downfall of the Unionist party and the accession to power of the Liberals. On the defeat of the Liberal party in 1895 he again became first lord of the Treasury and leader of the House of Commons in the administration of Lord Salisbury. During the three years in opposition, B. won for himself added fame by his conduct of the opposition. During the early days of this second period of leadership B.'s attitude on the education questions called forth criticism not only from the opposition, but from his own party as well, and this feeling was accentuated by his suggested scheme for a Rom. Catholic unit. for Ireland. His conduct of foreign affairs during the absence and illness of the Premier, Lord Salisbury, however, added very considerably to his reputation. His negotiations with Russia concerning N. China were brought to a successful close, and by means of a compromise he succeeded in establishing friendly relations with Russia in place of a threatened quarrel. With the remainder of the Conservative Cabinet he took responsibility for the negotiations with the Transvaal, but his conduct of the war, when war did break out, met with very considerable criticism.

In July 1902 Lord Salisbury resigned and B. succeeded him as Premier. The administration which followed will probably be remembered chiefly by the fiscal questions which came to the front during that period. The Conservative Cabinet, surprised by the sudden proposals of Joseph Chamberlain, divided itself into two camps. Many resignations took place, but B. retained his position as Premier, and declared himself in favour of a retaliatory tariff. By-election after by-election went against the ministry, and in Nov. 1905 the Gov. resigned, a gov. being formed by Sir Henry Campbell-

Bannerman. The election which followed brought about the complete downfall of the Unionist party. B. himself being defeated in E. Manchester, a seat he had held for 20 years. A safe seat was found for him in the City of London. Up to 1911 B. led the opposition in the House of Commons; On the question of the Veto Bill B. sided with Lord Lansdowne, and found himself opposed by a considerable and influential section of his party. After the Veto Bill had been passed, and just previous to the introduction of the Home Rule Bill, B. resigned his position as leader of the party. For some considerable time his position had been threatened by his own party, and his leadership was regarded as too pacific. In 1911 he resigned, saying that his health forbade his further continuance in so arduous a post; he, however, did not give up his seat, and after his resignation was of very great help to his party. His resignation was deplored by all parties. He was at this time, and even later, regarded as the future leader of the Conservative administration. But, until the outbreak of war in 1914, he lived in comparative retirement, although speaking strongly, both in and out of Parliament, against Home Rule for Ireland and disestablishment of the Church in Wales. He devoted some of his new-found leisure to giving addresses on literature and philosophic subjects. It was during this period that he again used his calming influence in the Marconi case, for the report of the committee on the case was embarrassing, but his intervention in the debate which ensued was decisive.

During this time he had retained his seat on the Committee of Imperial Defence, of which he was the chief author, and at the outbreak of war he placed his services at the country's disposal. On the formation, in 1915, of the first Coalition Cabinet, he became first lord of the Admiralty, and in this capacity he restored the harmony of the Board, which had been somewhat disturbed by Lord Fisher and Mr. Churchill. When Lloyd George succeeded Asquith as Prime Minister, B. accepted the foreign secretaryship, an office in which he had had some experience and had thus shared in the recent foreign policy. No sooner had he assumed this office than Germany instituted the unrestricted submarine campaign, which brought the U.S.A. into the war. The result of this was that B. left England for America, in Apr. 1917, as head of the Brit. mission which went to arrange co-operation with that country. His visit was a triumph, and he received the great compliment of being asked to address the House of Representatives. B. was also one of the four members of the War Cabinet.

In the business of making the peace after the war he was the second Brit. representative at the conference which assembled in Paris in Jan. 1919. Shortly after the peace of Versailles was signed he left the Foreign Office and became Lord President of the Council in 1919. About this time he was elected chancellor of the

univ. of Cambridge. He did not again hold Cabinet office. In February 1920 he presided at the first meeting of the council of the League of Nations and remained the Brit. representative of the League until he retired from office in Oct. 1922. In July 1921 he had accepted the invitation of President Harding for an international conference to be held at Washington, to deal with the limitations of armaments and to discuss Far E. and Pacific problems. Here he endorsed the bold proposals of Secretary Charles Hughes for the reduction of armaments and was largely responsible for the contribution made towards international peace. (See WASHINGTON, TREATIES OF (4)).

He visited Palestine in 1925 to open the univ. of Jerusalem. He had been associated with the gov. policy on Palestine enunciated in 1917 (see BALFOUR DECLARATION). He was much impressed by the advance the country had made, and convinced that the Arabs had benefited by the establishment of Palestine as a Jewish colony. On his return he became Lord President of the Council in Mr. Baldwin's second ministry, and took charge of the Civil Research Committee. B. attained no less a rank as a philosopher than as a statesman. In 1904 he had become president of the Brit. Association at Cambridge. He was raised to the peerage in 1922. Amongst his varied publications are: *A Defence of a Philosophic Doubt*, 1879; *Essays and Addresses*, 1893; *The Foundations of Belief*, 1895; *Economic Notes on Insular Free Trade*, 1903; *Questionings on Criticism and Beauty*, 1909; *Theism and Humanism*, 1915; *Theism and Thought*, 1923. See E. T. Raymond, *Mr. Balfour: a Biography*, 1920; and B. E. C. Dugdale, *Arthur James Balfour, First Earl of Balfour* (2 vols.), 1936-40.

Balfour, Edward Green (1813-89), Brit. surgeon-general and author. He entered the medical dept. of the Indian Army 1834, and became a surgeon 1852. His chief work is the *Encyclopædia of India*, 1857.

Balfour, Francis Maitland (1851-82), Scottish biologist, younger brother of Earl B. Born at Edinburgh, educated at Harrow, and Trinity College, Cambridge, where in 1870, he was elected natural sciences scholar. Animal morphology next claimed his attention, and he succeeded in obtaining one of the two seats allocated to Cambridge at the zoological station at Naples. He had been impressed by the work of Sir Michael Foster in comparative embryology, and in 1880 pub. the first vol. of a treatise on that subject, following it with a second in 1881. The first of these vols. dealt with the embryology of the invertebrata, the second with that of the vertebrata. B. was resolute in refusing all offers of professorships from other univs., and continued to reside at Cambridge, which at length recognised his singlemindedness and ability by the institution of a special chair of animal morphology, of which he was appointed first prof. His health, never robust, was

undermined by typhoid fever. On his convalescence he visited Switzerland, and whilst there he essayed the ascent of the Aiguille Blanche, Mont Blanc, which at that time had not been attempted. In this effort he lost his life.

Balfour, George John Gordon Bruce, Baron Balfour of Burleigh (b. 1883), succeeded his father as seventeenth baron in 1921. During the First World War he served in France, being mentioned in dispatches four times and receiving the Legion of Honour. In 1922 he was elected a Scottish representative peer.

Balfour, Gerald William, second Earl (1853-1945), younger brother of first earl, to whose title he succeeded in 1930. Fourth son of J. M. B. He was educated at Eton and Trinity College, Cambridge. In 1885 he was returned to the House of Commons as member for Central Leeds. He was chief secretary for Ireland, 1895-1900; president of Board of Trade, 1900-5; president of Local Gov. Board, 1905-6. He was instrumental in introducing an Irish Local Gov. Bill which did much to conciliate the Home Rule party and which estab. co. councils and dist. councils, one half of the expenditure of those bodies being met from the imperial exchequer. On his defeat at Leeds in 1906 he retired from politics. In 1908 he was chairman of the Commission on Lighthouse Administration, and also chairman of the Cambridge committee of the Commission on Oxford and Cambridge Univs.

Balfour, Sir Isaac Bayley (1853-1922), Scottish botanist, b. in Edinburgh. He was regius prof. of botany at Glasgow, 1879-84; Sherardian prof. of botany at Oxford and fellow of Magdalen College, 1884-88. In 1888 he accepted a similar chair at the univ. of Edinburgh, and was regius keeper of the Royal Botanic Garden in that city from 1888 until his death in 1922. For the same period he was king's botanist in Scotland. In 1880 he explored the is. of Socotra, in the Indian Ocean, and in 1888 pub. the results of his travels in the *Transactions*, vol. xxxi., of the Royal Society, Edinburgh. Among his other publications are *Botany of Rodriguez*, 1878, and a translation of Goebel's *Organography of Plants*, 2 vols., 1900-5. He also ed. *The Annals of Botany* from 1887.

Balfour, Jabez Spencer (1849-1916), Brit. financier and politician, who became notorious as the chief promoter of the Liberator Building Society, 1868, and of similar speculative ventures, which failed in 1892 with liabilities amounting to over £8,000,000. B. fled to the Argentine, but was extradited to England and sentenced, in 1895, to 14 years' penal servitude. He was released in 1906. Between 1880 and 1893 he sat as Liberal M.P. for Tamworth and Burnley, and in his time was the first mayor of Croydon.

Balfour, James (1702-95), Scottish philosopher, of Pillrig in the shire of Midlothian, was admitted an advocate of the Scottish Bar in 1730. He early became an opponent of Hume, whose speculations he attacked in two anonymous treatises,

the one entitled *A Delineation of Morality*, the other, *Philosophical Dissertations*. In 1754 he resigned his judicial office, having been elected to the chair of moral philosophy at Edinburgh. This he resigned in May 1764 for the chair of public law, and afterwards he pub. his lectures under the title of *Philosophical Essays*. In 1779 he resigned the chair of public law, and retired to Pillrig, where he d.

Balfour, Sir James, of Denmyne and Kinnaid, Bart. (c. 1600-57), Scottish antiquary. He early displayed a capacity for poetry, and trans. Lat. verse into the Scottish vernacular. He studied heraldry at the College of Heralds in London, and later wrote the *Monasticon Scoticum*, a collection of Scottish eccles. charters. In 1630 he was created Lyon king-of-arms, and in 1633 was made a baronet. He was deprived by Cromwell of his office, but solaced himself with the collection of heraldic antiquities, and framed valuable abridgments of Scottish charters and chronicles, notably the *Annals of the History of Scotland*, etc., and *Memorials and Passages of State from 1641 to 1654*.

Balfour, Sir James, of Pittendreich (d. 1584), Scottish lawyer of the sixteenth century, studied for the Church. Implicated in the murder of Cardinal Beaton, in 1547 he was sent with other conspirators to the Fr. galleys, whence he escaped in 1550. Returning to Scotland, his lack of Protestant zeal drew upon him the wrath of Knox. Appointed rector of Flisk in Fiffe, he was created a lord of session or judge by Queen Mary in 1563. In 1567 he was appointed governor of Edinburgh Castle, and, having assisted the enemies of the queen, was after her dethronement made president of the court of session. He was forced to retire to France because of a charge brought against him of assisting in the murder of Darnley, but later returned. He compiled *Prædicts of Scots Law*, a handbook of the Scottish legal system.

Balfour, John Blair, see KINROSS OF GLASLUNKE, BARON.

Balfour, John Hutton (1808-84), Scottish botanist, was b. at Edinburgh and graduated at the univ. of his native city. Originally intended for the Church, he later abandoned this intention, and in 1831 took his M.D. degree. In 1841 he was appointed prof. of botany in the univ. of Glasgow, a seat he held until 1845, when he was called to fill a similar position at his Alma Mater. He was also appointed keeper of the Royal Botanic Gardens, where he had been preceded by Hope, Roxburgh, and Buchanan. This dept. of his work was so fostered by him that the botanical effort displayed in the outlay and scientific arrangement of these gardens brought him recognition from botanists all over the world. He was dean of the faculty of medicine in Edinburgh for 30 years, ultimately retiring from his various appointments in 1879. He d. at Edinburgh.

Balfour, Lord, of Burleigh, Scottish peer, d. 1688. The only remarkable circumstance concerning him is that he was mistaken by Sir Walter Scott for B. of

Burley, and as such introduced into the novel *Old Mortality*.

Balfour Declaration arose out of negotiations between the Zionists and the Brit. Gov. early in 1917, when the Brit. advance on Palestine was imminent and at a time when the Allies appreciated the value of winning the support of world Jewry for the allied cause. Similar negotiations ensued with the Fr. and It. Govs. The Zionists had previously put forward a definite scheme of Jewish nationalism, which received the official approval of the Allies, but the announcement of this approval was postponed till, at the end of Oct. 1917, the success of Allenby's invasion of Palestine seemed certain. On Nov. 2, 1917, the Brit. Gov. pub. a statement of policy, afterwards known as the Balfour Declaration, which took the form of a letter from Mr. (later Earl) Balfour, then foreign secretary, to Lord Rothschild: 'I have much pleasure in conveying to you on behalf of His Majesty's Gov. the following declaration of sympathy with Jewish Zionist aspirations, which has been submitted to, and approved by, the Cabinet: "His Majesty's Gov. view with favour the establishment in Palestine of a National Home for the Jewish people, and will use their best endeavours to facilitate the achievement of this object, it being clearly understood that nothing shall be done which may prejudice the civil and religious rights of existing non-Jewish communities in Palestine, or the rights and political status enjoyed by Jews in any other country." I should be grateful if you would bring this declaration to the knowledge of the Zionist Federation.' The text of this famous declaration, which in its practical realisation was destined to cause so much trouble subsequently in the Holy Land, was, prior to its publication, approved by President Wilson, and it was publicly endorsed by the Fr. and It. Govs. early in 1918. The declaration was not an expression of a wholly new sentiment. Brit. public opinion had long sympathised with the victims of anti-Semitic persecution; but the time and manner in which this sympathy, like that for the victims of the old Ottoman regime, was trans. into action were determined by the exigencies of the war. The moment was favourable for some such declaration; for Jewish sympathy with the allied cause would confirm the support of Amer. Jewry, and, besides, would make it more difficult for Germany to reduce her military commitments and improve her economic position on the E. front. To inform world Jewry of the declaration millions of leaflets were circulated throughout the Jewish communities; they were dropped from the air on Ger. and Austrian lns., and widely distributed through the Jewish belt from Poland to the Black Sea. The central powers retaliated with a counter-proposal for a kind of chartered company for Ger. Zionists coupled with a right of immigration into Palestine but, before these arrangements could be confirmed in Constantinople, Palestine was in Allenby's

hands. As regards the reaction of the B. D. on Arab opinion, it would seem clear that they expected, as the price of their support of the allied cause, the full independence of all Arab countries then in the Ottoman empire. Early in Nov. 1918 the Brit. and Fr. Govs. had issued a joint declaration encouraging the establishment of indigenous govs. in Syria and Mesopotamia, and, as the Arabs had always regarded Palestine as included in Syria, this announcement seemed to promise them all they wanted and their disappointment was therefore great when they learned that the allied powers proposed not only to separate Palestine from Syria but to place it under a special form of gov. in order to implement the policy of the B. D. For not long after the announcement of the B. D. Sir Henry McMahon, representing the Brit. Gov., had written dispatches to Sherif Hussein of Mecca giving his 'pledge' of support for Arab independence in consideration of Arab military aid in the war. This latter 'pledge' has always been interpreted by the Arabs to connote a promise of independence for all Arab lands, including Palestine, inasmuch as Palestine was always regarded by the Arabs as being part of Syria and was not specifically excluded from the countries mentioned by Sir Henry McMahon among those which were promised their independence; and, moreover, the so-called McMahon pledge was the only compact of which they knew. But during the peace negotiations in London and Paris the Emir Feisal, son of Hussein (who had then become king of the Hedjaz) was persuaded not merely to accept but even to welcome the policy of the B. D. This was not surprising because practically the whole of the Arab world was now free and independent as the result of the allied victory; and, furthermore, previously to coming to London Feisal had been convinced by Dr. Chaim Weizmann, the head of the Zionist organisation, of the benefits which the Jewish National Home would bring to Palestine as a whole. The emir, however, added a note of reservation to his agreement which he had then concluded with Dr. Weizmann, to the effect that 'if changes were made, he could not be answerable for the failure to carry out the agreement.' This agreement marks 'the one brief moment in the whole story at which a genuine harmony was estab. between Arab and Jewish statesmanship. If King Hussein and the Emir Feisal secured their big Arab state, they could concede little Palestine to the Jews' (Peel Report). It seems doubtful whether the Arabs of Palestine would ever have acquiesced, without revolting, in any appreciable development of the Jewish National Home in their country, but the last chance of any peaceful settlement on the lines of the Feisal-Weizmann agreement disappeared in 1920 when the Fr. Gov. made it clear that it was vehemently opposed to the establishment of an Arab state under the Emir Feisal's control at Damascus; and soon afterwards the emir was expelled from Syria and the

country was in Fr. occupation. In 1920 and again in 1921 violent Arab outbreaks against the Jews occurred in Palestine. The conflict between Arab and Jewish nationalism had begun and was to reach its climax in 1936-39, when murder and sabotage became the order of the day and a Brit. army of 30,000 men were in the country engaged in hunting down the Arab bands. There is an obvious conflict of two ideals implicit in the B. D., and there seems little doubt that the royal commission (under Lord Peel) in their report of July 1937, were justified in their assumption that the words 'the establishment in Palestine of a National Home' were the outcome of a compromise between those ministers who contemplated the ultimate establishment of a Jewish state and those who did not. But the Brit. Gov. evidently realised that a Jewish state might in course of time be set up, but it was not in a position to say that this would happen, still less to bring it about of its own motion. Yet many responsible statesmen, including Lord Robert Cecil, Mr. Winston Churchill, and Sir Herbert (later Lord) Samuel, all spoke or wrote in terms that could only mean that they contemplated the eventual establishment of a Jewish state in Palestine after the termination in the course of years of the Brit. mandatory regime. No precise definition of the meaning of the expression 'National Home' is given in the Mandate, or indeed anywhere else. From the text of the Mandate, however, it is clear that it could not mean merely expropriating Arab inhab. and transferring their land wholesale to the Jews as soon as, by immigration and organisation under a sympathetic administration, they should be in a position to fulfil the requirement of the Covenant of the League of Nations that there should be estab. a local independent gov. It is, on the other hand, equally certain that it cannot have meant merely encouraging Jews to settle in Palestine under the legislative and administrative dominance of a permanent Arab majority. This, however, is precisely what the Arabs sought, through a strong delegation in London in 1930, and what, in effect, they secured as the result of the Palestine conference held in London, Feb.-Mar. 1939. The Brit. Prime Minister (Mr. Ramsay MacDonald) made a statement in the House of Commons in 1930, which, while emphasising Brit. mandatory obligations, did not attempt to solve the problem. He said: 'A double undertaking is involved, to the Jewish people on the one hand, and to the non-Jewish pop. of Palestine on the other; and it is the firm resolve of His Majesty's Gov. to give effect, in equal measure, to both parts of the declaration, and to do equal justice to all sections of the pop. of Palestine.' But that Palestine was not to be converted into a Jewish state may be held to be implied in the phraseology of the White Paper of 1922 (Cmd. 1700), a statement which did not, however, remove doubts; hence, after the tragic events of 1936 to 1938, the Brit. Gov., having invited Arab and Jewish delegates

to a conference in London in 1939, declared unequivocally that it was not part of their policy that Palestine should become a Jewish state. This statement of policy (Cmd. 6019 of 1939) adhered to the interpretation, such as it is, of the National Home in the White Paper of 1922—'. . . the development of the existing Jewish community in order that it may become a centre in which the Jewish people as a whole may take, on grounds of religion and race, an interest and pride; but in order that this community should have the best prospect of free development . . . it is essential that it should know that it is in Palestine as of right and not on sufferance.' The Peel Commission thought that the association of the policy of the B. D. with the mandate system implied the belief that Arab hostility to the former would sooner or later be overcome, and the hope of Brit. Govs. ever since the B. D. was issued was that in time the Arabs, recognising the advantages to be derived from Jewish settlement and development, would become reconciled to the further growth of the Jewish National Home. But the Brit. Gov. realised, even before 1939, that that hope would never be fulfilled, and in the result adopted a policy which involved, *inter alia*, a definite limitation of Jewish immigration, the rejection of the scheme of partition proposed by the Peel Commission and the substitution of proposals for the gradual creation of a Palestinian state in treaty relationship with Britain. After the Second World War the Brit. and Amer. Govs. appointed a joint committee of 'inquiry regarding the problems of European Jewry and Palestine,' though it might well seem improbable that any new aspect of the problem could be found which might offer a hope of eventual solution. The committee reported, rather otiosely, that such information as they received about countries other than Palestine gave no hope of substantial assistance in finding homes for Jews driven out of Europe, and that Palestine alone could not meet the emigration needs of the Jewish victims of Nazi and Fascist persecution. They therefore recommended that their govts., in association with other countries, should try at once to find homes for all such 'displaced persons,' regardless of creed or nationality, whose ties with their former communities had been irreparably broken. The committee recommended that 100,000 certificates should be authorised immediately for the admission into Palestine of Jewish victims of Fascism, and that the certificates be awarded as far as possible in 1948, while actual immigration should be pushed forward as rapidly as conditions would permit. This was a startling proposal, and, of course, it at once excited Arab hostility. The committee, however, was not over-tolerant of Arab claims and incorporated in their recommendations a 'statement of principles' to the effect that neither race should dominate the other in Palestine, that Palestine should be neither a Jewish state nor an Arab state (contrary to the White Paper

of 1939), and that the form of gov. ultimately to be estab. should, under International guarantees, fully protect the interests in the Holy Land of Christendom and of the Moslem and Jewish faiths. 'Thus,' said the committee, 'Palestine must ultimately become a state which guards the rights and interests of Muslims, Jews, and Christians alike: and accords to the inhab., as a whole, the fullest measure of self-gov., consistent with the principles (now) set forth.' The committee recognised that any attempt to establish either an independent Palestinian state or independent Palestinian states would only result in civil strife such as might threaten the peace of the world, and therefore they thought that the mandatory regime should continue 'pending the execution of a trusteeship agreement under the United Nations.' Among other recommendations they advised the rescission of the land transfer regulations of 1940 in favour of new regulations based on a policy of freedom of sale and providing adequate protection for the interests of small owners and tenant cultivators. The Jews were hostile to the Brit. Gov.'s proposals of 1939 and Jewish terrorism, which had ceased at the beginning of the Second World War, broke out again in 1942 and continued thereafter. An Anglo-Amer. Committee of Inquiry, in a report of 1946, rejected partition and proposed a continuation of the mandate, pending the execution of a trusteeship under the United Nations. The various plans to put this proposal into operation were all rejected by the Jews and Arabs and the Brit. Gov. then decided to submit the whole problem to the United Nations. In May 1947 a special committee to investigate the problem and recommend a solution was then set up by the United Nations, and the majority of the members recommended the partition of Palestine into independent Arab and Jewish states. The Jews were willing to accept partition, subject to reservations. The Arabs rejected it completely. While this plan was still under discussion the Brit. Gov. announced its intention to withdraw all Brit. forces from Palestine by a certain date, and on Dec. 20, 1947, it was announced that the mandate would end on May 15, 1948. *See further under PALESTINE.*

Balfrush, or Barfrush, tn. in the prov. of Mazanderan, Persia, situated on the R. Bhawal, some 12 m. from the Caspian Sea. The riv. is not navigable, and it is necessary to land all merchandise and other goods at the port of Meshed-i-ser on the Caspian. A large trade grew up with Russia, and silk and rice are exported. The pop. is variously stated at from 10,000 to 50,000.

Balgonie, Lord, see LESLIE, ALEXANDER.
Balguy, John (1686-1748), Eng. theologian, was b. at Sheffield. He was educated at Cambridge, and in 1718 pub. 2 pamphlets in defence of Bishop Hoadley. In other works he defended Dr. Clarke and his views against such antagonists as Tindale and Shaftesbury. He wrote an *Essay on Redemption*, 1741, which

exhibited considerable broadmindedness for his time, and for his services, personal and otherwise, was appointed a prebendary of Salisbury in 1727 by Hoadley. He d. at Harrogate.

Balguy, Thomas (1716-85), Eng. divine, educated at Ripon Free School and St. John's College, Cambridge, where he held the Platt Fellowship, 1741-48, and was assistant tutor to Dr. Powell, lecturing on moral philosophy for 16 years. Among the various positions he held at different times were those of public orator, tutor to the duke of Northumberland, rector of North Stoke, prebendary of Winchester, archdeacon of Salisbury, archdeacon of Winchester, and vicar of Alton. He pub. many discourses, sermons, essays, and a life of his father, John B.

Bali, or **Bally**, tn. on the Hugli, W. Bengal, 4 m. N. of Howrah; pop. about 17,000.

Bali, **Bally**, or **Little Java**, is. of the Malay Archipelago, lying E. of Java, from which it is separated by the Bali Strait, and W. of Lombok. Area about 2100 sq. m. The pop. is over 1,000,000. There are volcanic mts., the highest being Gunung Agung, 10,400 ft. The country is split up into dists.: (1) Buleleng and Jembrana on Dutch ter.; (2) Badung, Mengwi, Tabanan, Bangli, and Klung Lung, which are autonomous states. The Dutch rule was estab. in 1849, and the residency of B. and Lombok is at Buleleng, in the N. The products of the soil are rice, cotton, tobacco, sugar, coffee, and indigo. Fine wood-carving and metal work is executed, and the women take a share in the trade and industries. The religion of the people of B. and the neighbouring is. Lombok is Brahminism, in a form even older than that now found in India. There is a written language called Balinese. B. was captured by the Jap. in 1942, and was formally liberated in 1946 when an allied force of 2600 Dutch troops, escorted by a Dutch destroyer, arrived on Mar. 3. No resistance was encountered from the Jap. garrison of 3400 who, indeed, co-operated in providing transport. B. remained unaffected by the nationalist movement of the Javanese, although these latter made efforts through emissaries to organise a similar movement against the Dutch in B., and gangs of disaffected people tried to terrorise the countryside. The Balinese people, however, evinced no sympathy for these manifestations, and the is. remained quiet.

Balihri, tn. in the Jabalpur dist. of the Central Provs. of India. In former times it was a city of much prosperity. It contains many temples. Pop. about 3000.

Balikesir, or **Balakissar**, or **Balikisri**, cap. of the Karasi sanjak of the vilayet of Brusa, Asiatic Turkey. It is situated on a fertile plain, 575 ft. high. The chief products are opium, silk, and cereals. Noted for a large fair held annually. Pop. 21,000.

Balin and **Balan**, two brothers in the Arthurian legend. They met on their wanderings, and, failing to recognise each other, fought, and both were slain. Consult Malory, *Morte d'Arthur*. There

is also an early poem called *Balan*, belonging to the Charlemagne cycle, the Eng. version of which is *The Sowdone of Babylone*.

Balinag, tn. of Luzon, Philippine Is. It is in a fertile dist., and manufs. silk and cotton. Pop. 40,000.

Ballol, **Family of**. The B. family was founded by Bernard de B., who came from Barnard Castle, and was a courtier of David I. of Scotland. Probably of Norman origin, it shared in the prosperity and prestige which the Normans attained in the Scotland of the twelfth century. It was in connection with the famous dispute concerning the heirship of the crown of Scotland on the death of the Maid of Norway (1290) that the family achieved such power that its representative and head, John de B., claimed the crown as grandson of Margaret, the eldest daughter of David, earl of Huntingdon, brother of King William the Lion. After the commissioners of Edward I. of England had given hearing to the rival claimants, the chief of whom was Robert Bruce, grandfather of the celebrated monarch of that name, their award was given to John de B., who assumed the crown of Scotland as vassal of Edward. From the first he was unpopular with the Scots, who dubbed him the Toom Tabard, or empty garment. In 1296—5 years after his assumption of the royal authority—he revolted from his vassalage, giving as his reason for so doing the wanton outrages which Edward committed upon his subjects. The Scots made an inroad into Tynedale, but were defeated with considerable loss at Dunbar (Apr. 28, 1296). B. at once submitted, and was compelled to do penance in a white sheet for his rebellion, resigning his crown, after which he and his three sons were sent to London, where they were confined in the Tower for three years, when he was released at the request of Pope Boniface, and delivered up to the papal legate. He d. in France, at his patrimonial estate of Bailleul, in 1314. Edward, his son, displayed some ambition, and in 1332, in the reign of David II. of Scotland, invaded that country, defeating the earl of Fife at Kinghorn. By means of the treachery of the Scottish nobility he again defeated the royal forces at Dupplin Moor, after which he took possession of Perth. He was crowned at Scone in Sept., but the national resistance proved too great for him to withstand, and he was routed at Moffat. After the defeat of the Scots at Halidon Hill, however, B. returned to Scotland, and attempted to dismember the kingdom by dividing it among the nobility. In 1335, deserted by the nobles, he fled to England and surrendered his claims to Edward III. He d. childless in 1363. Henry, his brother, had been slain at the battle of Moffat. John B., father of the king of Scotland of the same name, founded Balliol College, Oxford, about 1263. See B. J. Scott, *The Norman Balliols in England*, 1914.

Ballista, see **BALLISTA**.

Balistes, or **File-fish**, classified in the

Plectognathous div. of the order Teleostei, and generally known as file-fishes from the serrated spines on their dorsal fins. A peculiarity of this spine is that it can be retracted by muscular action into a groove in the underlying osseous structure, and when erected can be fixed by interlocking with a spinal projection which can be depressed and raised at will. There are sev. varieties, of which one, *B. caprisus*, is found off the coasts of Great Britain.

Balize, see BELIZE.

Balkan Mountains (anciently Hæmus), branch or sub-range of the central European mt. system, extending from the Iron Gates of the Danube to Cape Eminch on the Black Sea. The highest peak is the Shar Dagh, 9000 ft. Other peaks: Yumrukhal, 7800 ft.; Kadimlia, 7500 ft.; and Ambarika, 7300 ft. Shipka, Troyan, and Rosalita are the chief passes.

Balkan Peninsula. The, the most easterly of the three great peninsulas of S. Europe, it runs southward between the Ægean and Adriatic Seas. Its area is about 200,000 sq. m. The boundary of the peninsula is roughly a line drawn from the mouth of the Danube to the head waters of the Adriatic at Trieste. On the E. it is bounded by the Black Sea, the S. by the Marmora, and the Ægean, on the S. of the Mediterranean, and on the W. by the Ionian and the Adriatic Seas. With the exception of a stretch of ter. along the Danube, the whole of the peninsula is extremely mountainous, and this is especially noticeable in the S., where the mts. stretch down to the sea and reappear as ls. in the Ægean. In the N.E. are found the B. Mts., to the S. of which lie the Rhodope Mts. From the shores of the gulf of Salonika rises Mt. Olympus, about 10,000 ft. On the borders of Albania is the Shar Dagh, 9000 ft. In Greece is found the Pindus range, while Yugoslavia, which includes the ters. of Montenegro, Serbia, Dalmatia, and Bosnia, is a very mountainous country. The Dinaric Alps extend along the borders of Bosnia and Dalmatia. The prin. rivs. flow in an easterly or south-easterly direction. The Danube enters the Black Sea; the Maritza, Mesta, Strumna, Vardar, and Salambria enter the Ægean. The Drin and the Viossa are the only considerable rivs. that enter the Adriatic. The climate is very severe in winter, although the winter is short, but during the early spring very bitter weather indeed is experienced even in the most southerly parts of the peninsula.

The Races of the Peninsula. The Ottoman inhab. of the B. P. are rapidly declining in numbers. Turkey-in-Europe, restricted practically to Constantinople by the treaty of Sévres (1920), and in 1922 extended by a convention to Adrianople and the Maritza R., has a pop. of 1,266,000 (1935). There were 289,000 Turks in Rumania in 1930, but since then the area of Rumania has been reduced, and 500,000 Turks in Bulgaria. By far the greater part of the pop. of the

peninsula is made up of Slavonic tribes, of which the two main divs. are the Serbs and the Bulgars. The Serbs are mostly contained in the republic of Yugoslavia, which includes Croatia-Slavonia, Bosnia, Dalmatia, and the former kingdoms of Serbia and Montenegro. The total area is 248,050 sq. m., and the pop. is approximately 13 millions, of which 9 millions form the Slav element. The Bulgars number 85 per cent of the pop. of Bulgaria, which totals 6,172,000 in an area of 39,825 sq. m. (or 103,140 sq. km.). In 1930 there were 361,000 Bulgars in Rumania. Rumania, through the annexation after the First World War of Bessarabia and Transylvania, had an area of 114,000 sq. m., and its pop. was estimated in 1930 as nearly 20,000,000; but as a result of territorial changes made in compliance with an ultimatum from the Soviet Gov., Bessarabia and N. Bukovina were ceded to U.S.S.R., the area affected being 20,000 sq. m., with a pop. of 4,000,000. In Aug. 1940 Rumania ceded 3000 sq. m. of the S. Dobrudja to Bulgaria so that, by that year, the area of Rumania had been reduced to 84,000 sq. m. with a pop. of 13,291,000. The oldest inhab. of the B. P. are the Albanians, who number a million in Albania, a country of about 12,000 sq. m. S. of Yugoslavia, and half a million in Yugoslavia itself. The Gks. are the second oldest race in the B. P. Greece now extends its boundaries over Macedonia and W. Thrace. The total area of Greece is 50,271 sq. m., and the pop. (estimated in 1937) 6,936,000, but the pop. of W. Thrace is very mixed, with as many Turks and Bulgars as Gks., but, on the other hand, there are nearly 300,000 Gks. in Constantinople. The rest of the pop. of the peninsula is made up principally of Armenians and Jews. The former, greatly reduced in numbers since 1896 by massacre, are found, as the Gks., in the commercial centres of the B. P. The political questions in the Near E. are always complicated by the differences of the religious creeds which are found there. The Moslem pop. is considerably smaller than the Christian, not many of the conquered races having adopted the faith of their conquerors. Seventy per cent of the Albanian pop., however, professes the Muslim religion, and there are 1,561,000 Muslims in Yugoslavia and 260,000 in Rumania. The remaining inhab. of the B. P. are divided between the Gk. Church and the Lat. Church. The Gk. Church is divided between the Gk. Catholics and the Orthodox. There are also some Protestants. Religious toleration is now officially estab. in the peninsula, together with compulsory education and the recognised use of dialects. For some time Turkish, as the language of the conquering race, had been the official language, while Gk., because of its tradition and hist., was the language of the educated classes. The Slavonic dialects were not, however, allowed by the Slavs to die out, and with the growth of national autonomy they have come back into current use. The languages of Rumania and Albania have also been

preserved, and the latter is of great interest to the philologist, as it is the only remaining dialect of the Thracian-Ilyrians.

History of the B. P. during the Nineteenth and Twentieth Centuries. Up to the beginning of the nineteenth century the Turks were undoubtedly the sole dominant race in the B. P. The whole of the peninsula was under their sway except Dalmatia, Montenegro, and the Ionian Is. The centuries of Turkish rule had brought to the conquered races no desire to amalgamate with their conquerors, and no assimilation of the races had taken place. In the third decade of the nineteenth century the war of Gk. Independence began, an independence which was recognised by the Turks in 1829, and in 1830 the independence of Serbia as a tribute-paying principality was also recognised. The break-up of the Ottoman empire began in 1875 with an insurrection in Herzegovina. Similar revolts in Bulgaria were crushed by the massacre of 12,000 Christians, an act which alienated Brit. sympathy and paved the way for the Russo-Turkish war (1877-78). By the treaty of San Stefano a large Bulgarian principality was created as a threat to Turkey, but England and Austria, both hostile to Russia, forced a revision of this treaty at Berlin in 1878. Bulgaria was cut down to a smaller state under the suzerainty of the sultan; Serbia, Rumania, and Montenegro were independent, while Bosnia and Herzegovina were put under Austrian administration. The new states had a respite of about 20 years in which to attend to internal development. Attempts to strengthen Bulgarian national unity led to trouble with Russia and Turkey. Serbia, to obtain territorial compensation for the aggrandisement of Bulgaria by the addition of E. Rumania, made a precipitate attack on Bulgaria, but was repelled. King Ferdinand and his minister, Stambulov, with the support of European diplomacy, made Bulgaria a strong buffer state. To counteract nationalism in the B. P., Turkish despotism was increasing under Abdul 'the Damned,' who was befriended by Germany. His reign was marred not only by the Armenian massacres, but also by the oppression of the Turks themselves. In July 1908 the Young Turk party revolted, and a constitutional gov. was set up under Abdul's brother, Mohammed V. The Young Turks' foreign policy embroiled them in a war with Italy over Tripoli, and oppression in Albania and Macedonia led to the formation of the B. League on Aug. 26, 1912.

The first Balkan war began in Oct., and the allies (Bulgaria, Serbia, Montenegro, and Greece) were victorious over Turkey. Then the 'allies' quarrelled over the partition of almost the whole of former Turkey-in-Europe, and the second Balkan war followed in June 1913. *See also* under BALKAN WAR.

From 1913 to 1914 European diplomacy was making the most of the B. situation. Germany was maturing the scheme of a *Mittel-Europa*, a central

empire from Hamburg to Constantinople. Ger. influence was predominant in Turkey and Bulgaria, while Austria coveted the port of Salonika. On June 28, 1914, the Archduke Ferdinand, heir to the Hapsburg monarchy, was assassinated in Sarajevo. At the outbreak of the First World War, Turkey, Greece, Rumania, and Bulgaria declared their neutrality. The aim of diplomacy was to bring these nations into the conflict on one side or the other. By Nov. England and Turkey were at war. The prestige of the Entente suffered by the failure to force the Dardanelles in the Gallipoli campaign of 1915. As a result Bulgaria declared for Germany. The Gallipoli forces were diverted to Salonika, and from there operations were started to save Serbia from the Austrians and Bulgarians. This also failed, and Serbia was disabled in the autumn of 1915. In 1916 Rumania declared war on Austria, but was decisively defeated. The dreams of the pan-Ger. imperialists were now almost fulfilled.

In June 1917 Greece under Venizelos (*q.v.*) declared war on Germany, Turkey, and Bulgaria. A year later a general allied attack began with Salonika as base, and Bulgaria was put out of the war. (*See MACEDONIAN FRONT, OPERATIONS ON.*) The Serbians were again occupying their old cap., Nish, thus cutting the Berlin-Constantinople railway. The various treaties at the end of the war caused the growth of Rumania and the union of the Serbs, Croats, and Slovenes into the kingdom of Yugoslavia. Not long after the war, however, there were three conflicts, first, between Italy and Yugoslavia over the Dalmatian seaboard and the occupation of Fiume (1919); then between Greece and Turkey over the Gk. occupation of Smyrna (1922); and finally between Greece and Italy over a political murder, leading to the bombardment of Corfu (1923). Over these difficulties European diplomacy did its utmost to prevent a renewal of war, but was unsuccessful in the second of these cases (*see* GRECO-TURKISH WAR, 1921-22).

During the 12 years following the First World War, the B. P. states had not many successes to their credit in the difficult task of reconstruction. Yugoslavia was torn by political faction, until parliament was dissolved by King Alexander (*q.v.*), who declared a royal dictatorship in Jan. 1929. Rumania, after the elections of Dec. 1928, was ruled by the National Peasant party under Premier Maniu, and in June 1930 King Carol came to the throne by a *coup d'état*, after having renounced the succession some years before. In Greece Venizelos, who became Prime Minister of a republican Greece in 1928, tackled the problem of the port of Salonika and its 'free zone.' Bulgaria, like Hungary, smarted under territorial losses, and Albania, ruled by King Zog, was even then under It. influence.

In 1933 Bulgaria tried to form a S. Balkan bloc, consisting of Bulgaria, Greece, and Turkey, by way of political

and economic counterpoise to the Little Entente (*q.v.*). Up to that year, the great difficulty of adjusting the financial questions between Greece and Turkey, besides keeping those states aloof from each other, stultified the efforts of Kemal to lay the foundation of a Triple Entente, whose representatives should enhance the influence of their states by sitting in rotation on the council of the League of Nations. Originally Turkey declined to enter the League of Nations unless she were guaranteed a permanent seat on the council, but later Kemal relaxed this attitude. Naturally this political move caused a hostile reaction in Yugoslavia, whose Gov. endeavoured to prevent any Greco-Bulgarian understanding. A B. pact, between Yugoslavia, Rumania, Turkey, and Greece, was, however, signed at Athens, Feb. 9, 1934, by which the signatories mutually guaranteed the security of all their B. frontiers; and also, not to embark on political action against any other B. non-signatory without previous mutual discussion, nor to assume any political obligation towards any other B. state without mutual consent.

The movement for a Bulgar-Yugoslavian *rapprochement* was advanced by the signing of a non-aggression pact between those two countries in 1936, and there were also, in the same year, tentative efforts towards a Bulgarian *rapprochement* with the B. Entente (Greece, Rumania, Turkey, and Yugoslavia). The Gk. interpretation of the B. pact was made clear at a B. conference, at Belgrade, in 1936; it was that it would limit Greece's application of assistance in case of war to an attack by Bulgaria, and that it was designed to prevent her from being drawn into a war between Italy and Yugoslavia. Again, Greece did not regard Albania as a B. state within the meaning of the pact of 1934, but as a state under the tutelage of Italy. In Feb. 1938 the permanent council of the B. Entente, held at Ankara, under the presidency of Gen. Metaxas, the Gk. Prime Minister, to consider the orientation of the Entente after the It. conquest of Abyssinia and the general tension in the Mediterranean owing to It. and Ger. interference in the Sp. Civil war, described their Mediterranean policy as one of good relations and co-operation with the Mediterranean powers, Great Britain, France, and Italy. At about the same time Greece and Turkey signed a new treaty, of 10 years' duration, under which each agreed to remain neutral if one of them was attacked, and to use its mediation in case of attack on the other. By this time the general political situation in Europe had deteriorated and swift diplomatic moves were made by B. countries to safeguard their position in the event of a general European war. A non-aggression pact between Bulgaria and the B. Entente was signed at Salonika on July 31, 1938. Under this treaty (besides the provisions on mutual non-aggression) the military and naval

clauses of the treaty of Neuilly, 1919, were renounced, as also were those clauses in the Lausanne convention of 1923 respecting the Thracian frontier. The effect of this pact was that Bulgaria was thenceforward free to introduce military service and to complete her armaments without restrictions; and, further, she was at liberty to occupy with troops the Thracian frontier zone between Bulgaria, Greece, and Turkey, which had been demilitarised under the Lausanne treaty. The integrity of the three countries of the B. Entente—Greece, Rumania, and Turkey—was guaranteed by Great Britain and France in 1939 as a counter-move to the fear of Ger. penetration into S.E. Europe. The most definitive of these guarantees was the mutual aid pact between Great Britain and Turkey concluded in May 1939; this was, in effect, a long-term agreement of a reciprocal character in the interests of their national security. For the impact of the Second World War on the B. P. see EASTERN FRONT, OF RUSSO-GERMAN CAMPAIGNS, IN SECOND WORLD WAR; also GREECE, SECOND WORLD WAR CAMPAIGNS IN (1941).

Bibliography: *The Present Condition of the Balkans and of European Responsibilities*, by various writers, ed. by Luigi Villari, 1905, has historical value. Other useful works on this earlier period or before are *Turkey in Europe*, by 'Odysseus,' 1900; R. Wyon, *The Balkans from Within*, 1904; W. Miller, *The Balkans*, 1909; also Yovanovitch, *An English Bibliography on the Near Eastern Question, 1481-1906* (Belgrade), 1909. Turrill, *Plant Life of the Balkan Peninsula*, 1929. See also under individual Balkan nations.

Balkan War, The (1912-13), the first European war of the twentieth century. The epoch of European hist. brought to a close by this war was that which opened in 1453 with the fall of Constantinople, cap. of the Byzantine empire, which, together with the whole B. Peninsula, was submerged beneath the wave of Turkish invasion from Asia Minor. In the centuries which followed it was only gradually that one by one races achieved

a partial or complete autonomy. The decline of Ottoman power was only stayed by the jealousies of the great powers of Europe and by the rivalries of the petty B. states themselves. The Crimean war (1854-56), between Russia on the one hand and England and France on the other, was undertaken by the latter powers to maintain Turkish rule in Europe, and in 1885 Bulgaria and Serbia, for a brief period, were at war with one another because the latter country feared a territorial aggrandisement by Bulgaria in E. Rumelia. The sultan, Abdul-Hamid II., benefited from these jealousies, and thus for many years secured an immunity, during which he continued to oppress his European provs. But his misgovernment and despotism were too much for even his Mussulman subjects. He was deposed in 1909, and a constitutional regime inaugurated, with his long-imprisoned brother, Mohammed V., as sultan.

The hopes raised by the successful revolution of the Young Turks that the Christian pop. of Turkey-in-Europe would be better treated proved to be illusory. It is true, so far as the Turks themselves were concerned, that some reforms were effected. It is true also that Jews and Christians were allowed to become officers in the army, but the non-Islamic pop. (which in Turkey-in-Europe numbered about three-fifths of the total pop.) was no better off. The small states who were Turkey's neighbours in the B. Peninsula unavailingly protested against the oppression of their kinsmen in Albania, Macedonia, and Thrace. They appealed to the great powers, who formed the so-called Concert of Europe, to fulfil the obligation to which they had pledged themselves by the treaty of Berlin in 1878, but with little result. At last, despairing of anything being done by the powers, the B. states themselves decided to cut with the sword the Gordian knot. Greece had already, in 1897, fared badly in a war with Turkey. But what each state was individually too weak to accomplish might be effected by union. Sinking for a while their differences, Bulgaria, Serbia, Greece, and Montenegro combined to form the B. League, a league having for its object the safeguarding of the common interests of their nationals in the Turkish empire. By this means a striking force was formed of approximately the same strength as the Ottoman troops, with the added advantage of being able to attack on all sides at once. A suitable opportunity to commence hostilities presented itself towards the end of Sept. 1912. The Ottoman administration was then suffering from the strain of the year-old war with Italy (albeit that war was confined to its Tripolitan ter.) and the rising of the Albanians, restive under the constitutional regime. After the B. mobilisations, the powers, hastily seeking some formula which would preserve an artificial *status quo* in the Balkans, invoked the almost forgotten clause xxiii. of the treaty of Berlin—an article by which

the great powers pledged themselves to compel Turkey to introduce reforms into its European provs. But on Oct. 8 the smallest of the allied states, Montenegro, without even an ultimatum declared war. On Oct. 10 the great powers by their collective note made a last attempt to induce Turkey to grant such reforms as would avert war, and three days later an identical Græco-Serbo-Bulgarian note was presented to the Ottoman Gov. Turkey's reply to the latter was to declare war on the allies on Oct. 17. In the meantime the Montenegrins had invaded Albania, captured successively Detchitch, Skip-tchanik, Tuzi, and Berane, and had invested Tarabosh and Scutari. Also before Turkey declared war on the allies two other significant events had taken place: the admission of deputies from Crete into the Gk. Chamber on Oct. 14, and the conclusion on Oct. 15 of the peace of Ouchy (or Lausanne) between Turkey and Italy, a peace in which Turkey recognised the *fait accompli* of It. occupation of Tripoli.

Each of the invading armies by itself, and without the aid of its allies, overcame Turkish resistance in various parts of the country. Thus the Bulgarians alone, under the supreme command of Gen. Savoff, and with Gen. Dimitrieff as his prin. lieutenant, on Oct. 22 to 24 at Kirk-Killise turned the right flank of the army under Nazim Pasha, the Turkish commander-in-chief, of whose forces Mahmud Mukhtar Pasha and Abdullah Pasha were important leaders. The Turks fled from Kirk-Killise, abandoning in their flight large quantities of stores and guns. The Bulgarian losses alone were estimated at 2000 killed and 5000 wounded. By this turning movement the Turkish forces were divided: some were driven S. towards the Aegean Sea; the main body retreated towards Constantinople (now Istanbul), while the remainder speedily found themselves invested in Adrianople (now Edirne). Pursued by the Bulgarians, Nazim nevertheless succeeded in rallying his forces, and a stand was made in an engagement extending over a front of 100 m. In this great battle, known officially as that of Lule-Burgas-Bunarhissar, which was fought on Oct. 28-31, success at first seemed to attend the Turkish arms, for the right wing more than held its own, but at length the left wing was smashed in the carnage that raged round Lule-Burgas. This compelled the Turkish right and centre to fall back; the retreat again became a stampede, which was only checked at the banks of the Choriu. Eventually this position was abandoned for the stronger Chataltja lines. The casualties in this engagement reached 55,000, of which 15,000 were in the Bulgarian forces. The captures from the Turks included 75 guns, 2800 prisoners, and much stores and ammunition. The subsequent fighting before the Chataltja line of forts was desultory, owing in part to the exhaustion of the Bulgarians and their desire to avoid the epidemic of cholera which began on Nov. 7, and which ravaged the Turkish forces.

Meanwhile the Serbian forces, under Gen. Putnik, commander-in-chief, and Prince (afterwards King) Alexander, were marching on Uskub, the cap. of Old Serbia. Encountering a Turkish force under Zeki Pasha at Kumanovo, an engagement was fought there on Oct. 23-24, in which the Serbians won a victory. The Turks fled, leaving behind them 98 field-guns, 15 howitzers, and the road open to Uskub. The losses on both sides were heavy, the Turkish casualties being estimated at 6000. On Oct. 26 Uskub was occupied by the Serbian troops, and a few days later (Nov. 2) King Peter made his triumphal entry. In a short time the Serbian troops had swept over Macedonia, and a detachment was sent to occupy ports on the Adriatic. Monastir, at which the remnant of Zeki Pasha's army had gathered, surrendered on Nov. 18, and Alessio, on the Adriatic, was occupied two days later.

Unbroken success likewise attended the Gk. army, directed by the crown prince, Constantine. Advancing through Thessaly, a few minor engagements were fought with a numerically weaker Turkish force under Hassan Tahsin Bey, which retreated towards Salonika. The Turks lost 17 guns at Seldjé, and on Nov. 1 were badly beaten at Yenidje near the Vardar. The Gks. crossed this riv., and on Nov. 9 Salonika, then the second city of Turkey-in-Europe, surrendered without further fighting.

In the W. the Montenegrins were content to let disease and starvation, aided by bombardment, work their devastating effects on Scutari and Tarabosh, which were invested by them and defended by the Turkish leader, Hassan Riza Bey.

A notable feature of the war was the presence in the field of all the sovereigns of the allied states. These were King Ferdinand of Bulgaria, Peter of Serbia, George of Greece, and Nicholas of Montenegro. From the military point of view one or two facts would seem up till then to have been demonstrated: first, the utility of aeroplanes in war, of which machines Bulgaria had several; second, that the bayonet was still a most effective weapon, especially in a final assault after artillery preparation; third, that the success of the allies was largely attributable to the superiority of the Fr. (Creusot) cannon over the Ger. (Krupp) guns of the Turks. Finally, it may be observed that, on the part of the Turks at any rate, the war was regarded as a holy war, for on Nov. 8 the Sheikh-ul-Islam ordered the preaching of a jihad.

Naval operations in this war were of small importance. Three only of the combatants possessed any fighting ships—Greece, Bulgaria, and Turkey. The Turkish fleet at that time was negligible, but it served to establish a blockade of the Bulgarian coast in the Black Sea, and it bombarded a few coast towns, notably Varna. Also its presence served as a menace to the Bulgarian left wing before the Chatalla lines. On Nov. 10 the Turkish fleet in the sea of Marmora bombarded Rodosto, a Turkish tn. then

occupied by the Bulgarians. On Nov. 21 the Turkish cruiser *Hamidieh*, accompanied by two destroyers, was attacked by four Bulgarian torpedo-boats about 15 miles from Varna in the Black Sea. Turkish fire sank one torpedo-boat and damaged another, but the *Hamidieh* was struck in the bows and began to founder. Her captain—Raouf—was, however, able to bring her safely back to Constantinople. On the other hand, the Gk. Navy (strengthened by four Eng.-built torpedo-boat destroyers bought from the Argentine Republic just prior to the outbreak of hostilities) occupied the Is. of the Aegean Archipelago, beginning with Lemnos on Oct. 21, and finishing with Mitylene, Nov. 22. On Nov. 12 Turkey—after fruitlessly appealing to the powers for mediation (Nov. 4)—asked Bulgaria for an armistice. On Nov. 25 delegates met at Chatalla to arrange terms for this armistice, and the eventual peace. The armistice was signed on Dec. 3 by Turkey and all the allies except Greece, who maintained that the terms were too favourable to Turkey.

It is estimated that during the first six weeks of the war the Turks lost from all causes 200,000 men. The allies captured 500 guns, 100,000 rifles, and vast quantities of stores and ammunition. The total casualties of the B. League are put at 80,000.

In the peace negotiations in London the issue was narrowed to the question whether Turkey was willing to surrender the Aegean Is. and all her European possessions W. of Adrianople. Over Adrianople and the Is. the Turks assumed a *non possumus* attitude, and for a while the peace conference was suspended. At length, yielding to the pressure of the powers applied by a collective note, the aged grand vizier, Kiamil Pasha, advised by the Grand Council he had summoned, agreed to surrender on this point.

Before this resolution could be carried out, Kiamil's gov. was overthrown on Jan. 23, 1913, by the Young Turk party, led by Talaat Bey and the popular Enver Bey (see ENVER PASHA). Nazim Pasha, the Turkish war minister, was murdered, Kiamil resigned, and the Young Turks set up Mahmud Shevket Pasha as grand vizier. The new ministry made the retention of Adrianople a cardinal point of policy. The conference of London broke up and hostilities were resumed. During Mar. and Apr. the three centres of Turkish power in the Balkans, the garrison towns of Adrianople, Janina, and Scutari, surrendered to the Bulgarians, the Gks., and the Serbs respectively. On May 1 the Turks were compelled to sign the treaty of London. In this treaty the great powers of Europe had a guiding hand, and reserved to themselves the right to settle the boundaries of Albania and to determine the destiny of the Aegean Is. Turkey-in-Europe was confined to a piece of E. Thrace, within a boundary line drawn from Enos to Midia. The B. allies had the task of partitioning the rest of Turkey's former possessions in Europe. The div. of Macedonia was at once a

source of contention and the creation of Albania as an independent state under Austrian influence increased the friction between Serbia and the Hapsburgs eventually to cause the spark which caused the conflagration of the First World War. Austrian policy was directed towards preventing Serbia from gaining ter. on the Adriatic, thus cutting off possible Austrian expansion towards Salonika and the Aegean Sea. On the other hand, Nicholas II. of Russia, coming forward in the historic role of protector of the Slav peoples, offered to act as arbiter in the Macedonian dispute. Bulgaria, however, was under Teutonic influence, and on June 29, 1913, the Bulgarian army made a treacherous surprise attack along the Gk. and Serbian lines in Macedonia. A month's fierce fighting followed between the B. allies. Rumania advanced upon Bulgaria from the N. and occupied the ter. of Silistria. Bulgaria was forced to make peace, and on July 30, 1913, the treaty of Bucharest was signed, thus bringing to an end the second Balkan war. By its terms Bulgaria was excluded from Macedonia, and Adrianople reverted to the Turks. Rumania, Montenegro, Serbia, and Greece made large territorial gains. The two wars had caused the death of nearly 350,000 men.

Consult J. R. Schurman, *The Balkan Wars, 1912-13*, 1913; D. J. Cassavetti, *Hellas and the Balkan Wars, 1913*; R. Rankin, *Inner History of the Balkan War, 1914*; M. E. Durham, *The Struggle for Scutari, 1914*; E. and S. Ashmead-Bartlett, *With the Turks in Thrace, 1913*.

Balkh, cap. of a principality of that name in N. Afghanistan, and once known by its Persian name Bakhtri as the cap. of anct. Bactria. It is situated 23 m. S. of the R. Oxus and the ruins of its anct. site are still discernible, having a circumference of at least 20 m. Four m. to the eastward lies the new tn., called Mazr-i-Sherif, the modern Afghan cap. of the prov., with a pop. of about 30,000. It was here that the Græco-Asiatic civilisation first found expression, but even before this the magi of Persia founded the Zoroastrian religion. On the death of Alexander the Great it became incorporated with the Græco-Syrian kingdom of the Seleucidae, and later figured as a centre where Buddhist propaganda was disseminated. The natives designated it Am-ul-Beled, mother of cities, and trusted in its rehabilitation to the condition of its anct. splendour. The neighbouring soil is fertile, and large quantities of wheat are grown.

Balkhash, a lake lying in the vicinity of the Kirghiz steppes, and contiguous to the ter. of Semipalatinsk in Kazakhstan. It is 150 m. in length, with a breadth of half that distance, and is the fourth largest inland sea in the U.S.S.R. For six months in the year, from Nov. onwards, it is frozen over. During the rest of the year it is open to water-borne traffic, and shipyards have been put in operation at the mouths of the Karatal,

Lepsa, and Ill Rs., which are the chief rivs. feeding the lake.

Ball, Games of. Originally the game of B. had probably a religious significance, and some of the pastimes into which the use of the B. or sphere enter, such as the B. game of certain Amer. Indian tribes, or that of the anct. Mexicans, are known to have possessed an astronomical basis. Again, the struggle of good against evil is thought to have been typified by certain anct. Persian B. games, the sphere in this instance representing the world. In Greece and Rome in classic times various B. games were indulged in by young and old, and in medieval England and France tennis and pell-mell were favourite pastimes. In more modern times first golf, native to either Holland or Scotland, and cricket were evolved as B. games, and football, perhaps the most popular of all, has been a game of both the Scottish and Eng. people for centuries. Polo and baseball, the latter a game of Amer. origin, lawn tennis, lacrosse, and basket ball are other modern B. games.

Ball, Albert (1896-1918), Eng. air pilot, b. at Nottingham, son of Alderman Sir Albert B., sometime mayor of Nottingham. On the outbreak of the First World War, B. joined the Sherwood Foresters; later he was seconded to the Royal Flying Corps, reaching the rank of captain. A single-seater pilot by temperament, he was transferred, in 1916, to the 11th Squadron, to fly the then new Nieuport Scout machine; and on May 29 of that year he brought down the first of his long list of enemy aeroplanes. Awarded the V.C., D.S.O., and M.C. Killed in action May 7, 1918.

Ball, Sir Alexander John (1757-1809), Eng. admiral, served in the Mediterranean under Lord Nelson. In 1799 he was elected by the Maltese as their chief and the president of their congress. He became rear-admiral, 1805. Nelson thought him a 'great coxcomb' before B. received a command; but afterwards, when B. was continuously employed, they became close friends. B. served under Nelson at the battle of the Nile, where his ship *Alexander* was the particular opponent of Bruce's flagship *L'Orient*, which blew up. He proved a very popular governor of Malta, being solicitous for the interests of the Maltese.

Ball, Charles James (1851-1924), Brit. archaeologist. Taught classics at the Merchant Taylors' School, appointed chaplain at Lincoln's Inn, and then given the rectory of Blackington, Oxon. Lectured on Assyriology at Oxford Univ. and held univ. professorship in that subject. Wrote numerous works on Assyriology and Heb.: *Merchant Taylors' Hebrew Grammar* (1878); *Inscriptions of Nebuchadnezzar* (1887); *The Metrical Structure of Qînôth; Iranian Names among the Hetta-Hatti* (1888). Also studied Chinese, his work, *Sumerian and Chinese* (1913), attracting attention from the theory advanced in it that the Chinese language and characters were derived from the Sumerian.

Ball, John (d. 1381), agitator who assisted to stir up the people during the rebellion headed by Wat the Tyler in 1381. His propaganda spread like wildfire among the peasantry, and spurred them on to many excesses. On the collapse of the revolt and the death of Tyler he was captured and hanged at St. Albans, July 15, 1381. See C. E. Maurice, *Lives of English Popular Leaders in the Middle Ages*, vol. II., 1875; William Morris, *A Dream of John Ball*, 1888.

Ball, John (1818-89), Irish scientist, politician, and traveller. He was called to the Irish Bar, 1845; became M.P. for co. Carlow, 1852; under-secretary of

for painting and sculpture. In 1852 he made busts of Jenny Lind and Daniel Webster; his other chief works are the statue of Washington in Boston Public Garden, of Webster in the Central Park of New York, and the group of 'Emancipation' in Washington. See his autobiography, *My Threescore Years and Ten*, 1891.

Ballachulish, vil. and par. on the S. banks of Loch Leven in Argyllshire, Scotland. The staple industry is the quarrying of marble and slate. The name is derived from the Gaelic *Baile-na-coolish*, the vil. on the strait. Pop. 1500.

Valentine, Dundee

LOCH LEVEN AND THE GLENCOE MOUNTAINS FROM NORTH BALLACHULISH

state for the colonies, 1855-57; and first president of the Alpine Club, 1857. He pub. the *Alpine Guide*, 1863-68, and wrote works on physical and geographical science.

Ball, Sir Robert Stawell (1840-1913), Irish astronomer, b. in Dublin, 1840, and educated at Trinity College. Lord Rosse, the celebrated authority on astronomy, appointed him his astronomer in 1865, and in 1873 he was created prof. of applied mathematics in the Royal Irish College of Science. In the following year he quitted that post to fill the more important one of prof. of astronomy at Dublin, with which went the office of astronomer-royal for Ireland. His best-known works are *The Story of the Heavens*, 1885; *In Starry Realms*, 1892; and *In the High Heavens*, 1893. D. at Cambridge.

Ball, Thomas (1819-1911), Amer. sculptor, b. in Charlestown, Massachusetts. In early life he was a distinguished basso, but soon gave up singing

Ballad, poetical composition narrative in matter and lyrical in form which generally recounts some legend or story. It must not be confounded with the ballade (q.v.). This type of composition was known to the Gks. and Roms., who utilised it for laudatory purposes. Such Bs. were almost invariably accompanied by symbolical dancing until the fashion of accompanying them on the lyre or harp brought the custom into desuetude. Subsequent to the fall of the Rom. empire we find the *saga* form in general use among bards, jongleurs, and minstrels, and the B. as we know it to-day is thought to have evolved from it. On the other hand, it is advanced with some reason that the *saga* may have grown from a collection of Bs. on any cognate subject, for example, the siege of Troy or the deeds of any hero or house of heroes as the Nibelungs or Hukings. But it is in its lyrical form that we must here consider the B., which originally received its present name and shape in the Italy of the twelfth century.

It is, however, in N. Europe rather than in the house of its modern origin that the B. has risen to highest distinction, and although the Bs. of the Ger. poets Uhland, Bürger, Goethe, and Schiller certainly touch a level of the highest excellence as regards both composition and romantic feeling, it is to our own country we must look for the B. in its most natural form. Perhaps the most perfect specimens of the Brit. B. are those to whom no authorship can be assigned, but the works of Scott, Burns, Wordsworth, Tennyson, and Coleridge contain examples of this type of story-song.

What is true of folklore may be also held true of folk-song. The plots utilised in the B. are few and of world-wide acceptance. As the epic, folk-tale, fairy-tale, and *Märchen* are all universally wrought on the basis of a few venerable plots, so the material for the folk-song is almost equally scanty. These bases of the B. are among the romantic heritage of the sev. European peoples as much as is the story of the 'fatal children' common to all mythologies, or the tale of the neglected daughter, the origin of so much matter of faery. We may even be enabled to trace mythologic processes in the B., but we will first examine its universality. We have, for example, the tale of the girl who follows her 'fause luvie.' Such is the subject-matter of *Burd Ellen*, one of the most touching ever sung to the harps of the 'North Countrie,' and such is the plot of the Bs. in Fr., Dan., and other tongues. Again, we have the B. of the girl who, doubting her lover, is taken by him to a secret place, and is there told by him that she must die. By a trick she succeeds in taking his life instead. Such a plot is almost universal. In the Bs. of Bürger and Goethe, modelled on older types, we notice that the shades of the departed act as if alive. They return to lie beside their lovers until cock-crow, and rise on swift steeds on which they often carry off the object of their earthly affections. So acts Clerk Saunders in the old Scottish B., and so do scores of ghostly wights in the Bs. of all lands. This conception is drawn from Norse mythology. For example, we find in one of the Norwegian sagas the wife returning to the dead husband who is buried in the great mound on the moor by his dwelling. We thus find the same machinery employed throughout the Bs. of many lands, however different the local colouring may be. But there are other marks which betray the universality or B. idea beside sameness of plot. For example, we are never far away from the talking bird or the chorus of birds, the 'wee birdie' of the Scottish Bs. which with warning accents bids the 'bonnie may' beware of the 'fause Sir John.' Again, we find that the generality of B.-mongers have a decided partiality for gold and silver, and that the heroes and heroines of their songs are always mightily bedizened. They are liberally bedecked with the 'red goud,' and 'siller' is always plenteous. They have 'roses till their shoon,' and a great display of feathers.

Their body-linen is invariably white as snow, and the cramoiisy and satins they wear are minutely specified with all the snobbery of a sycophantic bardhood. But there is wretchedness too. Hynd Horne and his like who come to claim their own are dressed as beggars, but the lordliness shines through their rags, and after receiving hospitality—they usually ask for a drink for the sake of their own memory to find how it will be received—they stand forth in their native dignity and are duly remembered. In the refrains of such—in *Hynd Horne* it is 'The birk and the broom blooms bonny'—we find many allusions to plants. We know not the wherefore of this popularity of the heath plants, which permit their names to recur in B. refrain alternately with 'down-derry-down,' and the like, but some deeper significance probably lurks behind what would seem to be mere caprice. Ghastly crime is often, too, found in the B. motif. The Lammikin who slaughters his may (maid), the luckless 'childe' who is drowned or smothered—invariably the possessor of 'gouden locks'—recur among the old, unhappy, far-off things with the dastard groom who goes in his master's stead to his lady's bower, and is slain by his exasperated lord.

In the limits of such an article as this an extended review of B. literature is manifestly impossible, and a brief hist. of the B. form in the sev. European countries in which it has found favour must necessarily suffice.

The B. in Britain. No B. forms of Brit. origin of a greater antiquity than the fourteenth century may be said to have come down to us. Of the thirteenth century we have such specimens as *Kyng Horn*, *Sir Tristram*, *Haveloc*, and *Sir Gawayne*, which partake more of the nature of extended romances than Bs. proper, and it may be further laid down that any specimens of a date anterior to this are mere Eng. translations of Fr. examples. In the fourteenth century the native Eng. composition began to find favour with the people to the detriment of the Fr. importations, and the era of its introduction appears to have been that of its highest ascendancy and its most abundant and felicitous production. In succeeding centuries the B. form became gradually neglected and remained so until the period of its resuscitation by Bishop Percy, after a period of nearly 300 years. In his *Reliques of English Poetry* that celebrated antiquarian laid the foundation of that immense vogue of the romantic which dominated Eng. poetry for the next century.

The material whence Sir Walter Scott's *Minstrelsy of the Scottish Border* and its like was drawn was in all probability for the most part 'made' in the fifteenth and sixteenth centuries. The *Ballad of Sir Patrick Spens*, for example, is regarded by some as a modern forgery, yet in its machinery and circumstances it bears the stamp of eld. It was probably written in the sixteenth century from a still older B. contemporary with the times of which

it sings—the days succeeding the death of Alexander III. of Scotland, when the Maid of Norway was called to the throne. We may take it that most of the B. material that survived into the eighteenth century lost completely its original form and phraseology. This is clear, for example, in such productions as *Thomas of Erceldoune* and *Sir Tristram*, attributed to the hero of the first B. It is strange to find matter superior to that of the contemporary poets of the sev. eras through which these Bs. passed and survived handled by the mere verse-makers of the day. For it was not the Chaucers, the Dunbars, the Lindsays, or Spensers who fostered the B., but the Blind Harrys, the Hucheons, and the 'borrel' or rustic minstrels.

The literature of the Brit. B. has been examined by Furnivall, Ritson, Madden, Halliwell, and others, and especially by Prof. F. J. Child (q.v.).

The B. in Germany. Although the *Volkslieder* of the Ger. peoples is a form of considerable antiquity, it probably attained its present type at the hands of the minnesingers who clustered around the courts of the landgraves and petty kings of the Germany of the Middle Ages. At the court of Hermann, landgrave of Thuringia (c. 1180-c. 1200), poetical effort reached a high standard, and such singers arose as Wolfram von Eschenbach and Gottfried von Strassburg. Such 'epics' as the *Parzival* and *Tristan* of these poets were the lineal ancestors of the B. form, and we find their echoes in many a later effort. In the *Heldenbuch*, or great book of national heroes, and the *Nibelungenlied* we find gathered together a number of Bs., the sequence of which assists to make up a completed whole. During the fifteenth century a satiric type of B. arose, and was succeeded by the comic B. of which *Till Eulenspiegel* is the form *par excellence*. During the Lutheran period the B. declined, but upon the romantic renaissance which in Germany had as its protagonists Klopstock, Wieland, and perhaps Lessing, the B. returned to fostering influences, and in the hands of Bürger, Goethe, Schiller, and Uhland attained perfection. The Bs. of modern Germany do not possess the almost child-like brightness of those of the old *Minne-lieder*, but are marked by a gloomy grandeur and mysticism.

The B. in France. The earliest Fr. B.—perhaps the only one of early origin that has survived—is that of *Aucassin et Nicolette* (really a *conte-fable* or *nouvelle*), and with the withering of the Langue d'Oc before the Langue d'Oïl practically all the B. poetry of the former dialect must have vanished. Such 'epics' as the *Chanson de Roland*, *Ogier le Danois*, and the like, were probably a conglomeration of Bs. During what may be called the Arthurian period the B. appears to have been lost among the romances which, if they partook of the B. form, and were sung in the same manner as a B., were yet too extended to justify their inclusion in the same nomenclature. In medieval France, in short, the B. ran to a

more extended and epic form, and thus lost that simplicity and brevity which were its chief characteristics. It is not until the fifteenth century that we get back to anything like the B., the rather affected and frigid efforts of Charles d'Orléans possessing some slight affinity with its *genre*. Villon, too, had B. affinities which, however, were counter-balanced by his richness of fancy and display of effort. With the rise of the romantic school in 1830, the B. came back to its own, and in the works of Victor Hugo, Gautier, Sainte-Beuve, and Émile Deschamps received liberal treatment and recognition.

The B. in Spain. Sp. literature is rich in Bs. Perhaps the earliest type is that of the *Poema del Cid*, probably, like most early epics, composed of numerous Bs. joined into a compact whole. The strife with the Moors inspired many Bs., which in their turn might have been welded into another epic like the *Cid* had the master-hand been present. These are mostly anonymous, and deal with the deeds of noble knights, the love of fair ladies, Sp. and Moorish, and other chivalric matter. A good idea can be had of the quality of these Bs. by a perusal of Lockhart's *Spanish Ballads*. In Spain the B. has mostly to do with romance pure and simple. A peasant or bucolic muse arose separately, but although it approximates at times to the B. type it cannot altogether be classed with it. The Bs. of Spain are in general composed in a more varied metre than those of other European countries, and have furnished many Brit. poets with models for the composition of narrative verse.

In other countries of Europe the B. may be said to have followed a course similar to that indicated in the case of those countries dealt with. The foreign type of B. which bears most resemblance to the Brit. is the Scandinavian (Dan., Norwegian, and Swedish), and there can be no doubt that sev. of our Bs. are direct Scandinavian importations, whilst the reverse can also be maintained. Norman-Fr. forms also display some connection with ours, and the Bs. of Brittany exhibit what might be described as a territorial connection with those of this country. The B. is by no means confined to Europe, and the various Asiatic countries possess forms which closely approximate to the European. S. America, too, has a B. literature of its own, and the U.S.A. is by no means destitute of folk-songs cast in B. form.

Bibliography.—COLLECTIONS: T. Percy, *Reliques of Ancient English Poetry*, 1765; J. Ritson, *Pieces of Ancient Popular Poetry*, 1791; Sir W. Scott, *Minstrelsy of the Scottish Border*, 1802-3; F. J. Child, *The English and Scottish Popular Ballads*, 1857-8, 1882-98 (with bibliography); Sir A. T. Quiller-Couch, *The Oxford Book of Ballads*, 1910; L. Pound, *American Ballads and Songs*, 1922; B. von Münchhausen, *Meisterballaden*, 1923. CRITICISM AND HISTORY: F. B. Gunmere, *The Popular Ballad*, 1907; T. F. Henderson, *The Ballad in Literature*, 1912; L. Bianchi,

Novelle und Ballade in Deutschland, 1915; R. Graves, *The English Ballad*, 1927; L. C. Wimberley, *Folklore in the English and Scottish Ballads*, 1928.

Ballade, a form of verse consisting of 3 stanzas of 8 or 10 lines, concluding with an envoi of 4 or 5 lines. Each stanza must include 3 rhymes only, and the same rhymes in the same order must occur in each of the succeeding stanzas throughout the B. Each stanza, as well as the envoi, must have the same refrain. The envoi usually contains the dedication of the poem to some particular person, and often commenced with the title of the person to whom it was addressed, as 'prince' or 'sire.' It forms the climax of the poem. The B. is usually classed by prosodists among the forms utilised as *vers de société*. It must not be confounded with the ballad (q.v.). Modern lis. of excellence have been written by W. E. Henley, A. C. Swinburne, Austin Dobson, Andrew Lang, Oscar Wilde, G. K. Chesterton, Bayard Simmons, Paul Selver, Hilaire Belloc, and Théodore de Banville (q.v.), who brought this and other medieval Fr. forms into fashion again. It is essentially an antique form modernised, and was probably first perfected by Villon.

Ballagi, Moritz (1815-91), Hungarian philologist and Protestant theologian who studied at Paris and at Tübingen. He edited the journal *Protestans egyházi és iskolai lapok*; but he is chiefly known as a philologist, his works consisting of Hungarian-Ger. dictionaries and a grammar.

Ballance, John (1839-93), New Zealand Premier, b. at Glenavy, Antrim, N. Ireland. He emigrated to Wanganui, where he was first a shopkeeper, then a journalist, and the founder of the *Wanganui Herald*. He took an active part in the Maori war of 1867. In 1875, he entered the House of Representatives; in 1878 became treasurer in Sir George Grey's ministry; resigned in 1879. He re-entered Parliament in 1884 as minister of lands and native affairs; became leader of the Liberal opposition in 1889, and Prime Minister in 1891. In politics he showed himself broadminded, and his treatment of the Maoris was pacific.

Ballanche, Pierre Simon (1776-1847), Fr. philosopher, b. at Lyons. Early in life he succeeded in joining the literary circle represented by Madame Récamier and Chateaubriand. He was an exponent of the theocratic school of philosophy, being opposed to rationalism and upholding revelation and authority. His prin. work is *Palingénésie*, divided into three parts: I. 'L'Orphée'; II. 'La Formule'; and III. 'La Ville des expiations.' In these works he may be said to outline the hist. and philosophy of the world, past, present, and future. His later *Vision d'Hébal* contains the supposed prophecies of a chief of a Scottish clan gifted with second sight, who sets down what he sees of the future hist. of the earth. See C. Huut, *La Vie et les œuvres de Ballanche*, Paris, 1904.

Ballantine James (1808-77), Scottish

author, b. in Edinburgh. He is known for *Gaberlunzie's Wallet* (1843), a miscellany in which the items are supposed to be drawn from the wallet of a wayfaring pedlar. He was also the author of *The Miller of Deanhaugh*, and of some of the liveliest of Scottish humorous songs. He completed successful designs in a competition, the purpose of which was to provide stained-glass windows for the House of Lords in 1844.

Ballantine, William (1812-87), Eng. serjeant-at-law, b. in London. Educated at St. Paul's School, he was called to the Bar in 1834, and being disposed to a literary and theatrical life, soon acquired a number of friends connected with these professions. His most famous case was the one in which he defended the Tichborne claimant. He successfully carried off sev. causes célèbres, especially that of Franz Müller, who was tried for murder in 1864. He also acted for the gawkwar of Baroda in 1875. He d. at Margate. Anecdotes of B. will be found in Montague Williams's *Leaves of a Life* (1890).

Ballantrae, fishing vil. in S.W. Ayrshire, Scotland, and brought into prominence from the fact that R. L. Stevenson's novel *The Master of Ballantrae* deals with its topography. Formerly it was a reputed haunt of smugglers. Pop. of par. 1300.

Ballantyne, James (1772-1833), Scottish editor and publisher, was b. at Kelso. As a young man he founded the *Kelso Mail*, and was the first to introduce an improved style of printing into Scotland. This attracted the notice of Sir Walter Scott, whose productions he printed, not hesitating to advise certain alterations in the subject-matter of the MSS. In 1826 the company of which he was the head became involved in the bankruptcy of Messrs. Constable. B. distinguished himself in the eyes of his contemporaries as a judge of dramatic literature.

His brother John was b. at Kelso in 1774. He took part in the business of his brother, and was known as a judge of *objets d'art* and works of antiquity. He pub. separately a number of celebrated works, notably Scott's ed. of the *British Novelists*, and the works of Beaumont and Fletcher. He also ed. two periodicals, *The Visionary* and *The Saleroom*. He d. at Melrose in 1821.

Ballantyne, James Robert (d. 1864), Scottish orientalist; was superintendent of the Gov. Sanskrit College at Benares from 1845, and librarian to the India Office, London, 1861. He made translations from the Sanskrit, and wrote on oriental subjects.

Ballantyne, Robert Michael (1825-94), Scottish author, b. at Edinburgh. His descriptions of the life of the trapper and hunter dwelling in wild outposts gave him a reputation as a writer of books of adventure for boys, and his informative and interesting method of writing from personal experience has given his work a value not often associated with fiction of its class. Among his best known books are *Ungava* (1857) and *The Coral Island* (1858).

Ballarat, or **Ballaarat**, city of Victoria, Australia, 74 m. by railway W.N.W. of Melbourne. It is famous for its goldfields, which were discovered in 1851, and still yield a considerable revenue. But whereas the auriferous soil was found almost at the surface in the middle of last century, it has now to be sought at a depth of about 2500 ft., and quartz mining has become the staple industry of the dist. The deepest mine, S. Star, yielded, from 1851 to 1930, over £85,000,000. The community is divided into B. E. and W., the pop. of the two portions aggregating 40,000. The city is modern in construction, and possesses many handsome buildings, besides factories, breweries, and mills. There are Anglican and Rom. Catholic cathedrals, art galleries, botanic gardens, an observatory, a museum, and a school of mines affiliated to the univ. of Victoria. B. is the second city of Victoria; it is an important railway junction, and, being nearly 1500 ft. above sea level, has an excellent and healthy climate. On Dec. 3, 1854, the method of licensing miners brought about a serious riot which culminated in a veritable battle known as the Eureka Stockade, where over 500 miners were attacked by 270 troops and police, who captured the stockade; about 30 miners were killed and some 60 wounded. Pop. 39,500.

Ballard, name of a famous family of Fr. printers of music who held the monopoly of their business for two centuries, handing it down from one generation to another until the Revolution. They were enabled to resist all innovations in music-printing by their privilege, and were supported by the court. Robert B., the founder of the firm, received his privilege from Henry II. in 1552; and each generation of the family was confirmed in its monopoly by successive royal commands until 1793, when monopolies were abolished by the Revolution.

Ballast, term used to denote any weight placed in a ship's hold, with the object of sinking her deeper in the water, to secure proper stability and safe sailing, when her cargo is too light. B. may consist of gravel, stone, sand, iron, or water. Modern steamers carry tanks forward, aft, and amidships, which can be filled with water to regulate the trim of the boat. The term is also applied to bags of sand and gravel used to steady a balloon. The word is used in engineering to denote the gravely material laid as packing between railway sleepers.

Ballater, vil. in Aberdeenshire on the R. Dee, 36 m. W.S.W. of Aberdeen. From its proximity to the royal residence of Balmoral and the numerous beauty spots of that part of Aberdeenshire, it is a favourite tourist centre. It is renowned for its chalybeate springs. Pop. 1500.

Ball Bearings, hard steel balls surrounding a shaft or axle, intended to lessen friction by substituting rolling for sliding contact. Where a fixed bearing is used, the journal, or portion of the shaft within the bearing, slides over the surface of the encircling material; such movement

not only causes the wearing out of the parts in contact, but necessitates work being done to overcome the friction. Both of these disadvantages may be minimised by efficient lubrication, that is, providing a thin film of oil between the journal and the bearing. Theoretically, the resulting friction is reduced to the reluctance of the fluid to move over either surface; but practically it is impossible to maintain an absolutely continuous film of oil. For light loads and moderate speeds it has long been the custom to place a row of balls between hardened surfaces, called ball-races, on the rotating piece and the stationary piece. The balls roll over these surfaces if properly adjusted, and the only sliding friction which occurs is between ball and ball, and if the balls are of good shape and well lubricated, this is not considerable. The qualities of an efficient B. B. are therefore hardness in the balls and races, perfect sphericity and equality of diameter in all the balls, and a good lubricating arrangement. The races may be plane or concave, the best results being obtained where the races are curved to a radius of two-thirds of the balls' diameter.

Ballenstedt, tn. and health resort in the duchy of Anhalt, Germany. It is situated near the Hartz Mts., and contains a palace of the dukes of Anhalt, famous for its library and paintings. The tomb of Albert the Bear, margrave of Brandenburg (1100-70), was recently discovered there. Pop. 7000.

Balleny Isles, group of volcanic is. in the Antarctic Ocean discovered by John B. and H. Freeman, the commanders of two vessels sent out on a sealing expedition to the S. Seas, in 1838. The group was first seen Feb. 9, 1839. It consists of five is. which, proceeding from E. to W., are called Sturge Is., Buckle Is., Borradaile Is., Young Is., and Row Is. Young Is. rises to a peak, called Peak Freeman, which is 12,000 ft. above sea level. Whales, penguins, seals, and Cape pigeons are numerous. Thick fogs are frequent, and navigation in the neighbourhood of the is. is dangerous from drifting ice.

Ballet, The, in all probability originated in the semi-religious dance ceremonies common to nearly all primitive peoples, in which certain mythological personages are represented as enacting in dumb show various incidents in their careers. Thus we have well-defined Bs. in the dance ceremonies of the snake societies of the Hopi and Moqui Indians of New Mexico and Arizona, the Gueguense B. of the Maya, and the theatric Bs. of the people of the S. Sea Is. In anc. Greece the corybantic dances partook of the nature of Bs. In medieval Europe the B. seems to have been more nearly evolved from the spectacle with which we find the courts of Charles IX. in France and James IV. in Scotland especially connected. From these, as from the early pantomime of Italy in the late fifteenth and the sixteenth century, we find the B. proper emerge in sixteenth-century France, where Baltazarini (q.v.), master

of the music to Catherine de' Medici, developed the *B. comique*, which later had rival forms in the *B. héroïque* and the *B. historique*. Later, the mythological matter of Greece and Rome found favour as *B.* subjects in the eyes of the Grand Monarque, who did not disdain to take part in them, and who alluded to himself as the God of Dancing. The *B.* form of modern times was first given its present shape by Noverre, who in the middle of the eighteenth century attempted to treat the highest themes in the light of this art-form. The *B.* in England has departed considerably from the more classic type still in vogue on the Continent, where the various centres of grand opera maintain schools for the training of persons of both sexes in the art. The schools connected with the opera in Paris, Brussels, Milan, Berlin, and St. Petersburg (now Leningrad) have been especially famous and are still notable. Differences in training exist between the Fr. and It. schools, but the latter is thought to adhere to the more rigidly classical forms and methods. The prin. exponents of the *B.* in England early in the twentieth century were Mlle Adeline Genée, a lady of Dan. extraction, and Mlle Lydia Kyasht, a Russian dancer, who appeared in most of the productions at the prin. London houses. The Lanner family were for many years the premier individual trainers of this form of dancing in England. In 1906 a new type of *B.*, perfected by Isadora Duncan (q.v.), an Amer., was introduced into Europe. In 1907 she went to St. Petersburg, and her type of dancing—with bare feet, classical draperies, and graceful 'natural' poses, instead of black shoes, *B.* skirts, and toe-dancing—had considerable influence on the development of the Fokine type of Russian *B.* The Imperial Russian *B.* instituted in 1735, developed extraordinarily, and in the nineteenth century, when the art was declining throughout the rest of Europe, it was at its greatest brilliance and vitality. The Russian schools of dancing were state institutions, and the members of the *corps de ballet*, after a career of about 20 years, were pensioned off like other civil servants. Anna Pavlova, who first visited England in 1910, introduced there the Russian style of dancing; she was immensely popular, and every time she returned was as successful. The Russian *B.* itself was brought to Europe by a band of dancers from the Russian Academy of Dance, who, under the direction of Serge Diaghilev (q.v.), toured the Continent with a series of extraordinarily effective *Bs.*, very modern in character, and by no means conforming strictly to the regular imperial tradition. Until 1912 Michel Fokine was *B.* master; in 1913 that post was taken by Vasilv Nijinsky, who, with Tamara Karsavina, was leader of the *B.*, one of the characteristic features of the Russian *B.* being the equal importance of male and female dancers. The costumes and stage settings, designed by Bakst and Benois, were brilliant and spectacular. In 1917 Leonide Massine produced his first *B.*

Among the most notable dancers of the Russian school may be mentioned Anna Pavlova, Tamara Karsavina, Lydia Lopokova, Lydia Sokolova (in reality an Englishwoman, Hilda Munnings), Vasilv Nijinsky, Leonide Massine, and Adolf Bohm. The *B.* has naturally had some considerable effect on music, and many of the most remarkable if not the greatest efforts of composers of note have been directed towards it. The *B.* music of Schubert, Gounod, Delibes, Massenet, and others is too widely known to require description. Perhaps the first opera in which the *B.* was connected with the opera proper was the *Orfeo* of Gluck, who wrote special music for the accompanying *B.* Tchaikovsky, Stravinsky, and Debussy have all composed for the Russian *B.*, and the works of Schumann, Chopin, Scarlatti, Rossini, etc., have been adapted to it with equal success. Among the best known of the Russian *Bs.* are: *Luc des Cygnes* (Tchaikovsky), *La Boutique fantasque* (Rossini), *Petroushka* (Stravinsky), *Scheherazade* (Rimsky-Korsakov), and *L'Oiseau de Feu* (Stravinsky).

The Russian *B.* of these years is a blend of the Fr. tradition, through Christian Johansson (1817-93), a Swede, who made his debut in St. Petersburg in 1841, with the It. tradition of Enrico Cecchetti (1850-1928). The Fr. tradition, carried on by Marius Petipa (1819-88), is really the more predominant element in the Russian school, and indeed it was Gerdt, a pupil of Johansson, who first perceived Pavlova's exceptional gifts and developed her frail physique on appropriate lines; but all three, Johansson, Petipa, and Cecchetti, moulding generations of Russian dancers, developed Russian *B.* into a system which became the ideal of dancers everywhere. Cecchetti, it has been well said, did not consciously devise a system of education or even inquire into the artistic nature of dancing; he was a great dancer, and became a great *maestro* or teacher of dancing, and Diaghilev chose him to train his dancers. Cecchetti completed the training of Karsavina and Nijinsky and taught Massine, Lifar, Danilova, and Markova, and also many in England, especially Ninette de Valois and Marie Rambert. Virginia Zucchi (b. 1851), an It. dancer who went to St. Petersburg in 1878, dominated the Russian *B.* for nearly 10 years, revealing herself as one of the most accomplished mimes in the hist. of dancing, and her influence was great enough to convert both Diaghilev and Benois into *balletomanes*. Other prominent Russian ballerinas of modern days include Mathilde Kchesinka, of Polish descent, who excelled in roles like *Esmeralda*; Olga Preobrajenska, notable in comic roles, and Vera Treflova, who danced in London in 1921 for Diaghilev. Pavlova, however, outshone all; so much so that good judges think that even when Diaghilev was making modernistic experiments, Pavlova's art made his technique seem old-fashioned; for through Fokine's influence Pavlova held to the standards of the main tradition and yet eventually pursued

her own way, an individualist harmonising new and old. Nijinsky, who succeeded Fokine in the Diaghilev B., was an exponent of classicism, yet he showed that B. could successfully widen its scope so as to exploit contemporary subjects. None the less his dancing in, *e.g.* *Les Sylphides*, was more impressive than any of his experimental or non-traditional work. Massine, too, was a creative artiste, who, like Nijinsky, could extend the frontiers of B. without distortion, and Balanchine, who followed after Massine in the Diaghilev R., was also a traditionalist. The inference from experience,

W. Europe, though later B. became a popular form of light entertainment at the Empire and the Alhambra theatres. Towards the close of the century Adeline Genée appeared at the Empire, holding the stage for the next 10 years, and her influence in Eng. B. has been most marked. During the first decade of the present century the Russian dancers, Lydia Kyasht and Anna Pavlova, settled in England, while Phyllis Bedells was the first distinguished Eng. ballerina at the Empire. The Diaghilev company came in 1911 and gave the impetus to the vogue of B., regarded as a serious art, and

Druet

'THE REHEARSAL,' BY DEGAS

A ballet school scene in the foyer of the Opera House, Paris, 1872.

therefore, seems to be that in spite of apparent occasional revolutionary changes, the B. remains fundamentally unchanged, and only in inessentials, such as a change in choreography, is there any difference. Modern Russia has not found a new technique in spite of early experiments and seems to-day no longer even to desire it.

B. in England. B. in England had its origins in the masque as resuscitated in the folk-dance. But in the long period between the disappearance of the masque and the modern folk-dance movement B. in England existed only in the performances of talented foreign visitors like Taglioni and Grisi in the earlier part of last century. There were some notable Eng. dancers, such as Adeline Plunkett and Clare Webster, but they were exceptional. England, however, really shared the decline which followed the heyday of the romantic B. throughout

very soon Eng. dancers were becoming members of Russian *corps de ballet*. It was only with the arrival of Anton Dolin as *premier danseur* that the existence of Eng. B. dancers became noticed, the most accomplished among them being Sokolova and Markova (Alice Marks). Another important figure in the development of B. in England is Ninette de Valois, the pupil of Cecchetti, who became a member of the Diaghilev B. in 1924, and afterwards founded her own school and staged Bs. at the Abbey Theatre, Dublin. Her group was the nucleus of the Camargo Society, from which sprang the Sadler's Wells company, the truly national ballet of England.

The lesson of the hist. of the B., says Mr. Arnold Haskell, is that 'if national movements are to succeed, the dancer must not neglect a wide general education, and this is also the lesson for the contemporary Russian B.' Another lesson

is that classicism exists through every change, through romanticism, cubism, surrealism, but that from time to time it needs a great mind to reassess it in terms of the present. Yet another lesson is that the B. has been built 'wholly on cultural creativeness, distinguished from real life by the phantasies of its creator. Hence a touch of realism proves fatal. Combined with music it has found its domain in this intangible kingdom. Bs. are dreams, sometimes light and poetical like *Les Sylphides*, sometimes tragic like *Petrushka*, sometimes nightmarish like *Le Sacre du Printemps*, but always dreams, never reality' (Prince Peter Lieven), and an attempt to introduce realism into a dream is to miss the whole conception and genius of a B. Commenting on the period 1915-30, Prince Lieven says: 'In this period I see occasionally highly successful productions. I see false steps, much wavering, much "searching," but I find no signs of the birth of a new art.'

See Prince Peter Lieven, *The Birth of Ballets-Russes* (trans. L. Zarine), 1936; Arnold L. Haskell, *Ballet Panorama*, 1938, and *The Making of a Dancer*, 1946.

Ball-flower, ornament in Eng. Gothic architecture, resembling a ball placed within a circular flower, sometimes with three, sometimes with four, petals. It is characteristic of the Decorated style of the fourteenth century. It is supposed by some to be an imitation of a pomegranate, and by others of a hawk's bill.

Ballia, tn. and dist. of the United Provs., India, on the Ganges, 70 m. E.N.E. of Benares. Noted for the bathing fair, held in Nov. Pop. about 19,000.

Ballin, Albert (1857-1918), Ger. ship-owner, of an old Jewish family in Hamburg. Joined his father's emigration business in 1874. Was agent for some Eng. shipping companies. Joined Hamburg-America line in 1886 and became director-general. He had gifts as a negotiator and worked for a political agreement between Germany and England. On the Ger. collapse in 1918 he committed suicide two days before the armistice of Nov. 11.

Ballin, Claude (1615-78), Fr. goldsmith, who copied the works of Poussin, and who was employed by Louis XIV. His nephew, Claude B. (c. 1660-1754) was also a noted goldsmith, his chief work being the coronation crown of Louis XV.

Ballina, seaport in cos. Mayo and Sligo, Eire, on both sides of the R. Moy, 7 m. from Killala Bay. The Sligo portion is properly called Ardarae, a suburb of B. The R. Moy and Lough Conn are favourite resorts of anglers, as there is excellent salmon fishing. Coarse linens are manufactured, and there is trade in all kinds of agric. produce. The Fr. took possession of the tn. in 1798, but shortly afterwards were defeated at Killala. There is a Rom. Catholic cathedral. Pop. 5000.

Ballinasloe, mrrkt. tn. in Connaught, on the borders of cos. Galway and Roscommon, Eire. It is situated on the Suck, a trib. of the Shannon, and is further connected with the Shannon by the Grand

Canal, opened for commercial purposes in 1828. There is a celebrated wool fair held on July 13, and a cattle fair in Oct. There are breweries and flour-mills, and tanning, hat-making, and carriage-building are among the other industries of the tn. Garbally Castle, in the neighbourhood, is the seat of the earl of Clancarty. Pop. 5000.

Ballinrobe, tn. in co. Mayo, Eire, on the Robe, near its mouth in Lough Mask, 27 m. N. of Galway. Pop. 2000.

Balliol College, college of Oxford Univ. Its foundation is attributed to Sir John de Balliol of Barnard Castle, Durham, and his wife, Devorguilla. John de Balliol was a keen supporter of Henry III. in his wars, but as an act of penance for the injuries done to sanctuaries in his neighbourhood, and to show his pious love of learning, he maintained 16 poor scholars of Oxford between 1262 and 1268. On his death Lady Devorguilla completed his project of founding a residence for these scholars in 1282, and other benefactors added gifts of money, land, and church livings. Part of the library dates from 1430, but many new buildings have been added during the last century in the Gothic style. The college is endowed with many scholarships and exhibitions, and consists of a master, 12 fellows, about 50 scholars and exhibitioners, and the undergraduates, on an average, number over 200. B. boasts of many brilliant scholars, and has been the home of the champions of many intellectual and social movements. Wycliff was its master about 1360, when scholastic philosophy was cultivated within its walls. In the fifteenth century it harboured many Eng. humanists, including Humphrey, duke of Gloucester (one of the founders of the Bodleian Library), and the earl of Worcester. In the nineteenth century it contributed Cardinal Manning to the Oxford Movement. Among its distinguished graduates are Dr. Adam Smith, Robert Southey, Matthew Arnold, Swinburne, Andrew Lang, Herbert Henry Asquith (Lord Oxford and Asquith), and Alfred Milner (Lord Milner).

Ballista, engine used by the Romans for propelling heavy missiles in siege operations. It was constructed on the same principle as the catapult, the difference being that the catapult was used for propelling arrows, stones, etc., in siege and field warfare, whilst the B. discharged heavy beams and large stones for the battering down of buildings, or, in other words, the distinct high-trajectory B. discharged heavier stones from the end of rotating arms. The motive power in both types of engine is supplied by tightly twisted hemp, sinews of animals, or raw hide. Two such skeins were firmly fixed vertically in a heavy wooden framework; two stiff wooden arms were inserted in the skeins and were attached to a bow-string which was drawn back by a winch and locked by a trigger mechanism. The projectile was propelled through a window in the vertical framework.

Ballistic Pendulum, see under PENDULUM.

Ballistics, the study of the motion of projectiles. It consists of two main branches, interior B. and exterior B. Interior B. deals with the motion of the projectile inside the bore of the gun, and is concerned with providing a theoretical basis for the methods and rates of burning of various kinds and shapes of propellants, the ultimate object being the determination of the maximum pressure set up by the gases inside the gun, and the velocity with which the projectile is ejected from the muzzle. The theory having been developed, the practical application is the fixing of the weight of the propellant, and the size and shape of its component pieces or grains, necessary to produce any desired velocity in a particular gun without subjecting it to a pressure greater than the material can stand. The consideration of the stresses in the material itself belongs to the province of gun construction and design. Exterior B. deals with the motion of the projectile outside the bore and its prin. problem is the calculation of the path of a given projectile once its muzzle velocity and the elevation at which it was fired are known. The solution of this problem enables the ballistcian to construct range-tables by means of which the gunner can lay his gun so as to hit a given target. In investigating the problem, measurements have to be made to ascertain the nature and amount of the air's resistance to the shell; how it is affected by the weight, shape, and steadiness in flight of the projectile; how it is affected by the atmospheric conditions of temp., air density, and humidity; and, finally, what amount of twist must be given to make the projectile come down nose first, and how this twist affects the flight of the projectile. These measurements are usually considered under the heading of experimental B., and the term exterior B. is properly applied to the calculation of trajectories once the necessary data regarding velocity, elevation, and air resistance are known.

Developments in anti-aircraft defence have led to increased interest and research in the production of accurately burning time fuses for projectiles. This section of B. belongs both to interior B. as regards the rate of burning of the powder of the fuse under various pressures, and exterior B. both as regards the variations in pressure occurring as the projectile travels along the trajectory and the time taken for it to reach various points on that trajectory.

Bomb-dropping from aeroplanes calls for a knowledge of exterior B., bomb sights being constructed from ballistic data obtained from experiments on the air's resistance to bombs of different shapes and sizes moving at various speeds.

Consult C. Cranz, *Handbook of Ballistics*, Eng. translation, 1921; F. R. Moulton, *New Methods in Exterior Ballistics*, Chicago, 1926.

Ballistite, smokeless explosive formed from gun-cotton. It is very similar in composition to cordite and the various blasting gelatins.

Balloch, vil., Dumbartonshire, Scotland, at the S. end of Loch Lomond. It is a terminus for the steamers on the loch.

Balloonist, see BAILLOU, GUILLAUME.

Balloons. The science of aerostation is not so old as that of the sister science, aviation, but the younger science more speedily reached any degree of success. During the thirteenth century we get many attempts, either theoretically or practically, to solve the problem of aerostation. The flying dove of Archytas, the experiments and theories of Roger Bacon and Albert of Saxony, have been dealt with elsewhere (see AERONAUTICS). Francis Lana failed to solve the problem, yet, at the same time, made great strides in the right direction; the science had also attracted the attention of Leonardo da Vinci. But it was not until the eighteenth century that the solution of the problem appeared to be in sight. Among those who had been attracted by the results of Cavendish's experiments were two brothers, Joseph and Etienne Montgolfier, the sons of a paper merchant of Annonay, in France. That they did not fully solve the problem, nor yet understand the full significance of the experiments of Cavendish, is now fairly obvious, and, furthermore, they thought that it was the smoke that caused the fire B. to ascend. But the development of the B. and the research which led to the practical perfection of the science of aerostation, date from the first experiments of these brothers with their fire-Bs., or Montgolfières, as they came to be called later.

The Fr. physicist Charles, however, who knew from his experiments with hydrogen the real cause of the ascent of the B., was entrusted with the work of making a hydrogen B. He realised the necessity for making the B. thoroughly air-tight, and so his B. was made of silk and coated with a rubber solution. The ascent was successfully made in Aug. 1783, amidst the plaudits of an enthusiastic Parisian crowd. The brothers Montgolfier in the meantime continued their experiments, and attained a certain degree of success, being enabled to send up a B. that contained a number of animals; they were given enthusiastic receptions throughout France, and received rewards at the hands of royalty. The next step in the evolution of the B. was the construction of a B. that would carry passengers. An ascent in a captive B. was made by one Pilâtre de Rozier in Oct. 1783, and the same aeronaut made an ascent in a free B. during the same year. In the following year an ascent was made by a certain Madame Thiblé, who has therefore the honour of having been not only the first lady aeronaut, but also one of the pioneers of the movement. But the many experiments which were made with Montgolfières showed that the B. of that type was not entirely practicable nor very serviceable. The B. was often burnt during the inflating process, sometimes they caught fire in the air. The type of B. used by the physicist Charles did not differ essentially from the modern type, and ultimately it was in

favour of this type that opinion veered. The hydrogen B. of Charles was fitted up with a net which covered about half the B. and was used to support the silk covering and also to distribute the pressure more evenly. From the wooden ring in which this silk netting ended, the car of the B. was attached by short ropes. From the experimental flights with Montgolfières and Robertières (sometimes called Charlières) much knowledge was gained, and during the next few years flights took place in a great many places. Flying from London in 1784, Lunardi made a successful descent in Hertfordshire, after having been in the air for a little over two hours. In the following year, in the face of much difficulty and in spite of considerable hardships, the first cross-Channel flight was made by Blanchard and Jeffries. Blanchard had previously made a number of successful flights, being one of the first professional balloonists.

The success of the B. was soon assured, and many ascents were made during the years following the first experiments of the Montgolfiers, and of Charles, Robert, and others. The problem which now immediately presented itself to the minds of those interested in ballooning was the construction of a B. which should not be at the mercy of the elements, and which the passengers should be able to direct. The early experiments for the production of a dirigible B. were failures; experiments were made with oars, with rudders, with sails, and by means of air-bags. In 1852 we get the first dirigible whose motive power was a steam engine which drove a propeller. This was built by Giffard. The weight of the dirigible, which was made with pointed ends, was roughly 1½ tons, and experiments with it showed that it was useless for its purpose. The experiments commenced by Giffard were continued in other countries, especially under Dupuy de Lôme (q.v.), and almost at the same time by Hænelin, who used for the first time a gas engine. The machine was an advance on the type of Giffard and Dupuy de Lôme, but on the whole was not a great success. The first real success of the dirigible type of B. was the successful flight of the airship *La France*, under the direction of two Fr. officers, Renard and Krebs. In Aug. 1884 they were able to prove conclusively that a dirigible airship could be produced, and could be manœuvred in the face of the wind, providing that the wind was not blowing at too great a velocity. Their first successful flight lasted for about 23 minutes, and they covered considerably more than 5 m. The successful flight of *La France* caused a renewal of experiments in most of the countries of Europe. In Germany a new dirigible was made by Dr. Wolfert, and its first ascent in 1897 ended in disaster. In 1898, however, the first experiments of Count Zeppelin met with considerable success.

Zeppelin's first dirigible was experimented with in 1900; it made three flights, and was finally abandoned. In 1906 Zeppelin made his second attempt, but

without meeting with great success. The machine was landed safely, but was damaged by the wind during the night so considerably that it had to be broken up. The Zeppelin III. was built soon after, and was most successful. It carried 11 passengers for a distance of about 69 m. In the following year (1908) appeared Zeppelin IV., which made a number of successful voyages, the crowning achievement being the journey from Friedrichshaven to Mainz and back, after which the airship was unfortunately destroyed by fire. In June 1909 the count also succeeded in travelling over 900 m. in 38 hours, and on his arrival in Berlin was greeted with enthusiasm by the populace.

Another great name in the annals of the dirigible B. is that of Santos Dumont, a young Brazilian, who built altogether 14 airships, and the results of these flights and the remedying of the failures went far to solve the question of aerial flight. The Lebaudy airship was a type that also proved successful, and was practically adopted as the type by the Fr. military authorities. The Lebaudy dirigible was the first example of the semi-rigid type which later proved successful. The first Lebaudy machine, after a series of successful trips, was wrecked in Nov. 1904; but so successful had the type of machine been that immediately the brothers Lebaudy built another on a large scale, which ultimately was adopted as the parent type of the dirigibles of the Fr. Army. The Fr. airship, the *Patrie*, was built after this model, and had a long and successful career before coming to an untimely end in the Atlantic. In Great Britain the first airship was of the non-rigid type, and was almost from the beginning antiquated and useless, but later on other airships of the semi-rigid type were built.

Military Ballooning. During the early period of the revolutionary wars two B. corps were organised by the Fr. Their success was not very great, but they were of some value during the battle of Fleurus, 1794, and annoyed the enemy to such an extent that, at least by the Austrians, balloonists were treated in the same manner as spies. But there were tremendous difficulties in the way of the B. corps, and in 1798, on his return from Egypt, Napoleon ended their existence. In the nineteenth century a great many attempts were made to revive the use of military Bs. The insurgents in Italy made use of them; during the Civil war in America use was made of them; and even in the wars of the republics of S. America Bs. were used at least for reconnoitring purposes. In most of the armies of the great powers experiments were made with Bs., and in France Napoleon III. tried to revive the B. corps, which had been done away with by his great predecessor. In Great Britain many military experiments were tried, but no attempt was made actually to form a B. corps until after 1870. Both the Fr. and Ger. military authorities tried to utilize Bs. during the Franco-Prussian war. The Ger. attempts were almost complete failures; the Fr.

attempts to use Bs. also to a large extent failed. So little information was gained that the military authorities ultimately sold their Bs. to the postal dept. On the other hand, passengers and letters were conveyed out of the besieged tn. of Paris in comparative safety by means of a B., and altogether, out of the 66 Bs. that left Paris during the period of the siege, at least 59 arrived quite safely at their destination. After the war of 1870-71, B. corps were formed in practically every army, and the experience gained during that war went far in helping in the organisation of the B. corps throughout the

Fox Photos

BARRAGE BALLOONS

world. One natural result of the war was the invention of a gun which could be used for firing at Bs., and this in turn led to experiments in the manner in which Bs. might best be disabled in time of war, and to what extent rifle and cannon fire would injure them. After the Franco-Prussian war the Fr. organised the B. corps so that to each army corps could be attached a B. corps which would be self-contained and self-reliant. To each corps were attached wagons for the carrying of tools and appliances and for carrying also the actual B., while further gas wagons were attached which would give the corps a constant supply. In Germany the first B. corps was formed in 1884. In Great Britain a B. corps was first founded in 1879, and during many of the wars which England fought after that period the B. corps did useful work. During the S. African war the B. corps rendered valuable services to the troops in the field,

and especially during the events which led to the surrender of Gen. Cronje. America also used Bs. in 1898, during her war with Spain, and B. corps were afterwards formed in Austria and Russia. The types of B. used may be divided into two classes—the free B., the captive B., and in this category, although not strictly a B., we may add the kite. Of these the captive B. was probably of most service, since by use of it observations could be made of the movements of the enemy, and the fire of the guns of the artillery could be directed from such a B. The spherical B. was practically doomed by the invention of the airship (*q.v.*), which at the outbreak of the First World War had assumed the well-known 'sausage' shape, i.e. it was cylindrical and had an inflated bag attached to the rear to act as a rudder. Such Bs. attached to warships proved invaluable to the Brit. in the Gallipoli campaign. For the use of Bs. in the Second World War as a defence against aircraft, see ANTI-AIRCRAFT DEFENCE.

The B. and Science. The use of the B. as a means of examining the phenomena of the atmosphere was first made soon after the earliest successful ascents had been made by the Montgolfiers and by Charles. Charles made scientific observations during his first voyages, but the first ascent made wholly in the interests of science was made by Jeffries in 1784. From his observations the B. rose to a height of 9000 ft., and the temp., which was about 50° F. in London, fell to 29° F. During the first half of the nineteenth century many ascents were made, but until the experiments of Glaisher began the results obtained were not of outstanding importance. The chief questions which Glaisher sought by experiment to determine were: the temp. of the atmosphere, the amount of moisture contained in it at the higher levels, the determination of the old point—the suitability of the higher levels for human habitation (this had reference principally to the mountains of India), the determination of the electrical properties of the atmosphere, the properties of the oxygen of the air at various levels, the constitution and the height of the clouds, the velocity and direction of the breezes; later special instruments were invented in order that the information gathered during these scientific ascents should be accurate, and much information was gained by the use of these instruments during the numerous ascents. The work has been confined chiefly to meteorology, but useful astronomical work has been done also. The phenomena attendant on the eclipse of the sun have been observed from a B., and interesting information concerning shooting stars has been gathered also. The experiments commenced by Glaisher were continued by distinguished scientists in almost every country in the world, and the information gathered was of vital importance to the science of meteorology. The B. has also been used for attempts to reach the N. Pole, the most famous of

which was the unfortunate attempt of Andr  e (q.v.); it was not till more than 30 years later that it was learned that his B. had remained in the air for 3 days and reached 84   N. Two voyages of over 1000 m. are on record, the first being that of Wise in 1859, from St. Louis to Henderson, New York, which covered a distance of 1120 m.; the other the voyage of the Count Henry de la Vaulx, who, starting from Paris, reached the tn. of Korostyshev in Russia, thus covering a distance of nearly 1200 m. Exploration of the stratosphere has been effected in recent years by Prof. Auguste Piccard, who was the first to use a specially sealed gondola; and, among others, by Cpts. Stevens and Anderson (U.S. Army Air Corps) who, in their balloon, *Explorer II.*, reached a height of 14 m. in 1935. See F. A. Magoun and E. Hodgins, *A History of Aircraft*, New York and London, 1931. See also AERONAUTICS; PARACHUTE.

Ballot (It. *ballotta*, diminutive of *balla*, a ball), originally the little ball used for secret voting; hence 'voting by ballot' is a term applied to the practice of secret voting. Secret voting was practised in Greece and Rome by means of balls, marked stones, shells, and tickets, in cases of ostracism, at criminal trials, and in Rome at the election of candidates to a public office. Secret voting at elections of members of Parliament was advocated by Eng. reformers in the early nineteenth century; it was included in the draft of the Reform Bill of 1832, a bill on the subject having been introduced by O'Connell in 1830. It was first used in 1870, in connection with the London School Board elections, and two years later, by Forster's Ballot Act, it was introduced into all parl. and municipal elections. The practice is now in force at elections in all countries where a constitutional gov. prevails.

Ballot, Paul Marie Victor (b. 1855), Fr. colonial administrator. He was appointed commander-in-chief of Senegal in 1878; of the settlements around the gulf of Benin, 1887; and organised the Fr. explorations of the interior of Africa as far as the Niger.

Ballou, Hosea (1771-1852), Amer. Universalist clergyman, was b. at Fitchmond, New Hampshire, son of Maturin B., a Baptist minister. In 1794 B. became a pastor at Dana, Massachusetts. From 1817 until his death he preached as pastor of the second Universalist church at Boston. Founder and editor of the *Universalist Magazine* (later called the *Trumpet*), the *Universalist Expositor*, and the *Universalist Quarterly Review*. His *Notes on the Parables* (1804), a treatise on the Atonement, estab. him as chief Amer. exponent of Universalism.

Ballou, Hosea (1796-1861), grand-nephew of the above, was b. in Halifax, Vermont, also a Universalist preacher, and associated with his uncle in editing the *Universalist Quarterly Review*. Advocated the establishment of the Universalist Denominational College of Tufts at Medford. He wrote *Ancient History of Universalism down to A.D. 553* (1829).

Ballou, Murray Maturin (1820-95), son of the first Hosea B., pioneer of Amer. illustrated journalism. Ed. *Gleason's Pictorial* and *Ballou's Monthly* and founded and ed. the *Boston Daily Globe*. Wrote a life of his father and a hist. of Cuba.

Ballston Spa, co. seat of Saratoga co., New York, U.S.A., 7 m. S. of Saratoga Springs; it is well known as a summer resort, having chalybeate and other springs. Pop. 5000.

Bally, Bengal, see BAIL.

Ballybunion, seaside vil. in Kerry, Eire, 9 m. N.W. of Listowel. It has a wireless station.

Ballycastle, seaport in the N. of co. Antrim, N. Ireland, opposite Rathlin Is. The castle was built by the earl of Antrim in the reign of James I. Pop. 1485.

Ballyclare, mrlt. tn., co. Antrim, N. Ireland, 9 m. E.N.E. of Antrim. It is noted for its paper mills. Pop. 2000.

Ballymena, tn. in co. Antrim, N. Ireland, on the Braid. It is a railway centre, on the Belfast to Londonderry line. The linen manufs. were introduced c. 1733, and are an important feature of the tn. The agric. and iron-mining industries are also carried on. The tn. was taken by the insurgents in 1798, but was not held for long. Pop. 12,000.

Ballymoney, tn. in co. Antrim, N. Ireland. Brewing, distilling, and tanning are carried on, and linen, soap, candles, and tobacco are manufactured. Pop. 3000.

Ballymote, tn. in the co. of Sligo, Ireland. It flourishes as a mrlt. tn., and has considerable agric. trade besides carriage works. In 1300 Richard de Burgh built a castle here the remains of which are still standing, and it was the scene of hostilities in 1641 and 1652. There are also the ruins of a Franciscan foundation which are assigned to the thirteenth century. The fame of its learning spread for some considerable distance at that time. The erudite monks left a literary monument in the form of the *Book of Ballymote*, a MS. now in the possession of the Royal Irish Academy. It is a miscellaneous collection of prose and verse, written in Gaelic, and compiled about 1301. There are some translations of Lat. romances, and the rest is of historical and genealogical interest. The book was once in the possession of the O'Connell family, who bought it for 140 cows. A facsimile reprint was issued in 1887, ed. by Prof. Atkinson. Pop. 930.

Ballyshannon, seaport of Donegal co., Eire, at the mouth of the Erne. Salmon fishing is extensively carried on at a waterfall in the Erne, where the salmon-leap and mounting ladders facilitate capture. Owing to a bar, the harbour is only available for small craft. Remains exist of a castle of the O'Donnells, where the Eng. in 1597 were defeated. Pop. 2170.

Balm (*Melissa officinalis*), species of Labiate found in Europe and W. Asia, and frequently cultivated in Eng. and Amer. gardens. It has an upright stem, opposite and alternate leaves, which are

toothed and ovate, and the ordinary dead-nettle-shaped flowers of the order, faint yellow or a white colour. The leaves are used in medicine for their tonic and stimulant properties. Bastard B. (*Melittis melissophyllum*) is the only species of its genus, and is found in S. Europe; it also belongs to the Labiatae.

BALM

Balm of Gilead, or **Balsam**, oleo-resin produced from the *Balsamodendron opobalsamum* and used in oriental countries for its sweet scent and medicinal properties. It is referred to in the O.T. and by many anc. writers, who affirm its power to heal. See **BALSAMODENDRON**.

Balmaceda, José Manuel (1838-91), Chilean politician, b. and d. at Santiago. As a politician he joined the Liberal party and later became president of the republic of Chile. He did much work for the development of public instruction and for the army and navy. He also promoted the construction of railways.

Balmain, shipbuilding suburb of Sydney, New S. Wales; pop. 32,000.

Balme, Col de, mt. pass situated between Mts. Blanc and Dent du Midi. It is traversed by the road from Martigny to Chamonix. Its highest point is 7200 ft. above sea-level.

Balmerino, James Elphinstone, first Baron (1553-1612), Scottish politician. Under James VI. he was appointed judge and royal secretary. He was made Lord B. in 1604. He was responsible for a letter addressed to the pope, without the king's knowledge. The letter was pronounced a forgery, and B. was imprisoned.

Balmés, or **Balmes**, **Jaime Luciano** (1810-48), Sp. publicist and philosophical writer, was b. at Vich in Catalonia. He founded a political paper of a clerical and monarchical character in Madrid in 1844, calling it *El Pensamiento de la Nación*. His *Filosofía fundamental* (1848) has been trans. into Eng.

Balmont, Constantin (b. 1867), Russian poet. His significance in Russian literature is that he regenerated the methods

of Russian poetry, giving to it technical methods of a variety hitherto unemployed in the language. Thus he introduced inferior rhymes and assonance. A prolific writer, he pub. regularly in Russia up to the time of the revolution, when he emigrated to Paris. He contributed largely to Russian periodicals pub. in France.

Balmoral Castle, residence of the Brit. sovereign in Aberdeenshire, Scotland. It is situated on the r. b. of the Dee, which at this point is crossed by a suspension bridge. The prince consort acquired it from Sir Robert Gordon and gave it to Queen Victoria, together with the estate attached. It is built in granite and has an E. tower 100 ft. high, which commands a magnificent view.

Balnaves, Henry (d. 1579), of Halhill, Scottish reformer, b. of poor parents at Kirkcaldy. Fife, and studied at St. Andrews Univ. and at a free school at Cologne. He acted for some time as a procurator in the courts of St. Andrews and then removed to Edinburgh, where in 1538 James V. made him a lord of session. On the accession of Mary (1543) B. was promoted to the office of secretary of state, and was instrumental in getting the Holy Scriptures trans. into the Scots vulgar tongue. He was confined for six months in the castle at Blackness for his aggressive Protestantism. In 1546 he joined the murderers of Cardinal Beaton in the castle of St. Andrews. In the following year he was captured by the Fr. and was thrust into the castle of Rouen as a prisoner of war. In 1554, when the dowager queen, Mary of Guise, became regent of Scotland, B. was released and his forfeiture rescinded. On his return to Scotland he took an active part on the side of the lords of the congregation, and in 1563 was appointed a lord of session and was chosen as one of the commissioners to revise the *Book of Discipline*. During his imprisonment he wrote a treatise on justification, which was pub., with a preface by Knox, under the title of *A Confession of Faith*.

Balneology and **Balneotherapeutics**, science of baths and their effects upon the system. Baths act more by modifying temp. than by skin absorption. The *cold bath* (45-66° F.) causes a contraction of the vessels of the skin and consequently drives the blood into the internal organs, where the resulting dilatation causes an exhilarating after-effect if the immersion be of short duration. The cold bath is thus valuable as a tonic. The *tepid bath* (85-90°) is of value in fevers through actual heat abstraction. Between 93° and 95° baths are at the point of thermal indifference; they do not change the movement of the bloodstream and have a sedative effect on the nervous system. Baths of higher temps. promote circulation in the surface blood-vessels, and the *hot bath* (103-108°) operates as a powerful stimulant, and is used in dropsies, catarrh, kidney disease, etc., to increase the absorption of morbid products. If the immersion be prolonged, there may be weakness of the

heart, with the possibility of fainting. The *Turkish bath* is a hot-air bath where the patient passes through compartments ranging in temp. from 100° to 200°. It is used for promoting perspiration, and in cases of catarrh, neuralgia, and rheumatism. It is deleterious in fatty degeneration of the heart. The *Russian bath* is a vapour-bath in which steam is generated by throwing water on heated mineral or metallic surfaces; it is of value in rheumatism. The *douche* is a bath where water is forced by considerable pressure upon the surface of the body; it is used in insomnia and the coma of alcohol or sunstroke. The *shower-bath* is a douche where water is forced against the body from a nozzle with numerous perforations; it is used as a general tonic.

There are also special forms of bath where the body is immersed in peat, mud, slime, pine-leaves, herbs, brine, sand, bran, malt, tan, glue, milk, soap, acid, mustard, etc. Air-baths are dealt with under AEROTHERAPEUTICS, and electric baths under ELECTROTHERAPY.

Balneotherapeutics is a term generally restricted in application to treatment at spas, where patients systematically drink and bathe in water naturally mineralised, or artificially modified at the places where the springs emerge from the earth. The beneficial results of spa treatment in many types of diseases are undeniable, but there is some difficulty in apportioning the credit among the various curative factors in such treatment. The usually favourable climate, the submission of the patient to a regime that would probably be relaxed at home, the presence of physicians with special experience, the provision of specially appropriate appliances and organisation, and the combination of regular exercise in a good atmosphere with systematic medical treatment, all contribute in varying measures to the well-being of the patient. As to the waters themselves, it is undoubtedly true that many of them lose their properties when bottled and exported, and cannot be artificially prepared so as to produce the same conditions, or contain such subtle ingredients that their composition is not wholly known. It has been suggested that the warm mineral springs consist of water which is formed by the combination of hydrogen distilled from granite rocks at great depths with oxygen derived from metallic oxides also found there, thus producing what is called nascent or virgin water. Many waters also contain radium emanation, which has a therapeutic value in certain morbid conditions. The bubbles of carbonic acid gas, which have such an exhilarating effect on the skin, cannot be exactly reproduced in baths artificially charged with carbonic acid.

Spa treatment is suitable in the sub-acute or chronic stage of disease, where the patient has a good supply of reserve force. Acute cases, or those tending to a fatal issue at an early period, should not be recommended; serious visceral disease, advanced arterio-sclerosis, serious mental or nervous depression are also unsuitable,

whilst children and old people should have recourse to climatic influences only. In any case, the patient should be reconciled to separation from all business and domestic entanglements which are liable to occasion worry.

The chief object of spa treatment is to promote excretion by way of the kidneys, bowels, and skin. For elimination by the kidneys the alkaline waters at Vichy, Bad Neuenahr, Vittel, Contrexéville, Wildungen, Evian-les-Bains, and Aix-les-Bains are suitable. For elimination by the bowels the waters containing sodium sulphate are useful, as at Marienbad, Karlovy Vary (Karlbad), Brides-les-Bains, and Cheltenham. Arthritic ailments are best suited by Aachen, Aix-les-Bains, Bath, Droitwich, Harrogate, and Buxton. Nervous diseases are specially provided for at Oeynhausen, Schlangenbad, and Church Stretton. Colitis is a leading speciality at Plombières and Châtel-Guyon. Primary anæmias are treated at Schwalbach, Spa, and St. Moritz, whilst for secondary anæmias Royat, La Bourboule, Uriage, Harrogate, and Llandrindod are suitable. Marienbad is specially recommended for the systematic treatment of obesity. Diabetic patients will secure experienced treatment at Karlbad, Brides-les-Bains, Neuenahr, Vichy, Vittel, Royat, Buxton, Gastein, Evian-les-Bains, St. Moritz, and other spas. Phlebitis and varicose veins are specialised in at Bagnols-de-l'Orne. Luchon and Schinznach have a good reputation for the cure of skin diseases, and Cauterets attracts sufferers from throat maladies. Famous Amer. watering-places are Hot Springs, Arkansas; French Lick Springs, and W. Baden, Indiana; White Sulphur Springs, W. Virginia; and Saratoga Springs, New York. See A. G. Gordon and F. G. Thomson, *The Physiology of Hydrology*, 1930.

Balquhider, vil. of Perthshire, Scotland, at the head of Loch Vail and below the braes of B. It is celebrated in the list. of Itoab Roy.

Balrampur, tn. in United Provs., India, near the R. Rapti. Its rajah was loyal during the Mutiny. Pop. 17,000.

Balsa, a raft or fishing boat, used by Indians on the Pacific coast of S. America. It is constructed usually of floats made of logs of the B. tree. B. wood is a light useful timber now used in the construction of aircraft.

Balsam (Gk. *βάλσαμον*, balsam-tree), name given in medicine to many resins and oils taken from plants of different kinds, but given in particular to B. of Peru and of Tolu. These two varieties come from leguminous plants, the first species being known as *Myroxylon peruvianum*, the second as *M. toluiferum*. Liquidambar, a balsamic product of *Liquidambar styraciflua*, is sometimes called white B. of Peru. B. of Copaiba is also obtained from many varieties of the genus *Copaifera*. Bs. have a pleasant fragrance which renders them of service in making confectionery and perfumes; they also have tonic properties.

Balsam (*Impatiens*), genus of Balsaminaceæ which is native to India and Japan. The plants are generally herbaceous annuals with white or red flowers. *I. balsamina*, found in the E. Indies, is a beautiful plant cultivated in gardens and conservatories in England; *I. noli-melangere*, yellow B. or touch-me-not, is found in Europe, and often in Britain.

BALSAM

If the ripe capsule of the flower be touched it immediately dehisces and scatters its seed.

Balsamina, another name of the genus *Impatiens* which belongs to the order Balsaminaceæ. The former is a name given by Tournefort, the latter by Linnæus.

Balsaminaceæ is an order of Dicotyledonous which contains only two genera, of which *Impatiens* is the chief. It has numerous species of herbs which are cosmopolitan and are remarkable for the elastic force with which the valves of the capsular fruit contract and eject the seeds. The flowers are regular zygomorphic, have 5 petaloid sepals, 5 petals, 5 stamens, and 5 carpels which are united, superior, and contain numerous ovules.

Balsamo, Giuseppe, see CAGLIOSTRO.

Balsamodendron, or Commiphora, genus of Burseraceæ which grow in tropical Asia and Africa. *B.* (or *C.*) *myrrha* yields myrrh, which exudes as a resin from the bark and becomes hard by exposure to the air; it has a bitter taste and peculiar odour, and is used in the manuf. of incense and some medicines. *B.* (or *C.*) *opobalsamum* produces balm of Gilead (*q.v.*).

Balsam, Hugh de (*d.* 1286), succeeded William de Kilkeny as bishop of Ely, 1256. In 1280 he obtained a charter to introduce 'studious scholars' into his hospital of St. John, Cambridge, in place of the secular brethren. In 1284 he founded Peterhouse, Cambridge, for his own pupils.

Balta, tn. in Podolia, Ukraine. It is situated between the Dniester and the Bug. It has a trade in cattle, horses, and

grain. Two fairs are, or were, held there annually. Among its industries are tallow-melting, soap-boiling, tile-making, and brewing. A large part of the pop. are Jews; pop. 22,590. Also the name of one of the Shetland Is.

Baltadjî, Mohammed (*d.* 1712), Turkish statesman, became grand vizier under Ahmed III. In 1710 he gained a decisive victory over the Russians, but was induced by the Empress Catherine to sign the treaty of Falezî renouncing his advantages in the battle. This alienated Charles XII. of Sweden who had aided him. His death took place at Lemnos.

Baltard, Louis Pierre (1764-1846), Fr. architect, engraver, painter, and author. He at first became an engraver, then went to Italy, where he served as an architect, but owing to the revolution he returned to Paris and entered the army. He afterwards became prof. of architecture at the Polytechnic, and built the chapels of Sainte-Pélagie and Saint-Lazare, and the court of justice at Lyons. His engravings were very numerous.

Baltard, Victor (1805-74), Fr. architect, son of Louis Pierre. As director of architectural works at Paris and La Seine he built sev. public buildings, and he also restored the churches of Saint-Germain-des-Prés, Saint-Eustache, Saint-Severin, and Saint-Etienne-du-Mont. Of his publications, illustrated with his own designs, the chief are: *Monographie de la villa Médicis à Rome*, 1847; *Monographie des Halles centrales*; and *Les Peintures et arabesques de l'ancienne galerie de Diane à Fontainebleau*.

Baltasarinî (*f.* sixteenth century). It, musician, first violinist of his time and founder of the modern ballet. His real name was Baldassaro de Belgoloso; he went to France and became first *valet-de-chambre* to Catherine de' Medici (1555) and led his royal mistress's string band—gallicising his name to Balthazard de Beaujoyeux. Introduced it. dances to Paris. *D. c.* 1587.

Balthazar, or Balthasar, the Gk. form of the name Belshazzar (*q.v.*).

Baltic, The (Baltic Mercantile and Shipping Exchange), situated in St. Mary Axe, London, E.C., where merchants dealing in grain transact both buying and selling. It is the outgrowth of merchants meeting in the B. Coffee House, once situated in Threadneedle Street, for the transaction of business. Its dealings are not, as the name would appear to indicate, limited to the products of the B.

Baltic, Battle of the, sea-fight which took place off Copenhagen on Apr. 2, 1801. In this battle Sir Hyde Parker and Nelson destroyed the Dan. fleet.

Baltic Port, or Baltiski, port of Estonia, on the gulf of Finland, about 30 m. W. of Tallinn, with which it is connected by rail. Exports timber. Pop. 2000.

Baltic Provinces, region lying on the gulf of Finland and the B. Sea, including the three former Russian govts. of Courland, Livonia, and Estonia, later the independent states of Estonia, Latvia, and Lithuania. The term was generally used to include also St. Petersburg (now

Leningrad) and Finland. The bulk of the pop. consists of Lettish and Estonian races, the latter being a branch of the Finns, while there is a considerable admixture of Gers., especially in the large tns. and among the higher classes. The number of Russians is still fairly small. Excepting Courland, which was a dependency of Poland, all the B. P. once belonged to Sweden. The foundation of St. Petersburg in 1703 first gave Russia a secure footing on the B., and the Swedish provs. were ceded to her soon after. Courland did not come into her possession until 1795. Strenuous attempts were made to Russianise the B. P., and to convert their inhab. to the Russian Church, but were not very successful.

In the first year of the First World War Lithuania was occupied by the Gers. The Ger. policy was to make Lithuania a subordinate buffer state against Russia and Poland. Lithuania, therefore, began her career towards autonomy under Ger. influence. In 1915 the Gers. occupied Courland, S. of Latvia, and in 1917 they also held Riga and Livonia. Latvia had been drained of resources and man-power by the retreating Russians, but the Ger. policy was to make Latvia, not a separate state like Lithuania, but a part of Prussia. The end of the war put an end to this scheme, but a Ger. army of occupation still remained in Latvia under Gen. von der Goltz, and this, at the instigation of the Ger. landowners, the Balt barons, was used to fight the Bolsheviks. In Feb. 1918 the Gers. had also occupied Estonia, but on their departure in Nov. the country was invaded by the Bolsheviks, who were not expelled until Feb. 1919. In the same year Estonia was invaded by von der Goltz, until the Allies ordered the Ger. Army to evacuate. Meanwhile Estonia was the base of a counter-revolutionary 'white' army under Yudenitch. He was defeated, however, and peace being concluded the Bolshevik Gov. recognised the independence of Estonia. In the same year (1920) they recognised the independence of Latvia and Finland. At the Peace Conference (1919) Latvia, Estonia, and Lithuania pressed for recognition as sovereign states, granted only in 1921, while Lithuania did not obtain full recognition until 1923, after sundry attempts at a union with Poland had failed.

Between the two world wars the B. P. or states existed as buffer states between Soviet Russia and the W. Russian aspirations for the re-acquisition of these countries, or part of them, were only temporarily abandoned after 1918. Russia was, by long tradition, desirous of obtaining ice-free ports, together with control of the B. In Sept.-Oct. 1939 Stalin took advantage of the war situation to compel Lithuania, Latvia, and Estonia to agree to the establishment of Russian naval bases and garrisons on their ters. Ger. influence in this region was ousted by the Soviet and Ger. minorities were transferred to Germany. In Dec. 1939-Mar. 1940 Finland was forced, after a short war, to surrender vital strategic

areas to Soviet Russia (see FINLAND: *History*). In June-July 1940 Lithuania, Latvia, and Estonia were completely occupied by Russian troops; puppet pro-Russian govts. were set up, and in Aug. 1940 all three states were incorporated in the U.S.S.R. as federal republics. They were, however, overrun by Ger. forces in the following year and remained in Ger. occupation until 1944. In that year, in Sept., there was a major Russian advance E. and S. of Riga; on Oct. 10 the Russians reached the B. coast in Latvia. Riga fell on Oct. 13. Previously, in June, the Russians had broken through the Mannerheim line in the Karolian Isthmus, and on Oct. 25 they crossed the Norwegian frontier in Finland and took Kirkenes. See further under EASTERN FRONT OR RUSSO-GERMAN CAMPAIGNS, in SECOND WORLD WAR. The Soviet system, which is absorbing these small countries, may leave some opportunity for the retention of their languages and artistic achievements, but may not admit of survival of their highly democratic social-economic systems.

See articles dealing with the separate B. states; also A. MacC. Scott, *Beyond the Baltic*, 1925; O. Rutter, *The New Baltic States and their Future*, 1925; E. W. P. Newman, *Britain and the Baltic*, 1930; F. W. Pick, *The Baltic States*, 1945; and B. Newman, *Baltic Background*, 1948.

Baltic Sea, sea between 54° and 66° N. lat. and 9° and 30° E. long. It is surrounded by the dominions of Sweden, Russia, Germany, and Denmark. It is 960 m. long and 400 m. broad. It has 5000 m. of coast-line. A channel connects it to the North Sea. The W. portion of this channel is called the Skager Rack, while the remainder is called the Cattegat. It fills the S. extremity of the Cattegat, and communication is continued by narrow straits called the Sound, the Great Belt, and Little Belt. Its total area is 166,397 sq. m. The separating factor between the B. and the North Sea is a plateau upon which the is. Zealand, Fünen, and Laaland are situated. Its depth has been computed to be 36 ft., which falls considerably lower than that of any other inlet of the sea of similar character. The bed of the B. S. in the deeper parts is generally of soft brown or grey mud, or else of hard clay. Near the low coasts and on the shallower banks fine sand with small pebbles are seen.

Its navigation is rendered dangerous by shallowness, narrowness, and sudden changes of wind followed quickly by storms. It runs eastward into three gulfs, gulf of Bothnia, the northernmost, gulf of Finland, and gulf of Riga. There is not such a quantity of salt in the B. as in other oceans, and the water therefore is clearer on that account. From three to five months of the year access through the sea is hindered by ice, but the whole surface is seldom frozen entirely, though records of that event have been estab. in the years 1658 and 1809. It possesses the characteristic of all inland seas that it is little affected by tides. The perceptible rise and fall of its waters are due more

to the variations in the water-bulk of its rivers than to any tidal circumstances. Of the rivers that discharge their waters into this sea there are 250, resulting in a drainage of almost one-fifth of the area of Europe. The most important of these are the Oder, Vistula, Niemen, Dvina, Narva, Neva, while the chief of the is. are Zealand, Fünen, Bornholm, Stamsöe, and Læland (Denmark); Gottland, Öland, and Hveen (Sweden); the Åland Is. (Finland), and Rügen (Germany). The principal exports from its bordering countries are timber, furs, tallow, and grain. Amber is cast upon its shores in stormy weather. The canals connecting the B. S. with the North Sea are the Kiel, which cost £8,000,000, and which proved an immense advantage to Germany; the Elbe Canal, and the Gotha Canal. The chief harbours in the B. are Copenhagen (Denmark); Kiel, Lübeck, Stralsund (Germany); Szczecin (Stettin) and Gdansk (Danzig) (Poland); Kallningrad (Königsberg) and Klaipeda (Memel) (Lithuania); Riga (Latvia); Narva (Estonia); Kronstadt (R.S.F.S.R.); Sveaborg (Finland); and Stockholm and Karlskrona (Sweden).

Baltimore: 1. Port and the largest city of Maryland, U.S.A. It is, as regards pop., the eighth largest city of the U.S.A., and is situated on the N. bank of the R. Patuxent, an inlet from Chesapeake Bay. It is 250 m. distant from the ocean by canal. Its environment is pleasing, and its site is of varied altitudes. It owes a great deal of its importance to its safe harbour, whose minimum depth is 24 ft., and it has direct communication with the principal ports on both sides of the Atlantic. Over 100 steamship lines enter the port, which is one of the best on the Atlantic coast. Many railways converge at B. and a great trade in bread-stuffs is carried on, while among further articles of export are tobacco, provisions, coal, cotton, naval stores, canned fruit, and oysters. The chief articles imported are guano, coffee, other tropical products, fertilisers, iron, steel, tin-plate, and chemicals. Besides its great shipping trade, B. has extensive manufactures, which include smelting and refining copper, motor vehicles, tin cans, and other tin-ware, refining sugar and petroleum, slaughtering and meat-packing, printing and publishing, and the making of clothing and tin-ware. The canning of oysters forms one of the chief industries of B., and many thousands of vessels are engaged in their quest. The splendid appearance of many of its buildings has made additional fame for the town, among which buildings the most notable are the chamber of commerce, the Roman Catholic cathedral, the custom-house, the Maryland Institute, and the Peabody Institute. In Feb. 1904 the greater part of the business quarter was destroyed by fire. In 1920 the city area was nearly trebled by the inclusion of the adjacent districts, and its water-front was much enlarged.

There are five noteworthy public monuments, the chief being that of Washington, a column 210 ft. high. The fineness of these erections has caused B. to be

called the monumental city. The most famous of its many beautiful parks is the Druid's Hill Park of nearly 700 ac. in extent. Since the first decade of the present century great improvements have been carried out in B.; cobbled streets have been converted into smooth-paved ones, and new water and sewage systems have been installed. There are approximately 200 churches, conspicuous among which are the Roman Catholic, Protestant Episcopal, and Methodist. One of the first seats of learning in the country is the Johns Hopkins Univ. (q.v.). It was opened in 1876. Other educational centres are the B. city college, the academy of science, the law school, St. Mary's Univ., and Loyola College. The Enoch Pratt library contains over 350,000 books. In addition to its main building, it has 26 branches. As a social centre and a town famous for its enthusiasm for art, B. is specially to be noted. It is the see of an Anglican bishop and a Roman Catholic archbishop, who acts as primate of U.S.A. Dr. John Carroll was the first archbishop. The pop. includes a large element of German descent, with Irish and French creole families. Negroes number over 100,000. In the days when B. was a colony, the Puritans and Scottish-Irish Presbyterians were in great numbers. The city was founded in 1729 in honour of Lord B., who established Maryland colony. During the wars of 1812-15 it became the scene of many engagements. Pop. (1940) 1,046,700.

2. A fishing vill. in Co. Cork, Eire, on B. Bay, 8 m. from Skibbereen.

Baltimore Bird, or Oriole (*Icterus baltimore*). It is very common all over N. America, and is something like a finch, measuring about 7 in. from the tip of its long, sharp beak to the end of its rounded tail. The beak is conical and longer than the head, and the wings long and pointed. The males come N. early in May, preceding the females by a few days. They choose a spot preferably near houses, and build a beautiful hanging nest, from 6 to 7 in. long, in a tulip-tree or pea-vine, taking their materials from moss patches, cattle hairs, or fibres. Their plumage, especially of the males, is very gay, glossy black, orange, and vermilion. Orange and vermilion were the colours of the livery of Lord B., whence the name. It is also called fire-bird from its bright plumage, and hang-nest from its method of building. The B. B. has a strong and sweet song particularly pleasing during its mating season, and is gregarious in its habits. Although it does much damage among the fruit, it ridges the orchards of such insects as the canker-worm and tent-caterpillar. See Baird, Brewer, and Ridgway, *N. American Birds*.

Baltimore, George Calvert, first Baron (1580-1632), Eng. politician. He was a native of Yorkshire, and was educated at Trinity College, Oxford. He became secretary to Robert Cecil, afterwards earl of Salisbury. He helped James I. in a discourse against Vorstius, an Arminian theologian. In parliament he was regarded with suspicion, and his unpopularity was increased by his support of a

Sp. marriage. In 1625 he threw up office and acquired his title with large estates in Ireland. His name is generally connected with the growth of our colonial empire. He estab. a settlement at Newfoundland in 1621, and attempted a similar settlement in Virginia, but his refusal to sign oaths of allegiance prevented the execution of his project. He wrote *An Answer to Tom T'ell-Troth*, and many of his letters are found in the *Clarendon State Papers*.

Baltinglass, mkt. tn., 30 m. W. by S. from Wicklow, Eire. Pop. 2000.

Baltiski, see BALTIO PORT.

Baltistan, otherwise Little Tibet, mountainous region below the Karakoram Mts. and the Himalayas. Its mean elevation is 11,000 ft. The Upper Indus flows through the region, which is a mass of lofty mts. and contains the largest glacier in the world out of the Arctic regions. The inhab., numbering 52,000, are of Tibetan origin and Shilte Muslims in religion. B. with Ladakh form a prov. of Kashmir. See also BULTI.

Baltjik, Bulgarian seaport on the Black Sea, situated 20 m. N.E. of Varna. The ruins of Tomi, the scene of Ovid's exile, are near it. Pop. 6500.

Baltai, see BIELTZI.

Ba-luba, large negroid tribe of the Belgian Congo, living between the Kassai and Lubilash Rs.

Baluchistan (Beluchistan), country in S. Asia. Its boundaries are: on the N., Afghanistan; on the E., Sind; on the S., the Arabian Sea; and on the W., Kerman, a prov. of Persia. It has a coast-line of 500 m. The anct. dominion of Padrosia bears a certain relation to the present B., whose extent does not equal exactly that of the preceding kingdom, which extended to the Indus. Much of the country is still unknown save to a number of explorers. It was formerly part of Persia, and was later divided into the prov. of B. under Brit. rule and the agency states of Kalát (or Kelát), and Las Bela. Brit. B. was acquired partly from Afghanistan by the treaty of Gandamak, 1879, and partly from the khan of Kalát by arrangement, and comprised the dists. of Sibi, Quetta, Pishin, Thal-Chotiali, Nushki, Zhob, Chagai, Nasirabad, and the Bolan. The Afghan-Baluch frontier was demarcated in 1896-7. The total area of B. is approximately 134,638 sq. m. with a pop. (1941) of 920,943, divided as follows: Brit. B., 54,228 sq. m., pop. 501,631; Kalát, 73,278 sq. m., pop. 356,204; Las Bela, 7132 sq. m., pop. 63,008. In Aug. 1947 Brit. B. was assigned to the new independent state of Pakistan as well as the former agency states. The surface is mountainous, particularly in the N. region of the former Brit. B., which consists mainly of valleys and mt. ridges, the valleys themselves being a mile above sea level. Here there is an elevation of 12,000 ft., formed by the spurs of the Suliman Mts. In the S. the direction of the mt. systems runs from E. to W., while northwards the mts. are stretched across from N. to S. The chief routes are the valleys formed

by the parallel mt. chains of the S., the main thoroughfares being those to Quetta and Kalát through the Bolan and Mula passes respectively. The N.W. railway of India traverses the Bolan Pass—a great engineering feat—and serves Jhatpat, Sibi, Harnai, Quetta, Bostán, and Chaman. A line also runs to Nushki, an extension running thence to Duzdap on the Persian border. There is also a short narrow-gauge line from Bostán junction, 21 m. N. of Quetta on the Chaman line, to Fort Sandeman; this line passes through Hindubagh and was constructed during the First World War, to render more accessible the Hindubagh chromite deposits, which were needed for munitions. Altogether there are about 1020 m. of railway in the country. There is a complete postal service in Brit. B. and the administered terr., and a network of telegraph lines covers the N.E. dists., extending to Kalát and Killa Robat, and connecting with the Indo-European system. Some of the valleys are as high as 5700 ft. at their bottom, and Kalát, on the slope of one of these, is itself 6783 ft. high. Large tracts of the country are formed of impassable deserts, subject to fierce sandstorms in summer and equally formidable cold winds in winter. The rivs. are dependent upon the heavy rains, and when these fall are soon exhausted. This desolate character is chiefly true of the W. region. The temp. varies between suddenly changing extremes. In March the thermometer has actually registered 125° F. at Kalát, in spite of excessive cold in the previous month that has fallen many degrees below zero. Necessarily, therefore, pasturage is very scarce, and cattle are consequently few in number. Sheep and goats are numerous, however. The nature of most of the soil makes the camel the most useful beast of burden, while in the N.W. horses bearing traces of Arab pedigree are reared.

Among the wild animals are the tiger, leopard, wolf, hyena, apo, while fish are caught in large numbers off the coasts. Those regions that enjoy sufficient rainfall are fairly productive. The plain of Kachhi, in Kalát, is, indeed, very fertile, three crops being harvested annually; among the crops being rice, wheat, barley, millet, lucerne, potatoes, and maize. An area of 1750 sq. m. is classified as 'reserved forests,' i.e. forests intended to be permanently maintained by the provincial forest depts. for timber, or for protecting the water supply. There are also nearly 500 sq. m. of unclassified forest land. Fruits are many, and large quantities of grapes, melons, peaches, apricots, and apples are produced; the Makran dist., a sun-scorched, desolate region in the S.W., specialises in date growing.

Of the mineral wealth of B., there are deposits of gold, silver, lead, antimony, iron, copper, sulphur, alum, and sal-ammoniac. In 1887 a petroleum well was discovered in the N.

Kalát is the chief native tn. and cap. of Kalát state. The khan of Kalát, the head of a loose confederacy, formerly received

about £10,000 a year for quit-rents and subsidy from the Indian Gov. Some roadsteads are found on the sandy parts of the coast, among them being Soumlani Bay, Homara, and Gwadar. The roads in Kalât have been greatly improved and extended in recent years; journeys from the cap. to outlying dists., which used to occupy many weeks, can now be taken in as many days. The state boasts over 13,000 m. of good motor roads. The natives are formed of Brahui and Baluchis, the former being the dominant race, while Pathans inhabit the Brit. B. and

and Loralai, and there was also a police force. Early in 1918 there was serious unrest among the unruly Marri and Khetran tribes in the N.; the fort of Gumbaz was attacked in mid-Feb., and, later, gov. buildings at Kohlu were burnt, and Barkhan and Fort Munro were sacked. A punitive expedition marched into Khetran and took Kahan, the Marri cap., the rebels thereupon submitting unconditionally. During the Afghan war the Pathan tribes gave considerable trouble, but though disaffection smouldered for some time in the fastnesses of

BALUCHISTAN: THE BOLAN PASS

E.N.A.

the Agency ters. Much of the pop. is nomadic, or semi-nomadic. The inhab. are by religion mostly Mohammedan of the Sunni sect, and Hindus. Pushtu is the chief language.

The right of Britain to occupy Quetta was secured in 1877 and it, with Bolan, was leased in perpetuity in 1883. The Brit. and Agency ters. were administered by a chief commissioner and agent of the governor-general of India, headquarters being at Quetta, which is the only municipality. After the destruction by earthquake of the greater part of Quetta in May 1935, the offices of the administration and the military forces were moved to other parts of B. and to Sind pending the reconstruction of the tn. The military cantonment and administrative offices were rebuilt on rock foundations to the N.E. of the former site. (See also QUETTA.) Troops were stationed at Fort Sandeman, Chaman,

the Waziristan border, elsewhere it was soon quelled. See H. W. Bellew, *From the Indus to the Tigris*, 1874; E. A. Floyer, *Unexplored Baluchistan*, 1882; D. Bray, *Ethnographic Survey of Baluchistan*, 1913. Later works: A. L. P. Tucker, *Sir Robert Sandeman, K.C.S.: Peaceful Conqueror of Baluchistan*, 1921; Sir M. Aurel Stein, *Archæological Tour in Waziristan and Northern Baluchistan*, 1929.

Balue, Jean de la (1421-91). Fr. cardinal and minister of Louis XI. He was first introduced to Louis by Charles de Melun, and he became chaplain to the king, comptroller of finances, secretary of state, bishop of Evreux, 1464; bishop of Angers, 1467; and cardinal 1483. He intrigued with the duke of Burgundy, Charles le Téméraire, against Louis, for which he was imprisoned in an iron cage in the castle of Onzain, 1469. He was, however, released in 1480, and went to Rome.

Baluster or **Banister** (from Gk. βαλυστήριον, the flower of the pomegranate), the name given to pillars or shafts supporting a cornice or coping. The pear-shaped swelling at the lower end of the pillar accounts for the origin of the name.

Balustrade is the range of equidistant balusters, together with the cornice or coping they support. They are used as parapets or to enclose stairs, and may be decorated with various devices.

Baluze, Etienne (1630-1718), Fr. historian. He served as bursar at the univ. of Toulouse, 1646-54, and afterwards acted as librarian to Le Tellier and the archbishop of Auch, obtaining, in 1667, a similar situation with the famous Colbert, which he held until 1700. He held various other positions, and in 1707 was appointed inspector of the Royal College of France. His chief works are *Capitularia Regum Francorum*, 1677; *Miscellanea*, 1678-1715; *Nova Collectio Conciliorum*, 1683; *Vitæ Paparum Arentionensium*, 1693; *Historiæ Tulensis Libri III.*, 1717. On account of his *Histoire généalogique de la maison d'Autvergne*, 1708, B. was exiled in 1710, but was recalled to Paris in 1713.

Balzac, Honoré de (1799-1850), Fr. novelist, b. at Tours, of a well-to-do bourgeois family. From 1806 to 1813 he attended the Collège de Vendôme, and for the following three years the Collège de Tours, but he showed no aptitude for study, though he must have read widely in his early youth. Much of his school life is reflected in the pages of *Louis Lambert*, 1832. His father put him to study law at the Sorbonne, but B. kicked over the traces, refused to practise, and in 1819 went to Paris, confident of his real vocation. From 1820 to 1829 he tried his hand at tragedy and at novel writing, but made little progress in either. It was a period of hard work and privation. In 1825 he started business as a publisher, printer, and type-founder—a speculation which entailed debts that harassed him almost to the end of his life. The publication of *Les Chouans* in 1829 marks the beginning of his literary career. Though it has been termed melodramatic, it is superior to his previous work, giving a brightly coloured picture of Brittany in 1799. The imitation of Scott is obvious.

From 1829 B. worked with untiring energy. In 20 years he produced 85 novels, in addition to his dramatic attempts, articles to the newspapers, miscellaneous minor works, and a lengthy correspondence, addressed chiefly to his sister Laure and her friend Mme Zulma Carrand. Some of his best-known works may be mentioned: *Les Contes drolatiques*, which are written in a Rabelaisian vein, and must be classed separately from his novels; *La Maison du chat qui pelote*, 1830; *La Femme de trente ans*, 1831; *La Peau de chagrin*, 1831; *Le Chef-d'œuvre inconnu*, 1831; *La Bourse*, 1832; *Eugénie Grandet*, 1833; *Les Marana*, 1833; *Le Père Goriot*, 1834; *La Recherche de l'absolu*, 1834; *Séraphita*, 1835; *Les Illusions perdues*, 1834; *La Cousine Bette*, 1846.

B. conceived the idea of uniting his various pieces into one mighty whole, under the title *La Comédie humaine*, which should comprise all the multifarious aspects of life—*scènes de la vie parisienne, de la vie militaire, de la vie privée*, and so on. This vast scheme was not completed.

In Paris he made numerous friends, including Victor Hugo, Vigny, George Sand, and Lamartine. He fell in love with a Polish lady, Mme Hanska, who was his ideal to the end of his life. Though her husband d. in 1840, debts and other causes prevented B. from marrying her till a few months before his death. He was buried in Paris on Aug. 29, 1850, the pall-bearers being Dumas, Hugo, Baroche, and Sainte-Beuve. Hugo delivered the funeral oration.

B.'s genius is undeniable. He flashed on all the little, unnoticed things the lurid light of his imagination, and therefore he has been called both a realist and a romanticist, according to the point of view of the reader. Nothing escaped his notice, and in the remorseless handling of his material he has been accused of exposing the sordid, unhealthy side of life. But it cannot be doubted that his aim was moral, in the widest sense of that term. His stage is so vast, his persons so true to life, that as a creative genius he stands among the greatest writers of all time.

See Everyman's Library (translations of 15 of the best-known novels); C. L. Kenney, *Balzac: his Life and Letters*, 1878; A. le Bréton, *Balzac, l'homme et l'œuvre*, 1905; J. M. Burton, *Honoré de Balzac and his Figures of Speech*, 1921; W. H. Royce, *A Balzac Bibliography*, 1929. Lives by Sir F. Wodmore, 1887; F. Lawton, 1910; F. Gribble, 1930; S. Zweig, 1947.

Balzac, Jean Louis Guez de (1594-1654), Fr. essay-writer, b. at Balzac, near Angoulême. He went to Italy with Cardinal de la Valette, and was struck by the rich smoothness of the It. style as compared with that of his own country. His writings mark the beginning of polish and elaboration, before unknown in Fr. composition. His *Letters* were pub. in 1624; *Le Prince*, 1631; *Discours*, 1644; *Le Baron*, 1648; *Le Socrate chrétien*, 1652; *Aristippe*, 1658. He became a member of the Fr. Academy in 1634, and was a friend of Richelieu. His collected works were pub. in 2 vols. (1665).

Balze, Jean Etienne Paul (1815-84), Fr. artist, was b. at Rome, and made his début at the Salon in 1835 with a painting from Scott's *Lady of the Lake*. He was assisted by his brother, Jean Antoine Raymond (b. 1818), in his reproductions from Raphael, and in his mural paintings in the palace of the senate re. the scientific, agric., and industrial discoveries of the nineteenth century. Other works: *'La Mort de Sixte IV.'*, 1856; *'Le Couronnement de la Vierge'*, 1859; and *'Le Triomphe de Galatée.'*

Balzico, Alfonso (1825-99), It. sculptor, b. at Cava di Tirreni, near Salerno. He studied at the academy of Naples and at Rome, where he executed the colossal

statue, of John the Baptist. 'Cleopatra,' 'The Coquette,' 'Revenge,' and 'The Tree' were executed by special request of King Victor Emmanuel. His other works include 'Massimo d'Azeglio,' 1873, and 'Duke Ferdinand of Genoa,' both at Turin, and 'Victor Emmanuel,' 1897, at Naples.

Bamangwato, African tribe, of the Bantu race, and the largest tribe of the Bechuanaland Protectorate, numbering about 102,000. See BECHUANALAND.

Bambarra, or **Bambara**, name sometimes given to a dist. of W. Africa, in the colony of Fr. Sudan (until 1920 known as Upper Senegal and Niger), the name being that of the Negro tribe that inhabits the area. Segu (pop. 8229) is the cap. of the dist., and was formerly the seat of the native ruler; Sansandig, on the Niger, was once an important trading centre. The dist. is fertile and rich in minerals. See SUDAN, FRENCH.

Bamberg, city of Upper Franconia, Bavaria, situated on the Regnitz, not far from its entrance into the Main, 33 m. N.W. of Nuremberg. There are many interesting buildings of an early date—the old castle of the former prince-bishops of B., the ruins of the castle of Altenburg, once the seat of the count of Babenberg, and the cathedral. The last-named is a magnificent structure in the Byzantine style, founded by the Emperor Henry II. in 1004. It suffered from a conflagration and was restored in 1110. There are many interesting medieval tombs, a beautifully carved choir screen, and the crypt is a fine example of early Romanesque. The modern buildings include an art gallery, a municipal hospital, and a theological and philosophical high school. The industries are tobacco, textiles, leather, electrical, and brewing. Pop. 54,000.

Bamberger, Ludwig (1823–99), Ger. politician and economist, b. at Mainz, of Jewish parentage, studied law at Giessen, Heidelberg, and Göttingen. He took part in the revolutionary movement at the time when he was editing the *Mainzer Zeitung* (1848–49). He was a member of the National Liberal party in the Ger. Reichstag (1871–80). He was a free-trader and opposed the economic policy of Bismarck. With other Liberals he seceded from the party, forming a group of 'Secessionists,' the later Liberal union which opposed the colonial policy of the Gov. His books include: *Erlebnisse aus der pfälzischen Erhebung*, 1849; *Monsieur de Bismarck*, 1868; *Die fünf Milliarden*, 1873; *Deutschthum und Judenthum*, 1880.

Bambino (It., babe), a term in art applied to the swaddled figure of the infant Christ, and particularly to the Santissimo B. in the church of Ara Coeli, Rome, which is supposed to have miraculous healing power. It is a richly decorated figure carved in wood. The festival of the B. takes place at Epiphany.

Bamboccio, **Pieter van Laer** (1613–c. 1673), Dutch artist, b. at Laer, Holland. Studied at Rome. Classical art he neglected, and delighted in fairs, rustic parties, banditti, etc., subjects which the

its comprise under the general name *bambocciati*. Hence his name, B., not, as some have said, owing to the deformity of his person.

Bamboo (*Bambusa*), genus of Gramineæ which grows in the tropics of Asia, Africa, and America. The plants are in reality gigantic grasses with a jointed subterranean rhizome, which is the true trunk of the B., the shoots being the branches. The stems are hollow and contain only a light pith, but they are jointed and at the nodes strong partitions stretch across the inside. The Bs. grow in clumps, and may reach a height of 120 ft. and a thickness of 10 in. The young

BAMBOO

plants for the first few years produce a well-stored rhizome, but when once they begin to increase in height their growth is very rapid. Some species flower only once, some every year, and others at longer intervals.

The B. is noted for its great economic importance, and serves a variety of useful purposes. The young shoots of some species are cut when tender and eaten like asparagus; the seeds also are sometimes used as food, and for making beer; some species exude a saccharine juice at the nodes which is of domestic value; the rhizomes and shoots, when pickled, form a condiment; silica, found in the stems of *B. arundinacea*, is used in E. medicine. The hard stems are converted into bows, arrows, quivers, lance shafts, masts of vessels, bed-posts, walking-sticks, poles of palanquins, rustic bridges, bee-hives, water-pipes, gutters, furniture, ladders, domestic utensils, and agric. implements. Split up finely they afford a most durable material for weaving into mats, baskets, window blinds, ropes, and even sails of boats. Perhaps the greatest use to which they are put is in building, for in India, China, Japan, Assam, Malay, and other countries of the E., houses are frequently constructed solely of this material.

Bamburgh Castle, in the vil. of B., off the coast of Northumberland, 16½ m. S.E. of Berwick. According to the A.-S. Chronicle it was built by Ida, first king of Northumbria, in 547, and called Bebbanburgh after his wife, Bebbe. It has massive strength and dignity, rising high out of a rock 150 ft. above the sea. It belongs to the Norman period, and has a fine keep and an apsidal chapel dedicated to St. Peter. The castle was attacked by Penda, king of Mercia, in 642, and was twice taken by Dan. invaders. In 1095 Robert de Mowbray surrendered the castle to William Rufus. During the wars of the Roses it was twice taken by the Yorkists and twice recaptured by Margaret. Elizabeth appointed Sir John Forster to be its governor, but this right was forfeited by his descendant, Tom Forster, for his share in the rising of 1715. In 1721 the castle was bought by Lord Crew, and its restoration was carried out under the direction of Rev. Dr. John Sharpe. From this time onwards the proceeds from the castle went to charitable purposes till in 1894 it was bought by Lord Armstrong for almshouses. B. was a royal borough and returned two members to Parliament. Grace Darling's grave is in the churchyard.

Bambuk, country in W. Africa, formed by the angle between the R. Senegal and its trib. Falemé. The climate is unhealthy, but the soil is rich and remarkable for its fertility. The vegetation consists of tamarind, baobab, calabash, acacias, and palm-trees. Maize, rice, millet, cotton, and water-melons are cultivated. The country is rich in iron-ore and gold deposits, the latter especially in the R. Falemé. The pop., estimated at 800,000, consists of Mandingoes, professedly Muslims. The B. country belonged to the Portuguese in the fifteenth century, and was recognised as part of the Fr. Sudan in 1858. The chief tns. are Kayes, Faranaba, and Mardinka.

Bambusa, see BAMBOO.

Bamian, valley in Afghanistan, 50 m. N.W. of Kabul, near the N. base of the Koh-i-Baba Mts. The B. or Hajikhak Pass, at an elevation of 8496 ft., on the road from Kabul, is the only known pass for military purposes over the Hindu Kush, and was once crossed by Alexander the Great. There are a number of cells hewn in the rock, and carved human figures of enormous size. The largest figure stands 173 ft. high. These remains seem to indicate that the place was once a centre of Buddhist worship. There are many interesting ruins of mosques and tombs belonging to the old city Ghulghuleh, which was destroyed in 1221 by the Mongols under Genghis Khan.

Bampton, mrkt. tn. in Devonshire, England, 6 m. N. of Tiverton. There is a weekly market held on Saturday, and two fairs in the year, one on Whit Tuesday and one on the last Thursday in Oct. Pop. 1500.

Bampton, John (1690-1751). Eng. divine and the founder of the B. Lectures (q.v.). He graduated from Trinity Col-

lege, Oxford, 1709, and took his M.A. in 1712. He held a preferment in Salisbury cathedral from 1718 till his death.

Bampton Lectures, course of 8 divinity lecture sermons, called after their founder, Canon John B. (q.v.), who left an estate of £120 for their endowment. They are preached in alternate years at Great St. Mary's, and 30 copies are pub. within two months of their being preached, at the expense of the estate. The lecture is chosen on the fourth Tuesday in Easter term by the heads of colleges, and the lecturer must be an M.A. of Oxford or Cambridge, and cannot be chosen twice. The lectures must be based 'upon the divine authority of the holy Scriptures—upon the authority of the writings of the primitive Fathers as to the Faith and Practice of the Primitive Church—upon the Divinity of our Lord and Saviour Jesus Christ—upon the Divinity of the Holy Ghost—upon the articles of the Christian Faith, as comprehended in the Apostles' and Nicene Creeds.'

Ban, word found in many European languages, in various senses, but as the idea of publication or proclamation runs through them all, it is the anct. word B. still preserved in Gaelic and Welsh, with the sense of proclaiming. It occurs in Spenser, Marlowe, and Shakespeare. On the foundation of churches and monasteries, writings were drawn up specifying what lands the founders and other benefactors endowed them, and as these frequently concluded with curses which would fall on any one who should attempt to divert the land from the purposes for which they were bestowed, the word has come to be associated with cursing. Hence the common use of the term. Persons who escaped from justice or opposed the church were placed under a B. (see BANISHMENT). A similar word was used in Germany with the sense of outlawry. In France a proclamation to call the people to arms was called a B., and those people liable to be called out came under the same name, so we have the *banlieue* of a city, and hence the modern use of the word. The Fr. also use the word in the sense of the Eng. word banns (q.v., under MARRIAGE).

Ban, Banus, from the Slavonian *ban*, a chief, the name given to a governor of certain dists. in the kingdom of Hungary, Dalmatia, Croatia, Slavonia, Bosnia, and Szörény. His power was unlimited, like that of a margrave, and he took command in time of war for the defence of his banat. In 1849 the Bs. of Croatia, Slavonia, and Dalmatia were declared independent of Hungary and received their orders from Vienna. In the year 1867 these banats were incorporated with Hungary, and one of the Hungarian ministers was appointed B. of Croatia and Slavonia by the king under the direction of the president of the council and the Hungarian ministers. See BANAT.

Banam, tn. in Cambodia, Cochin China, on the Tien, cap. of the prov. B.; pop. 28,000.

Banana (*Musa sapientum*), species of the order Musaceæ, which grows in all

tropical countries. The fruit is a long berry, from which, through cultivation, the seeds have disappeared, and forms a valuable food. The plantain or pisang (*M. paradisiaca*), similar to the B., has a larger fruit of a milder taste. The plants on which they grow are in reality herbs, but have a tree-like appearance, and attain a height of 5 to 25 ft. At the apex of the stem grows a bunch of palm-like leaves, from the centre of which the flowers grow in spikes. In tropical countries the fruit is the chief food, and *M. textilis* of the Philippine Is. yields the fibre known as Manila hemp. Jamaica and Fiji are among the Brit. colonies which have a large export trade in Bs. to the United Kingdom market. The total world production is about 2½ million tons. The chief exporting countries before the Second World War were Jamaica, 375,000 tons; Mexico, 290,000 tons; Honduras, 270,000 tons; Brazil, 230,000 tons; Guatemala, 170,000 tons; Colombia, 160,000 tons; and Canary Is., 190,000 tons. See C. W. Fawcett, *The Banana*, 1921.

In Jamaica the B. industry in recent years assumed great proportions, the exports exceeding 26,900,000 bunches in 1939; but this total has not since been approached. The Jamaica B., which is the variety known as the *Gros Michel*, is cut when it is about three-quarters full, so that the fruit on the trees in Jamaica is green and not the familiar yellow. The smaller Canary B. (*M. cavendishii*) was exported from Barbados before the First World War, but the industry was suspended for want of shipping space. The two kinds of Bs. were existing in the W. Indies when the famous Fr. missionary, Père Labat, visited the is. in 1696. The larger species was known to him as the *bananier*, and the smaller as the *figuier*. The former grows to a height of 20 ft., the Canary tree some 10 or 12 ft. The Jamaican industry, however, has been largely destroyed by the incidence of the disease known as B. leaf spot. The disease is caused by *Mycosphaerella muscicola*, and was first recorded in the W. Indies in 1934; but until 1941 it was considered to be caused only by the imperfect fungus *Cercospora musae*, first described by Zimmern (1902) in Java. Only recently has the existence of the perfect stage of the fungus (*Mycosphaerella muscicola*) been estab. by the Leaf Spot Control Div. of the Jamaican Dept. of Agriculture. Following on the experience gained by the United Fruit Company in Central America, and from the original spraying trials carried out in Jamaica in 1937-38, considerable progress has been made towards combating the disease.

Banana, port of the Belgian Congo, W. Africa, cap. of the dist. of the same name. It is situated at the N. of the mouth of the Congo. There are a number of Eng., Fr., and Dutch factories, and steamships run to Liverpool and Antwerp. The chief exports are palm oil and nuts, gum, and rubber. Pop. 3000 (300 whites).

Bananal, tn. in the state of São Paulo, Brazil, on the railway running between

São Paulo and Rio de Janeiro. Pop. 151,000.

Banas, riv. of Rajputana, India, near the Aravalli Hills. It flows in a N.E. direction until it joins the Chambal. Length about 300 m.

Banat, in general, a region under a ban; more particularly applied to a dist. in S. Hungary, which was divided by the treaty of Trianon (1920) between Rumania and Yugoslavia.

Banbridge, tn. in co. Down, N. Ireland, on the Bann, 22 m. S.W. of Belfast. Its prin. manuf. is linen. Pop. 3000.

Banbury, tn. in Oxfordshire, England, on the Cherwell and the Oxford Canal, 23 m. N. of Oxford. The Yorkists were defeated in the neighbourhood in 1469. The old castle, built in 1125, was destroyed during the Civil war, when B. was noted for its Puritanic zeal. The term 'B. man' came to be used as an equivalent for a typical Puritan. B. Cross, of nursery rhyme fame, existed down to the time of Queen Elizabeth, and has now been replaced by a modern one. The tn. is still noted for its cake, cheese, and ales; the prin. industry is the manuf. of agric. implements. Pop. 14,000.

Banco, legal term for a seat or bench of justice. 'Sittings in B' or 'in banco' were formerly held at Westminster before two or more judges of the king's bench and exchequer and the court of common pleas. By the Judicature Act of 1873 two or more judges of the king's bench or probate div. of the High Court, sitting together 'in B.' for the purpose of trying issues of fact, are called a divisional court.

Banca, or **Bangka**, is. in the Malay Archipelago, belonging to the Dutch, situated S.E. of Sumatra, from which it is separated by the strait of B. With one or two neighbouring is. it forms a separate Dutch residency; pop. 160,358, including 68,359 foreign Asiatics, mostly Chinese. Area about 4500 sq. m. The most important product is tin, but other minerals found are gold, iron, silver, lead, amber, arsenic, and lignite. The chief vegetable products are bananas, durian, coco-nuts, nutmegs, benzoin, and sago. During the Second World War the Jap. attacked the is. by air on Feb. 7, 1942, and occupied it with their troops on Feb. 28. The Dutch regained control in 1946.

Banchory, small tn. in Kincardineshire, 17 m. W.S.W. of Aberdeen, on the Dee.

Bancroft, George (1800-91), Amer. historian, diplomat, and statesman. He graduated from Harvard College at the age of 17, studied hist. in Göttingen, where he received a degree of doctor of philosophy, and on his return to America in 1820 became Gk. tutor at his own college. In conjunction with Dr. Joseph Cogswell he estab. a school at Northampton, with which he was connected till 1830, when he devoted himself wholly to historical studies. He was made collector of the port of Boston, 1838-41, by President Van Buren. As secretary of the Navy he had a seat in the Cabinet of President Polk, 1845. Appointed minister to Great Britain, 1846-49, minister to Berlin, 1867-74. He was a democrat, and his

historical work, written at the time of the Civil war, was influential in inspiring an ideal conception of liberty. The first vol. of the *History of the United States* appeared in 1834. His miscellaneous publications: *Poems*, 1823; *History of the Colonisation of the United States*, 1841; *An Oration* (in memory of Andrew Jackson), 1845; *A Plea for the Constitution of the United States*, 1886; *Martin Van Buren*, 1889.

BANDS, OR MOULDINGS

Bancroft, Hubert Howe (1832-1918), Amer. historian, b. at Granville, Ohio, May 5. He opened a bookshop at San Francisco in 1852, and made a large fortune, which he devoted to collecting documents—chiefly about Amer. hist.—and forming a fine library. His own contributions to historical literature include: *The Native Races of the Pacific States*, 1874-76; *The History of the Pacific States of North America*, 1882-90; *Popular History of the Mexican People*, 1888; *British Columbia*, 1887; *The New Pacific*, 1900. He also wrote *Retrospection, Political and Personal*, 1913.

Bancroft, Richard (1544-1610), Eng. prelate. He was b. at Farnworth, Lancashire, and was sent, at the expense of his great-uncle, Hugh Corroen, archbishop of Dublin, to Cambridge. In 1576 he became rector of Teversham, near Cambridge, and rose rapidly to the bishopric of London in 1597. He became archbishop of Canterbury in 1604, and chancellor of Oxford Univ. in 1608. In the reign of James I. he was appointed commissioner on behalf of the Church of England in the Hampton Court conference. He opposed Puritanism, and was a supporter of the theory of the divine origin of episcopacy.

Bancroft, Sir Squire (1841-1926), Eng. actor-manager, b. in London. His first appearance on the stage was at the Theatre Royal, Birmingham, as Lieutenant Manley in *St. Mary's Eve*. He remained in the provs. for 4 years. In 1865 he appeared in London at the Prince of Wales's Theatre as the leading actor, under the management of H. J. Byron and Marie Effie Wilton. Two years later he married Miss Wilton and continued with her the management of the Prince of Wales's till 1880, when they moved to the Haymarket. They retired from

management together in 1885. In 1893 he appeared by the command of Queen Victoria at Balmoral Castle in *Diplomacy*. He was knighted in 1896. Collaborated with Lady B. in *Mr. and Mrs. Bancroft On and Off the Stage, Written by Themselves*, 1888, and was the author of the *Bancroft Recollections of Sixty Years*.

Band, in architecture, the name given to a flat strip or fascia, encircling a building or continued along a wall, usually horizontally. Also used of a B. of foliage, quatrefoils, or bricks. Special varieties of Bs. are indicated by the terms lintel course, frieze, platband, string course, etc.

The B. of a shaft is the moulding which encircles pillars of small shafts, characteristic of Gothic architecture, and very prevalent in the Early Eng. style.

Band, linen appendage to the neck-cloth or collar forming a part of the clerical, legal, or academic costume. Some regard it as a survival of the amice, while others date it back to the collar worn by laymen in the reign of James I. It still forms part of the legal costume in England, but has been replaced in Scotland by the white tie, except in the case of the king's counsel. Also worn by ordained Presbyterian ministers as distinguished from Hcentiates.

Band: 1. *Military*. Military Bs. are composed mainly of wind instruments and drums, but their composition is not uniform, varying in different countries and even in different regiments. Generally speaking, an ordinary Brit. regimental B. consists of at least a dozen ordinary clarinets, 2 brass clarinets and a small clarinet, oboe, piccolo or flute, 2 bassoons, 2 saxophones, 4 horns, 4 cornets, 2 trumpets, 3 trombones, 2 euphoniums, 4 bombardons, and a variety of percussion instruments played by 2 drummers (Scholes). The instruments used in cavalry and artillery regiments include bugles, while Highland regiments have bugles, fife, bagpipes, and drums; but a distinction must here be drawn between the military B. proper, which consists of brass, reeds, and percussion instruments, and the marching B. of drums, fife, and bugles, etc. The brass B. strictly so-called is dealt with below. For centuries European armies have had their Bs., which were used for making signals in battle and to give encouragement to the fighters. The idea of present-day Bs. was introduced into Europe by the crusaders, who took it from the Saracens. In the sixteenth century Bs. became uniform and the Eng. 'drum march' won continental fame. Modern Bs. owe their inception to Frederick the Great, who used them as means to make army service popular. His B. in 1763 consisted of 2 oboes, 2 clarinets, 2 horns, and 2 bassoons. Within fifteen months France, Austria, and England had adopted similar Bs. Coloured men were employed in Brit. Bs. for many years as drummers and to play the symbols, 'jangling Johnnies,' and similar instruments. They ceased to be employed in 1843. In 1823 the War

Office ordered all officers to contribute towards their Bs. Valve instruments were introduced in 1830. In 1857 the Gov. instituted a Royal Military School of Music, at Kneller Hall, near Twickenham, which was at first supported partly by Gov. and partly by the various Brit. regiments. In 1867, however, the War Office took over the entire expenses. This institution trains B. sergeants, recommended by their commanding-officers, for the position of bandmaster, and also trains promising young instrumentalists from such schools as the Duke of York's. Every officer, when serving abroad, contributes not more than 12 days' pay of his rank to the B. fund. Apart from these subscriptions, Gov. maintains the upkeep of regimental Bs. All Brit. cavalry and infantry regiments have Bs. on their establishments. Other corps have one or more Bs. Bs. vary in strength; staff Bs., such as those of Household Cavalry and Foot Guards, R.A., R.E., and Royal Marines, have more musicians than those of line regiments. In time of peace Bs. are supplemented by acting bandsmen and boys; in war bandsmen act as stretcher-bearers. The best-known military Bs. are the Guards, the R.A., and the Royal Marines. The duty of regimental Bs. is to play at parades, at 'marches out,' at the officers' mess, and when required to do so by their officers. Subject to military exigencies, they may also accept private engagements. When the regiment leaves home on active service the B. is usually left at home, unless the regiment is expected to be absent on long service. After the Crimean war a uniform pitch (old Philharmonic) for Brit. Army Bs. was introduced; in 1928, however, they adopted the new Philharmonic pitch, thereby conforming, at considerable expense from the adaptation of instruments, to the slightly lower pitch of civilian Bs.

2. *Naval, etc.* Flag-ships and other large ships in the R.N., when commanded by an officer of post-captain or of higher rank, very frequently possess Bs. The number of performers ranges between 10 and 15, the bandsmen being recruited from the boy Bs. of training ships. Royal Marines Bs. are also popular favourites. The Royal Air Force also has its Bs.

3. *Volunteer, etc.* With the growth of the volunteer movement many volunteer Bs. were formed, which were organised as far as possible on the model of the army Bs. These disappeared when the old volunteer force was abolished. Practically all the infantry and such leading artillery units as the Honourable Artillery Company (H.A.C.) of the modern T.A. have their own Bs. The brass B. proper is a type of instrumental combination which is especially suitable for open-air performance and amateur cultivation. It is found throughout Europe and is particularly popular in the N. cos. of England, where numerous tns. and dists. possess brass Bs. more or less resembling military Bs. As a movement brass Bs. began early in the last

century, and at the beginning of the present century there were at least 5000 such Bs. in the United Kingdom, exclusive of the Salvation Army Bs. As in the case of the military B. it is difficult to specify categorically the constituent instruments of a brass B., but generally they consist of members of the cornet and saxhorn family, together with trombones. A normal Brit. brass B. has 24 players, besides percussion. At one time every autumn the contest of the brass Bs. of Great Britain was a popular festival at the old Crystal Palace. The National Brass B. Church Festival is held at the Albert Hall. *See also* DANCE BAND.

Band, Bund, or Bend, the Persian word for a dike or an artificial embankment, is often met with as a component part of names in E. geography; e.g. in the name of the Persian riv. Bendemir. This riv. was so called after Emir Azadaddaula, who raised a dike on the riv. near the ruins of Persepolis in order to procure water for fertilising the land.

Banda, cap. of the dist. of the same name, United Provs., India, situated on the r. b. of the R. Ken. There are 66 mosques and 161 Hindu temples in the city. It is a centre of the cotton trade. Pop. 20,000. The dist. has an area of 3061 sq. m.; pop. 613,000. During the Second World War it was occupied by Jap. troops early in the winter of 1942.

Banda Islands, group of is. belonging to the Dutch E. Indies, situated about 50 m. S. of Ceram, their mean lat. and long. being respectively 4° 30' S. and 129° 50' E. Area 17 sq. m. The is. are volcanic, the Gunong-Api, 2000 ft. high, rising from the centre of the group, and eruptions and earthquakes frequently occur. There are 12 is. in all, the most important being B.-Neira, B.-Lontor, Gunong-Api, and Pulo-Ay. The pop. is estimated at 10,000, the great majority being native descendants of emancipated slaves. Nutmeg is the chief production, but sago, mace, and coco-nuts are also cultivated. B., in B.-Neira, is the centre of trade and the seat of the Dutch Gov. B.-Lontor, B.-Neira, and Gunong-Api form between them part of the circle of the crater of an anct. volcano. The space thus formed is an excellent harbour, with good entrances on either side. The is. were first visited by the Portuguese, who made a settlement in 1520, but they were expelled by the Dutch c. 1580. The Eng. afterwards contended for a settlement, but the is. were finally acquired by the Dutch 1801-16. They were occupied by Jap. forces during the Second World War, but were liberated in 1945.

Bandage, a strip of muslin or other material, of varying widths and lengths, used by surgeons to support a part of the body or to restrict movement, to apply pressure in order to prevent bleeding or swelling, or to fix dressings or apparatus in their places. Bs. may be simple, when they consist of one piece, as the roller and triangular B.; or compound, when they consist of two or more pieces.

The *Roller B.* is usually a strip of calico, flannel, linen, or muslin, about 18

ft. in length and 2-4 in. in width. In bandaging a limb, the turns commence at the extremity and proceed upwards, so that the blood is partly driven from the limb. Circular bandaging consists of taking circular turns around the part, each loop covering about two-thirds of the width of the loop previously applied. Oblique bandaging means making the loops at an oblique angle to the axis of the limb. As the arm and leg gradually increase in diameter from the extremity upwards, simple, circular, or oblique bandaging would tend to bind the limb by the edge of the strip only, leaving portions of the skin too loosely bound. To remedy this, the B. is occasionally reversed; that is, the strip is turned so that the surface previously in contact with the limb becomes the exterior surface, and vice versa. When a joint such as the knee or elbow has to be passed, the turns cross each other like a figure of 8. The 'spica,' also used for passing projections in the limb, is an arrangement resembling the overlapping of the husks in an ear of corn. When sufficient turns have been taken, the end of the B. may be split in two, one tail carried round the limb in a direction reverse to the turns and securely tied to the other tail; a better plan is to sew the end, or fasten it by a safety pin, care being taken to pass the needle or pin through two or three previous loops, so that the whole may be held firmly together without undue pressure from any single loop. The fingers and toes should never be bandaged with two injured surfaces touching, as there would be considerable danger of adhesion. If the extremities of the toes or fingers are not involved in the injury, they should be left uncovered, as their appearance will indicate whether the circulation has been unduly interfered with, when the B. will have to be readjusted. Any inequalities of pressure may be remedied by the use of paddings of cotton wool.

Bs. of rubber fabric are used when considerable pressure is required, as in sprains or varicose veins. Martin's rubber B. is used to lend support in cases of varicose veins. It consists of a roller B. which is wound spirally about the leg while the patient is in a horizontal position. It should not be tight, and the necessity for reversing is obviated as the elasticity of the rubber tends to keep all parts of the B. in contact with the surface of the limb. Esmarch's B. is used to prevent hæmorrhage from a limb during amputation. It is wound spirally about the limb with considerable pressure, beginning at the extremity, so that the blood is driven from the limb as much as possible. When the B. has passed above the seat of the proposed operation, a thick piece of rubber is bound tightly round the limb so as to prevent the return of the blood and thus save it for the remainder of the body. Before the widespread use of anesthetics such an arrangement was used not only to prevent hæmorrhage, but also to diminish pain.

The *Triangular B.* consists of a piece of thin calico made by cutting a square

yard diagonally, two such Bs. being thus provided. The 'broad B.' is made by bringing the right-angled 'point' to the 'centre' of the long side, and folding the trapezium thus formed once again. The 'narrow B.' is made by folding the broad B. yet again. The triangular B. is used chiefly in first-aid work, being adaptable to many different uses. To cover the top of the head for securing dressings on wounds, the centre should be placed between the eyebrows, the point allowed to hang over to the back of the head, and the ends passed round to the back, crossing over the point and brought together again on the forehead, where they are secured by a reef knot; the point is then turned up and safety-pinned on the top of the head. A sling for fracture of the collar-bone or forearm is made by placing one end of the B. over the sound shoulder, the operator standing in front of the patient; the forearm of the injured part is then drawn across the chest so that the point of the B. is on a level with the elbow; the other end of the B. is brought in front of the arm and carried over the shoulder of the injured side, the two ends being tied behind the neck, but in such a position that the knot is not in the way of the patient when lying down; the point is then brought round the elbow and secured in front by a safety pin. To B. the foot, the sole is placed on the B., the toes being directed to the point. The point is then brought up above the front of the ankle, the ends crossed over the instep, and the point passed under the foot and over again and tied behind the ankle. The triangular B. may also be made into a tourniquet by folding it very narrow and tying a knot to the middle. The knot is placed over the artery when the bleeding occurs in the upper arm or thigh; the ends are passed round the limb and tied tightly. Additional pressure may be imparted by pushing a thick pencil between the tourniquet and the limb, and twisting it. In tying knots in Bs. the reef knot must be used in preference to the granny knot; that is, after making one bend in the ordinary way, the second half should be tied in the reverse direction. See M. Farnworth, *Roller and Triangular Bandaging*, 1940; L. Oakes, *Illustrations of Bandaging and First Aid*, 1942.

Bandaisan, volcano of 5100 ft. in height, situated in the main is. of Japan. An eruption occurred in 1889.

Bandanna, or **Bandana**, a particular kind of silk or calico handkerchief on which has been printed a pattern made up of spots and diamonds. B. handkerchiefs were originally made in India, but are now manufactured in England. The handkerchief is first dyed one colour, and then placed between leaden plates, on which the pattern has been cut out, and put into a powerful Bramah press, when the colour is discharged by means of a bleaching liquid, and the spots are left white on the dyed background.

Bandar Shah, one of the prin. Caspian Sea ports of Persia (Iran) in the prov. of Astrobad. Pop. 25,000.

Bander Abbas, which means 'harbour of Abbas,' from the Shah Abbas Is., tn. on the N. shore of the Persian Gulf, belonging to the Kirman prov. in Persia. It is 12 m. N.W. of the Is. of Ormuz. It has port accommodation, and good anchorage for large vessels in 4-5 fathoms, about 2 m. off tn. Its trade is small. The exports are cotton, tobacco, drugs, dyes, opium, dried fruits, carpets, woollen and silk goods. The imports are dry goods, sugar, spices, glassware, and hardware. Under the name of Gombroon, it at one time took its place among the first seaports of Persia. The tn. is surrounded by walls. The Eng. were allowed to build a factory in 1620, and the Dutch soon after received the same permission. The old Dutch factory still stands. Pop. 10,000.

Bander-i-Gaz, or **Bendar-i-Gez**, port on the Caspian, Persia. Its chief exports are raw cotton, almonds, dates, raisins, wheat, wool. Its chief imports are glass, grain, and manufactured goods.

Bandawe, mission station in Nyasaland, on the W. shore of Lake Nyasa.

Bandel, Joseph Ernst von (1800-76), Ger. sculptor, b. at Ansbach in Bavaria. His chief work was a colossal statue of Arminius, at Detmold.

Bandelier, Adolph Francis Alphonse (1840-1914), Amer. archæologist, b. at Berne, Switzerland. He went as a youth to U.S.A. and devoted his life to archæology; studied and travelled in Central America and S.W. U.S.A. for the Archæological Institute of America and the Amer. Museum of Natural Hist.; wrote extensively on anct. Amer. civilisation. Among his works are: *Tenure of Land and Inheritances of the Ancient Mexicans*, 1878; *Social Organisation and Mode of Government of the Ancient Mexicans*; *The Gilded Man*, 1892; *The Islands of Titi-caca and Koati*, 1910.

Bandello, Matteo (c. 1485-1562), It. writer, second only to Boccaccio as a story-teller. He was b. in Piedmont of good family, and early became a Dominican friar. In 1525 he left Italy after the battle of Pavia, and settled in France, where he became bishop of Agen (1550) and d. there 11 years later. His *novelle*, which number 214, provided themes for Shakespeare, Massinger, Byron, and others, and they were pub. at Lucca in 1554, and at Lyons in 1573. There is a danger of dismissing B. too lightly on the grounds of prolixity, coarseness, and want of humour. But he was a born raconteur, with a flair for finding his own stories, which the many who have borrowed from him may well have envied, even though he lacked the fecundity of invention and humanity of Boccaccio. He first acquired a reputation as a story-teller in the lesser coteries which formed around some socially ambitious woman of the aristocracy, and a number of his tales are believed to have necessarily been either anecdotal or else founded on *crimes passionnels* committed at no great distance from his own circle of acquaintances. One obvious example is the story of the wicked countess of Celano, and another

the far more celebrated story of the duchess of Malfi. B. is not lewd, though in his period it was the fashion to treat directly of certain aspects of a story which modern technique is content to leave implied. Technique may cavil at B.'s moral lessons, but his stories have a force which is more or less independent of technique. He had a natural gift for turning a bawdy tale into a salutary moral homily. His lovers are generally paragons of courtesy and, as has been well said, only communicate their natural desire through the devious channels of classical examples and precepts of honour. If often drawn out, B.'s style is simple and fluent, his narrative vivid and direct, his characterisation excellent and, above all, the movements of passion admirably represented. A tale which combines most of his merits is that of Anselmo and Angelica, a story of a gentleman of Siena and of the enemy whom he delivers from death. The well-known Eng. translation of 13 'Tragical Discourses or Tales' is that of Sir Geoffrey Fenton, which first appeared in 1567; and it gave the impetus to that wholesale pillaging by which poets obtained the material for so many of their greatest pieces. Fenton, who resided in Paris, seems to have chanced upon these popular stories from reading the rendering of Belleforest. His translation is one of the most notable surviving specimens of that stream of It. translations which filled the bookshops of the period. The latest ed., *Bandello: Tragic Tales. Translated by Geoffrey Fenton*, ed. by R. L. Douglas and H. Harris, was pub. in 1924. Wm. Painter's *The Palace of Pleasure* (1566) also contains translations from B., either direct or from the Fr.

Bandermassin, see BANJERMASIN.

Banderole (It. *banderuola*, little banner), long, narrow flag which flies at the mast-head of a fighting ship, or sometimes carried at the funeral of a great man. The word was also used for the streamer fastened to the lance of a knight, and had other meanings now obsolete. Another spelling is *bannerol*.

Bandes Noires, given to a body of Ger. foot-soldiers, who were employed in the It. wars by Louis XII. of France, in consequence of their carrying black ensigns after the death of a favourite commander. Another body of troops, formed of It., afterwards took the same name from the same cause, on occasion of the death, in 1526, of their leader, Giovanni de' Medici; and still later the Fr. regiment of Piedmont, who had served for a long while in Italy, followed the same example after the death of their colonel, the comte de Brissac, in 1569.

Band-fish, marine fish of the family Cepolidæ. It is elongated and has spiny rays. *Cepola rubescens*, the red B., is a Brit. species of vivid hue, and is about 15 in. long.

Bandicoot, name for the family of the Marsupials known as Peramelidæ. They are all natives of Australasia, and none is larger than a hare. In the structure of the hind feet they resemble the

kangaroo, but there is less disproportion between the limbs. They are all insectivorous, but sev. species are omnivorous. *Peragale* are the rabbit Bs., *P. lagotis* being known as the native rabbit in W. Australia; *Perameles*, which are fond of an herbaceous diet, include *P. nasuta*, long-nosed B., and *P. myosuroides*, saddle-backed B.; *Cheropus* are the pig-footed Bs.

Bandicoot Rat, a species of *Nesokia*, its scientific name being *N. bandicota*. It is a rodent of the family Muridæ, to which rats and mice belong. It is a native of the E., and its flesh is used as food in India and Ceylon.

Bandiera, Attilio (1811-44) and **Emilio** (1819-44), brothers of a Venetian family who incited a rising against the Bourbon tyranny of Naples in favour of It. independence, 1843. The rising failed and they fled to Corfu. With about 20 comrades, they landed in Calabria, expecting that their arrival would be the signal for a revolt. However, they were betrayed by one of their companions and were shot, with 6 others, in the square of Cosenza, July 25, 1844. Their letters to Mazzini, which were opened by the Brit. Gov., aroused keen interest, and were pub. by Mazzini under the title of *Ricordi dei Bandiera*, 1844.

Bandinelli, Baccio or **Bartolommeo** (c. 1489-1561), It. sculptor and painter, and disciple of Leonardo da Vinci. According to Vasari, his affection for da Vinci and hatred for Michelangelo led him to destroy the famous cartoon of the latter, which was supposed to excel da Vinci's on the same subject. Amongst his best-known sculptures are a statue of St. Peter, a fine copy of the Laocoön, 'Hercules slaying Cacus,' 'Bacchus and Orpheus,' and 'Adam and Eve.' See Vasari's *Lives* and Benvenuto Cellini's *Autobiography*.

Banditti, see BRIGANDS.

Bandoeng, or Bandung, tn. Java, 75 m. S.E. of Batavia. It is situated on the W. coast, near the volcano of Guntur. Pop. 166,800. During the Second World War the Dutch defences here were pierced by the Jap., and heavy pounding from the air led the Dutch to sue for an armistice to save the civilian pop. After the Jap. collapse in 1945, B. became (Dec. 1945) the main centre of resistance in the Indonesian nationalist revolt. See further under JAVA.

Band of Hope Movement, started about 1847 with a number of disconnected children's temperance societies, organised itself in 1855 into the United Kingdom Band of Hope Union, which has now over 25,000 branches and upwards of 3,000,000 members. The official organ of the union is the *Band of Hope Chronicle*. The office is at Great Peter Street, London, S.W.1. There are also Scottish and Irish unions.

Bandolier, also **Bandoleer** and **Bandolier**, broad leather belt worn over the shoulder, across the breast, and under the arm. As worn by the old musketeers, it had attached a bag for balls and a number of metal cases or pipes, each containing

a charge of gunpowder. Later the B. was fitted with leather pockets for cartridges.

Bandoline, gummy perfumed substance, variously produced from quince seeds, gum tragacanth, and Irish or Iceland moss, used to impart glossiness and stiffness to the hair. It is usually scented with attar of roses or oil of bitter almonds.

Bandon, or Bandonbridge, tn., Co. Cork, Eire, 20 m. S.W. of Cork, on both banks of R. B. Has distilleries and woollen, leather, and cotton industries. Pop. 3000. The R. B., 40 m. long, rises in the Carberry Mts., near Dunmanway, and flows S.E. into the harbour of Kinsale.

Bandra, tn. in the Thana dist., India, connected with Bombay by a causeway and bridge; pop. 29,000, of which about 8,000 are Christians.

Bandy, See ICE HOCKEY.

Baneberry, or Herb Christopher (*Actæa spicata*), species of Ranunculaceæ, a native of Europe. When mature the plant bears black and poisonous berries.

Baner, Banner, or Banier, Johan (1596-1641), Swedish general, b. at Djursholm near Stockholm, and d. at Halberstadt in Germany. At the battle of Breitenfeld, Sept. 17, 1631, he commanded the right wing of the army under Gustavus Adolphus, and on the death of Gustavus he was made field-marshal. His two most celebrated victories were those of Wittstock in 1636 and Chennitz in 1639.

Banerjee, Sir Surendranath (abbreviated and corrupted form of *Surendra-Nātha Vandyopādhyāya*) (1848-1925), Indian nationalist, son of a Brahman physician in Calcutta, where he was b. and attended Doveton College; entered Bengal Civil Service, 1871, at Sylhet, Assam, where his conduct led to removal from the service. In 1875 prof. of Eng. literature at the Metropolitan Institute of Calcutta; in 1876 took part in founding and became secretary of the Indian Association. Founded Ripon College, 1882. Estab. *Bengali* weekly in 1879; it became a daily in 1900. Opposed partition of Bengal (1905). Was on Calcutta Corporation, Legislature of Bengal, and (1913-20) Imperial Legislature, and was president of National Congress in 1895 and 1902. In England 1909 as delegate to Imperial Press Conference. On reversal of partition, B. became moderate; was in England again in 1919; in 1921 retired from editorship of the *Bengali* and accepted a knighthood, but he was defeated at the poll by a Swarajist. Wrote an autobiographical book, *A Nation in Making*, 1925.

Banff: 1. Seaport, royal and parl. burgh, and cap. of Banffshire, Scotland, at mouth of R. Doveron, on the Moray Firth, 50 m. N.W. of Aberdeen by rail. It has woollen, leather, rope, and sail manufs., iron foundries and shipbuilding yards, and is the headquarters of an important fishing industry. There is a considerable export trade. The adjacent tn. of Macduff, with a good harbour, is included in the burgh. Amongst the chief edifices are the co. buildings, the tn. hall, the Chalmers hospital, the academy,

the masonic hall, and the museum. Duff House, presented to the burgh by the late duke of Fife in 1906, contains a fine collection of pictures and an armoury. B. is a place of considerable antiquity, having received its first charter from Malcolm IV. in 1163. The old castle, of which but little now remains, was the bp. of Archbishop Sharp. The modern castle is the property of the earl of Seafield. Pop. 3500. 2. Post-tn., Alberta, Canada, on the Canadian Pacific Itailway, 922 m. W. of Winnipeg and 560 m. E. of Vancouver. It is situated amongst the beautiful scenery of the Rocky Mts. National Park, and is a noted tourist resort. Pop. 2000.

Banffshire, maritime co., N.E. Scotland, bounded on the N. by Moray Firth, on the E. and S. by Aberdeenshire, and on the W. by the cos. of Inverness and Elgin. The surface in the S. is mountainous, the land in the N. being flatter and more fertile. Partly in the co. are Cairngorm Mt. (4085 ft.) and Ben Macdui (4296 ft.). The chief rivs. are the Spey, Avon, and Deveron. The chief lochs are Loch Avon, Loch Builg, and Loch Etebachan. Cattle-breeding is the prin. rural industry. Other important industries are fishing and whisky distilling. The co. tn. is Banff. The other chief tns. are Portsoy, Cullen, Buckie, and Keith. Area, 633 sq. m. Pop. 58,000. Pictish remains are to be found at Rothiemay, Ballindalloch, Boharm, and elsewhere, and mediæval remains at Balvenie, Auchindoun, Findlater, and Keith. The co. was the scene of many conflicts between the Scots and Norse invaders. The co. returns one member to parliament. See W. Barclay, *Banffshire*, 1922.

Bang, Hermann Joachim (1857-1912), Dan. author, b. in the is. of Seeland; educated at the academy of Sorø and at Copenhagen. His novels include: *Haab-løse Slægter*, 1880; *Pædra*, 1883; *Stille Eksistens*, 1886; *Liv og Død*, 1900; and *Mikael*, 1903. Also wrote critical works—as, for example, *Realisme og Realister*, 1879.

Bang, Nina (1866-1927), Dan. Socialist politician, b. at Copenhagen. From 1913 to 1917 she was a city councillor of Copenhagen, and in 1918 was elected a member of the Upper House of the Dan. Parliament. In 1924 she became education minister, being the first woman to hold Cabinet rank in Denmark.

Bangalore, cap. of Mysore state, India, 216 m. by rail W. of Madras, and 70 m. N.E. of Seringapatam. It has a healthy climate, being situated over 3000 ft. above sea level, and is equipped with good drainage and water supply. There is a considerable European settlement, and quite a large number of the inhab. are Christians. It has cotton and other manufs. The fine botanical garden is worthy of note. The tn. was a favourite residence of Hyder Ali. It was captured by Lord Cornwallis in 1791. Pop. 306,500.

Banganapilli, or Banganapilly, tn. in Madras, India, cap. of a state, area 255 sq. m., 89 m. E. by N. of Bellary; pop. 32,000.

Bangar, tn. in La Union prov., Luzon, Philippine Is., 17 m. from San Fernando. It produces alluvial gold, and agric. products such as tobacco, rice, cotton, etc. Pop. 9000.

Bangka, see BANCA.

Bangkalan, see BANEKALLAN.

Bangkok, cap. of Siam, on the Menam, 20 m. from its mouth. The area of the city is about 15 sq. m., and the pop., estimated in 1938, is 681,000, of which about one-half is Chinese. The older part of the city is built on rafts, but there are more streets than formerly and people move about in motors rather than in boats. Most heavy labour is done by Chinese, and trade conducted by Europeans, Chinese, and Indians. Nearly every road has its trams and omnibuses, taxi-cabs, and jinrickshas. The city is the terminus of four railway lines. Huge structures of reinforced concrete are separated by wooden huts. The royal palace is in size a small city. The modern throne hall, about a mile away, is of white marble brought from Italy. There are many Buddhist monasteries. The Chulalongkorn hospital is probably the finest in the Far E.; it has a snake park attached to it. Antidotes are made from their venom. Gambling in B. is prohibited by law. There are sev. hundred second-hand shops for the sale of curios. Fruit gardens supply the city with a bounteous supply of fresh food, including rice, the staff of life, while fish takes the place of meat. The chief exports are rice and teak; the imports, textiles, bullion, and gold leaf. The number of its beautifully coloured temples make B. one of the most picturesque cities in the E. The city suffered severely during the Second World War. It surrendered to the Jap. forces on Dec. 13, 1941. On Jan. 24, 1942, the R.A.F. made a heavy night raid on the city. The power station was completely destroyed, large fires started in the dock area, and much damage was done to the aerodrome. The following day a further raid was made on the docks and commercial centre, starting fires visible for 70 m. After the Second World War B. was the scene of a *coup d'état* by Marshal Pibul Songkram, whose party, the Tharmathapat, seized control of the gov. on Nov. 10, 1947.

Bangor: 1. Episcopal city, seaport, and municipal bor., Carnarvonshire, Wales, on the Menai Strait, 9 m. N.E. of Carnarvon. The chief trade is the export of slate from the Penrhyn quarries. The cruciform cathedral was restored by Sir Gilbert Scott (1869-80). The Univ. College is situated here. Pop. 12,000. 2. Seaport and watering-place, on Belfast Lough, Co. Down, N. Ireland, 12 m. E.N.E. of Belfast. Carries on embroidery and flowering of muslin. Pop. 8000. 3. City and co. seat, Penobscot co., Maine, U.S.A., on the Penobscot R. at its junction with the Kenduskeag stream. Has extensive manufs. of boots, shoes, and clothing, and is one of the chief lumber depots of the U.S.A. Pop. 29,000.

Bangorian Controversy, dispute which

arose out of a sermon preached before George I. in 1717 by Bishop Hoadly of Bangor. In this sermon Hoadly denied the right of the Church to exercise authority over the conscience. The Lower House of Convocation was preparing to take steps against the author of these opinions, when it was prorogued by Parliament for a period of some months.

Bangs, John Kendrick (1862-1922), Amer. author, b. at Yonkers, New York; educated at Columbia Univ. He was editor of *Harper's Magazine*, *Literature*, and *Puck*. Author of many novels, prin. of which are: *Tiddledywinks Tales*, 1890; *The Tiddledywink Poetry Book*, 1890; *Three Weeks in Politics*, 1894; *Mr. Bonaparte of Corsica*, 1895; *A Houseboat on the Styx*, 1895; *The Idiot at Home*, 1909; *Mrs. Raffles*, 1905; *Autobiography of Methuselah*, 1909; *The Real Thing*, 1909; *Andiron Tales*, 1908; *Echoes of Cheer*, 1912.

Bangweolo, or **Bemba**, lake, N. Rhodesia, 3700 ft. above sea level. Area of open water, about 1670 sq. m. in dry season. It is said to be nowhere deeper than 15 ft. It was first discovered by Livingstone in 1868.

Banialuka, tn. in Yugoslavia, situated on the R. Verbas, about 60 m. S.E. by E. from Novi. Pop. 15,000.

Banian Days, originally a sailors' name for the days when meat was not served to the crew. The phrase has now come to be applied to any period of indifferent feeding. The expression owes its origin to the abstention from meat practised by the Bs., a class of Hindu merchants who were a caste of the Valsya, who, on religious principles, abstain from meat. It is estimated that there are over 3,000,000 of them scattered over various parts of Asia.

Banias, vil. in Palestine, on the site of the ruins of Paneas, afterwards Caesarea Philippi. It is situated near the sources of the Jordan, at the foot of the Anti-Libanus (Jebel Helish), the Mt. Hermon of Scripture, and is 45 m. W.S.W. of Damascus. The tn. came into prominence during the time of the crusades, about the thirteenth century, when the castle of B. was built, the ruins of which may still be seen.

Banim, John (1798-1842), Irish novelist, poet, and dramatist, b. in Kilkenny, where his father was farmer and trader. He was educated at Kilkenny College, and studied at the academy of the Royal Dublin Society. In 1820, after sev. years of ill health and disappointment, he settled in Dublin, ultimately abandoning art for literature. In 1821 the production of his tragedy, *Damon and Pythias*, brought B. fame and money, and in 1822, he and his brother Michael set about the writing of a series of Irish tales on the lines of Scott's Waverley novels. Their *Tales by the O'Hara Family* (1st series, 1825; 2nd series, 1826) won popularity. He was granted a civil list pension in 1836. Amongst his other works is the novel *The Boyne Water* (1826), also a book of essays entitled *Revelations of the Dead Alive* (1824), the tragedies of *Turgustus*

and *Sylla*, and the poem *The Celt's Paradise* (1821). See P. J. Murray, *The Life of John Banim*, 1857.

Banim, Michael (1796-1874), elder brother of John B., and joint author of *Tales by the O'Hara Family*, was originally intended for the law, but was compelled to renounce his studies owing to his father getting into financial difficulties. Like his brother, he was the victim of ill health, and in his latter years lived in reduced circumstances. His was probably the greater share in the delightful *Father Connell* (1842), while he was sole author of the following tales among others: *The Croppy* (1828); *The Ghost Hunter and his Family* (1833); *The Mayor of Windgap* (1835); and *The Town of the Cascades* (1864).

Banishment, term derived from the old word *ban* (see BAN). In primitive society B. meant the exclusion of an individual from the protection of the law and the benefits of society, a sentence of outlawry which also involved the confiscation of his property. In more recent times the word has come to mean expulsion from a country or place in punishment for crime. In England B. seems first to have been introduced as a punishment in judicial procedure in a statute of Elizabeth's reign, and in the form of transportation the practice received the sanction of Eng. law until far on in the nineteenth century.

Banister, see BALUSTER.

Banjermasin, or **Bandermassin**: 1. Dist., Dutch Borneo, intersected from N. to S. by mts., and watered by the Banjer and other rivs. Rice is grown, and the region also produces gold, diamonds, gum, wax, spices, etc. The pop. is composed mostly of Dyaks. 2. Tn., cap. of Dutch Borneo, on the Martapura, near its junction with the Barito. B. is largely built on piles. There is an extensive trade in the products of the locality. Pop. 16,700. 3. Riv. in S.E. Borneo. It is navigable for about 50 m. from the sea.

Banjo (negro corruption of the word *bandore*, derived from Gk. *pandora*, a musical instrument with three strings), stringed musical instrument, played with the fingers, often without frets to guide the stopping. It consists of a long neck, on which are the tuning-pegs, and a drum-like vellum body, and has from five to nine strings. It was introduced into America by the Negroes. The pitch is one octave lower than the written notes.

BANJO

Banka, or **Mengka**, tn. on the Is. of Formosa. It is in a tea-growing dist., and its port is Tamsui. Pop. 45,000.

Bankallan, or **Bangkalan**, tn. of the Dutch E. Indies, on the coast, near the W. end of Madura Is. Pop. 14,000.

Bankers' Association of America was founded in 1875 to include all the prominent banks of the U.S.A. In 25 years' time it had a membership of over 21,000, which meant over 90 per cent of the nation's banking power. Every year the association holds a convention at which all the leading bankers are present, and at which subjects of importance to the banking world are discussed, and recommendations for courses of future conduct are given. To commemorate the golden anniversary of the association, an educational foundation of 50,000 dols. was completed in 1927, with the object of furthering banking and financial scholarship and research in colleges. The official organ of the association is the *American Bankers Association Journal*, a monthly magazine. The headquarters are at 110 E. 42nd Street, New York city.

Bankers, Institute of, founded 1879, is an association of men and women connected with various branches of banking. Its objects are to facilitate the consideration and discussion of matters of interest to B.; to afford opportunities to its members for the acquisition of knowledge; and to take measures which may be desirable to further the interests of banking. This it does in part by the arrangement of lectures on banking, mercantile law, political economy, and other subjects, and partly by the issue of certificates to those who pass the examinations approved by its council. The ordinary meetings of the institute are held in London from Nov. to May, and the papers read and discussed are pub. in the institute's *Journal*. There are local centres of the institute in the chief provincial tns. of England and Wales. Its fellows, associates, and ordinary members number over 30,000. London address, 11 Birchin Lane, E.C.3.

Bank Holidays, first estab. by Sir John Lubbock's (Lord Avebury) Act of 1871. B. H. in England and Ireland are Easter Monday, Whit Monday, the first Monday of Aug., Dec. 26 (Boxing Day), or if that day falls on a Sunday, the 27th, Christmas Day, and Good Friday. In Ireland Mar. 17 is also a B. Holiday. In Scotland B. H. are Christmas Day, New Year's Day, and the first Mondays of May and Aug. On these days banks are closed, bills and notes due on such days becoming payable on the next day, except in the case of Christmas Day and Good Friday. Bills, etc., due on these two days are payable on the preceding day.

Banking, see BANKS.

Bank Note. The machinery and processes for printing B. Ns. and other forms of securities employed in London were for a long time more developed there than elsewhere in the world. Orders for this kind of work still come to London from all the important countries of the world except the U.S.A. The U.S.A. have

improved on Brit. methods, and the best machinery now comes from that country. The engraving and printing of B. Ns. is a peculiarly Brit. industry; Waterlow's have carried on the business from 1811 to the present day, De La Rue's from 1815, and Bradbury, Wilkinson from 1855, and in all of these firms the staffs include men who have inherited their skill from their grandfathers and fathers before them. The business requires organisation of safeguards against forgery and other forms of fraud. Every attempt of the forger adds something to the knowledge of the B.-N. printer. In these days it is the camera and photo-mechanical processes to which the forger usually resorts, and the B.-N. printer has to thwart these efforts with finer and more closely engraved lines, more intricate designs and complicated colour combinations. The actual machinery and methods of engraving and printing are in themselves strong safeguards, for the machines are altogether different from those used in ordinary printing. A geometric lathe of extremely intricate mechanism is used for engraving interlacing patterns on B. Ns. The designs are obtained by combinations of gearing and pattern wheels, and without having possession of the key figures to the combination, no one could make a repeat. This is a Brit. invention, but is now also made in the U.S.A., as is also the transfer press for impressing the engraved designs into the steel printing plates. It was originally invented by Jacob Perkins, who came over to this country to exploit it and founded a firm which to-day is chiefly occupied in postage-stamp printing. Any person outside the recognised B.-N. printers who should attempt to buy such machines would not only at once be under suspicion, but would have to give proof of his *bona fides*. The machine for printing from the steel plates have been gradually evolved from the first crude handpress, which was practically a mangle, for printing from flat plates, the inking, wiping, and application of pressure being done by hand. A Frenchman, named Guy, first constructed a machine for automatic, or semi-automatic, inking and wiping, originally for flat plates and afterwards for rotary printing for curved plates, Guy's machines were shown at the Paris Exhibition of 1874, and one was purchased by Bradbury, Wilkinson, who later installed a more elaborate machine made by Voisin of Paris. The machines used at the present day are designed and manufactured by the firms using them, and the features of the design are jealously guarded. See also BANKS.

Bank of England. The, owes its origin to the scheme of William Paterson (q.v.) for meeting the expenses of the Fr. war which followed the revolution of 1688. Other and rival schemes were proposed, but Paterson's was eventually accepted by Montagu, chancellor of the exchequer. Briefly, the scheme was that in consideration of £500,000 subscribed by some 40 merchants towards the sum of £1,200,000 lent to the Gov., the subscribers were to be made a corporation

under the title of the Governor and Company of the B. of E. The B. of E. still remains the most famous in the world and at the same time 'the most original bank in the world.' Its importance to the Gov. and to the Eng. nation is obvious from a consideration of the loans made to William III. and Queen Anne which enabled England to regain that position among European nations which she had then to all appearance lost. The gov. of the day sought the B. of E.'s assistance on the eve of all the eighteenth-century wars, and on the day of reckoning which followed the futile transactions of the Land Bank and of the S. Sea Bubble. Further, not only the establishment of public credit by the formation of the permanent debt, but the organisation of the floating debt and even the conversion of the national debt, are, in the main, the work of the B. of E., and in return for these services the Gov. has always defended the interests of the B. of E. in times of stress. It may be said that a true understanding of the position and transactions of the B. of E. during the first 3 decades of its existence can be obtained only by the study of the political events contemporaneous with its creation, and also of the banking operations of London goldsmiths. For the B. of E. was really created for political reasons, and from the outset it was distinguished from other European banks by certain characteristic features introduced into banking operations by the goldsmiths, so that a comprehensive list of the B. of E. necessitates a study of the business methods of the goldsmiths as exchangers and as discounters of bills and loans at high rates of interest. So successful had they become that large sums were deposited by the citizens generally, and receipts were given for these deposited savings which circulated better than the actual coins whose scarcity they not seldom supplied. Thus goldsmiths' notes are to be regarded as the earliest form of bank notes in England. It is therefore not surprising that the goldsmiths offered some opposition to Paterson's proposal. There was also opposition from the Tories, who declared that a State bank would be one step towards a republic; while certain Whigs opposed it on the ground that it would lead to an absolute monarchy, inasmuch as the king could then escape the financial control of Parliament; while yet others feared that the Tonnage Bank—as it was nicknamed from the fact that the scheme of the new bank was included in the Tonnage Bill of 1693—would absorb all the money in the kingdom and subject commerce to usurious exactions. But political necessity decided the matter, and the above-mentioned Act was duly passed for 'granting to their Majesties sev. Rates and Duties upon Tunnages of Ships (and) for securing certain Recompenses and Advantages to such persons as shall voluntarily advance the Sum of Fifteen hundred thousand pounds towards carrying on the war with France'; and, after various articles referring to the imposition of taxes, the Act authorised the raising of

£1,200,000 by subscription, the subscribers forming a corporation to be called 'The Governor and Company of the Bank of England.' Sir John Houblon was the first governor with Michael Godfrey, deputy-governor, and a court of 24 directors. The subscription list was opened at the Mercers' Chapel, June 1694, and proved a great success. The corporation was to lend the whole of its capital to the Gov. and to be paid interest at 8 per cent; and to be paid £100,000 per annum for expenses. The corporation was also to have the privileges of a bank for 12 years, the Gov. reserving the right of annulling the charter after giving 1 year's notice. The corporation was not authorised to borrow or owe more than its capital and, if it did, the members became personally liable in proportion to the amount of their stock. The corporation was not to trade in merchandise, but could deal in bills of exchange, gold or silver bullion and sell any wares on which it had lent money. The B. was started on condition that a certain sum should be lent to the Gov., but the increase in the following years was due to further loans to the Gov. of the day, and, in return, the B. obtained renewals of its charter and also other advantages. The influence of the B. during the eighteenth century was far greater than in the present day, for, at that time, the large issues of notes made it a very formidable opponent of London bankers. It became the chief factor in the money market, and therefore fixed the price of the loan capital. This was so because it was then the only joint-stock bank in existence, and, as such, held large deposits in comparison with the private banks. The rate of interest fixed by it became the market rate, and, at the present time it remains so, but to a less degree, as London banks have, to some extent, abandoned the method of allowing interest on deposits to be governed by the bank rate. The gold reserve of the country is largely under the control of the B. of E., and it is able to replenish that reserve when the necessity arises—other things being equal. The B. of E. is, in fact, the only institution where large amounts of gold can be obtained in order to meet home and foreign demands, and its position as a bank of discount is very often impeded, since the rate of interest is advanced in order to prevent the reserve of gold from getting too low. The business of the B. of E. consists of 3 divs.: (1) the management of the national debt; (2) issue of bank notes (the Bank Act of 1844 divided the issue from the banking dept. and from that date the 2 offices were kept distinct); (3) Gov. and private banking. The B. of E. carried on its business in Grocers' Hall until 1732. Its present building in Threadneedle Street, London, which has recently been enlarged, was erected from the designs of Sampson (1734), Sir Robert Taylor (1776–81, 1783), and Sir John Soane (1788). A 'Bank Guard' is furnished every evening by the battalion of Guards on duty. This practice dates from the attack on the B. during the Gordon riots in 1780. There are country

branches at Birmingham, Bristol, Hull, Leeds, Liverpool, Manchester, Newcastle, and Plymouth.

B. of E. Nationalisation Act, 1946. Passed by the third Labour Gov. with the aim of bringing the capital of the B. of E. into public ownership, and the B. under further control and to make provision respecting relations between the Treasury, the B. of E., and other banks. Under the Act the whole of the B. stock was transferred to Treasury nominees 3 months after the passing of the Act. It is provided that the Treasury shall issue

the Treasury and the B. The new court of directors consists of a governor, deputy-governor, and 16 directors (8 fewer than previously) appointed by the Crown. The governor and deputy-governor hold office for 5 years, the directors for 4, and all are eligible for reappointment. On the day the Act came into operation all the existing directors resigned, and of the first directors who took office 4 were appointed for 1 year only, 4 for 2 years, and 4 for 3 years. Members of Parliament, persons holding offices of profit under the Crown, aliens,

Valentine & Sons, Dundee

THE BANK OF ENGLAND AND THE ROYAL EXCHANGE, LONDON

to stockholders in exchange 3 per cent Gov. stock, the amount to be issued to any stockholder being such that the ann. interest is equal to the average ann. gross dividend declared during the 20 years to Mar. 31, 1945. The amount of the capital stock outstanding then being £14,553,000 and the average ann. gross dividend during the previous 20 years having been 12 per cent, the nominal amount of Gov. stock to be issued in exchange for B. stock was £58,212,000 (£400 for every £100 of B. stock). The Gov. stock is to be perpetual, but may be redeemed at par by the Treasury on or at any time after Apr. 5, 1966. No dividends are to be declared by the B. after the passing of the Act, but, instead, the B. will pay to the Treasury £873,180 half-yearly (i.e. the equivalent of 3 per cent interest on the above total of Gov. stock) or such lesser or greater sum as may from time to time be agreed upon between

and persons disqualified under the B.'s charter, are excluded from appointment. Only 4 of the directors may be employed whole time by the B. The Act also provides for the drawing up of a new charter. The Treasury may give directions to the B. from time to time, but subject to such directions, the affairs of the B. are managed by the court of directors in accordance with the charter. The B. may, if they deem it necessary, in the public interest, request information from, and make recommendations to, bankers (i.e. any person carrying on a banking undertaking and declared by the Treasury to be a banker) and may, if so authorised by the Treasury, issue directions to any banker for the purpose of securing that effect is given to any such request or recommendation. The new court took office from Mar. 1, 1946. Lord Catto continued as governor, and all the directors were members of the former

board except Brig. R. Brook, an economist, who served in the war as director of resistance in W. Europe, and was after on F.-M. Montgomery's staff: Mr. George Gibson, former chairman of the Trades Union Congress General Council and a member of the National Investment Council; and Lord Piercy, chairman of the Industrial and Commercial Finance Corporation. *See also* BANKS and BANKING; CURRENCY; DEBT CONVERSION; MONEY; PUBLIC DEBT.

Thorold Rogers, *The First Nine Years of the Bank of England*, 1887; A. Andréades, *History of the Bank of England, 1640-1903* (trans. by C. Meredith), 1909; Sir J. H. Clapham, *The Bank of England* (2 vols.), 1938.

Bank Rate, the advertised official minimum rate at which the B. of England will discount approved bills of exchange-maturing at not more than three months—or grant short loans. The B. R. is generally somewhat above the current market rate or rate which is generally charged to the bank's customers. The rate is fixed by the bank directors at their weekly meeting and announced every Thursday. The object of raising the B. R. is to attract more gold to the country; while lowering the rate makes borrowing easier and tends to draw gold to centres where higher interest is to be earned. The rates, whether for loans, deposits, or discounts, of all other banks in the country are, generally, regulated according to the B. R. The changes in the B. R. in the past few years have been as follows:

Year	No. of Changes	Highest	Lowest
1914	8	10	3
1915	None	5	5
1916	1	6	5
1917	2	6	5
1918	None	5	5
1919	1	6	5
1920	1	7	6
1921	4	7	5
1922	4	5	3
1923	1	4	3
1924	None	4	4
1925	4	5	4
1926	None	5	5
1927	1	5	4.5
1928	None	4.5	4.5
1929	5	6.5	4.5
1930	4	5	3
1931	6	6	2.5
1932	7	6	2
1933-38	None	2	2
1939	3	3.88	2
1940-45	None	2	2
1946	None	2	2
1947	None	2	2

The B. R. is looked upon as a useful weapon against an ill-balanced expansion of business. In Great Britain the rate has, with slight variations on the outbreak of war in 1939, stood at 2 per cent

since 1933—an indication that the Gov. still holds to the policy of cheap money. B. R. is, in fact, a smooth, certain, and speedy check on an undue expansion of business activity as compared with the system of restriction.

'The real importance of a variation in the minimum rate of the bank does not consist in the power exercised over, but in the indications afforded of, the money market. The fixity of the minimum rate has this effect; that practically it becomes a maximum to the public. Persons in good credit are almost always able to procure money a fraction under the bank rate, and consequently the Bank of England is generally the last to feel the pressure of a rising demand' (Goschen, *The Theory of Foreign Exchanges*).

Bankruptcy. In England and Wales a bankrupt is a person who declares, or by his conduct makes it manifest, that he is unable to pay his debts, and whose property is accordingly distributed among his creditors under the B. laws. In its original signification the term bankrupt meant a trader who hid himself or did other acts tending to defraud his creditors. The term insolvent, which in one sense connotes any person who is unable to pay his debts, in a more restricted sense meant a non-trader who sought the benefits of the Insolvency Acts. Since 1861, bankrupt includes both traders and non-traders, and our whole modern law of B. applies indifferently to both. Insolvency now connotes the condition of a debtor who is unable to pay his debts but who has not been 'adjudged.' B. legislation dates from the time of Henry VIII., the most notable Act being that of 1825, which introduced the principle of deeds of arrangement as an alternative to B., subject to very severe restrictions. In 1869 all the previous statutes were repealed and a 'trustee, in whom the property of the bankrupt was to vest, was substituted for the old 'official assignees.' The present law of B. rests on the general Acts 1883 and 1890, and various measures dealing with procedure, all of which Acts were repealed and substantially re-enacted in the Consolidating Act of 1914. The purpose of the Acts of 1883 and 1890 was to secure that the property of a person who could not pay his debts in full should be divided ratably among his creditors, and that the debtor should then be freed from his debts either absolutely or conditionally. According to the present law, proceedings may be instituted by the debtor or by the creditors: in the former case the B. is called voluntary, in the latter involuntary. The claim of the creditors must amount to £50. On the petition being presented, the property of the debtor is taken over by an official receiver, who is an officer of the Board of Trade, and the debtor must make a full statement of affairs on oath in public, after which the creditors hold a meeting to determine whether the debtor shall be adjudged bankrupt or whether a composition can be arranged. Such a composition must be approved by three-fourths in value of the creditors, and must

receive the sanction of court. If, however, the debtor is adjudged bankrupt, the creditors appoint a trustee to distribute his estate, under the supervision of a committee of inspection. The debtor is liable to imprisonment if he refuses to assist in the discovery of his property or conceals his goods from the trustee. After the distribution of his property among the creditors the bankrupt may obtain a discharge from the court, but the discharge is withheld under certain conditions: if he (1) has not kept proper books within 3 years before B.; (2) has traded after knowledge of insolvency; (3) has lived extravagantly or speculated rashly; (4) has been previously bankrupt; (5) has contracted debts without expectation of being able to pay them; (6) has given preference to any creditor within 3 months before B. By the B. Act of 1883 the procedure was simplified in the case of persons with property less than £300, when the official receiver became trustee, and there was no committee of inspection. The jurisdiction was transferred by this Act from the Court of B. to the High Court of Justice; it also provided for persons dying insolvent, the administration of whose property could formerly only be dealt with by a suit in chancery.

B. proceedings are now conducted under the B. Act of 1914, and the rules made thereunder as amended by the B. (Amendment) Act of 1926. By this Act previous statutes were consolidated and certain changes were made, chiefly in the direction of increasing the stringency of conditions and placing on the debtor the onus of proving himself not guilty of fraudulent intent. The jurisdiction under Debtors' Act, 1869, to commit debtors is now transferred to the B. court, which has power to make a receiving order instead of committing the debtor. An undischarged bankrupt is now guilty of a misdemeanour, the official receiver having the power to institute and conduct proceedings if he (1) either alone or jointly with another person obtains credit for £10 or over from any person without informing that person that he is an undischarged bankrupt; (2) engages in any trade under a name other than that in which he was adjudicated bankrupt without disclosing to all persons with whom he trades the name under which he was adjudicated bankrupt; (3) has contributed to or increased the extent of his insolvency by gambling or hazardous speculation within 2 years of his petition; (4) fails on request of the official receiver in course of public examination to account for the loss of any substantial part of his estate incurred within a year before petition or to give a satisfactory explanation of the manner in which loss was incurred. An undischarged bankrupt must reveal his position when asking for credit; if he thinks such knowledge has been given to the creditor when it has not, he has no defence. General assignments of book debts not collected before B. become void unless registered as bills of sale, but this does not apply to a specific debt assigned.

A bankrupt is disqualified from holding office of (a) member of Parliament; (b) justice of peace; (c) mayor, alderman or councillor; (d) co. councillor; such disqualification to cease if and when the adjudication of B. is annulled or the bankrupt obtains discharge with a certificate to the effect that B. was due to misfortune. An undischarged bankrupt may apply for discharge if his assets were more than 10s. in the £, if no criminal intent has been proved. A discharge order releases him from all obligations with certain exceptions, such as debts to the Crown, etc.

In Scotland a bankrupt is liable to the distributing process known as sequestration. A 'notorious bankrupt' corresponds to a person who has committed what is called in England an act of B. There is no separate court of B., the jurisdiction being assigned to the sheriff of a co. or to the bill chamber of the court of session. The procedure closely resembles that in England. See also *INSOLVENCY*. Consult Ringwood, *Principles of Bankruptcy*.

Banks, Elizabeth, Amer. authoress, b. Taunton, New Jersey. Began journalism as a society reporter on Baltimore papers, but later went to Peru as secretary to the Amer. minister there. She lived in England the greater part of her life. Author of essays entitled *The Lady at the Round Table* in the *London Referee* under the pen-name of 'Enid,' and of serial stories under the pen-name of 'Mary Mortimer Maxwell.' Other books: *A Dog of Belgium*, 1914; *On the Boat that Uncle Sam Built*, 1917; *School for John and Mary—A Story of Caste in England*, 1925. Her autobiography was pub. under the title *The Remaking of an American*, 1932. She d. in 1938.

Banks, Sir Joseph (1743-1820), Eng. naturalist and explorer, b. in London. In 1766 he made a botanical expedition to Newfoundland. From 1768 to 1771 he accompanied Cook in his voyage round the world on the *Endeavour*, and his journal proved an important source of information. In 1772 he made a trip to the Hebrides and Iceland, and was instrumental in bringing to the general notice the marvels of Staffa. He formed a valuable collection and library, which he bequeathed to the Brit. Museum. In addition to various scientific articles, he wrote *A Short Account of the Causes of the Diseases called the Blight, Mildew, and Rust*, 1805; and *Circumstances Relative to Merino Sheep*, 1809.

Banks, Nathaniel Prentiss (1816-94). Amer. politician and general, b. at Waltham, Massachusetts. After being a factory worker and the editor of a local paper, he studied law and was admitted to the Bar. After a period of service in the Massachusetts legislature, he was in 1853 elected to Congress, where for some time he was speaker of the House. From 1857 to 1859 he was governor of Massachusetts, and later became president of the Illinois Central railroad, which position he relinquished on the outbreak of the Civil war, when he joined the Federals.

He was defeated by Jackson at Fort Royal, and was later beaten at the battle of Cedar Mt. In 1863 he captured Port Hudson, but after his defeat at Sabine Cross Roads in 1864 he was relieved of his command. He re-entered Congress in the same year, and served as chairman of the committee on foreign relations. A mental disorder brought about his final retirement from public life in 1891. He was popularly known as the Bobbin Boy, in allusion to his early factory career.

Banks, Thomas (1735 - 1805), Eng. sculptor, b. in Lambeth, London. Apprenticed at the age of 15 to a wood-carver he studied sculpture in the evenings under Schemmachers. He continued his studies at the Royal Academy, where, in 1770, he gained the gold medal. In 1772 he gained a travelling studentship and went to Rome. He did not return to England until 1779, his marriage to Miss Wooton, a lady of considerable means, rendering him independent. In 1781 he proceeded to Russia, where he gained the favour of Catherine II., who purchased his 'Cupid catching a Butterfly' and 'Caractacus and his Family before Claudius.' He was elected a member of the Royal Academy in 1785.

Banks and Banking. The term bank (derived from Fr. *banque*, a money-changer's bench or table) is applied to various forms of establishments which deal with money, including not only those institutions to which it more strictly applies, dealt with in this article, but also the great merchant and financial houses, discount businesses, and the like. Banks have been classified into banks of issue, i.e. those which have the right to issue their own notes, and banks of deposit, those which receive money from their customers. Another classification divides banks into private banks, those whose capital is owned by a limited number of partners, in Eng. law not more than ten, and joint-stock banks, where the shares are owned by a corporate body. For practical purposes the Bank of England is the only Eng. bank of issue, and the notes of those banks which still preserve the right of issue are but rarely seen. The Bank of England notes are legal tender in England except at the bank itself. Though the bank-note is of the greatest importance in regard to the reserves held against deposits by the banks, and so ultimately in regard to the gold basis of our credit system, the cheque is the medium by which business transactions of every kind are now carried on. A bank, usually a joint-stock company, and with capital found by its shareholders, receives the money of its customers, either on deposit, i.e. only to be withdrawn after certain notice, or on current account, i.e. to be withdrawn on demand, during business hours. On deposit accounts interest is allowed, on current accounts usually none. The Bank of England allows no interest on deposits. These deposits, whether on deposit or current accounts, are the bank's liabilities, which it must be prepared to meet with cash on demand, and though in theory the

liabilities might all be drawn upon at one moment, the system is based on experience that except in times of panic they never are. Thus the accumulation of deposits can be used by the bank for its own profit in financing the business and trade of the country, and expanding the credit on which it is built up. A glance at the yearly or half-yearly balance sheet of one of the great joint-stock banks will show the kind of business which is done by them. On the debit side will be found the paid-up capital of its shareholders, i.e. the original working capital, the reserve fund, the accumulation of profits not paid out in dividends; then will follow the largest item, the deposit and current accounts of its customers, which form the bank's liabilities, and the profit and loss account. On the credit side comes first the cash; (1) Gold and notes in the tills, ready for the ordinary day-to-day drawings; these are normally small in amount, owing to the use of cheques; (2) cash held by the bank at the Bank of England, which, as the bankers' bank, is the centre of the Eng. banking system. Cash held at the Bank of England appears as 'other deposits' in the weekly bank return. Next upon the credit side appears the item 'loans at call or short notice'; these are day-to-day or weekly advances made chiefly to the brokers of bills of exchange at a low rate of interest. The largest amount is found in the item 'bills discounted and advances.' Not only do the banks discount bills themselves, but they finance by advances the merchants who confine themselves to that business; thus the banks play an important part in the supplying of credit to the trade and industry of the country, for it is the bill of exchange (q.v.) which is the prin. medium of the supply of credit. 'Advances' also include the loans made by the bank to its customers, on securities of all kinds, from the large sums advanced to corporations, companies, bill-brokers, and discount houses, or to members of the Stock Exchange for dealings in shares, to the loans made to ordinary private persons on securities lodged with the bank or as overdrafts on personal security or guaranteed by a third person. The value of the bank's premises and investments made by it in the highest form of securities close the credit side of the balance sheet. An examination of a bank's balance sheet will show that the deposit and current accounts, its liabilities, amount to perhaps 6 or 7 times that of the cash in hand or at the Bank of England, and the balance will be chiefly found in the sums lent either at call or short notice, on bills, or in other advances, and sound banking depends on these advances being promptly repaid and securities easily and at all times readily realisable in cash. A bank has always to be prepared for a panic, and it is always faced by this problem: if too much is laid up in cash reserve against its liabilities, there will be so much less available for making its own profits and for the financing of trade and industry; if too little, at any moment it may be called on to pay more than it can command in cash at

once, with the consequence of realising its securities at heavy loss or of even suspending payment. The cash reserves of a bank are, as already mentioned, the gold and notes in its tills and the reserve at the Bank of England, which is, in turn, a credit in the books of the bank, capable of being drawn on in gold or notes also. The ultimate reserve, therefore, is gold; for, as will be shown, the note issue of the Bank of England is restricted by law and depends on the gold held by it, except when the Bank Act is 'suspended.' A control is kept by the banks, therefore, on the expansion of credit by the varying rates of discount allowed in the money market, so that some equilibrium is kept between their liabilities and their reserves (*see MONEY*). Of all the business done by the banks, a very small proportion is carried on in gold or notes, for the commercial currency in, for instance, the United Kingdom and the U.S.A., is the cheque. The enormous amount of business done by the interchange of cheques is carried through not by paying in or out of notes and gold, but by book-entries in the various banks through the clearing house (*q.v.*). The various banks at the clearing-house day by day balance all the cheques out and in against each other, and the differences are settled between them by a corresponding alteration in their accounts at the Bank of England, which is their common banker, and is not a member itself of the clearing-house. Similarly, when a loan or an advance is made by a bank, it usually consists of an entry in the bank's books, giving a credit against which the person to whom it is given has the right to draw cheques. Thus on a comparatively small capital of its own, with cash perhaps amounting to one-seventh of its liabilities, an estab. bank does its work of providing the readiest way of settling a vast vol. of transactions, and of providing the credit necessary to finance these transactions with a currency which, though not actually paid in gold, is payable in gold. Some idea of the vol. of business done can be gained from the fact that the ann. amount dealt with at the London clearing-house reaches some sixteen thousand millions. As the keeper of the gold reserve, on which ultimately this vast business is built, and as the bankers' bank, the central figure is the Bank of England. (For a more detailed hist., *see BANK OF ENGLAND*.) The Bank of England is first of all the Gov. bank, receiving all revenue payments, and paying the dividends, etc., to holders of Gov. stock. It is the agent of the Gov. in the financing of Treasury and Exchequer Bills, and in other ways is the right hand of the Gov. in the financial side of its administration. It is the only bank whose notes are legal tender, i.e. must be taken in payment of a debt. It is, for all practical purposes, now the only note-issuing bank in England. The Bank of England is regulated by the Bank Charter Act, 1844, and by the Bank of England Nationalisation Act, 1946. The Bank Charter Act limited the note issue of all other banks in England and in Scotland and Ireland, but allowed

the last 2 to exceed this, on an equivalent of gold for every note in excess. The monopoly of note issue in London and the 65-m. radius, granted in 1826, was retained, and no new bank could obtain the right; the result has been that many banks have allowed their note-issuing rights to lapse on opening offices in London, or from amalgamation with London banks. The Act separated the issuing and the banking depts. of the Bank of England. It could issue notes up to £14,000,000, being the amount of its loans to the Gov. at that date, this is the 'fiduciary' issue; above that amount the bank must hold an equivalent in gold coin or bullion. The bank is obliged to make a weekly return, reporting its financial position. This is issued every Thursday, and will be found in *The Times* and other papers on the Friday following.

Most of the notes in circulation are held in bankers' tills as their immediate day-to-day cash transactions require. The notes held by the Bank of England in its banking dept. are the first line of defence against its prin. liability, that of 'other deposits,' which include the other banks' reserve, figuring in its balance sheet as 'cash at the Bank of England.' This with the bullion and coin are the Bank of England's reserve. In time of panic the banks will naturally draw against their deposits, and the Bank of England, not having an unlimited note issue, has to appeal to the Gov. to suspend the Bank Act. This has only been done in 1847, 1857, and 1866, and only in 1857 has an actual excess of notes been issued. The item on the debit side of the banking dept. termed the rest, is the equivalent of the reserve in other banking balance sheets, viz. the undivided surplus of profits; this is never allowed to fall below £3,000,000. The Bank of England rate, termed the bank rate, is the official *minimum* rate of discount at which the bank will discount bills; it is usually above that of the discount obtainable for money in the open money market; but if there is a shortness of cash, the tendency is for the open rate to equalise with the bank rate. *See also* BANK RATE, EXCHANGE, and MONEY MARKET.

Banker and Customer. The Eng. law affecting the relations between banker and customer is that of debtor and creditor, as was laid down in the House of Lords in *Foley v. Hill*, 1848, 2 H. of L. 28. The banker is not a trustee, responsible to the depositor for the way in which he uses his money, and the banker keeps what profit he may make with the money deposited. If the bank stops payment, the depositor ranks with the other creditors. If he has not used his account for 6 years and there has been no payment of interest or repayment by the bank of any part of the deposit or no acknowledgment in the meantime, the debt is statute-barred. A banker is obliged to honour a customer's cheques provided only that there are sufficient funds to his credit, and is liable for damages without proof of actual injury or loss if he dishonours cheques. This liability holds good only between the

banker and the drawee of the cheque, and the person in whose favour the dishonoured cheque has been drawn has no right against the banker. The banker's authority to pay money on cheques is ended by the customer's death, insanity, or bankruptcy, or by notice of an act of bankruptcy. A customer may by order revoke the authority to pay cheques or a particular cheque, but such order must be in explicit terms. A garnishee order against the funds of a customer at a bank attaches to all the funds, and a banker may not pay on any cheques drawn by the customer, even if the amount of the judgment is exceeded by the funds. Valuables, such as plate, etc., deposited by a customer for safe custody with a banker, are not in the same position as funds deposited. The banker acts as a bailee, and they cannot be taken by the banker as set-off against a debt due from the customer, nor, in the case of the failure of the bank, do they rank with the bank's assets; the banker is liable for loss through negligence on his part, and they can be recovered from the banker after any lapse of time. The deposit of valuables for safe custody differs from the deposit of securities, for on these last the banker has a lien, which covers also all cheques and bills paid in for collection by the customer. The banker can retain all such against his customer's debt, and may realise the securities. This banker's lien can, of course, only be exercised where there is no agreement between him and the customer to the contrary, or where goods are deposited only for safe custody or money is paid in to meet particular bills. Further, a banker may not alter any system of dealing which has been recognised as holding good between him and the customer without due notice. If securities have been deposited as cover for a specific loan, the banker's lien terminates when the loan has been repaid. An overdraft or advance is arranged by agreement, and interest may be charged; a customer, drawing a cheque when there are not sufficient funds to meet it, makes an implied request for an overdraft, which the banker may refuse by dishonouring it. Much of the law affecting banker and customer is that which relates to cheques, bills of exchange, and other negotiable instruments. Finally, a banker is bound to keep secret all matters relating to his customer's account, unless authorised to reveal them or compelled to do so by law. See J. Paget, *Law of Banking* (4th ed.), 1930, and H. Hart, *Law of Banking*, (4th ed.), 1931.

General Hist. Clay tablets have been found in Babylonia and Assyria showing some of the functions of the banker, such as money-changing, advances, and the like; we also know from the code of Hammurabi that payments were made through a banker and by drafts against deposits. Deposits bearing interest, letters of credit, and other means of transferring credits from one place to another were also known in ant. Greece and Rome. The Chinese are said to have had a paper currency about A.D. 800. But though it is possible

to trace the evolution of banking, especially in Italy during the Middle Ages, continuously from early times, it is now accepted that the first public 'bank,' properly so called, was the Banco di Rialto, estab. at Venice by Acts of the Senate in 1584 and 1587. In 1619 the Banco del Giro was founded; this became the only public bank in the state, and was long famous as the Bank of Venice. Banking in Venice developed out of the money-changers and private exchange bankers, who as early as 1318 seem to have taken deposits, and as far back as 1270 gave security to the State for the proper carrying on of their business. It was the failure of many of these deposit banks that led to the founding of the Rialto Bank as a public bank by the State. The Bank of Venice suspended payment sev. times owing to its loans to the State, and ceased after the Fr. invasion in 1797. Another early It. bank was that at Genoa, the famous Bank of St. George; this was a private bank of deposit; it was founded in 1407, and by its advances to the republic dominated the State and managed the public funds. The Fr. appropriated its property in 1800. The bank had an earlier hist., dating back to 1200, as a merchant and financial company, and is the first example of a body of shareholders whose liabilities were limited to their shares. The banks mentioned above were 'deposit' banks, receiving cash and paying it out on demand, and developed out of the business of the dealers in foreign exchanges. Another class of early banks were those which remained, at any rate principally, as exchange banks, of the utmost importance in the days when there was a large quantity of debased and clipped coin in circulation. Of these exchange banks the Bank of Amsterdam, founded 1609, lasted till 1820, and the Bank of Hamburg, 1619 till 1873, are the most famous. Their business lay 'in the assistance of commerce not by loans but by the local manuf., so to speak, of an international currency' (Palgrave, *Notes on Banking*). This currency was 'bank money.' Merchants brought coin or bullion to deposit, and were credited with the real intrinsic value; their credit was in 'bank money,' which they could draw on to meet their requirements. The income of the bank was gained from the small charges for such transfers in the books of the bank as were made from one merchant to another to meet their dealings. There is a good account of the working of the Bank of Amsterdam in Adam Smith's *Wealth of Nations*, iv. iii. The next great step in advance was the appearance of the bank note, i.e. a promise to pay in coin made by the bank which issued it. If these notes were backed by a general confidence in the bank issuing them, they would circulate as cash, and thus create a great expansion of credit and business with an economy of actual metal currency. The invention of the bank-note—apart, that is, from the Chinese paper money already alluded to—is due to Palmstruck, who founded the Bank of Sweden (Riksbank) in 1656; the

first bank-note was issued from the bank in 1658. The further hist. and development of modern banking is discussed in the following sections dealing with different countries.

English Banking and the Bank of England. The rise of banking in England has often been dated from the seizure by Charles I. in 1640 of the bullion deposited in the Tower of London by the city merchants. Though it was returned to them, for the future they deposited it for safety with the goldsmiths, who not only did business in money-changing, but were also employed in taking charge of rents and money on deposit from the country gentlemen, granting interest thereon. The goldsmiths had begun taking deposits in James I.'s reign, but the development of their business dates from the Civil war. They gave receipts for the money deposited, and these receipts, known as goldsmiths' notes, the earliest form of bank-note in England, circulated even more freely than coin, and large transactions were carried out by their means as late as 1696. During the Protectorate the goldsmiths were of assistance in financing the Gov., and after the Restoration they became lenders to Charles II. receiving as much as 12 per cent or over, and paying less than half that rate to their creditors whose deposits they used. In 1672 came the suspension of exchequer payments, a declaration of national bankruptcy which brought ruin not only to the goldsmiths, to whom the Gov. owed £1,300,000, but also to their depositors. The successful example of the Dutch banks, the demand for better security for deposits, a correspondingly safer form of paper currency than the goldsmiths' notes, together with a lowering of the rates of interest, charged in spite of the still existing laws against usury, still further the political necessities of the Gov. in the matter of loans, all these factors contributed to the demand for the establishment of a properly regulated bank, a banking system, and the end of the goldsmiths. Three private banks, Child's, Martin's, and Hoare's, which later carried on business in London were descended from firms of goldsmiths mentioned in the *London Directory* of 1677. Smith's Bank at Nottingham claims to have been founded in 1688: it was later amalgamated with the Union of London Bank, under the style of the Union of London and Smith's Bank. Other early banks, now amalgamated with other firms, are the Bristol Old Bank, 1750, and the Hull Old Bank, 1754. The proposal for the foundation of the Bank of England (*q.v.*) came from William Paterson (*q.v.*), Michael Godfrey, and other London merchants in 1691. The actual foundation took place in 1694, by Act of Parliament, the charter being granted on July 27 for 12 years, to 'The Governor and Company of the Bank of England.' The restoration of the coinage, the attempt to found a rival land bank, and the Gov.'s pressing need for money, led to the extension of the bank's privileges and capital by the Acts of 1697 and 1709, especially in the

strengthening of its monopoly, and interest was reduced to 6 per cent. No bank whose members consisted of more than 6 was allowed in England to borrow or take up money on its bills or notes payable on demand. This was thought to be sufficient protection against competition, as at that time no bank could, it was supposed, do business without the power of issuing notes. No joint-stock banks were, in fact, founded. In 1722 the bank's reserve, called the 'rest,' was estab. In 1750 the rate of interest on the debt was converted to 3 per cent, the debt to the bank amounting then to over £11,000,000, and in 1751 the bank was given the administration and management of the national debt, which it holds to the present day. Further renewals of the charter were made in 1764 and 1781. In 1795 the first issue of 25 notes was made, and later, for a short period, £1 notes. In 1797 cash payments were suspended by the Bank Restriction Act, owing to the general drain of gold and financial strain of the war; the bank's notes were thus made practically legal tender. The Bullion Committee Report was issued in 1810 and rejected by Parliament, and cash payments were not resumed till 1821. The overissue of notes by the small country private banks, and the constant failures, led to the Act of 1826, which allowed joint-stock banks, *i.e.* of any number of partners, and with the power of issuing notes; but they were not allowed in London or within a 65-m. radius. No notes were henceforth, until the First World War, allowed in England below £5. In 1833 joint-stock banks without note issue were allowed within the 65-m. radius; it may be noticed that the use of cheques had by this time begun to act as substitutes for notes. Finally, the Bank of England notes were made legal tender. In 1844 came Peel's great Bank Charter Act. The main features of this Act, as regulating the bank's position at the present day, have been already given. The Act also confined the right of note issue to those banks which possessed the right before 1844; as each lapsed or became absorbed, the limit of the Bank of England was to the extent of two-thirds of the lapsed issue expanded. The note-issuing powers of Eng. banks is of little importance at the present day, and the Bank of England note is practically the only circulating note in England. In 1862 companies with liability limited to the amount of their shares were allowed, and in 1879 unlimited companies formed before the Act of 1862 were allowed to adopt limited liability. Practically all the joint-stock banks availed themselves of this Act.

The nineteenth century in England was not without its times of crisis in banking. Since the Bank Act of 1844 there have been 4 banking panics and 1 financial crisis; the first, that of 1847, was the result of the speculation in railways and a hazardous extension of credit. On Oct. 1 all advances on public securities were stopped, and the bank rate was 8 per cent at the end of the month, when the coin

and bullion reserve at the Bank of England fell to a little over £1,500,000. The Bank Act was suspended on the 25th, and though no notes above the limit were issued, the panic ceased, but there had been serious failures of banks in Liverpool, Manchester, Nottingham, and the W. of England. Over-expansion of credit and a great depletion of banking reserves led to the panic of 1857, which continued even after the Bank Act was suspended on Nov. 12. On this occasion notes in excess of the limit were issued amounting to nearly £1,000,000, and the panic did not cease till the beginning of 1858. In 1866 the panic was marked by the historic failure of Overend, Gurney & Co.; it is stated that £4,000,000 in gold and notes was withdrawn from the Bank of England in one day; the rate was raised to 10 per cent and the reserve fell to less than £500,000. The Bank Act was suspended, but no excess issue actually took place. The failure of the W. of England Bank in 1878 caused great distress, but there was no general panic. In 1890 the failure of the great financial house of Baring (see *BARING*, family) resulted in a serious crisis. It must be remembered that London became the centre of the money markets of the world, and consequently had to bear an international as well as a national strain. This fact was marked in the New York and Amer. panic of 1907 and 1908, when the necessary gold importation to the U.S.A. was conducted through London.

Banking during the First World War. At the outbreak of the First World War the financial situation was fraught with difficulties for the authorities in London. The system of credit was so delicate that a move in the wrong direction might throw the whole machinery out of gear. England was still the great creditor nation, most of the world's bill transactions being liquidated in London. The estimate of Great Britain's trade with the belligerent nations in Europe could be put at over £2000 millions. An indication of the trend of events was given towards the end of July 1914, when the Ger. banks, in order to increase their cash reserves, began selling their securities in London. This caused some alarm and the London Stock Exchange was closed on July 29. Germany's selling activities were transferred to the U.S.A., and the New York Stock Exchange was closed on July 31. When the war began there was a run on the banks, the reserve at the Bank of England falling to £10 million. The bank rate rose to 10 per cent. The Gov. took immediate action. The banks were closed from Aug. 1 to 4, and it was decreed that there should be a moratorium for bills falling due. This was a beneficial measure. To husband the nation's gold and to keep it concentrated at the Bank of England, arrangements were made to issue £1 and 10s. currency notes. These were made legal tender for any amount and were issued on a fiduciary basis. The issue of these notes was tantamount to the suspension of the Bank Act. The Bank of England decided to lend money

to the banks to enable them to meet calls which might be made upon them while the excitement lasted. By this timely decision confidence was restored. Bank deposits rose immediately by £100,000,000 and the Bank of England deposits rose from £46,000,000 to £219,000,000. A Foreign Debt Committee was appointed to make advances to Brit. export traders against debts due to them from abroad. Advances of 50 per cent of the amount outstanding were made. A 6 months' bill was drawn by the trader upon his banker and accepted by him. The bill was left with the banker as cover for a loan of the amount required. The bill was renewable from time to time until 12 months after the close of the war. Any loss that might occur was distributed in the proportion of 75 per cent as to the exchequer and 25 per cent as to the accepting bank. As the bulk of foreign trade finance was carried on by means of bills of exchange, the Gov. decided that it would be as well to let these instruments function as freely as possible. A scheme was therefore drawn up which set forth that: (1) the Bank of England would provide, when required by acceptors, the funds necessary to pay all approved promissory bills at maturity; (2) acceptors would be under obligation to collect from clients all funds due to them, such funds to go towards repayment of advances; (3) the Bank of England would not claim repayment of any amounts not recovered by acceptors for a period of 1 year after the close of the war; (4) the joint-stock banks, in order to induce new business, would arrange with the co-operation, if necessary, of the Bank of England and the Gov. to advance the amounts required by clients to pay their acceptances at maturity. It is a creditable reflection on the quality of the business done by Brit. finance houses to note that the advances made by the Bank of England against bills of exchange were duly paid off. The foregoing were the chief measures adopted to meet the financial exigencies created at home by the war. Gold disappeared from circulation, its place being taken by treasury notes. These were partly covered by gold and partly by Bank of England notes and securities. Small notes had been issued by the Irish and Scottish banks for many years, and these banks were allowed to exceed their fixed issue limits of pre-war time. It is interesting to note that the paper currency issued during the war was greater in face value than all the gold and silver produced since the discovery of America (1492).

The foreign exchanges were greatly disturbed during this period. This will be at once apparent when it is remembered that the usual method of paying for imports by exports had been so deranged. The excess of imports over exports for 1914 was approximately £450 million, and this had to be liquidated. Matters were eased by loans raised in New York and credits arranged by the banks. As was natural, where the shipment of gold was restricted the old pars of exchange disappeared, and the par between.

London and New York fell from 4.85 to 3.74.

Post-1918 Problems. From the closing years of the First World War the history of banking must not be treated as abnormal, but as the evolving of new methods and means by bankers to meet conditions which had changed and were rapidly changing. The gold standard was restored in 1925, in accordance with a recommendation of the Cunliffe Commission of 1918. A Treasury minute of Dec. 15, 1919, imposed a limit known as the Cunliffe limit on the issue of treasury notes and laid down that the uncovered note circulation in any year must not exceed the maximum uncovered circulation of the previous year. The policy of deflation carried out by the Gov. in the following year checked the depreciation of sterling in relation to the dollar which had taken place as soon as the wartime control of the exchange rate was removed in 1919. When the pound and the dollar were near their former parity the Gold Standard Act of 1925 was passed whereby the Bank of England was again under an obligation to sell gold at the former price. The Bank was not, however, obliged to redeem bank notes and treasury notes in gold coin. In 1928 the Bank assumed control of the treasury note issue under the Currency and Bank Notes Act of the year. Bank notes of a pound and ten shillings were issued gradually to replace treasury notes. The amount of permissible fiduciary issue was accordingly raised to £260,000,000 and by the Currency and Bank Notes Act of 1939 it was raised again to £300,000,000. The fiduciary issue continues to be governed by these two Acts. The Treasury may, however, authorize a temporary increase by means of a minute laid before Parliament if requested by the Bank of England to do so. As shown below, this occurred during the years which followed, and by the end of the Second World War the fiduciary note issue stood at £1,350,000,000.

In 1931 it became clear that Britain could not maintain the gold standard. A financial crisis of the first magnitude had been precipitated (following a world depression), largely through the mismanagement of gold by the U.S.A. and France. That was not the sole cause of the crisis, for Brit. policy in 1925 was misconceived, though none could have foreseen the subsequent developments. That policy implied, besides co-operative policies in other countries, certain adjustments in the economic structure which in fact could not be made. Eventually, in 1931, in order to support the exchange, Britain was reduced to borrowing £130,000,000 in dollars and francs. But though the budget was balanced and the foreign drain on funds ceased for a time, there was a renewed outbreak of panic and another sudden drain of foreign funds. Faced with the prospect of parting with the rest of its gold reserves, the Bank of England gave up the struggle, and, for the second time since the war, Great Britain was forced off the gold standard. The Gold

Standard (Amendment) Act was passed on Sept. 21, 1931, and the Bank's obligation to sell gold was suspended.

For some years previous to the First World War the process of amalgamation of banks had been going steadily on. The advent of the war hastened it considerably, and in 1918 there emerged the joint-stock banks known as the Big Five (Barclay's Bank, Lloyd's Bank, Midland Bank, National Provincial Bank, and Westminster Bank). These five banks control current and deposit accounts to a combined total averaging over £1,700,000,000. A Treasury Committee appointed in 1918 decided that no further amalgamations without the approval of the Gov. would be allowed, and that the Treasury and Board of Trade must give their consent before more absorptions could take place. In Nov. 1929 the Securities Management Trust was registered. This is a subsidiary of the Bank of England, and its object is to examine with a view to assistance schemes for the 'rationalisation' of Brit. industry. In Apr. 1930 the Bankers' Industrial Development Company was registered. This company has a nominal capital of £6 million, divided into 45 'A' shares and 15 'B' shares of £100,000 each. The 'A' shares were taken up by the banks and first-class issuing houses, while the 'B' shares were subscribed by Securities Management Trust. As the 'B' shares have 3 times the voting rights of the 'A' shares, the Bank of England controlled 50 per cent of the voting strength. The purpose of this company was to advise and assist definite industries or sections of a particular industry in their preparation of reorganisation schemes, so that they could assume a form which could be recommended by the company to the City.

Financial and Monetary Policy in Second World War. There was no crisis on the outbreak of the Second World War, for experience in the First World War had taught what emergency measures were desirable in the way of financial and monetary policy. Yet there was nothing in the powers of the Gov. taken under the Finance Bill of 1940 over persons and property which endangered money in any bank. Equally there was nothing to endanger savings in any way. Indeed the figure of small savings in savings certificates, defence bonds, and in the increase in balances in the savings banks since the beginning of the war amounted to more than £180,000,000 and the weekly figure for these savings averaged over £5,000,000. Immediately on the outbreak of war the Currency (Defence) Act was passed to amend the law with respect to the application and financing of the Exchange Equalisation Account. The Gov. announced on Sept. 6, 1939, that the gold reserve in the issue dept. of the Bank of England had been transferred to the exchange equalisation account as part of the general plan put into operation for the strengthening of the nation's financial resources abroad. The value of the gold transferred (at 168s. per oz.) was about £275,000,000, and this entailed a corresponding increase in the fiduciary note

issue of the Bank of England from £300,000,000 to £580,000,000. On Sept. 5 the price of gold had been fixed at 168s. per oz., by the Bank of England, and the sterling-dollar rate at 4-04 dollars, and these prices were maintained subsequently. In pursuit of the Gov.'s policy of maintaining the purchasing power of sterling it was arranged that the vast bulk of transactions between sterling and other currencies should be conducted in London at official rates.

At the outbreak of war the Gov. assumed complete control over international issues to which the money belonging to Brit. subjects might be put, but at first the Gov. left the foreigner or person living outside the sterling area free to dispose of his assets, in England or elsewhere. But in June 1940 stricter control over the sale in the United Kingdom of securities by persons not resident within the sterling area was enforced by Orders in Council. Exchange regulations were issued by the Treasury with the object of placing the greater part of Brit. foreign trade on the basis of the official exchange rates, by tightening the exchange control and still further restricting the scope of the free sterling markets. A Treasury Order prohibiting dealings in foreign securities without Treasury permission was pub. on Aug. 27, 1939, under powers conferred by the Emergency (Defence) Act, 1939. Owners of such securities were directed to make a return of their holdings to the Bank of England. Steps were also taken early in 1940 for the control of retail prices in the case of primary necessities. There was early a system of food and industrial controls which were designed to avoid the vicious spiral of rising costs and prices and, to meet the problem of inflation through increased purchasing power, a substantial part of the surplus purchasing power of the public was withheld through the instrument of taxation. This was done in order to concentrate on the war effort as large a part as possible of the nation's productive resources, while at the same time satisfying the essential needs of the civil pop. and maintaining an adequate export trade.

An Order in Council of August 14, 1945, further extended the period during which the Treasury might authorise increases in the fiduciary note issue by Treasury Minute to be laid before Parliament for the life of the Emergency Powers (Defence) Act, 1945 (which expired six months after the end of the war). In Aug. 1941 the 2-year period originally provided was extended to 4 years, and in Aug. 1943 to 6 years, this authority expiring Sept. 5, 1945. Between Dec. 31, 1939, and Dec. 10, 1946, the fiduciary note issue rose from £580,000,000 to £1,450,000,000. All the profits of the note issue are passed on to the Exchequer.

See bibliography under BANK OF ENGLAND, and H. T. Easton, *History and Principles of Banks and Banking*, 1924; T. E. Gregory, *Select Statutes, Documents and Reports relating to British Banking, 1832-1928*, 1929; F. Lavington, *The English Capital Market*, 1934; R. Trupill,

British Banks and the Money Market, 1936; L. Waight, *The History and Mechanism of the Exchange Equalisation Account*, 1939.

Banking in Scotland. The Bank of Scotland was founded in 1695 by Act of Parliament. It issued notes of £100 to £5, and in 1704 £1 notes. In 1727 a rival bank, the Royal Bank of Scotland, was granted a charter, and in 1746 the Brit. Linen Bank. The private local banks ceased to exist by 1844, and Scotland shows an example of a small number of large banks with a highly developed system of branches, the number of offices to pop. being very high. The use of notes in business transactions is very great. The Act of 1844 fixed a limit to the issue of notes, beyond which the banks must hold specie; the banks of issue, now 8 in number, carry on the whole business of the country. Scottish banking hist. is marked by the disastrous failures of the W. Bank of Scotland, 1857, which failed for nearly £3,000,000, and the City of Glasgow Bank, 1878, which resulted in a total loss of over £6,000,000. Both these were unlimited liability companies. The Scottish banks, in addition, to those named, are the Commercial, National, Union, N. of Scotland, and Clydesdale Banks. See A. W. Kerr, *Scottish Banking*.

Banking in Ireland. The Irish banks have been conducted generally on the same principles as those in Scotland. Most of those which were estab. in 1844 are still in existence—an indication of the stability of banking in Ireland. But the assistance given in much more recent times by the existing banks to the general prosperity of Ireland has been equally marked. The Bank of Ireland was estab. in Dublin in 1783. Considerable privileges were granted to it, for, after 1820, no bank with more than 6 partners was permitted to issue notes within a radius of 50 m. from Dublin; but after 1845 this restriction was removed, and arrangements for the circulation of notes is now virtually the same as those in force in Scotland. There are 9 prin. banks in Ireland, 6 of which have the power of circulation. Their combined deposits total over £250,000,000 (1946). The Central Bank of Eire has the sole right in that country of issuing legal tender notes, and token coinage is issued by the finance minister through the bank. The Central Bank, which was estab. as from Feb. 1, 1943, in accordance with an Act of 1942, replaced the Currency Commission which was set up under the Currency Act, 1927, and had been responsible *inter alia* for the regulation of the note issue. On the dissolution of the Currency Commission its paid-up capital was returned to the shareholding banks.

Banking in France. In 1716 the celebrated John Law estab. the first bank of issue, Banque Générale, in 1718 the Banque Royale, the king guaranteeing the notes. It ceased to exist in 1721. Banks with limited issues carried on business, and there were attempts to reconstruct Law's bank. It was not till 1800 that Napoleon founded the Banque de France;

at first its note issue was shared with departmental banks, which, however, were amalgamated with it in 1848, and it became the sole issuing bank in the country. It has now over 400 branches, and does an enormous business in discounting bills and making advances. Its deposit business is not so large. The specie reserves of the bank are very high, reaching before the Second World War £140,000,000 in gold and £40,000,000 in silver, against a note circulation of nearly £200,000,000. In 1930 the gold reserve of the Banque de France was phenomenal, being the second highest in the world, the U.S.A. occupying the first place. The note issue is limited by law, but as long as the limit is not exceeded, it has not to hold any specific quantity of bullion against it. The bank can, to protect its gold reserve, pay notes in silver; the bank rate is therefore very steady. The governor and the 2 deputy-governors are appointed by the State. Other large banks in France include the Comptoir d'Escompte, 1848; Crédit Lyonnais, 1863; Société Générale . . . du Commerce, 1864; the Crédit Foncier, 1852, chiefly deals in mortgages. There are a large number of provincial joint-stock banks. The hoarding of gold in Fr. banks had a direct effect on the world financial crisis of 1931. By the middle of that year France had accumulated a stock of about £470,000,000 of gold which, added to the £1,000,000,000 in America, meant three-quarters of the world supply of monetary gold. This was the prin. cause—through the appreciation of the metal—of the catastrophic fall in prices that lay at the root of that crisis. On Dec. 2, 1945, a law was passed to nationalise the Banque de France and the 4 prin. deposit Bs.: Crédit Lyonnais, Société Générale, Comptoir National d'Escompte, and the Banque National pour le Commerce et l'Industrie. It also instituted strict gov. control over the activities of all other Bs. and set up a new body, the National Credit Council, to check the flow of credit in France.

Banking in Germany (1939). The Imperial Bank of Germany (Reichsbank) received its constitution in 1875; the Bank of Prussia was merged with it in 1876. It was closely controlled by the Gov.; the Chancellor appointed the president and council, and a proportion of its profits went to the State. The right of uncovered note issue is limited by law, frequently extended, but the bank is permitted to exceed the limit repayment of 5 per cent on the surplus. The Banks of Saxony, Bavaria, Württemberg, and Baden also possess the right of uncovered note issue, but the amount is small in comparison with that of the Reichsbank. An important feature is the 'clearing' system (*Giro Verkehr*) of the Reichsbank; a debt to a customer of the bank can be paid by paying the money at any of the numerous branches; it will be without charge transferred to the credit of his account. It amounts to a money-order business without expense, and serves as a substitute for cheques, which are not used to the same extent as in England. The private

and joint-stock banks in Germany are chiefly engaged in financing the country's trade and industries, and important banks, such as the Deutsche Bank (q.v.), took a prominent place before the Second World War in foreign and international finances. The Ger. banks are led by the 'Four D Banks'—from the initial letter of their names—viz. the Deutsche, the Discontogesellschaft, the Dresdner, and the Darmstadter. Since the end of the Second World War the banks in the Soviet zone of Germany have been nationalised.

Banking in the U.S.A. The Bank of N. America was founded by Congress in 1781, and obtained a charter from the state of Pennsylvania in 1782. It continued business till 1863. A federal bank of the U.S.A. was incorporated in 1791; its charter was not renewed in 1811, but owing to the financial straits of the various state banks, a second bank of the U.S.A. was estab. in 1816; it ceased in 1841. The state banks were regulated by varying legislation, and exchange naturally rose and fell according to the financial position of the different states. The close of the Civil war brought with it the necessity for some uniform system, and the national banks were estab. in 1865. The special feature of this system is the issue of notes secured upon U.S.A. bonds deposited with the treasury at Washington. No other banks have the right to issue notes, which, though not legal tender, are payable for all purposes except customs duties. National banks are bound to keep reserves up to 25 per cent of their deposits in the 'reserve' cities; in smaller centres this is reduced to 15 per cent. There are over 6000 national banks in the U.S.A. State banks, private banks, and the trust companies, which are, practically speaking, banks, are not thus restricted. During the panic of 1893, 150 national banks suspended payment; the panic of 1907 resulted in a suspension of all payments in currency. A change was made in the Amer. banking system by the Federal Reserve Act, which was approved on Dec. 23, 1913. The financial crises of 1893 and 1907 had indicated that some change was desirable and the Federal Reserve Act was framed to remedy certain defects which had become apparent in the national banking system. These were: (1) lack of concentration of banking reserves; (2) want of elasticity in the system of note issue; (3) absence of proper facilities for expanding credit in periods of pressure.

The Act divided the U.S.A. into 12 regional dists., in a tn. of each of which a federal reserve bank was estab. The 12 tns. so distinguished were: Boston, New York, Philadelphia, Cleveland, Richmond, Atlanta, Chicago, St. Louis, Minneapolis, Kansas City, Missouri, Dallas, San Francisco.

The management of each federal reserve bank is vested in a board of directors of 9 members. Three of these are chosen directly by member banks from their own ranks and 3 from outsiders engaged in commerce, agriculture, or some other

industrial pursuit. The remaining 3 are appointed by the Federal Reserve Board. One of the latter is appointed chairman, and to him is entrusted the custody of the securities presented by the bank as the basis of note issue. At the head of the system is the Federal Reserve Board, consisting of 7 members, 2 of whom, the secretary of the treasury and the comptroller of the currency, serve *ex officio*. Federal reserve banks are empowered to receive deposits from member banks and from the Federal Gov. only, becoming thus bankers' banks. They are excluded from competing with existing banks for the deposits of individuals and corporations, but they may enter the open market to deal in bills of exchange, etc. The Federal Reserve Board is responsible for the general policy of the system, prescribing regulations for member banks and determining from time to time the rate of discount. The chief specific powers granted to the board are: (1) to issue a weekly statement of condition of each federal reserve bank and a consolidated statement for all such banks; (2) to permit federal reserve banks to rediscount the discounted paper of other federal reserve banks, at rates of interest to be fixed by the Federal Reserve Board; (3) to suspend for a period not exceeding 30 days, and from time to time to renew such suspension for periods not exceeding 15 days, any reserve requirement specified by the Act; (4) to supervise the issue and withdrawal of federal reserve notes, provided for by the Act.

The capital of the federal reserve banks was to be provided from the subscription by each national bank of an amount equal to 6 per cent of its combined capital and surplus. Three per cent of this was to be paid up within a short time and the remaining 3 per cent at the discretion of the Federal Reserve Board.

A powerful factor of the new plan was the facility afforded by the issue of notes for the granting of credit through the rediscount of commercial paper. Good commercial paper may be presented for rediscount to a federal reserve bank by any of its member banks. Should there be a demand for currency, the rediscount may take the form of notes of the federal reserve bank, whose sole restriction in the making of rediscounts is its command over the requisite amount of gold laid down by law in respect of its own reserves. A federal reserve bank to which notes have been issued is required to pay 'such rate of interest on said amount as may be established by the Federal Reserve Board.' The following provision is made in regard to note issue: 'federal reserve notes to be issued at the direction of the Federal Reserve Board for the purpose of making advances to federal reserve banks through the federal reserve agents, as hereinafter set forth and for no other purpose, are hereby authorised.' These notes by the language of the law are 'obligations of the United States,' and are receivable by all national and member banks and federal reserve banks, and for all taxes, customs, and other public dues.

In the U.S.A. in 1930 there were over 2000 bank failures owing to the recession in business in 1929, and the gravity of the situation demanded a general reorganisation of Amer. banking institutions. The epidemic of failures of small banks in the depression of that and succeeding years changed Amer. public opinion in the direction of branch banking. In the U.S.A. there are 3 varieties of banks—national, state member, and state non-member—and reserves are held in different proportions against different types of deposits in different kinds of banks in various geographical localities. The position is further complicated by extensive interbank deposits and by Gov. deposits (all with their varying reserve regulations); so that a given change in the total reserves of the system may have different results on the supply of money in different circumstances.

Amer. banking is in the unique position of not having to worry about the adequacy of its reserves. 'Traditionally all bankers everywhere and always shape their policies with the double purpose of conducting their affairs profitably and of safeguarding their reserve positions. Amer. bankers have their full share of problems that are related to the extraction of profits from the business that they transact, but they alone among the bankers of the world must worry lest their reserves become too huge' (Leonard Ayres).

Reserve requirements of Amer. banks that are members of the Federal Reserve System are now much greater than they used to be in the years before the great depression (see above), but even so their excess reserves over and above the legal requirements have reached the huge total of \$4,000,000,000 (about £851,064,000). That excess is much more than the total of the entire stock of money in the United Kingdom at the beginning of the First World War. The chief cause of the piling up of these great excess reserves has been the gold imports of the past 54 years, which have amounted to more than \$8,000,000,000 (£1,702,128,000). The total holdings of gold owned by the U.S.A. amount to over \$15,000,000,000 (£3,191,489,000), which is about 60 per cent of the publicly reported gold stocks of the world.

See W. G. Summer, *A History of Banking in the U.S.A.*, 1896; J. J. Knox, *A History of Banking in the U.S.A.*, 1900; Lauchlin Currie, *The Supply and Control of Money in the United States*, 1934.

Banking in Australia and New Zealand. Under an Act passed in 1939 the Gov. of New Zealand has complete control of the Reserve Bank of New Zealand. The minister of finance is empowered to vary or suspend the minimum reserve of 25 per cent; and power is given to revalue the gold coin and bullion held by the bank on the basis of the market value of fine gold and to transfer any profit so obtained to a special reserve account. In Australia the governor in 1942 announced far-reaching measures to control the

operation of trading banks and to prevent expansion of credit by the banks, in accordance with recommendations of the Royal Commission on the Monetary and Banking System.

Banksia, or honeysuckle-tree, is a genus of shrubs and trees of the order Proteaceæ, which are native to Australia and receive their name from Sir Joseph Banks. They grow in sandy forest land or on rocks, and the flowers secrete a delicious honey; they do not produce good timber, but are cultivated in England for the dense heads of flowers. *B. compar* and *B. serrata* are tall trees, and *B. grandis* reaches a height of 50 ft.

Banksia, a dist. of Southwark, London, on the S. side of the Thames, notable as the vicinity of the famous Globe Theatre (1599) of Shakespeare's time. Other theatres of former times were the Rose (1587), Swan (1595), and Hope (1613) theatres, and there were also a bear-baiting and a bull-baiting ring.

Banks Islands, a group of is. N. of the New Hebrides, in the Pacific. There are 17 in all, the most important being Vanua Lava and Santa Maria. Pop. 5000.

Bankura: 1. Dist. of W. Bengal, India. Area 2621 sq. m. Pop. 1,100,000 (mostly Hindus). 2. Chief tn. of foregoing, 90 m. N.W. of Calcutta, on the R. Dhakisor. Silk and oil manufs. and trade in rice and cotton seeds. Pop. 26,000.

Bann, name of 2 rvs. in the N. of Ireland, known respectively as the Upper and Lower B. The Upper B., 25 m. long, rises in the Mourne Mts. and flows N.W. into Lough Neagh. The Lower B., 40 m. long, issues from the N.W. corner of the same lough and flows N.N.W. through Lough Beg into the Atlantic, 4 m. S.W. of Portrush, dividing the cos. of Antrim and Londonderry.

Bannatyne Club, literary club founded in Edinburgh in 1823 by Sir Walter Scott and other Scottish antiquaries, notably David Laing, of the Signet Library, the club's first and only secretary, and Archibald Constable. It derived its name from George Bannatyne (1545-1609), the collector of the Scottish poetry of the fifteenth and early sixteenth centuries. The club was formed for the printing of rare works relating to Scottish hist., literature, and antiquities. It was dissolved in 1861. Sir Walter Scott was the first president. During its career the club was responsible

for the printing of 116 works, some of which are much sought after by collectors.

Banner, see FLAG.

Banneret, a higher rank of Eng. knight-hood conferred for distinguished conduct on the field of battle. Part of the impressive ceremony consisted in the changing of the knight's pennon for a banner. The last knight B. proper was Sir John Smith, who received the dignity from Charles I. for bravery at the battle of Edgehill.

Bannermann, Sir Henry Campbell, see CAMPBELL BANNERMANN.

Bannock (Gaelic *bannach*, a cake), a round cake, common in Scotland, made of pease or barley meal, or a mixture of the two. A mashlum B. is one made of mixed meal. It is baked on an iron plate known as a girdle.

Bannockburn (Gaelic, the stream of the white knoll), tn. of Stirlingshire, Scotland, on the Bannock Burn, 3 m. S.E. of Stirling, the scene of the great battle, fought on June 24, 1314, in which 30,000 Scots under Robert Bruce inflicted a crushing defeat on 100,000 Eng. under Edward II. The victory was largely due to Bruce's device of undermining the front of his position with pits covered with turf and rushes, into which the Eng. cavalry were precipitated in helpless confusion. The Eng. are said to have lost 30,000 men. The 'Bore Stone' is still shown on which Bruce is reputed to have set up his standard. (See J. E. Shearer, *Fact and Fiction in the Story of Bannockburn*, 1909.) B. is to-day a thriving place, with manufs. of tweeds, tartans, and carpets, and other industries. Pop. 4000.

Banns, see under MARRIAGE.

Banquette, in fortification, is a step formed of earth at the foot of the interior slope of a parapet (q.v.), extending along its whole length except where intervals are left for placing artillery to fire through the embrasures. Its height allows soldiers to fire over it, while it affords them almost complete protection.

Banshee, in Irish and W. Highland folklore a guardian female fairy that by shrieks and wailings foretells the death of a member of the family over whose fortunes she watches.

Banstead, a vil. of Surrey, England, E. of Epsom, 14 m. from London, and near which are the commons known as the B. Downs.

Banswara, state in the S.W. of Rajputana, India; area, 1606 sq. m.; pop. (1941), 259,000. The cap. B. is situated 8 m. W. of the Mahi R.; pop. 9000.

Bant, com. of Oldenburg, Germany, in the dist. of Jever, near Wilhelmshaven; pop. 16,000.

Bantam, seaport of Java, 40 m. W. of Batavia, situated in, and at one time the seat of gov. of, the residency of the same name. The residency has an area of 3050 sq. m. and a pop. of over 900,000.

Bantam Fowl (*Gallus bankira*), ornamental variety of domestic fowl noted for its small size, silky appearance, and pugnacious disposition. It came originally from the E. It weighs little over a pound, and has fluffy legs; the hens are

good layers, the flesh is good, and the eggs are of a delicate flavour.

Bantayan, is. of the Visayas group, Philippines, 60 m. from the tn. of Cebu. Area about 40 sq. m. It has pearl fisheries. Pop. 20,000.

Banteng (*Bos sondaicus*), species of wild ox, found in the Malay peninsula and archipelago. It resembles the gaur (*Bos gaurus*) of India, but it is of a lighter build, has a longer, sharper head, and more rounded horns. Like the gaur, it has no dewlap. The cow is bright dun in colour, with white legs and short hair. The back rises to a hump behind the neck. The B. inhabits jungles and forests, and is very ferocious. It has, however, sometimes been tamed by the Malays and interbred with the zebu.

Banting, Sir Frederick Grant (1891-1941), Canadian scientist, the discoverer of insulin. Professor of medical research at the univ. of Toronto, where a special institute was built for him. Born at Alliston, Ontario, and educated in the schools of that town and at Toronto Univ., where he graduated in medicine. Served in First World War for 3 years; wounded at Cambrai; obtained Military Cross. In 1923, with J. J. R. Macleod—who had directed his and C. H. Best's investigations, at Toronto Univ., into the internal secretions of the pancreas, 1921-22—he was awarded the Nobel prize for medicine; these investigations having resulted in the discovery of the 'hormone' insulin, claimed to be a cure for diabetes. In 1930 Lord Moynehan, president of the Royal College of Surgeons, in London, went to Canada to preside at the opening of the B. Institute, in Toronto Univ. At the demonstration in honour of B., medical men from all parts of the Brit. Empire took part. When the Second World War broke out, 1939, B. joined the Canadian Army and was appointed director of a Canadian military hospital in England; but he was recalled to Canada to take charge of medical research in connection with air fighting. He met his death in a plane accident when, with others, he was travelling between Newfoundland and Canada. The world owes him a great debt of gratitude for his discovery, which, when first announced, was not unnaturally received with some incredulity. The results obtained, however, soon placed the efficacy of his remedy beyond doubt, and the Canadian Gov. took the unusual step of voting him a life policy to enable him to continue his medical research.

Important progress in the study of *diabetes mellitus* was made in the seventeenth century by Thomas Willis and, a century later, by Dobson, while late in the nineteenth century, Claude Bernard, von Mering, and Minkowski made further progress in that their combined observations suggested that extracts made from pancreatic glands must contain some principle which prevented the accumulation of an excessive amount of sugar in the blood. B. thought that the reason why effective extracts could not be obtained was that the secretion produced by the pancreas

contained a substance which could destroy the anti-diabetic principle. It was evident that the pancreatic extract must be secured in such a way that it was free from this destructive substance. B. conceived that this could be done by ligating, or tying up, the duct and allowing time for certain cells in the pancreas to degenerate. This was the crucial idea, though much scientific assistance was needed to make it fruitful. Macleod arranged that C. H. Best should collaborate with B. on the chemical preparation and physiological testing of the extracts and, on Jan. 23, 1922, insulin was injected into a human patient, a boy of 14 years of age, with brilliant results. Thus did a scientific achievement, centring on a single experiment, lead to the most important results for human welfare. See S. Harris, *Banting's Miracle*, 1947.

Banting System, diet treatment advocated for the reduction of fat. The cure was first proposed by Harvey, and was practised by William B. (1797-1878), an undertaker, of St. James' Street, London. At the age of 66, and scaling over 14 stone, he denied himself bread, butter, milk, sugar, beer, soup, potatoes, and beans, and took in their stead meat, fish, and dry toast. By this treatment he reduced his weight by over 3 stone and his girth round the waist by 12½ in. B. wrote a pamphlet on the subject, entitled, *A Letter on Corpulence, addressed to the Public*, 1863, which ran into many eds.

Bantock, Sir Granville (1868-1946), Eng. musical composer, b. London, son of George Granville B., M.D. He was trained at the Royal Academy of Music. Ed. *New Quarterly Musical Review*, 1893-1896. Toured America and Australia conducting for Gaety Theatre touring company, 1894-95. Director, School of Music, Birmingham and Midland Institute, from 1900, and later prof. of music at Birmingham Univ. until 1934 when he was made chairman of the Corporation of Trinity College, London. He wrote a number of songs, orchestral music, and much choral music, including choral symphonies (without orchestra), such as *Atalanta in Calydon* and *Vanity of Vanities*. His symphonies include the *Hebridean Symphony* for orchestra. He was knighted in 1930. Life by H. Osmond Anderson.

Bantry, seaport and tourist resort, Co. Cork, Eire, at the head of B. Bay, 50 m. W.S.W. of Cork. It has fisheries and textile manufs. The chief export is agric. produce. B. Bay, 25 m. long and 4-6 m. broad, affords fine anchorage. Here was fought the battle of B. Bay between the Fr. fleet sent to help James II. after his deposition and the Eng. fleet under Adm. Herbert, in which engagement the Fr. gained the advantage. Pop. 3000.

Bantu, term embracing the African peoples speaking the languages of the B. group. They are distributed over S., S.W., and S.E. Africa, and include the Matebele and Mashonas in Rhodesia, the Zulus of Natal, the Bechuans (Basutos,

etc.), the Damaras in the S.W., and further N. the Swahili. They are to be distinguished from the Negroes of the Sudan to the N., and the Hottentots and Negritos in the S. The B. races came originally from N. and Central Africa. The word Bantu (people) was first used in its present ethnographical sense by Max Müller. Ethnographically, the B. customs and beliefs are interesting. The religious beliefs of the Kikuyu and Uhamba tribes usually consist of a rudimentary conception of some high god, corresponding in some ways to the old Heb. concept of Jahveh. The tribal elders are supposed to have a clear conception of it, but in the popular mind a belief in ancestral spirits—*ngoma* or *ainmu*—is the predominant spiritual factor. These spirits are not necessarily evil, but they reflect the character of the persons from whom they are believed to emanate, and the powers of spirits are inextricably interwoven with the position of the person in the tribe. This explains why an ordinary person is cast out at death, while the elder, who has taken part in sacrificial ceremonies, receives burial, the burial being regarded as pleasing to the spirit. Tabu is widespread, and though the reason for many of the prohibitions is obvious, as in the case of taboos respecting pregnant women, that of others is very obscure. Charms are widely believed, and many of the them are of the character of sympathetic magic, while others are a kind of perpetual prayer. Charms against infection are also common, and of course extend beyond the B. races. The Kambu myth concerning the creation is very vague: the first man is said to have been produced by the god Engai out of an ant-hill on the sea coast; and this B. Adam is referred to as *imuuma ndi*, i.e. 'he who came out of the earth.' An important factor in the social life of the B. is the formal initiation into the tribe, of which the external sign or symbol is generally the ceremony of circumcision. Among the Kikuyu these rites have reached an elaborate stage, notably in the celebration of circumcision feasts. Dances, especially in connection with ripening crops, also form an important feature of tribal custom. With the Kikuyu tribe, the *kiwata*, danced when the *mauvele* grain is reaped, is one of the best known. The dancers, entirely nude, are ornamented with headdresses of ostrich feathers, and have strings of beads and bells hung about their bodies, while their faces and legs are coloured with bright yellow dye. Other favourite B. dances are the *nguru*, associated with rest and leisure, and the *muzogo*, which is danced on the ripening of the maize crop.

Consult especially C. W. Hobley, *Bantu Beliefs and Magic* (a monograph full of information for the student of savage thought and institutions), 1922. See also S. M. Molema, *The Bantu, Past and Present*, 1920; J. T. Brown, *Among the Bantu Nomads*, 1926; A. M. Duggan Cronin, *The Bantu Tribes of South Africa*, 1929; J. H. Soga, *The South-*

Eastern Bantu, 1930; R. E. Phillips, *The Bantu are coming: Phases of South Africa's Race Problem*, 1930. For the B. language consult A. C. Madan, *An Outline Grammar as an aid in the study of Bantu and kindred languages*, 1904; and the same author's *An Outline Dictionary of the Bantu and other Uncivilised Races*, 1905; Sir H. H. Johnston, *A Comparative Study of Bantu and Semi-Bantu Languages*, 1919; A. Werner, *The Bantu Languages*, 1919.

Bantwa, state in the prov. of Gujarat, India. Area, 208 sq. m. The chief tn., B., is 80 m. N.W. of Diu. Pop. 9000.

Banville, Théodore Faullain de (1823-1891), Fr. poet, novelist, and playwright, was a native of Moulins. His first vol. of verse, *Les Cariatides*, 1842, stamped him as a romantic, and was followed by *Les Stalactites*, 1846; *Odelettes*, 1856; *Odes funambulesques*, 1857; *Nouvelles Odes funambulesques*, 1869, and *Idylles prussiennes*, 1871, this last inspired by the Franco-Ger. war. His *Traité de Poesie Française* is a valuable work on Fr. versification, of which he proved such a dexterous master. His delightful handling of ballades, rondeaux, and other medieval forms of verse was the starting-point of a notable revival in that kind of poetry. His play, *Gringoire* (Eng. title, *The Ballad-monger*, trans. by W. Pollock and Sir W. Besant), has been played in England by Sir Herbert Beerbohm Tree. See his *Mes Souvenirs*, 1882; also J. Charpentier, *Théodore de Banville*, Paris, 1925.

Banyan Tree (*Ficus indica*), species of Moraceae, an order which includes the mulberry, fig, and india-rubber tree. The B. is a sacred tree in India. It grows on an erect plant, and its roots hang downwards like thick supporting pillars. It often covers much space and grows to a great height. Gum-lac and caoutchouc are produced from the B., and the bark is used in Hindu medicine.

Banyuls-sur-Mer, Mediterranean watering-place and fishing vil., dept. of Pyrénées-Orientales, France, 21 m. S.E. of Perpignan by rail. The bathing attracts many visitors. Pop. 3500.

Banyumas, tn., Java, on the Serajo, 170 m. S.E. of Batavia. It is the cap. of the residency of the same name. Pop. 10,000. The residency has an area of 2140 sq. m., and a pop. of 1,300,000.

Banyuwangi, seaport tn., E. coast of Java, cap. of dist. of same name. Pop. 16,000.

Banz, tn. situated in Bavaria, S. Germany, nearly 4 m. S.W. from Lichtenfels, on the R. Main. Specially noted for its fine castle, which originally was used as a monastery for the Benedictine monks.

Baobab (*Adamsonia digitata*), species of Bombacaceae found in Africa and Australia. It is one of the largest trees known, having an enormous trunk, sometimes 30 ft. thick. Various parts of the plant have different uses, the bark having a strong fibre and being the chief ingredient of a febrifuge, the fruit (called monkey-bread) consisting of a pleasant though acid

pulp and a juice which makes a cooling beverage, the leaves being of use medicinally and for food.

BAOBAB MONKEY FRUIT

Bapaume, tn. in the dept. of Pas-de-Calais, France, 12 m. S. of Arras. On Jan. 2 and 3, 1871, it was the scene of 2 fierce engagements between the Fr. and Gers., the former suffering a loss of over 2000 men. Being on the route to Paris from Belgium, B. suffered during the First World War from shell-fire and other forms of devastation. In Aug. 1914 the Gers. defeated the Fr. here and captured the tn. During the battle of the Somme in 1916 it was a position of some importance, and fierce fighting took place between the Gers. and Brit., but the latter captured and held it, in spite of vigorous counter-attacks, on Aug. 20, 1916. Later it again fell into Ger. hands, to be captured again by an Australian div., when the Gers. retreated to the Hindenburg line in Mar. 1917. On this occasion, however, they sacked and ruined the place before withdrawing. It fell once more to the Gers. in their offensive of Mar. 1918, only to be retaken finally by the New Zealanders on Aug. 29, 1918. Pop. about 2700.

Baphomet, name of a mysterious idol with 2 heads, male and female, which the Templars were accused of worshipping in secret with licentious rites. The word is a medieval form of Mahomet.

Bapta, genus of lepidopterous insects of the family Geometridae. The species are among the thin-bodied, day-flying, delicate moths with large wings. *B. bimaculata* and *B. punctata* are both found near London; the former is white with 2 brown spots on the front edge of the anterior wings, while the latter has the tips of its anterior wings clouded with brown.

Baptanodon, ichthyosaurian both amphibious and toothless, found in the Jurassic system of Wyoming. This fish-like reptile was from 9 to 11 ft. in length.

Baptism (from the Gk. βαπτισμός, sig-

nifying a ceremonial washing or purification), sacrament of the Christian Church. The Christian Church refers it to the authority of Christ, who commanded its administration as part of His teaching. Many references may be found to it in the books of the N.T. The idea of a purification by washing with water, however, did not originate with the Christian Church. The Christians themselves recognised that this ceremony had formed an essential part of the religions of many of the ancients. A controversy has long been in existence as to whether the sacrament of B. should be conferred only on adults who could profess their faith, or whether the sacrament could also be conferred on the children of Christians before they were able to answer and profess for themselves. The practice of the apostolic and early Christian Church was confined principally to the B. of adults, but probably this was due to the fact that the greater number of converts were adult proselytes from Judaism or heathen worship. The arguments brought to bear in favour of infant B. were principally that children had always occupied before the Christian era a recognised place in the Church, and that the new dispensation did not abolish that position. Also that from the words of Christ Himself it was obvious that children occupied a position in the Christian Church, and that B. of infants would occupy the same position as the rite of circumcision had in the Jewish ritual. On the other hand, it was argued that there was no definite command or statement that infant B. should take place, and great emphasis was laid on the fact that the apostolic B. was confined almost entirely to adults, the age at which most Bs. took place being about 30. In many cases it was much later, this being due to the desire to leave little scope for the commission of sin after B. It was sometimes deferred until death was felt to be near. The case of the Emperor Constantine may be taken as an example of this. Amongst the early fathers also there was considerable difference in the opinions expressed on the question of infant B. However, by the second century it had crept into a fair part of the Christian Church, and by the fifth century was an established doctrine of the Church. The Rom. Catholic and some of the Protestant churches recognise the rite of infant B., while, on the other hand, it was opposed by small sects during the pre-Reformation days and has been strongly opposed by a section of the Protestant Church since the Reformation. Another controversy ranged around the method employed in B. The methods adopted are 2, immersion and aspersion. From irrefutable evidence we know that the second method was adopted in the early days of the Church, but, on the other hand, from many authorities the advocates of immersion are able to claim that immersion is the only true B. Advocates of immersion are opponents of infant B., and while the upholders of aspersion recognise the validity of B. by immersion,

the immersionists do not as a rule recognise the validity of B. by aspersion. This controversy raged from the beginning of the Christian Church, and was one of the great separative forces in the quarrel between the E. and W. Churches. Although the W. Church ultimately adopted the ceremony of aspersion for a considerable time, B. by immersion was the general method throughout W. Europe.

W. F. Mansell

THE BAPTISTERY OF PISA

The rite of B. was accompanied in the early Church, and is still in the Rom. and oriental Churches, by a number of other ceremonies and forms. Most of these ceremonies, such as the signing of the cross on the infant's head, were rejected by the Protestant Church, but the latter was retained by the Church of England. Amongst some sects there still exists the ceremony of the B. of the dead. The ceremony of giving a name during B. apparently crept in from the Jewish use at the rite of circumcision.

Baptiste, Jean Baptiste Monnoyer (or Monoyer), see MONNOYER.

Baptiste, John Gaspar (d. 1691), Flemish painter, b. in Antwerp; a pupil of Bosch-aert. He came to England during the Civil war, and served in Lambert's army; but, after the Restoration, returned to his original profession, and was much employed by Sir Peter Lely in painting his draperies and backgrounds. He worked occasionally also for Kneller and Riley. He made designs for tapestries which reveal skill in drawing. There is a

portrait of Charles II. in St. Bartholomew's Hospital by this artist.

Baptistery, name given to the building in which Christians performed the ceremony of baptism. The most celebrated existing Bs. are those of Rome, Florence, and Pisa; the most anct. is the B. of S. Giovanni in Fonte, near the church of St. John Lateran at Rome, commonly said to have been erected by Constantine the Great. The plan of this building is an octagon, with a small portico at the entrance; the interior is decorated with 8 porphyry columns, the finest of the kind in Rome. The diameter of this structure is about 75 ft. The B. of Florence, which is octangular, with a diameter of about 100 ft., stands opposite the prin. entrance of the cathedral. The 3 bronze doors are celebrated for their bas-reliefs, and for the marble and bronze figures above them. The B. of Pisa, erected between the years 1152 and 1160 by Diotisalvi, is a singular design. The plan is circular, with a diameter of 116 ft.; the building is raised on 3 steps, and surmounted with a dome in the shape of a pear. The external elevation is divided into 3 stories.

The multiangular edifices placed at the sides of cathedrals, which are called chapter-houses, are very similar in plan to the anct. B. It is possible that they were originally used for that purpose.

Baptists, Christian denomination who differ from others in regard to the views which they hold concerning baptism. The distinctive view of the B. is that only believers should be baptised, and their method of baptism is by immersion. The modern B. distinguish themselves from the Anabaptists and reject any connection with them. They base their doctrines upon the teachings of the Apostles, maintaining that throughout the corruption of the Christian Church during the medieval period their doctrines were maintained by the Cathari and the Albigenses. The beginning of the modern B. Church, however, is traced to the work of John Smyth in the reign of James I. John Smyth was originally an ordained minister of the Eng. Church who broke away from that Church and fled to Holland. Here he fell under Mennonite teaching, and after severing his connection with the Independents, whom he had joined, he issued a confession of faith for the first Eng. B. church 'of Eng. people remaining in Amsterdam in Holland.' This declaration of faith laid down the 2 main doctrines of the B. Church, 'to receive all their members by baptism upon the confession of their faith and sins,' and that 'baptism in no wise appertaineth to infants.' Smyth d. in Holland, but his chief follower came to England in 1612, the year of Smyth's death, and estab. his church in Newgate. This was the origin of the 'General' B. denomination in Great Britain. The General B. denomination repudiated the Calvinistic doctrines, holding to the doctrines of the Arminians, and maintaining the doctrine of universal redemption. The beginning of the Particular B. Church in England may be traced to the

Jacob church in Southwark, and its foundation may be approximately dated as taking place in the year 1633. Of this Jacob church the famous Praise-God Barbon was a member. The Particular B. Church was the direct offshoot of the Independents, and was therefore naturally Calvinistic in doctrine. Both sections of the B. Church suffered persecution during the reign of Charles II., but the passing of the Toleration Act of 1689 gave liberty of worship and freedom from persecution to the B. together with other dissenters. The B. continued in this divided state for some very considerable time—the Arminian section, who held the doctrine of a general redemption, being known as the General B., and the Calvinistic section, who held the doctrine of a particular redemption, being known as the Particular B. A schism took place towards the end of the eighteenth century in the ranks of the General B., and a General B. New Connection was formed, the old connection being Unitarian. The names General and Particular B. gave rise to the impression that the General B. were those who admitted to their communion members who professed faith in Christ but did not agree with their views on baptism, and Particular as those who clung jealously to their own doctrines and refused admission. This idea, however, is entirely wrong, the names applied respectively to convey that idea being 'open B.' and 'strict B.' In 1891 the 2 sections of the B. were united into one body, known as the B. Union of Great Britain and Ireland. This union was due principally to the efforts of the Rev. John Clifford (*q.v.*). The method of church gov. is congregational, the officers of the church being the pastor, the deacons, and evangelists. Each church is self-governing, and is subject to no external pressure. The B. have a fine missionary association, and a number of colleges for the training of young men for the ministry. At the present day the B. have members in every part of the world in which white men are found. In the U.S.A. the first B. church was estab. at Providence, Narragansett Bay, by Roger Williams, in 1639. Another church was founded at Aquidnek, Rhode Is., 1641, and one at Newport, 1644. The Providence church did not flourish, but the Newport church increased its influence, and a branch was formed at Rehoboth, Massachusetts, 1649. The B. suffered persecution, but this only resulted in spreading the churches, and further branches were formed. The need of organisation was felt, and in 1707 the Philadelphia Association was formed 'to consult about such things as are wanting in the churches, and to set them in order.' At Charleston the Charleston Association was formed in 1751. A B. college was founded in 1764 (known since 1804 as Brown Univ.). By 1812 there were 173,972 members of B. churches in the U.S.A. B. are found chiefly in those countries where the Protestant form of Christianity predominates; thus they are numerically strongest in N. America and

in Great Britain. In the Brit. Isles there were (1944) 4100 chapels, and their members numbered 368,000. In U.S.A. the number of adherents is 8,262,000 (1936). B. churches were formed in the old Russian Empire about the middle of the last century, but suffered repression under the tsardom in the interests of the Orthodox Church. Statistics for 1931 give the following numbers of adherents in the Brit. Isles—England, 890,000; Wales, 410,000; and Scotland, 53,000. Elsewhere: Canada, 422,000; Australia, 90,000; New Zealand, 21,000; Union of S. Africa, 17,000; U.S.A., 8,440,000 (*The Church Self-Government Chronicle*, 1931). Prior to the Soviet regime there were probably 1,000,000 adherents in Russia. These figures give a world total of about 10,343,000, but later figures claim a communicant membership in 70 countries of over 13,000,000. There are, in the Brit. Isles, some 4000 B. chapels with a membership of about 400,000. In recent years, following the general trend of the Free Churches, the B. have tended to a broadening of their views and tenets. See H. C. Vedder, *A Short History of the Baptists*, London and Philadelphia, revised ed. 1897; W. T. Whitley, *Baptist Bibliography*, 1916; and *A History of British Baptists*, 1923; J. H. Rushbrooke, *The Baptist Movement in the Continent of Europe*, revised ed. 1923; A. C. Underwood, *A History of the English Baptists*, 1948; also *The Baptist Handbook*, ann.

Baptist World Alliance, formed in 1905 on the occasion of the first Baptist World Congress in London. Its object is to 'manifest the essential oneness in the Lord Jesus Christ and to promote the spirit of fellowship among the Baptist order and faith throughout the world.' The alliance has since organised sev. international congresses in the Old and New Worlds, the latest being that at Toronto, Canada, in 1928. In its *Directory* the alliance claims over 70,000 churches in 70 countries, with a total communicant membership of 13,000,000 (1946).

Baptist Young People's Union of America, federation of all Young People's societies connected with the Baptist churches in the U.S.A. and Canada, organised in 1891. It has a membership of over 175,000, and its headquarters are in Michigan Avenue, Chicago.

Bar, in law, term used to denote collectively those members of the legal profession who have the right to plead on behalf of suitors. It is also applied to the enclosed space in a court of justice where such members of the profession may plead, and to the prisoner's dock. A peremptory exception sufficient to stop a plaintiff's action either temporarily or permanently is also termed a B.

Bar, in heraldry, see **HERALDRY**.

Bar (formerly **Rov**), tn., Ukraine, 50 m. N.E. of Kamenets-Podolsk, on the Rov; an affluent of the Bug. Pop. 23,000, largely Jewish. See **BAR, CONFEDERATION OF THE**.

Bar Association, American, was formed in 1878, after the Civil war, at a time

when, as a consequence of that war, the course of judicial decision in the S. states had been affected in that the prominent positions both at the Bar and Bench being taken by N. and W. lawyers, and the S. jurisprudence had come to lose such distinctive character as it formerly had. The unification of Amer. law was assisted by the A. B. A., and of the 15 signatories of the call for the preliminary conference 5 came from the S. states. Its ann. meetings are opened by a presidential address in which are communicated 'the most noteworthy changes in statute law on points of general interest.' Its committee reports have had considerable influence in the shaping of the course of legislation, and it has improved legal education. Its membership, about 28,000, is representative of the whole Amer. B., and its ann. meetings are attended by as many as 2000 delegates. The headquarters of the A. B. A. are in La Salle Street, Chicago.

Bar, Confederation of the, confederation of Polish nobles, formed in 1768, at the fortress of Bar, in Podolia, for the purpose of defending Poland against the Russian Gov. After many victories it estab. a gov., and, ignoring the Polish king, sent envoys to the courts of Europe. It gradually lost power through the blunders of Dumouriez, sent by the court of Versailles to act as commander-in-chief, and dissolved in 1776.

Bar Council, or, more fully, the General Council of the Bar, is the accredited representative body of the Eng. Bar; its functions are to act in a consultative and advisory capacity, dealing with all matters affecting the profession, such as the proposal and criticism of legal reforms, matters of practice, conduct, etiquette, etc. The body consists of the attorney-general and solicitor-general for the time being, the ex-attorney- and solicitor-generals, together with 48 selected members of the Bar, not less than 12 'inner' barristers (king's counsel) and not less than 24 'outer' barristers (juniors). The General Council was estab. in 1895, and replaced the Bar Committee, estab. 1883.

Bar, Trial at, form of trial, in Eng. legal procedure, before a full bench of judges. It was the usual mode of trial prior to the writ of *nisi prius* (Statute of Westminster, 1285), and is now the only survival of the old procedure. Such a trial takes place in the king's bench div. before a bench of judges and only in cases of great importance, or when demanded on behalf of the Crown by the attorney-general. The trial of Col. Arthur Lynch for high treason, 1904, and the hearing of the petition of right, 1905, to decide the responsibility of the Brit. Gov. for claims against the Transvaal Republic for acts done by it before or during the S. African war, took place 'at B.' The last recorded T. at B. was that of Roger Casement for treason in 1916 (see CASEMENT, R. D.).

Barabanki, dist. in the United Provs., N. India. It is a marshy plain traversed by the Rs. Gogra and Gumti. Area about 1703 sq. m. The soil is fertile, and

wheat, rice, and grain are grown to a considerable extent. Pop. 1,100,000. The cap. is Nawabgunj, also known as B., which is 15 m. E. of Lucknow, and has a pop. of 15,000.

Barabbas, or Barabas (Aramaic, 'son of the father'), name of a robber mentioned in the N.T., who was released instead of Christ by Pontius Pilate at the desire of the Jews.

Baraboo, co. seat of Sauk co., Wisconsin, U.S.A., on the B. R., and on the Chicago and N.W. railroad, 37 m. N.W. of Madison. It is picturesquely situated 3 m. N. of Devil's Lake, 1000 ft. above the sea. It has woollen mills, railroad shops, and a fruit-canning factory, etc. Pop. 6000.

Barabra, see BERABERA.

Baracoa, seaport at the E. end of Cuba. The cap. of the is. from 1512 to 1514, it is now the centre of the banana and coconut export trade. Pop. 5000.

Baraguay-d'Hilliers, Achille, Comte (1795-1878), Fr. marshal, son of Louis B. d'H., b. at Paris; was a soldier almost from childhood; had his left hand carried away by a cannon-ball at the battle of Leipzig. He took part in the Sp. and Algerian campaigns, and was promoted to the rank of lieutenant-general. He commanded the Baltic expedition, took Bomarsund in 1854, and won the battle of Melejana in 1859.

Baraguay-d'Hilliers, Louis (1764-1812), Fr. general, b. at Paris. He served under Crestine, and was arrested with him, but re-entered the army and distinguished himself under Bonaparte in Italy. He took part in the ill-fated Russian campaign, and having been made prisoner, when released was ordered by Napoleon to return under arrest. He d. at Berlin on his way back.

Barahat, formerly cap. of the state of Garwhal, situated on the N.W. bank of the Bhagirathi R., United Provs., India. This tn. suffered very severely in 1803 from an earthquake; it recovered something of its former importance owing to the numerous pilgrims who used it as a starting point for the sacred source of the Ganges.

Barahona de Soto, Luis (c. 1535-95), Sp. poet, whom Cervantes praises highly in *Don Quixote*. He wrote a continuation of Ariosto's *Orlando Furioso*, the first part of which bears the title *The Tears of Angelica*. He also wrote satires, eclogues, epistles, etc.

Baralippton, see SYLLOGISM.

Baralong Case, incident in the First World War. The Brit. armed auxiliary B., disguised as a tramp steamer, sank a Ger. U-boat which had torpedoed the *Nicosian*, an Amer. boat carrying cattlemen. The crew of the U-boat were killed, Aug. 1915. The Ger. Gov. declined the offer of the U.S.A. Gov. to submit the case to a tribunal of Amer. officers, and threatened ruthless Zeppelin warfare in retaliation, Dec. 1915.

Baranov, Baranof, or Sitka Is., is in the Alexander Archipelago, Alaska, U.S.A. It is about 100 m. long, and its greatest breadth is 25 m. Coal and deposits of placer gold are found on it, and

there are fisheries along the coast. The cap. tn. is Sitka (q.v.), pop. 2000.

Barante, Guillaume Prosper Bruglière, Baron de (1782-1866), Fr. historian and politician, b. at Riom. He was the author of a hist. of the Burgundian dukes, as a result of which he was elected a member of the Fr. Academy. See his *Souvenirs* (1890-99), ed. by his grandson.

Barasat, tn. in W. Bengal, 12 m. from Calcutta; pop. 10,000.

Baras Khotun, or **Bars Khotan**, the City of the Tigers, formerly a large tn. on the banks of the Kherlon, in the country of the Mongols; the ruins of the tn. lie, according to Father Gerbillon, the only European who ever visited them, in 48° N. lat. and 113° 42' E. long. After the Moguls had been defeated and expelled from China, Toghon Timur, the Mogul emperor, built this tn. as the future seat of the empire; he d. there in 1370.

Baratang, see under ANDAMAN ISLANDS. **Barataria** (Sp. *barato*, cheap), a bay on the W. side of the Mississippi delta, which the notorious Jean Lafitte (1780-1826) and his band of pirates, smugglers, and slaves made their headquarters. Their band was broken up by Commander D. T. Patterson, of the U.S. Navy, 1815.

Baratier, Johann Philipp (1721-40), Ger. boy genius, b. at Schwabach, near Nuremberg, was the son of Francis B., pastor of the Fr. Protestant church at Schwabach. Before he was 5 years old he could speak Lat., Fr., and Ger., and could read Gk. At the age of 6 he began a 3 years' course of Heb. study, reading with great avidity the books of the Cabalists, Talmudists, commentators, etc. At 9 he collected materials for a dictionary of rare Heb. and Chaldaic words, with philological notes, and about 2 years later trans. into Fr. from the Heb. Benjamin of Tudela's *Itinerarium*, to which he added 8 dissertations. He took his M.A. at Halle at the age of 14 and was received into the Royal Academy at Berlin. He then studied law as a matter of duty, after which he turned to hist., philology, and antiquities. He began a *History of the Three Years War*, a *History of the Heresies of the Anti-Trinitarians*, and an *Inquiry concerning Egyptian Antiquities*, but he d. before he reached the age of 20. His life was written by Forney (Halle, 1741).

Baratieri, Oreste (1841-1901). It. general, b. at Condino, in the Tyrol. He served under Garibaldi in Sicily, 1860; was appointed governor of Eritrea, in Africa, 1891, where he adopted an aggressive policy, and, advancing into the interior, captured Kassala, 1894. In the following year he twice defeated Ras Mangasha, but was put to rout with great loss of life to his men by the army of Menelik near Adowa, 1896. He was tried before a court-martial and was censured, 1897; he left the army the same year, and pub. his defence, *Memorie d'Africa*, 1892-96 (1897).

Baratynski, Eugene Abramovitch (1792-1845), Russian poet. He at first entered the military service, but quitted the army in order to devote himself to poetry. He

was considered by his friend Pushkin to be the best elegiac poet of Russia. He d. at Naples.

Barava, see BRAVA.

Barb, name of a breed of bloodstock, reared by the Moors of Barbary and Morocco, and introduced by them into Spain. They are not remarkable for beauty or symmetry, but their speed, patience, and endurance are unrivalled. Probably nearly every Eng. racehorse of note has a strain of the blood of this animal. There has always been much controversy over the origin of the B. Prof. Ridgeway's view is that the anct. Libyan type of horse was the ancestor of the modern B. It seems certain that the Libyan horse of Lify's time is the ancestor of the Barbary horse found in its purest form in Morocco to-day. This animal is usually about 14 hands and resembles the Arab horse, except that it has a convex profile and a longer croup. In recent times Fr. and Eng. blood has been freely used in Algeria for crossing with the local Bs., and these have consequently lost their former type, except in Morocco. In Spain to-day the B. blood is predominant in Andalusia, Granada, and other S. regions. The usual colour of the Sp. Bs. (which are also influenced by the anct. Libyan B.) is bay, but there are greys and blacks. In N. Spain they are mostly grey and smaller than the Andalusian horses. There was formerly great controversy on the question of what the highly prized N. African blood in the Celtic pony really consisted, some believing it to be Arab, while others were of the opinion that it was the forerunner of the B. and not the Arab horse, that was crossed with the Celtic ponies of the Low Countries, and those of the cognate breed in S.E. England. It is, however, evident that it was not until many centuries later that an indisputably pure-bred Arabian horse reached England (1616). Shakespeare often refers to them, e.g. Iago mentions a 'Barbary horse' (*Othello*, i. i.), and Osric in *Hamlet* says that 'the king hath wagered six Barbary horses.' It is recorded that Henry VIII. received 2 pure-bred Sp. Bs. of good quality from Ferdinand of Aragon, and some writers assume that such horses laid the foundations, on the female side, for the thoroughbred stock which was to follow. Much controversy, too, existed as to whether the famous Godolphin, which came to England in 1724, was an Arab or a B. By whatever means the horse was obtained, it came eventually into the hands of Lord Godolphin, and became one of the three founders of Eng. bloodstock (the other 2 being the Byerly Turk and the Darley Arabian). The Godolphin was a dark bay, about 14-3 hands. Maj. Lamb thinks that the horse was a B. because he 'probably came from Morocco' and had 'a distinctly Barb appearance.' The strain of this great horse exercised much greater influence in earlier days than it does to-day, for the Darley Arabian is undoubtedly the ancestor of many more famous latter-day horses than is the Godolphin. On the other hand, other

writers, including Lady Wentworth, consider that the Godolphin was not a B. at all, but an Arabian, and that 'the only genuine and contemporary picture painted from life by Wootton shows him to be a high-class Arab.' See W. Ridgeway, *The Origin and Influence of the Thoroughbred Horse*, 1905; A. J. R. Lamb, *The Story of the Horse*, 1938; Lady Wentworth, *Thoroughbred Racing Stock and its Ancestry*, 1938.

Barbacan, see **BARBICAN**.

Barbacena, tn. in the state of Minas Geraes, Brazil, on the W. slope of the Serra Mantiqueira, 130 m. N.W. by N. of Rio de Janeiro. Elevation about 3700 ft. above the sea. Pop. 10,000.

Barbacoas, tn. in the dept. of Cauca, Colombia, 140 m. N. by E. of Jinto, on the Telembi, a trib. of the Patia, and navigable from the sea. Pop. 6000.

Barbados, or **Barbadoes**, the most easterly of the W. India Is.; it is 21 m. in length and 14 m. broad, and its total area is 166 sq. m. or rather larger than the Isle of Wight. Bridgetown is the cap., situated in lat. 130° 5' N. and long. 59° 41' W. The pop. of the Is. is about 200,000 or over 1100 to the sq. m. The Is. is of coral formation, and almost encircled by coral reefs which are dangerous to navigation. The surface is comparatively flat, but rises in terraces culminating in Mount Hillaby (1145 ft.). Much of the soil, though very fertile, has very little depth, and has been formed by successive eruptions of the Soufrière in St. Vincent (*q.v.*), the ashes of which, carried by an upper current of air for a great distance, fell as lately as 1902 over the Is. The first recorded fall was in May 1812, and is still spoken of as 'May dust.' B. has no natural harbour, but the open roadstead of Carlisle Bay is well sheltered and there is a small inner harbour of caracane protected by the mole-head. There are no rivers worthy of mention, the porous soil forming subterranean channels and wells which percolate to the sea below low-water mark. There are no forests. The Is. is very highly cultivated. Sugar is the staple product, nearly 70,000 ac. being devoted to sugar-cane cultivation, of which 40,000 ac. are under cane each year. The average ann. production of sugar and fancy molasses is equivalent to 100,000 tons of sugar. Other products are coffee, bananas, coco-nuts, cocon, and pimento. The Sea Is. cotton industry was revived in 1902, but to-day very little is grown. Like most W. Indian Is., B. suffered from the cane-sugar crisis that followed the increased production of subsidised beet sugar. Petroleum is known to exist and boring operations have been conducted in recent years though without much success. B. is the healthiest of all the W. Indian Is. for Europeans, and the great heat is moderated by the N.E. trade winds, particularly from Jan. to May. The temp. varies from 75° F. to 83° F., and in the winter months the minimum mean temp. at night is as low as 63° F. The ann. rainfall is from 50 to 70 in. Hurricanes and earthquakes occur. The Is. is much favoured by residents in neigh-

bouring colonies as a health resort. The Is. is divided into 11 Church of England parcs., and is the see of the bishop of the Windward Isles. There is a Supreme Court, and grand sessions are held every 4 months. There are over 500 m. of main and secondary roads, and 10,000 m. of telephone line. The governor has an executive council, executive committee, legislative council, and house of assembly, whose members are elected biennially by the people, but the number of coloured electors is not large. The old foundation made a liberal provision for education, which is supplemented by an ann. vote. B. is the only W. Indian Is. to make provision—in Codrington College—for a univ. education. B. is the trade mart for the Windward Is., which lie to the W., and is the headquarters of the Brit. forces of the W. Indies. The chief exports are sugar, fancy molasses, and rum. The imports are cotton goods, chemical manures, rice, dried fish, and machinery for sugar plant. Bridgetown (pop. 20,000) derives its name from an Indian bridge, which the first settlers found where the Chamberlain Bridge now is. Père Labat, the celebrated Dominican father, who visited the Is. in 1700, described the tn. as handsome, with straight, broad, clean, and well-planned streets. Trafalgar Square, formerly called the Green, has the second statue to be erected to the memory of Nelson in the Brit. Empire, the first having been unveiled in Montreal in 1808. The public buildings are an imposing group, built in post-It. renaissance style of locally hewn coral rock. St. Michael's Cathedral, also built of coral, stands to the E. of the public buildings, on the site of a building erected in the seventeenth century, which was destroyed in a hurricane in 1780, the cost of the new building being defrayed by a lottery sanctioned by the legislature. Another notable building is George Washington's House, the lodging which the Amer. statesman and his invalid brother occupied on their visit in 1751. St. Anne's Castle, a quaint fort facing the bay, was erected in 1703 by Sir Nevil Granville in honour of Queen Anne, Bathsheba, 14 m. from the cap., is a popular seaside resort. Long Bay or Lord's Castle, in the par. of St. Philip, is one of the finest mansions in the Caribbean. It was built in 1820 for one Samuel Hall Lord. Ragged Point, a lighthouse, 15 m. from the cap., is generally the first landmark sighted on approaching B. S. Point lighthouse (7 m. from the cap.), built of iron, also commands an extensive ocean view. Welchman's Hall Gully and Cole's Cove are among the well-known natural features of the Is. Other tns. are Speightstown (pronounced Spikestown), 12 m. from the cap. and formerly a shipping place of importance, which is said to be built on the lands of one William Speight, a member of Governor Hawley's assembly in 1639; and The Hole or Hole Town on the W. coast, in which is a tercentenary monument commemorating the landing of the party of the *Olive Blossom* in 1605.

Hist. B. is generally supposed to have been visited in 1536 by Portuguese navigators, who called it Los B., after the bearded fig-trees there. In 1605 settlers for Guiana, an Eng. party in the *Olive Blossom*, fitted out by Sir Oliph Leigh, landed near what is now Hole Town, and took possession in the name of King James of England. But there was no actual settlement till 20 years later, when a wealthy London merchant, Sir William Courteen (who tried also to settle Madagascar), equipped an expedition under the patronage of the earl of Marlborough. His ship landed a small band of settlers near the Hole Town site, and founded Jamestown or Hole Town. In 1625 the is. was included in the commission given to Sir Thomas Warner (see *SR. KITTS*), under the patronage of the earl of Carlisle who, later, had a grant from Charles I. of most of the Caribbean is. Naturally the earl of Marlborough opposed the grant, and a compromise was reached; but subsequently the earl of Pembroke succeeded in obtaining a grant of the is. Carlisle, however, returned to B. and, his rights having been restored, he lost no time in consolidating his position by offering land to speculators who founded St. Michael's Town, now Bridgetown. Eventually Carlisle's heir assigned his interest to Francis Lord Willoughby of Parham, who, however, while securing his own position under an Act of Parliament, acknowledged the king's right to dominion over the is. During the Civil war many royalist families fled to B. Cromwell sent a fleet under Adm. Sir George Ayscue to subjugate the is., and in 1652 Willoughby had to surrender the reins of gov. But on the Restoration Charles II. gave honours to many prominent Royalists in B., in recognition of their loyalty and defiance of Cromwell. Lord Willoughby agitated for the restoration of his rights, and in 1665 the Privy Council allocated the profits derived from the is. between him, the Gov., and the heirs of Marlborough and Carlisle. This involved raising a duty of 4½ per cent on all the is.'s exports, which cost the inhab. an enormous sum in the ensuing years, and in 1834 the is.'s legislature passed an Act remitting the duty which, however, was only finally repealed in 1838 by an Act of the Imperial Parliament.

See Sir Robert H. Schomburgk, *History of Barbados*, 1848; H. Darnell Davis, *Cavaliers and Roundheads in Barbados* (Georgetown), 1887; V. Harlow, *History of Barbados*, 1926, and *Christopher Codrington, 1668-1710*, 1928.

Barbados Cherry, fruit of the *Malpighia urens* and *M. glabra*, the latter resembling closely a cherry in size and appearance, but not in flavour. They are found in the W. Indies.

Barbados Gooseberry, fruit of the *Pereskia aculeata*, is an oval, yellow, edible fruit which grows on a W. Indian cactus. The plant on which it grows has thick, flat leaves with hard spines and the flowers are showy and white.

Barbados Leg, another name for *elephantiasis Arabum*.

Barbara, in formal logic, is the first word of a useful and ingenious set of mnemonic lines which form: a clue to the moods and their process of reduction in all the 4 figures. *Barbara* itself indicates that mood of the first figure which has all its propositions universal affirmatives. The lines are:

Barbara, Celarent, Darii, Ferioque prioris; Cesare, Camestres, Festino, Baroco, secundæ;

Tertia Darapti, Disamis, Datisi, Felapton,

Bocardo, Ferison, habet: quarta insuper addit

Bramantip, Camenes, Dimaris, Fesapo, Fresison.

The words printed in ordinary type are real Lat. words, signifying that 4 moods, whose artificial names are *Barbara, Celarent, Darii, and Ferio*, belong to the first figure; that 4 others belong to the second; 6 more to the third; while the fourth figure contains 6 moods. Each artificial name contains 3 vowels, which indicate the propositions forming a valid mood; thus *CELArent* signifies the mood of the first figure, which has E for a major premise, A for the minor, and E for the conclusion. The artificial words altogether contain exactly the combinations of vowels of the 24 valid moods selected out of the 44 possible ones. These mnemonic lines also contain indications of the mode in which each mood of the second, third, and fourth figures can be proved by *reduction* to a corresponding mood of the first figure. Logicians invented this curious system of artificial words at least 6 centuries ago. The device, however ingenious, is of a wholly unscientific character, but a knowledge of its construction and use has long been expected from the student of logic.

Barbara, St., saint of the Rom. Catholic Church, who suffered martyrdom at Nicomedia in Bithynia in 240 or 306. She was converted to Christianity, and her father on hearing this beheaded her. She is regarded as the patron saint of gunners and locksmiths. Festival day Dec. 4.

Barbarea, genus of perennial herbs of the order Cruciferae, which are found in Europe, Asia, and America. *B. vulgaris*, yellow rocket, winter cress, or herb St. Barbara, grows in Britain as a handsome border plant in gardens, and is used in spring salads. *B. præcox*, early winter cress, is common, to France, Britain, and N. America.

Barbarian (from Gk. *βάρβαρος*, Lat. *barbarus*), term applied by the anc. Gks. to peoples that did not speak the language of Greece. The word is probably onomatopoeic, since it represents the babble of a foreign tongue to the more highly cultured Gk. To the Gks. the whole world was divided into Hellenes and Bs. The Roms. were included by the Gks. in this general classification. At a later stage in the world's hist., when Rome had risen to power, the word was used to signify such peoples as did not

share the culture and civilisation of Rome. Gradually the word ceased to denote only a difference of tongue, and came to mean a difference of manners, customs, and culture. Thus the tribes and peoples outside the boundaries of the Rom. empire were known as the Bs., and they eventually encompassed the fall of Rome. In its present-day usage the word B. is applied almost exclusively with the meaning of lacking in culture and civilisation. Anything rough, savage, and uncouth is said to be barbaric, and the possessor of such qualities is held to be a B.

Barbarossa, see **FREDERICK I.**, Emperor of Germany (Holy Rom. Emperor).

Barbarossa, **Aroodje**, see **BARBAROSSA**, **HORUK**.

Barbarossa, **Horuk** and **Khair-ed-Din**, name of 2 Turkish corsairs who were the terror of the Mediterranean during the early part of the sixteenth century. **Horuk**, or **Aroodje** of **Orooch**, was b. at **Mitylene** c. 1474. He served the emir of **Tunis** and became commander of his fleet. In 1515 he took **Algiers**, but 3 years later the Arabs secured the help of Spain, and **Horuk** was defeated and slain by **Gen. Gomarez**, near **Oran**. The younger brother, **Khair-ed-Din**, took command, and with help from the Sultan **Solyman II.**, he captured **Algiers** (1519) and **Tunis** (1533). In 1536 he was appointed chief admiral of the Turkish fleet, and carried on his piracy up and down the Mediterranean, both on land and at sea, plundering **Port Mahon** (Minorca), the **Ionian Is.**, and **Dalmatia** and defeating the Christian powers in sev. sea-fights. He obtained victories over the fleet of Emperor **Charles V.** in the gulf of **Arta** (1538), near **Crete** (1540), and off **Algiers** (1541). In 1543 he gave his aid to the Fr. in the capture of **Nice**, and made a triumphal return to **Constantinople**, where he d. in 1546.

Barbaroux, **Charles Jean Marie** (1767-1794), Fr. politician, b. at **Marseilles**. In his early years he studied the physical sciences, but his ardent nature caused him to throw in his lot with the revolutionary movement at its outset. He directed the movement in his native tn., and was sent to Paris to bear a complaint to the legislative council against the director of his dept. He was present on 'Aug. 10,' and added to the success of the day by bringing up a battalion of volunteers. He allied himself with the chief of the **Girondin** party, and on being elected as a member for the dept. of **Bouches-du-Rhône**, he sat with that party. He distinguished himself by his fanatical opposition to **Robespierre**. On June 2, 1793, he refused to submit, and went to Caen to organise the **Girondin** resistance there, but was obliged to flee before the troops of the convention. He reached **Bordeaux**, but was there overtaken and made prisoner, after an ineffectual attempt to shoot himself. He was guillotined on July 25, 1794.

Barbary, general name for the most northerly portion of Africa, from Egypt to the Atlantic, and from the N. frontier of the Sahara to the Mediterranean. It thus includes **Morocco**, **Fez**, **Algeria**,

Tunis, and **Tripoli**, together with **Barca** and **Fozza**. The name B. is derived from the name of its anct. inhab., usually called **Berbers** or **Kabyles**. In anct. times this part of Africa prospered under the dominion of **Carthage**. After the fall of **Carthage** it was under Rom. rule, had many flourishing cities, and was regarded as the prin. granary of Rome. After being overrun by the N. barbarians at the fall of Rome it was subdued by the **Saracens** and fl. under their rule as much as at any period of its hist. But the **Saracenic** gov. gradually became a prey to disorder and B. sank into a degraded condition. A number of Turks and renegades acquired it, and subjected it to brutal despotism. Since they could not compete with the European powers in war, they carried on an extensive system of marauding; and the 'B. pirates' were the terror of the merchants of the region. They were suppressed finally at the conquest of **Algiers** by the Fr. The occupants of B. are principally **Bedouins**, **Jews**, **Turks**, and the Fr. colonists in **Algeria**. For a fuller description of the climate, produce, etc., see the various countries comprised in the name B.

Barbary Ape (*Macacus inuus*), belonging to the family of **Primates**, **Cercopithecidæ**, the only monkey found alive in a wild state in Europe. It is tailless, an agile tree-climber, and feeds on fruit. It is a native of N. Africa and the **Rock of Gibraltar**.

Barbary Pirates, see **BERBERS**.

Barbastelle, species of bat, found in **England**, **France**, and **Germany**, with hairy cheeks and lips.

Barbastro, chief tn. of a fertile dist. of the same name, in the prov. of **Huesca**, in **Aragon**, Spain. It is situated on the **Vero**, which is crossed by stone bridges. B. is the seat of a bishop. Pop. 7000.

Barbauld, **Anna Laetitia** (1743-1825), Eng. poetess, b. at **Kibworth**, **Harcourt**, in **Leicestershire**; the daughter of **John Aikin**, D.D. Her first vol. of poems, met with success on its appearance in 1773. In 1774 she married the **Rev. Rochemont B.**, a Fr. Protestant whose family had settled in **England** in the time of **Louis XIV.** They removed to **Palgrave** in **Suffolk**, where Mrs. B. wrote her *Hymns in Prose for Children* (1781), her best work. Mr. B.'s mind, which had never been strongly balanced, gave way entirely, and he d. insane in 1808. Mrs. B. continued to live and work at **Stoke Newington** until her death. See **G. A. Ellis**, *A Memoir, Letters and a Selection from the Writings of Anna Laetitia Barbauld*, 1874.

Barbecue (Sp. *barbacoa*, from the **Haitian**), name given to a framework placed over a fire, on which was placed meat, etc., to be dried or smoked. Later the framework developed into a kind of gridiron on which whole animals could be roasted. In **Cuba** B. is used for the upper floor of a house, where grain, etc., is stored, and in the **U.S.A.** it is used to denote an open-air feast on a large scale.

Barbed, term used in heraldry for an arrow with a pointed or jagged head; also for the 5 green sepals which appear

between the 5 petals of the conventional heraldic rose.

Barbed Wire Act, 1893, Act which enables a local authority to serve notice in writing requiring the occupier of land adjoining a highway to abate the nuisance caused by barbed wire fencing if it be likely to cause injury to persons or animals lawfully using the highway. If he fail to abate the nuisance, a court of summary jurisdiction, on application by the local authority, may order him to do so, and on failure to comply, the authority may execute the order and recover the cost from the occupier.

Barbel (Lat. *barba*, beard), name applied to the genus of fish known as *Barbus*, of the family Cyprinidae, allied to the carp and gold-fish. It has 4 soft appendages from its mouth, and the third ray of the dorsal fin is long, bony, and serrated. It lives in fresh, usually muddy, water in Asia, Africa, and Europe. *B. vulgaris*, common to Europe, is a large, coarse fish, weighing 15 to 18 pounds.

Barbellion, W. N. P., pseudonym of **Bruce Frederick Cummings** (1889-1919), Eng. biologist and writer, b. and educated in Devonshire; son of a journalist. Began as an assistant at the Brit. Marine Biological Association's laboratory at Plymouth and, later, was appointed to the entomological dept. at the Brit. Museum. Suffered from ill health throughout his life in London, succumbing to sclerosis soon after being compelled to resign through illness. His *Journal of a Disappointed Man* (with preface by H. G. Wells), which was pub. shortly before his death, under the pseudonym of W. N. P. Barbellion, describes his early passion for natural hist. It received favourable comment on all sides, and although the circumstances of the author's death enhanced sympathy for his work, the fact remains that it is one of the great psychological revelations in Eng. autobiography. Posthumous works: *Enjoying Life and other Literary Remains* (1919); *A Last Diary* (1920).

Barber (Lat. *barba*, beard, through Middle Eng. and Anglo-Fr. *barbour*), one who is occupied in shaving, hair-dressing, and trimming the beard, etc. In former times the Bs. were joined with surgeons. In France the B.-surgeons were a distinct body under Louis XIV., and in England the Bs. were incorporated in 1461. They were united with the company of surgeons in the time of Henry VIII., and were allowed to let blood and to draw teeth; they were not separated from the surgeons until 1745. The fillet round the B.'s 'pole' signifies the ribbon which was bound round the arm before bleeding.

Barberini, It. family, originally from Florence, raised to a high rank among the Rom. nobility in consequence of the elevation of one of its members, Cardinal Maffeo Barberino, to the papal chair in 1623, when he assumed the name of Urban VIII. (*q.v.*). Urban had 3 nephews 2 of whom were made cardinals, and the third prefect of Rome, and they ultimately, after some vicissitudes, became possessed of the fief of Palestrina,

which had formerly belonged to the Colonna family. The B. have ever since ranked among the first Rom. nobility, sev. individuals of their name having been successively raised to the rank of cardinals, while the lay representative of the family bears the title of Rom. prince, and is possessed of estates at Palestrina, Albano, and in other parts of the Rom. state. In the palace of the B. at Palestrina is the celebrated mosaic taken out of the temple of Fortune at Praeneste. (*See PALESTRINA*.) The palace B. at Rome is a vast structure, built by Bernini, and gives its name to the square before it. It contains a museum, a gallery of paintings, and a library, which was collected by Cardinal Francis B., one of the nephews of Urban VIII. The library is rich in valuable MSS.; its catalogue was printed at Rome in 1681, in 3 vols. folio. There is also a fine villa, with extensive gardens, belonging to the same family, at Rome, near the Thermæ of Diocletian, and another in the neighbourhood of Albano.

Barberini Vase, *see* PORTLAND VASE.

Barberino di Mugello, tn. in Italy, 15 m. N. of Florence, on the Sieve. It manufs. straw hats. In the neighbourhood is the villa of Caffegiolo, the anct. residence of the Medici. Pop. of com., 13,000.

Barberry (*Berberis vulgaris*), species of Berberidaceæ which is frequently found in Britain. The leaves of the shoot appear as spines having in their axils dwarf shoots which bear foliage-leaves and flowers. The flowers grow on a long, pendent stalk; the berry is oval, and is sometimes made into jam. The presence of B. plants is productive of the fungus called rust which develops on grasses.

Barber-Surgeons, *see* SURGEONS, ROYAL COLLEGE OF.

Barberton, tn. in Ohio, U.S.A., founded in 1893 by Barber, president of the Diamond Match Company. It was known as the 'magic city' owing to its rapid growth. It manufs. matches, boilers, chemicals, porcelain, etc. Pop. 24,000.

Barberton, mining tn. of the Transvaal, situated 2830 ft. above sea-level on a side of the De Kaap valley. Gold was discovered in the De Kaap valley in 1886. It is connected by rail with the Lourenço Marques-Pretoria trunk railway. During the Boer war of 1899-1902 the Boers were driven out from here by Gen. French. Present white pop. about 1000; total pop. 24,000.

Barbet (Lat. *barbatus*, bearded), name applied to various birds of the families Capitonidae and Bucconidae common to tropical Africa, Asia, and America, because of the prominent stiff bristles about the mouth which assist them to catch insects. They are bright-coloured, and somewhat resemble the cuckoo in shape. Those of the Capitonidae and Bucconidae are known popularly as thick-heads and puff-birds respectively.

Barbette (Fr. dimin. of *barbe*), name given to the earthen terrace inside the parapet of a rampart, serving as a platform for cannon. This terrace has such an elevation that cannon can be fired over the parapet instead of through

embrasures, thus giving a larger scope. When guns are thus mounted, they are said to be mounted in barbette. In the naval sense a B. is an armoured breast-work, fixed at no great height, behind which the heavy armament of a ship is mounted. The guns fire over the breast-work in the same way as over a B. on land, and are mounted on turntables, whilst the after-ends are protected by armoured hoods. The B. superseded other methods of firing heavy guns on board ship; the *Téméraire* in 1876 was the first Brit. iron-clad to be furnished with Bs.

Valentine & Sons, Dundee
MICKLEGATE BAR, YORK

Barbey d'Aureville, Jules Amédée (1808-89), Fr. author, b. at Saint-Sauveur-le-Vicomte, France. In 1851 he went to Paris, where he helped to found *Le réveil*. Among his most brilliant novels are *Une Vieille Maitresse* (1851); *L'Ensorcelée* (1854); *Un Prêtre marié* (1865); and *Les Diaboliques* (short stories) (1874). See E. Grélot, *Jules Barbey d'Aureville: sa vie et son œuvre*, 1902.

Barbeyrac, Jean (1674-1729), Fr. jurist, b. at Béziers, of Calvinistic parents. He became teacher of the *belles-lettres* in the Fr. college at Berne, 1697-1711; appointed by the senate of Berne to the chair of law and hist. at the academy of Lausanne, 1711; prof. of law at the univ. of Groningen, 1717, where he d. He made his reputation with *Traité du Jeu* (first ed. 1709). His other works include a translation of Puffendorf's *Law of Nature and Nations*, 1712; a new version of Grotius's *De Jure Belli et Pacis* and *Histoire des Anciens Traités*.

Barbezieux, tn. in the dept. of Charente, France, 19 m. S.W. of Angoulême. There are manufs. of linen and hats. Wheat, oats, and rye are grown in the neighbourhood; the vine is cultivated, and the capons of B. are held in great repute. It is the anct. tn. of Barbesillum, once surrounded by walls and defended by a strong castle. The castle was destroyed by the Eng. in the wars of Guienne, and rebuilt by Rochefoucault, but has since been almost entirely demolished. B. was the bp. of Elias Vinet, a sixteenth-century antiquary and scholar. Pop. 4000.

Barbican, or **Barbacon**, in anct. fortification, usually a small round tower for the station of an advanced guard, placed just before the outward gate of the castle-yard, or ballium. In cities or tns. the B. was a watch-tower, placed at some important point of the circumvallation. It had sometimes a ditch and draw-bridge of its own. The street of London called B. received its appellation from its vicinity to a tower of this sort attached to the city wall. B. was a term likewise used for a hole in the wall of a city or castle, through which arrows and darts were cast out. It also signified a long narrow opening left in the walls to drain off the water from a terrace or platform.

Barbier, Antoine Alexandre (1765-1825), Fr. bibliographer, b. at Coulommiers. He was a member of the council for the preservation of scientific and artistic objects of value. He was instrumental in saving from destruction many collections of books, which had been stored after the suppression of various civil and eccles. establishments, and placing them in public libraries. He was librarian to Napoleon, and administrator of the Crown libraries until 1822.

Barbier, Henri Auguste (1805-82), Fr. poet, b. in Paris. He was a voluminous writer. The work by which he is best known is his *Jambes*, a series of satirical poems in which he paints the life of his time in a rugged, forcible style. Amongst his other works may be mentioned *Lazare*, dealing with the oppressed condition of the Eng. people, and *Il Pianto*, which is concerned with the misery of Italy. B. d. at Nice.

Barbier, Paul Jules (1825-1901), Fr. dramatic author, b. in Paris. He was first known as a poet. Later he wrote many dramas and comedies, often in collaboration with various other authors, and his first 2 pieces were played at the Comédie Française. His best work was, however, done as a librettist.

Barbieri, Francisco Asenjo (1823-94), Sp. musical composer, b. in Madrid. Was first a clarinet player in the National Militia. As a musicologist he conducted researches into anct. musical documents, especially the books of the *vihuelistas* (players of the old Sp. instrument, the *vihuela*) and the *cancioneros* (collections of songs of the fifteenth and sixteenth centuries), thereby reviving the hist. of Sp. music and liberating it from It. influence. Pub. annotated transcriptions of the so-called *Cancionero de Palacio* and *Cancionero musical de Barbieri* (1890),

and a pamphlet on the *Canto de Ulreja*—the pilgrimage chant annexed to the Codex of Calixtus (twelfth century). As composer, his comic operas *El Barberillo de Lavapiés* and *Pan y Toros* have the greatest significance for Sp. music. In them, by far his most important work, 'he saved from oblivion a treasure of rhythmic and melodic elements characteristic of the national folk-lore of the eighteenth century, thus laying the foundation of a distinctive national school' (Pedro Morales). Other comic operas are *El Diabolo Cojuelo*, *Triste Chactas*, *Gloria y Peluca*, *Los Carboneros*, *Un loro y una lechuga*.

Barbieri, Giovanni Francesco, see GUERCINO.

Barbirolli, John (b. 1899), Eng. conductor, b. in London, of It. and Fr. parentage. Educated at Royal Academy of Music. First public appearance as violoncello soloist at Queen's Hall, 1911; toured Brit. Isles and Europe as member of an international string quartet. Founded and conducted B. Chamber Orchestra, 1925. Joined Brit. National Opera Company as conductor, 1926. Conductor and music director of New York Philharmonic Symphony Orchestra, 1937-42. Conductor of Halle Orchestra, Manchester, since 1943. Has pub. sev. arrangements of old classical music.

Barbiton, name of a musical instrument in use among the ancients. It was a kind of lyre.

Barbizon, Fr. vil. near the forest of Fontainebleau, which gave its name to the Barbizon school of artists. This was an outcome of the conflict between the classical and romantic schools of painting which occupied the first half of the nineteenth century. In 1824 the pictures of Constable confirmed the rising generation of artists in their resolve to abandon the pedantry of the old school. The B. school discarded the 'subject' idea, and took nature herself as a guide. The struggle of the school to achieve recognition is the more remarkable, in view of the beauty of their pictures. The B. school includes Corot, Millet, Rousseau, Daubigny, etc.

Barbon, Praise-God, see BARBONE PARLIAMENT.

Barbou, name of a family of Fr. printers, who long rendered themselves famous for the correctness as well as elegance of the works which issued from their presses.

Jean B. the first of the name who is known, was settled at Lyons, where he printed the works of Clément Marot, 1539. His descendants continued to exercise their art for more than 2 centuries. Two brothers of the family settled at Paris, Jean-Joseph B. in 1704, and Joseph B. in 1717. Joseph Gérard B., nephew of the 2 Bs. last mentioned, became a bookseller in 1746, took the printing office of his uncle Joseph's widow in 1750, and soon afterwards engaged in the series of classics which bears his name.

Barbour, Sir David (1840-1928), Eng. financial expert. Was commissioner of paper currency for the Punjab, Madras,

and Bengal, and secretary to Evelyn Baring, later Lord Cromer, when the latter was finance member in India. Pub. his *Theory of Bimetallism* in 1885 as a contribution to the solution of India's financial condition. Represented the Indian Gov. on the royal commission of 1886 to investigate the relation of gold and silver. When he became finance member in India he abandoned his former advocacy of the double standard, and proceeded to set up the gold standard and to shut down the Indian mints. Also investigated the finances of the Orange R. Colony and of the Transvaal after the S. African war, 1903-5. Publications: *The Standard of Value*, 1912; *The Influence of the Gold Supply on Prices and Profits*, 1913.

Barbour, or Barber, John (c. 1316-95), Scottish poet. He took holy orders, and was promoted by King David II. to the archdeaconry of Aberdeen about the year 1356. He obtained permission from Edward III. to reside in Oxford for a time for the purpose of studying (1357), and similar permission to study and travel in England was granted in 1365 and 1368. In 1373 he was clerk of audit to the household of King Robert II. and in 1374 one of the auditors of the exchequer. His fame rests on *The Brus*, which he completed about 1376. It is an epic poem, written in octosyllabic verse, recording the adventures of Robert the Bruce and his companion, Sir James of Douglas. It is written with great spirit; the style is clear and simple and the language more 'modern' than that of his contemporaries. The Edinburgh ed. (1571) is the first printed copy extant. The best eds. are by Skeat (1870-79) (with corrections, 1893-94), and *Barbour's Bruce*, ed. by W. M. MacKenzie, 1909. *The Buik of Alexander* and the *Legenis of the Saints* are not now generally held to be his. See G. Neilson, *John Barbour, Poet and Translator*, 1900.

Barbuda, is. of the Brit. W. Indies, situated in 17° 33' N. and 61° 43' W. It is 62 sq. m. in area, and is a dependency of Antigua, being formerly in possession of the Codrington family. It is densely wooded, and has a lagoon on the W. side. Produces cotton, pepper, and charcoal, and exports phosphate of lime and salt. There is good tarpon and other fishing. Pop. 1000.

Barbusse, Henri (1874-1935), Fr. poet, novelist, etc., b. at Asnières, m. daughter of Catulle Mendès; in 1910, editor of *Je Sais Tout*. He served as an infantryman in the First World War, gaining the Croix de Guerre. After the war he joined the Communist party, and later became the editor of *L'Humanité*. In 1935 he pub. *Stalin*. His book *Le Feu* (1916) was awarded the Prix Goncourt in 1917. It described his war experiences, showing all the horrors of war. Other works: *Pleureuses* (poetry), 1895; *Les Suppliants*, 1903; *L'Enfer*, 1908; *Nous autres*, 1914; *Clarté*, 1918; *La Lueur dans l'abîme*, 1920; *Quelques coins du cœur*, 1921; *Les Enchantements*, 1925; *Manifeste aux intellectuels*, 1927.

Barby, tn. of Saxony, Germany, on the l. b. of the Elbe, 82 m. S.W. of Berlin. It has 2 churches and a seminary school, and there are sugar factories and breweries. Pop. 5000.

Barcarolle, song in the Venetian dialect, sung by the gondoliers at Venice and often composed by them. The airs are generally simple, but full of melody, and frequently have considerable refinement. Formerly most of the gondoliers knew by heart the greater portion of *Gerusalemme Liberata* of Tasso, and sang it in alternate stanzas. The old B. was

contrasting strongly with the factories and busy docks. Formerly the city was surrounded by a strong line of ramparts, but these were pulled down in 1845 because they impeded the natural development of the city. The ground which had been covered by the citadel was laid out in gardens. B. is divided into 2 parts, the old tn. and the new. The former, with its narrow irregular streets, forming a contrast to the wide streets and symmetry of the new tn. The main street of the old tn. is the Rambla, which has a fine avenue of plane-trees. The houses of the

BARCELONA

Paul Popper

Puerta de la Paz and the Avenue of the Ramblas.

sung in parts, at stem and stern of the same boat, by its own gondoliers. The term B. may also be used for an imitation of the song of a gondolier. The well-known airs *La Biondina in Gondoletta* and *O Pescator dell' Onde* are pleasing specimens of this species of song. Chopin's piano B. is also well known.

Barcellona, tn. in Sicily, in the prov. of Messina. It is situated in a broad plain between the mts. and the sea. It abounds in corn, oil, wine, and fruit, and has sulphur baths. It forms one tn. with Pozzo di Gotto, the combined pop. being about 30,610.

Barcelona, prin. manufacturing tn. and seaport of Spain in the prov. of B., formerly part of the prov. of Catalonia; situated on the Mediterranean Sea on a plain between the Rs. Besos on the N. and Llobregat on the S. The surrounding vegetation is of almost tropical luxuriance,

new tn. are chiefly in the modern Eng. style of architecture. The large suburb of Barceloneta lies to the E. Gracia, Las Cortes de Sarria, and Horta are the chief suburbs. B. has been the see of a bishop since 383 and contains many eccles. buildings. The cathedral, erected between the thirteenth and fifteenth centuries, is a fine example of Sp. Gothic architecture. It contains the tomb of Santa Eulalia, the patron saint of the city, and its stained-glass windows are among the finest in Spain. The univ., founded in 1430, was suppressed in 1741, but restored in 1841. There are also many schools and colleges of art, science, and medicine, libraries, hospitals, charitable institutions, and sev. theatres. The prin. manufs. are silk, woollens, cottons, lace, hardware. Its fabrics are much inferior to Eng. wares. The harbour is an excellent one, with a maximum depth of 36 ft. The pop. is

1,109,000 (1944). Area of prov. of B. is 2890 sq. m., and its pop. 1,980,000 (1944). B. is the headquarters of Catalan art and literature, and was the centre of revolutionary Carlist and republican movements, its inhab. being the most restless, though most progressive, of the Sp. people. Many interesting historical events are connected with B. It is said to have been rebuilt by Hamilcar Barca, father of the great Hannibal, about 233 B.C. It was held by the Romans, Goths, Moors, and Franks, and, with the prov. of which it is the cap., was made an independent country about A.D. 864, and incorporated with Aragon 1164, the last count becoming king. The city has suffered much by war and plague. The siege by the Fr. in 1794 was relieved by the approach of the Eng. fleet, commanded by Adm. Russell, but the city was taken by the earl of Peterborough in 1706. It was bombarded and taken by the duke of Berwick and the Fr. in 1714, and was taken by Napoleon in 1808 and retained until 1814. It revolted against the queen in 1841, and was bombarded and taken in Dec. 1842 by Espartero. Frequent insurrections have been raised here. An exhibition was opened by Alfonso XII. in Mar. 1877. In Mar. 1882 there were riots on account of the Fr. treaty, and Catalonia was in a state of sieze. In 1856 a Progressist rebellion caused much bloodshed, and in 1874 the Federalists raised an insurrection here. In 1916 there was again serious friction in B.; 7 years later the city was the scene of a general strike, which led to conflicts between the Syndicalists and the police; and in 1923 the prov. suffered a military revolt, and was for a time under martial law. A tube railway was opened in 1924. In 1924 King Alfonso visited the city, and, as an earnest of improved relations between Catalonia and Castile, was presented with a fine dwelling-place, the Pedralbes Palace, in the suburb of Sarria. In 1929 an international exhibition was opened at B. In 1931 a Catalan Republic was proclaimed, the Sp. Republican Gov. issuing a decree whereby the Catalan Gov. was given a free hand in the organisation of the 4 provs. forming Catalonia, which thus became autonomous in respect of its own domestic affairs. Many fine buildings and large areas of the city were destroyed in the bombing attacks from the air during the Sp. Civil war, 1936-39. The first of these raids by Gen. Franco's It. auxiliaries was on Jan. 30, hundreds of persons being killed. The city had, towards the close of 1937, replaced Valencia as the Republican Gov.'s cap., and, simultaneously, Franco blockaded the E. coast of Spain from his naval base at Palma in Majorca, thus accentuating the difficulties of the large pop. of the city. In Mar. 1938, concurrently with the Nationalists' rapid advance on the Aragon front, relays of their bombers attacked B. from the air, thousands of persons being killed and injured. Anglo-Fr. protests were sent in that month, and were apparently not without effect. The city held out bravely for many months under its volunteer forces formed from trade

unionists, Anarchists, and Socialists, who had composed their differences and mutual animosities in order to offer a more effective resistance; but in Jan. 1939, the Republican resistance in Catalonia collapsed and B. surrendered on Jan. 26, Franco entering in triumph on Feb. 21.

Barcelona, tn. and port of Venezuela, the cap. of state of Bermudez, 12 m. by rail from Guanta; has salt works and coal mines, and exports coffee, sugar, and cacao. Pop. 16,000.

Barchamps, Charles Melchior Artus, Marquis de (1760-93), Fr. Royalist leader in the revolt of La Vendée. He took part in the Amer. war of Independence. On his return to France he was made a captain of the Fr. grenadiers, and was in this service on the outbreak of the Revolution. Being a strong Royalist he returned to his château and remained in retirement until he was chosen a leader of the revolt in La Vendée. To his skill and judgment much of the success of the Vendéens was due. Dissensions broke out amongst them, and finally, at the sanguinary encounter between revolutionists and royalists at Cholet in 1793, B. was mortally wounded. He d. the next day, commanding with his dying breath that the republican prisoners whom his followers had sworn to massacre in revenge for his death should be spared.

Barokhausia, **Barkhausia**, or **Borkhausia** (after Moritz Borkhausen, a Ger. who pub. a botanical work in 1790), name of a genus of Compositæ which has 2 wild (besides an introduced species, *B. setosa*) species in Britain. *B. taraxaci folia* and *B. foetida* have yellow flowers; the former grows in limestone dists. and the latter in chalky places. *B. setosa* is a native of Germany.

Barclay, **Alexander** (c. 1475-1552), poet, b. probably in Scotland, and of Scottish birth, although most of his life was spent in England: chaplain of the college of Ottery St. Mary, Devon, later a monk at Ely and Canterbury, and the rector of All Hallows, Lombard Street, London. His place in literature rests on *The Ship of Fools of the Worlde* (1509), an adaptation in Chaucerian verse of Sebastian Brant's *Narren schiff* (1494), a satire of the social vices of the age. His other works are the *Egloges* (c. 1513 or 1514), the earliest Eng. pastoral, *The Myrrour of Good Manners* (1523), and a translation of Sallust's *Jugurtha*, together with other translations. See T. H. Jamieson (ed.), *The Ship of Fools*, 2 vols., 1874; J. W. Fairholt (ed.), *The Citizen and Uplandishman* (5th eclogue), 1847; *The Myrrour of Good Manners*, Spenser Society reprint, 1885; A. Popen, *The English Versions of the Ship of Fools*, 1925.

Barclay, **Florence Louisa** (1862-1921), Eng. novelist, b. at Limsfield, Surrey; daughter of the Rev. Samuel B. Charlesworth, rector of that par. In 1881 she married the Rev. Charles Wright B., vicar of Little Amwell, Herts; she d. at Limsfield, 1909. Her works include: *The Rosary*, 1909; *The Following of the Star*, 1911; *The Mistress of Shenstone*, 1911; *Through the Postern Gate*, 1912; *The Broken*

Halo, 1913; *The Wall of Partition*, 1914; *Returned Empty*, 1920.

Barclay, John (1582-1621), Scottish writer, *b.* in France, son of William B. (*q.v.*). He came to London with his father and pub. a satire in Lat. on the Jesuits, *Euphormionis Lusini Satyricon*, 2 parts, 1603-07, and *Icon Animorum*, 1614. He subsequently was reconciled to Catholicism. He *d.* in Rome. His popular political romance, *Argenis*, also written in Lat., was pub. posthumously. See Jules Dugas, *Satyricon*, Paris, 1880; Dupond, *L'Argenis de Barclay*, Paris, 1875.

Barclay, John (1734-98), Scottish divine, was educated at St. Andrews and became assistant minister at Fettercairn, 1765. His opinions offended the Presbytery, which was supported by the General Assembly, and B. left the Church and founded the sect of the Bereans (*q.v.*). See memoir in collected works by Thomson and Macmillan, 1852.

Barclay, John (1758-1826), Scottish surgeon, nephew of the founder of the Bereans, *b.* in Perthshire; studied medicine at St. Andrews and Edinburgh; M.D. 1776. In 1806 he was lecturer in anatomy to the College of Surgeons. He pub. anatomical works, and was a pioneer of the movement for establishing surgical and pathological museums.

Barclay, Robert (1648-90), Scottish theologian, *b.* at Gordonstown, Morayshire. His father, Col. David B. of Ury, had served under Gustavus Adolphus. Robert was educated at the Scots College, Paris. Joining the Quaker society with his father in 1666, he was a strong controversialist with opponents, and suffered persecution. His *Apology for the True Christian Divinity* (Lat. 1676, Eng. 1678) is still a standard work of Quaker doctrine. He travelled with Penn and Fox, and was made nominal governor of the Quaker settlement of E. New Jersey by James II., 1682. He *d.* at the family estate of Ury. *Life* by M. C. Cadbury, 1912.

Barclay, Sir Thomas (1853-1941), Scottish lawyer, *b.* at Dunfermline, educated at the Univ. College, London, and at the univs. of Paris and Jena. In 1876 he became Paris correspondent to *The Times*, was called to the Bar in 1881, and in the following year gave up journalism to practise Fr. law. His life was devoted to fostering amicable relations between Great Britain and other countries, and he travelled widely for that purpose. He founded the Franco-Scottish Society in 1895, and the International Brotherhood Alliance in 1905. He was knighted in 1904, and sat as Liberal M.P. for Blackburn in that year. He was known as an authority on international law, and his numerous works include: *Problems of International Practice and Diplomacy*, 1907; *International Law and Practice*, 1917; *New Methods for Adjustment of International Disputes*, 1918; *Law and Usage of War*, 1918; *Collapse and Reconstruction*, 1919; *Wisdom of Lang-sin*, 1927.

Barclay, William (1546-1608), Scottish jurist, father of John B. (*q.v.*), the author of *Argenis*, studied law under

Cujas at Bourges, and became prof. of law at the univ. of Pont-a-Mousson. In 1605 he had a dispute with the Jesuits and went to England, but in 1604 was prof. of law at Angers, where he *d.* His chief legal work is *De Regno et Regali Potestate*, 1600; his attack on the temporal power of the Pope, *De Potestate Papae*, was ed. by his son, 1609, and was answered by Bellarmine's *De Potestate Summi Pontificis*, 1610.

Barclay-Allardice, Robert (1779-1854), Scottish pedestrian, generally known as 'Captain Barclay', was a descendant of the Barclays of Ury. He served in the Walcheren expedition. In his great walk he completed 1000 m. in 1000 successive hours, at Newmarket, 1809. His time varied from 14 min. 54 sec. at the start to 21 min. 4 sec. at the close.

Barclay de Tolly, Michael Andreas (1761-1818), Russian general, *b.* in Livonia, of an old Scottish family settled there in seventeenth century; distinguished himself against the Turks (1788), the Swedes (1790), and in Poland (1794). He fought (1806) as major-general at Pultusk and at Eylau, where he lost an arm. In 1808-9 he commanded in Finland, and his daring march across the ice of the gulf of Bothnia and capture of Umeo is famous. Minister of war (1810-1813), he and Bagration commanded the 2 armies against Napoleon, 1812. He was superseded by Kutusov after his defeat at Smolensk and left the army. He resumed command at Dresden, Kulm, and Leipzig, and was made field marshal, 1814, and Prince Bogdanovitch, 1815.

Barclays Bank, one of the 5 big banks or banking amalgamations of Great Britain. The nucleus of the present bank dates back to the eighteenth century, the founder of the London business being John Freame, a goldsmith, whose son and successor, Joseph, took James Barclay, a brother-in-law, into partnership, since when the Barclay family have always had a member in the business. B. B. was registered in 1896 as Barclay and Company Ltd., to acquire the banking businesses of Barclay, Bevan, Tritton, Bouverie and Company, and Ransom of London, and of Gurney and Company of Norwich, some of which banks were founded in the seventeenth century. Other concerns, such as United Counties Bank and the London and Provincial and South Western Bank, were absorbed during the First World War, and altogether over 40 banks have been merged in the amalgamation, the name being changed to the present style in 1917. B. B. also controls B. B. (Dominion, Colonial, and Overseas), which latter was incorporated in 1836 as the Colonial Bank and re-incorporated in 1925 under its present name. In 1896 the paid-up capital was £2,000,000 and the reserve £1,000,000, with deposits amounting to over £26,000,000. To-day, the authorised capital is £20,000,000; the issued capital £15,858,217; and the unissued 567,411 'A' shares (of £4) and 1,872,139 shares which can be issued as 'B' or 'C' shares (of £1). The total reserve at June 1948

was £12,250,000. The bank does large business in overseas investments. The authorised capital of B. B. (Dominion, Colonial, and Overseas) is £10,000,000, and the issued capital £7,121,500.

Bar-cochba, or **Bar-kokba**, Heb. 'son of a star' (Num. xxiv. 17), name of one Simon or Simeon, leader of the last Jewish revolt from Rome (A.D. 132-35). Nothing is known of his origin; the rabbi Aquiba recognised him as the Messiah. He was for a time successful, retaking Jerusalem. The Romans, under Julius Severus, captured Jerusalem (135), when B. was slain; the rebellion was ended with great slaughter at Bethar. To later rabbinical writers he is known as Bar-cochba, 'son of deceit.'

Barcochebas, see **BAR-COCHBA**.

Barcoo River, see **COOPER'S CREEK**.

Bard, name which the Celtic peoples applied to their minstrels, mentioned by classical writers as early as 200 B.C. Like the 'scops' of the A.-S. and the 'skalds' of the Scandinavians, they celebrated in song, to the accompaniment of the harp, national victories and the deeds of great men. They led armies to battle, and they sang before their prince or chieftain in the hall. They fl. in Wales during the sixth century, when Taliesin, Aneurin, and Llywarch lived. King Howel Dda is supposed to have defined their privileges as court Bs. in A.D. 940, and the laws of the order appear to have been regulated again by Gryffyth ap Conan about 1078. Elsteddfods were held at Caerwys, Aberffraw, and Mathra-val, when the Bs. competed with each other in skill, and judges, appointed by Welsh princes, awarded suitable degrees and privileges. On the conquest of Wales (1284), Edward I. is supposed to have suppressed the Bs., as promoters of sedition, but the bardship was revived by later kings, and existed down to the time of Queen Elizabeth. The elsteddfods were discontinued about this time, but were revived about 1822. Many early legends and ballads and much of the Arthurian cycle were handed down for generations in song by means of the Welsh Bs.

In Ireland the order was probably hereditary, and appears to have been divided into 3 classes: (1) The Filidha, who sang in the service of war and religion. (2) The Breitheamhain, who promulgated the laws in a recitative chant. (3) The Seanachaidhe, who chronicled the family hist. of the patrons to whom they were attached. Besides these 3 orders, there were minor Bs., called after the instruments they played. The harp, said to have belonged to Brien Boiroimh, who fell in the hour of victory against the Danes on the plain of Clontarf, is preserved in the museum of Trinity College, Dublin. After the conquest of Ireland by Henry II., the number of Bs. declined, though many chiefs retained them to keep alive a national feeling by their songs and legends. Turlough O'Carolan (1670-1737) was the last Irish B.

Less is known of the Scottish Bs., but it is supposed that their status was very

similar to that of the Irish Bs. They existed in the Highlands down to the seventeenth century.

The name B. has in modern times been applied to poets, e.g. to Shakespeare, the 'B. of Avon,' and to Burns, the 'Ayrshire B.'

See E. Evans, *Specimens of the Poetry of the Antient Welsh Bards*, 1764; J. Walker, *Historical Memoirs of the Irish Bards*, 1786; W. F. Skene, *Four Ancient Books of Wales*, 1868; T. Stephens, *Literature of the Kymry*, 1873; E. Jones, *Relics of the Welsh Bards*, 1884; D. Hyde, *A Literary History of Ireland*, 1899; D. D. Evans, *Ancient Bards of Britain*, 1906.

Bard, or **Bardo**, vil. in Italy, situated on the Dora Baltea, about 20 m. S.E. by S. from Aosta by rail. It has a strong fortress. Pop. 500.

Bardarion, see **AXIUS**.

Bardejov, or **Bartfeld**, tn. of Czechoslovakia on the R. Tapola, 28 m. N. of Presov. It has a thirteenth-century Gothic church and a fifteenth-century Rathaus, while 2 m. to the N. are famous chalybeate springs. The first general Protestant synod of Hungary met here. Pop. 7000.

Bardesanes (A.D. 154-222) (**Bar Daisan**, son of Daisan, a riv.), called the 'last of the Gnostics,' Syrian theologian, b. at Edessa. For some time he lived at the court of Abgar, but when Edessa was taken by Caracalla (217), he fled into Armenia. It was largely through the influence of B. that Christianity was first introduced into Edessa. He wrote 150 hymns, in which he expressed his doctrines, and which had a far-reaching influence. B. was accused of polytheism, a charge which he denied, and Eusebius speaks of him as having been a Valentinian Gnostic. He upheld that evil was the revolt of matter against spirit, and yet he maintained that the devil was an independent, existing spirit. He denied the doctrine of the resurrection of the body, and preached that Christ's body was not living flesh, but an illusory likeness sent by God. The book of *Laws of Countries*—Cureton, *Spicilegium Syriacum*, London, 1855, and the *Ante-Nicene Fathers*, New York, 1895—has been ascribed to B., but is probably the work of a disciple.

Bardi, tn. in the prov. of Piacenza, Italy, 31 m. S.W. of Parma. Pop. (com.) 7000.

Bardia, vil. on the N. coast of Africa, in the prov. of Cyrenaica, about 60 m. E. of Tobruk. It came into prominence during the Second World War when, on Dec. 19, 1940, a Brit. force captured it from the Its. The Gers, however, retook it on Apr. 12, 1941, and in Jan. the following year the Ger. garrison was subjected to an attack from the R.A.F. and Free Fr. air force, the place being finally recaptured in Nov. 1942.

Bardili, Christoph Gottfried (1761-1808), Ger. philosopher, b. at Blaubeuren in Württemberg. He became a prof. of philosophy at Stuttgart, and as an exponent of rational realism he anticipated Hegel and Schelling. His chief work, in

which he criticised Kant, is the *Grundriss der Ersten Logik*, 1800.

Bardowick, tn. of Hanover, Germany, 4 m. N. of Lüneburg, on the Ilmenau R. It was formerly an important commercial centre, but in 1189 Henry the Lion, duke of Saxony, destroyed the tn. There are ruins of a cathedral incorporated in a fourteenth-century Gothic church. Pop. 2400.

Bardsey, is. off Carnarvonshire, N. Wales, about 2 m. long by 1 m. broad. It is only accessible on the S.E. side, where there is a small well-sheltered harbour. There is a hazardous trade in taking eggs from the sea-cliffs. The soil is fertile, and produces barley and wheat. B. (or Bards' Ey, the Isle of Bards) was, according to legend, the last retreat of the Welsh bards. There was formerly an abbey, which was suppressed by Henry VIII. Numerous graves lined with stone, a large building, said to have been the abbot's lodge, and a ruined chapel or oratory are the only remains. Pop. about 120.

Bardstown, or **Bairdstown**, co. seat of Nelson co., Kentucky, U.S.A., near the Beech Fork of Salt R., and on the Louisville and Nashville railroad; 39 m. S.E., by rail, of Louisville. It has sev. educational institutions, besides various manufs., distilleries, saw-mills, and a wagon factory. There is trade in cattle, hogs, and grain. Pop. 2000.

Barbones Parliament, name of the 'Little Parliament' (July 4 to Dec. 12, 1653), summoned by Cromwell after his violent dissolution of the 'rump' of the Long Parliament. It consisted of 140 selected nominees of the congregations in each co. Its unruliness and incapacity led to its dissolution at the request of the moderates. The name, given to it by its opponents, is due to the member for London, Praise-God Barbon or B. (1596-1679), a rich leather-seller and 'fifth monarchy' man. He does not seem to have taken any prominent part in the parliament. He was imprisoned, 1661-1662, for his opposition to the Restoration. Consult H. A. Glass, *The Barbones Parliament*, 1899.

Barège, gauze-like fabric, used for women's dresses. It is a mixture of silk and worsted, or cotton and worsted, and is generally produced in light colours. The best quality is manuf. in France, where it is called *crêpe-de-barège*, from the tn. Barèges, where it was first made; also produced at Bagnères de Bigorre.

Barèges, watering-place with warm sulphur springs, Hautes-Pyrénées, France. It is 4040 ft. high, and its season is in summer. The mixed silk and wool fabric, barège, is made at Bagnères de Bigorre, 25 m. S.W.

Barcelly, tn. and dist., B. or Rohilkhand div. of the United Provs., India, area of dist. 1580 sq. m.; pop. 1,000,000; of tn. 193,000. This dist. is highly cultivated and is irrigated by the Rohilkhand canal system. There is an important native college in the tn.

Barents, Willem (d. 1597), Dutch explorer. His first expedition, 1594, in

search of a N.E. passage to Asia, surveyed the W. coast of Novaya Zemlya; the second, 1595, failed; he was chief pilot to the last journey, 1596. He discovered and named Spitsbergen and Bear Is., rounded Novaya Zemlya, and was the first to winter in the ice. On the return in open boats he d. The hut where they wintered was found in 1871, and B.'s journal in 1875. B. Sea and Is. are named after him. See Hakluyt Society translation of De Veer's *Three Voyages of Barents*, 1876.

Barents Island, is. in the E. of the Spitsbergen Archipelago, named after Willem Barents (q.v.).

Barents Sea, that part of the Arctic Ocean which lies between the European mainland, Novaya Zemlya, Franz-Josef Land, and Spitsbergen. Its average depth is 100 fathoms. The part near the Kola coast is called the Murman Sea. See F. Nansen, *The Norwegian North Polar Expedition*, 1900-8.

Barère de Vieuzac, Bertrand (1755-1841), Fr. revolutionist, b. at Tarbes; was elected as deputy for Bigorre to the States General, 1789, and reported the debates in his paper, the *Point du jour*. He joined the Republican party after the flight to Varennes. As deputy for Hautes-Pyrénées to the National Convention, 1792, he first was a Girondist, but later one of the Mountain, and voted for the death of the king. He closed his speech with the phrase, 'the tree of liberty does not grow if it be not watered with the blood of kings.' He was member of the first and second Committees of Public Safety, 1793, supporting Robespierre, but withdrawing at his fall. He was imprisoned after the Terror, but escaped. He was employed by Napoleon, turned Royalist in 1814, but was exiled as a regicide in 1815. He was the last survivor of the Committee of Public Safety. See Aulard, *Les Orateurs de l'assemblée constituante*, Paris, 1905.

Baretti, Joseph (1719-89), It. writer, b. at Turin; he came to London in 1751 as a teacher of It.; he became secretary to the Royal Academy, and pub. the *Italian Library*, 1757. His journal *Frusta Letteraria* (the literary scourge), Venice, 1763-65, was marked by bitter but independent criticism. He was known to Johnson and his circle, and figures in Boswell's *Life*. He was tried on the capital charge of killing a man who assaulted him in London, 1769; the evidence of Johnson, Burke, and Garrick as to his character served to secure his acquittal. His *Dictionary and Grammar of the Italian Language and Lettere Famigliari*, trans. 1770, were well received.

Barfleur, seaport tn. in the dept. of La Manche, France, 15 m. from Cherbourg. It was an important harbour for the Channel passage to England in the Middle Ages. The *White Ship* sank off the port with Henry I.'s only son William. Off Cape B. was fought the first of the series of naval battles between Tourville and Russell, May 1692, known in Eng. hist. as the battle of La Hogue (q.v.).

bankers and financiers, sev. members of which were distinguished as statesmen and administrators. There are 4 peerages in the family, the earldoms of Northbrook and Cromer, the baronies of Ashburton and Revelstoke. John B. came from Bremen, in Germany, and started a cloth factory near Exeter. His son Francis (1740-1810) founded the banking house of B. Bros. in 1770, was director and chairman (1792) of the E. India Company, supported Pitt in Parliament (1784-1806), and was made a baronet, 1793. At his death the firm was the first banking house in Europe. His eldest son, Sir Thomas (1772-1848), was a great art collector, and the firm was managed by his second son, Alexander (1794-1848), who extended its influence in America, was president of the Board of Trade, 1834, and made Baron Ashburton, 1835. He settled the Canada-Maine boundary question, 1842. At his death the management of the firm passed to Thomas (1799-1873), second son of Sir Thomas, and on his death to Edward (1828-97), son of Henry, third son of the founder of the firm, who was created Baron Revelstoke, 1885. It was during this period that the continued default of the Argentine Gov. involved the firm in such difficulties that a financial crisis ensued (1890), only relieved by the action of the Bank of England and the prin. London joint-stock banks, in taking over the enormous liabilities of the firm; to this end the governor of the Bank of England secured £3,000,000 in gold from the Bank of France. B. Brothers was reorganised as a limited company. Sir Thomas B.'s eldest son, Sir Francis (1796-1866), was chancellor of the exchequer (1839-44), first lord of the Admiralty (1849-52), and created Baron Northbrook, 1866; his son Thomas (1826-1904) was made Earl Northbrook 1876, was viceroy of India (1872-76), and first lord of the Admiralty (1880-85). The youngest son of Henry B., a brother of the first Lord Revelstoke, was Evelyn (1841-1917), first Earl Cromer (q.v.).

Baring, Alexander and William, see ASHBURTON, BARONS.

Baring, Sir Evelyn, see CROMER, EARL OF.

Baring, Maurice (1874-1945), Eng. novelist and poet, son of Lord Revelstoke, was educated at Eton and Trinity College, Cambridge; and in 1899 entered the diplomatic service. After some months at the Foreign Office he became attaché at the embassy in Paris, and later was transferred to Copenhagen, but in 1904 decided to abandon diplomacy for a literary career. When the Russo-Jap. war broke out, however, he became war correspondent of the *Morning Post* in Manchuria; special correspondent in Russia, 1905-8; Constantinople, 1909; and for *The Times*, in the Balkans, 1912. These experiences are described in *Letters from the Near East* (1909), *The Puppet Show of Memory* (1922), and in the novels *Tinker's Leave* (1927) and *Friday's Business* (1933). During the First World War he served in the Royal Flying Corps, becoming wing-

commander, and was made chevalier of the Legion of Honour. During his brief period in the diplomatic service he also wrote some poetical plays: *The Black Prince* (1899), *Gaston de Foix* (1903), *Proserpine* (1908), and *Desiderio* (1906). Later came short stories, *Orpheus in Mayfair* (1909), fairy tales, essays, and skits in profusion. His annotated anthology, *Have You Anything to Declare?* (1936), revealed the range of his acquaintance with the world's greatest literature, classical and modern, from which his original work drew its inspiration. His first novel, *Passing By*, appeared in 1921. The best of his subsequent novels are *Cat's Cradle* (1925), *Daphne Aedeane* (1926), *The Coat without Seam* (1929), *Robert Peckham* (1930), and *The Lonely Lady of Dulwich* (1934). It was during his journalistic career that he became a Rom. Catholic, and some readers saw in these novels a kind of Rom. Catholic propaganda. His outlook in European affairs, knowledge of foreign traditions, customs, and literature were remarkable as may be gathered from his *A Year in Russia* (1907) and *The Mainsprings of Russia* (1914), as well as in his essays. His *Collected Poems* were pub. in 1925. His final position in literature may establish him as one of the most subtle, profound, and original of later Eng. writers. See Dame E. Smyth, *Maurice Baring*, 1938; L. Lovat, *Maurice Baring: a Postscript*, 1947.

Baring-Gould, Sabine (1834-1924), Eng. author, b. at Exeter, educated Clare College, Cambridge; became rector of E. Mersea, Essex, 1871, and of Lew Trenchard, Devon, 1881. From 1854 onwards he wrote books of folklore, mythology, ant. customs, and of travel, such as the *Book of Were Wolves*, 1865; *Curious Myths of the Middle Ages*, 1866; *Strange Survivals*, 1892; *Family Names and their Story*, 1910; *Cliff Castles and Cave Duellings of Europe*, 1911. His theological works include *The Lives of the Saints*, 17 vols., 1872-89. From 1871 to 1873 he ed. the *Sacristy*, a quarterly devoted to the art and literature of the Church. His life of R. S. Hawker (q.v.), *The Vicar of Morwenstow*, 1875, was much criticised. His *Songs and Ballads of the West*, 1889-1891, contains a valuable collection of folksongs. Of his novels the best known are *Mehalah*, 1880; *John Herring*, 1883; *Court Royal*, 1886; and *Nebo the Nailor*, 1902. He was also the author of the following hymns: *Onward, Christian Soldiers*; *Now the day is over*; and *Through the night of doubt and sorrow* (trans. from Dan.). His *Early Reminiscences* appeared in 1923. See S. M. Ellis, *Mainly Victorian*, 1925.

Baringo, Lake, in Kenya, about 40 m. N. of the equator. Its elevation is 3325 ft. and length about 16 m. Its position was not accurately known till 1883, when it was first seen by Joseph Thomson.

Baris, genus of coleopterous insects, belongs to the family Curculionidae, or weevils. It feeds on dead parts of trees, and is consequently not injurious to any

way. *B. lignarius* feeds upon the elm-tree both in the larva state and that of the perfect insect. The little weevil selects a hollow tree, enters the dead wood hinder part first, lays its eggs, then dies, and its body thus blocks up the entrance and protects the young.

Barisal, tn., Bakarganj dist., E. Bengal and Assam, Pakistan, on B. R. It has a large riv. trade. The 'B. guns,' strange sounds, like the report of cannon or thunder heard off the mouth of the riv., have not yet been explained. Pop. 30,000.

Barito, riv. of Dutch Borneo, which flows southwards into the Java Sea, after a course of 550 m. It is navigable for some distance up; at high tide the bar at the mouth has over 12 ft. of water. An arm of the B. flows S.W. and joins the Kapuas; from the junction a canal runs to the main stream.

Baritone, i.e. deep-sounding (Gk. *barus*, heavy, *tónos*, tone), name of that range of the adult male voice which lies between a tenor and a bass. It is to be regarded as a high bass rather than a low tenor; compass from the lower A on bass stave to F above the stave.

Barium, a metallic element belonging to the group of alkaline earths. Symbol Ba; atomic number 56; atomic weight 137.36. In 1602 Casciorolus, a Bolognese shoemaker, investigated the properties of heavy spar, and noticed that it became phosphorescent in contact with ignited combustible matter. In 1774 Scheele discovered, in a sample of black oxide of manganese, a new earth, which was afterwards identified with a constituent of heavy spar. This earth was called baryta (Gk. *barus*, heavy) and was shown to be an oxide of a metal by Davy. He succeeded in producing an amalgam of the metallic B. with mercury, but no satisfactory isolation of the metal was accomplished until Guntz, in 1901, obtained an amalgam by electrolysis of a saturated solution of B. chloride; the amalgam was heated in the electric arc to about 1000° C., and the B. obtained in the form of a soft, silver-white metal. The monoxide BaO is obtained by heating the carbonate or nitrate; further heating transforms the monoxide into the dioxide BaO₂. At a still higher temp. the additional oxygen is set free, so that by alternately lowering and raising the temp. oxygen may be absorbed and collected from the atmosphere. This action was the basis of Brin's oxygen process, now obsolete but very successful for a number of years. B. hydroxide is a white soluble powder; the solution is known as baryta water and readily absorbs carbon dioxide from the air. B. chloride is obtained by the action of hydrochloric acid on witherite (i.e. native B. carbonate, BaCO₃); it is used in the preparation of the artificial sulphate, which is used as a pigment under the name *blanc fixe*, or permanent white, the impurities in the air having no effect upon it. A mixture of B. sulphate and zinc sulphide forms the very important white pigment known as lithopone. B. nitrate is a powerful oxidising agent, and like the

chlorate is used for the production of 'green fire' in pyrotechny. B. may be detected by the apple-green colour imparted to the Bunsen flame by the metal and its salts, and by the immediate precipitation of the salts by a solution of calcium sulphate. B. salts are very poisonous, causing death by paralysing the heart. In small doses they strengthen the muscular power of the heart, but are seldom employed. The old sulphur well at Harrogate and the waters at Llangam-march are said to contain about 6 grains of B. chloride per gallon.

Barium sulphate, see BARYTES.

Bar-Jesus, see KLYMAS.

Barjols, tn. in the dept. of Var, France. Its chief exports are figs, raisins, and olives. Pop. 2500.

Bark, outside covering of the trunks and branches of trees, consisting of dried-up tissues, which often belong to different tissue-systems, lying outside the active cork-cambium of stems. The first phellogen (cork-producing tissue) nearly always dies, and a second phellogen produces a cork layer cutting off the supply of water to the outside layers, and consequently aids in the formation of the B. It may be either scaly or ringed: in the first case only isolated patches of tissue have become B. and as the trunk of the tree increases in size the B. becomes torn in scales; in the second case concentric rings are formed and the B. forms a complete ring. Examples of the former are the pine, plane, and larch, of the latter, vine, clematis, birch, and honey-suckle.

The uses of B. are many and various. In savage lands, canoes, shields, baskets, and clothing are made of it. In tanning it is a most valuable object, and the *Quercus suber*, an oak of S. Europe and N. Africa, produces an outer covering which is rich in tannic acid. Sev. other varieties of oak, such as *Q. robur* and *Q. tinctoria*, are also much used, while *Acacia decurrens* and *Abies canadensis*, or hemlock spruce, are other plants containing tannin. The bast fibres are employed in commerce, examples of which are flax, jute, and hemp. Medicinally B. is frequently noteworthy, the best-known being cinchona; other kinds are angostura, cascarilla, cascarilla, and witch hazel. Cinnamon is obtained from B., the wild cherry is valued in cough-mixtures, pomegranate B., or granatum, is used to expel tape-worms. Resins, gums, and balsams may be produced from various barks.

Bark, Peruvian, see CINCHONA.

Bark (ship), see BARQUE.

Barkal, or **Jebel Barkai**, flat-topped, isolated rock, rising precipitously from the desert on the r. b. of the Nile, some distance above the vil. now called Merawi. It was in anct. times considered as a holy mt. by the Egyptians. Its interest in modern times is in the excavations and researches which have been carried on in the neighbourhood. Many pyramids, varying in height from 35 to 60 ft., and 6 temples are found.

Bark-bed, term used in horticulture for a bed made of waste bark from tanneries.

When placed in the brick pit of a forcing-house the bark ferments, and the warmth and moisture thus produced assist in the development of the tender plants.

Bark-beetles, coleopterous insects of the family Bostrichidae, but the name is often given loosely to beetles of other families. They do much damage as they live on the bark of forest-trees.

Barker, Benjamin (1776-1838), Eng. landscape painter, brother of Thomas B. (q.v.). Exhibited at the Royal Academy between 1800 and 1821. He pub. a set of 48 views engraved by Theodore Fielding.

Barker, Edmund Henry (1788-1839), Eng. scholar, b. in Yorkshire; educated at Trinity College, Cambridge. He assisted Samuel Parr at Halton and went to Thetford. His chief work was the revision of Stephanus's *Thesaurus Græcæ Linguae*, 1816-28, severely criticised by Blomfield. He d. in great poverty.

Barker, Sir Ernest, Eng. historian and classical scholar, b. Sept. 25, 1874; educated at Manchester Grammar School and Balliol College, Oxford. In 1908 he was elected fellow of Merton College; in 1909, fellow and lecturer of St. John's College; in 1913, fellow and lecturer of New College. In 1920 he went as principal to King's College, London, and in the same year became a member of the Consultative Committee of the Board of Education. He remained at London Univ. until 1928, when he became prof. of political science at Cambridge, also being elected fellow of Peterhouse. His works include: *Political Thought in England from Herbert Spencer to To-day*, 1915; *Greek Political Theory*, 1918; *The Crusades*, 1923; *National Character and the Factors in its Formation*, 1927; *Church, State, and Study* (essays), 1930; *The Citizen's Choice* (essays), 1937; *Ideas and Ideals of the British Empire*, 1941; *Reflections on Government and Britain and the British People*, 1942; *Development of Public Services in Western Europe*, 1944; *The Character of England* (ed.), 1947. B is also the editor of Dent's 'Library of Greek Thought.'

Barker, Harley Granville—see GRANVILLE-BARKER.

Barker, Sir Herbert Atkinson (b. 1869), Eng. manipulative surgeon, b. at Southport. Educated for the law, he early displayed such ability for manipulative surgery that he was placed under the tuition of Mr. J. Atkinson, to whose practice he succeeded in 1904. Though he has successfully treated over 40,000 cases of flat-foot, joint abnormalities, etc., he has never received the formal recognition of the medical profession. He was knighted in 1922 for his services in the First World War. In 1936 he gave a demonstration of his methods before an audience of the Brit. Orthopaedic Association, and made a film for record purposes. He was elected manipulative surgeon to Noble's Hospital, Isle of Man, in 1941. His memoirs, *Leaves from my Life*, were pub. in 1927.

Barker, Robert (1730-1806), Irish artist, b. in Ireland; settled in Edinburgh as a portrait painter. In 1788 he produced

the first panorama, that of Edinburgh, following a suggestion of a Ger. architectural decorator, Breisl. He subsequently produced popular panoramas of London, and of naval battles of the time.

Barker, Thomas (1769-1847), Eng. landscape painter, b. near Pontypool, Monmouthshire. He was allowed facilities for copying the works of some Dutch and Flemish masters by a rich coach-builder of Bath named Spackman, who sent him to Rome for 4 years in 1790. He returned to England after this and settled at Bath. Few pictures of the Eng. school have been more widely known than 'The Woodman,' which was engraved by Bartolozzi. His pictures were popular, being engraved on china, linen, and pottery. His best work was the large fresco which he executed in his house at Slon Hill, Bath, representing the 'Inroad of the Turks upon Scio in April 1822.' He was entirely self-taught in his art.

Barker, Thomas Jones (1815-82), Eng. painter, son of Thomas B., b. at Bath. After being given some education in art by his father, he went to Paris in 1834, and was a pupil of Horace Vernet for several years. He exhibited frequently at the Salon, his first picture there, 'Beauties of the Court of Charles II.,' gaining him a gold medal. In 1840 he was awarded the cross of the Legion of Honour for painting 'The Bride of Death' for the youngest daughter of Louis-Philippe. In 1845 he returned to England, and painted the portraits of sev. eminent men, Disraeli amongst them. He went to the Franco-Ger. war, whence he obtained many subjects for pictures.

Barking, tn. in Essex, England. It lies on the R. Roding, 8 m. from Liverpool Street station, London. It is a suffragan bishopric to St. Albans. Of the great nunnery only a gateway remains. All Hallows, B., near the Tower of London, belonged to it. The thirteenth-century church of All Hallows, saved from the Great Fire of 1666, was burnt in the Ger. fire-raid of Dec. 29, 1941. The church's historical records had been placed in safety, and the famous font in the style of Grinling Gibbons escaped damage, being put in the crypt. The church of St. Margaret has some interesting monuments. At B. Creek is the outfall of the N. London sewer. Pop. 51,000.

Barkly, Sir Henry (1815-98), Scottish colonial administrator, educated at Bruce Castle School, Tottenham. In 1845-9 he was M.P. for Leominster as a 'firm supporter of Peel's commercial policy.' 1849, governor of Brit. Guiana. Advocated introduction of coolies and Chinese as labourers, developed colony by introducing railways. 1853-56, governor of Jamaica; 1856, of Victoria; 1863, of Mauritius; 1870-76, of the Cape. K.C.B., 1853; G.C.M.G., 1874.

Barkly East, tn. in Cape Prov., S. Africa, situated 58 m. E.S.E. of Aliwal N. It is the cap. of a dist. of the same name, and stands at an elevation of 583 ft.

Barkly West, tn. in the N. div. of Griqualand W., Cape Prov., 25 m. as

the crow flies from Kimberley. It is the cap. of the dist. of the same name, and possesses diamond mines, in which the 'river stones,' of great value, are found. It is situated at an elevation of 3800 ft. Pop. 5000.

Bar-kokba, see **BAR-COCHBA**.

Barkol, tn. of Dzungaria, in Sinkiang, China, to the N. of the Gobi desert. Near to it is Lake B., which is situated 5100 ft. above sea level.

Barkway, ant. vil. of Hertfordshire, England, about 4 m. S.S.E. from Royston. At the time of the Conquest the lands were divided among 4 great lords into as many manors, and afterwards into 8 manors. It was privileged by Edward I. to have a market on Thursday, but this has been discontinued. Pop. 600.

Barlaam and Josaphat, Christian religious romance popular in the Middle Ages, and trans. into every European language. The Gk. original is attributed to John of Damascus (*f.* early eighth century), but modern writers have traced an earlier Syrian source. The story of the Indian prince Josaphat, and his withdrawal to the wilderness and a life of asceticism through the teaching of the hermit B., is a Christian version of the life of the Buddha. The name Josaphat is a perversion of Bodhisat or Bodhisat (see *Bodhisattra myth under LAMAISM*), and passages seem verbally taken from Sanskrit texts. The identity of the 2 stories was noticed in the sixteenth century, but first stated by Laboulaye, 1859, and proved by Liebrecht, 1860. Further, the lost *Apology of Aristides*, a second-century defence of Christianity, has been found embodied in the story. Both B. and J. were canonised in the E. and Rom. Church. See J. Jacobs, *Barlaam and Josaphat*, 1896.

Barlaeus, or Gaspar van Baerle (1584-1648), Dutch poet and historian, *b.* at Antwerp. Studied theology at Leyden; took orders; prof. of logic at Leyden, 1617; dismissed from his office, 1619, for siding with the Arminians against the Gomarists. Prof. of philosophy at Amsterdam, 1631. He wrote: (1) poems, chiefly in Lat., some in Dutch; (2) a hist. of Brazil, which was then possessed partly by the Dutch. One of his Lat. poems had for its subject the accession of Charles I. His letters were pub. at Amsterdam, 1667.

Bar-le-Duc, or **Bar-sur-Ornain**, cap. of the Fr. dept. of Meuse, on the R. Ornain, and on the Marno-Rhine canal, 158 m. E. of Paris. It manufs. cotton, calico, and hosiery; preserves are made, and there is trade in timber, iron, wool, and wine. The church of St. Pierre dates from the fourteenth century, and contains the tomb of William of Orange. A ruined castle, the ancestral home of the dukes of Bar, overlooks the entrance into Lorraine. The Old Pretender, Chevalier de St. George, lived here for 3 years. It was the bp. of the duke of Guise (1519-63), and Marshal Oudinot (1767-1847), and M. Raymond Poincaré (*q.v.*), president of the Fr. Republic. Pop. 16,000.

Barleria, genus of Acanthaceae found in the E. Indies. A few species grow in

Eng. gardens and hothouses, and of these *B. lupulina*, with its large bracts resembling hops, and *B. prionitis*, a common swamp-plant in Java, are the most remarkable.

Barletta, tn., prov. of Bari, Apulia, Italy. The fine harbour makes it an important seaport for the exports of wine, sulphur, and oil of the dist. Before the cathedral, S. Sepolero (twelfth century), is an antique bronze statue of Honorius. Pop. 46,000.

Barleux, vil. on R. Somme, Franco, S.W. of Peronne. Much hard fighting took place round B., 1915-16. During the battle of the Somme, 1916, it was an important position, and in July of that year was the scene of much bloodshed. In the following Nov. the allied line ran through B.

Barley (*Hordeum*), cercal of anct. culture, which belongs to the order Gramineae. There are 4 unimportant species

BARLEY

of B.-grass in Britain, of which *H. pratense* and *H. murinum* are 2. *H. vulgare* is the cultivated species, growing as far N. as 70°; it is the Scottish bere or bigg, and has its grains in 4 rows; *H. distichum* is a 2-rowed and *H. hexastichum* a 6-rowed variety. *H. caeleste*, the Siberian B., a variety with naked seeds, is cultivated in some parts of Europe, but the grain shakes off so easily as to render bad harvests frequent.

Formerly B. was considered to be of great value as a food in England, but now it is most often converted into malt for brewing and distilling. Ground down into B.-meal it is used for bread-making in N. Europe, and is a food for cattle; it is also made into decoctions for invalids, especially those who have pulmonary complaints, and is extremely soothing in fevers. The varieties known as pot-B. and pearl-B. are very nutritious and wholesome, and may be used in broths, stews, puddings, and as a substitute for rice. The former kind is obtained by depriving the grain of its

outer husk, the latter by rounding it and polishing it in the mill after the removal of the husk. In Scotland a peculiar dish, called sowens, is made of the bran, which is steeped in water and allowed to ferment for sev. days until it becomes acid.

B. grows best in a warm, dry climate; the soil should be richly manured, and the practice of sowing clover, rye grass, or other seeds with it is considered to improve it greatly.

The development of this crop in Empire countries (chiefly India, Canada, and the United Kingdom) showed an increasing trend from 1933. In 1938 the total area under B. in the Brit. Empire was 14,073,000 ac., of which the acreage in India was 6,225,000 and in Canada 4,454,000. The acreage for the United Kingdom was 989,000. The total acreage under B. in foreign countries for that year was 56,894,000. The Brit. Empire produced 5,790,000 tons in 1938-39 and foreign countries 28,639,000 tons. Imports of B. retained in the United Kingdom averaged over 900,000 tons in 1936-38 (as compared with an average of 711,000 tons in 1931-34). This increase coincided with the decline in production in 1936-38. The main sources of the imports into the United Kingdom were Canada (274,000 tons), Russia (188,000 tons), Iraq (155,000 tons), and the U.S.A. (136,000 tons). The Empire is on balance an importer of B., the consistently large imports of the United Kingdom being only partially balanced by the exports from Canada, Australia, and India. Retained imports in 1941 totalled 1,277,000 tons. In June 1945 there were 2,216,000 ac. under B. in Great Britain (as compared with 1,013,000 ac. in June 1939), and the quantities harvested were respectively 2,071,000 and 892,000 tons.

Barley-break, old Eng. country game which was popular in the sixteenth and seventeenth centuries, referred to by Herrick, Sidney, Suckling, and Massinger, and still surviving with modifications in the N. of England and Scotland. It was played by 6 couples, 3 of each sex, placed in 3 adjoining plots of ground, the central one being called 'hell.' The middle couple, always united, had to attempt to catch the other couples as they changed places, these latter being allowed to 'break.' The name may have come from the stack-yard in which it was played.

Barleycorn, John, malt liquor personified and a familiar figure in old Eng. ballads and pamphlets. The song of J. B., from *The English Dancing Master*, 1651, is generally attributed to Robert Burns, but all that Burns did was to alter slightly various parts of it. Also a corn measure—the third part of an inch in length. The term barleycorn is used in old conveyances of land as a synonym for a nominal consideration.

Barley Midge, dipterous insect of the family Cecidomyiidae, allied to the Hessian fly, or *Cecidomyia destructor*. It obtains its name from its destruction of B., while the latter is a speller of wheat.

Barley-sugar, confection made with syrup prepared from sugar, hardened in

moulds and generally twisted into spiral sticks. Originally the sugar was boiled in a decoction of barley.

Barlow, Henry Clark (1806-76), Eng. scholar, b. at Newington Butts, d. at Salzburg. His prin. work is *Critical, Historical, and Philosophical Contributions to the Study of the 'Divina Commedia.'* He bequeathed his Dante library to the library of Univ. College, London.

Barlow, Jane (1857-1917), Irish authoress of sketches, novels, and tales of Irish life and character, was b. at Clontarf, Dublin, where her father, the Rev. W. B., was vice-provost of Trinity College. Of her numerous publications may be mentioned *Irish Idylls*, 1892; *Strangers at Lisconnel*, 1895; *Creel of Irish Stories*, 1897; *Irish Neighbours*, 1907; *Irish Ways*, 1909; *Mac's Adventures*, 1911; *Flaws*, 1911; *Doings and Dealings*, 1913.

Barlow, Joel (1754-1812), Amer. politician and writer, b. in Connecticut; pub. his bombastic poem *The Vision of Columbus*, 1787, expanded into *The Columbiad*, 1807. He went to France, 1788, and became a violent republican; *Advice to the Privileged Orders*, 1792; *Hasty Pudding*, burlesque poem, 1793. He was Amer. consul at Algiers, 1795-97, and ambas. to France, 1811. He d. near Cracow on a visit to Napoleon. See C. B. Todd, *Life*, 1866; and M. C. Tylor, *Three Men of Letters*, 1895.

Barlow, Peter (1776-1862), Eng. mathematician, b. at Norwich. From 1806 to 1848 he was prof. of mathematics at the Royal Military Academy, Woolwich. His publications on pure mathematics include *Elementary Investigation of the Theory of Numbers* (1811), and his mathematical tables (1814) are still used. His studies in magnetic attraction, on which he pub. a treatise (1820), led to improvements in the compass, and the pattern he introduced remained in use till superseded by the Thomson compass in 1876. He was a F.R.S., 1823, and Copley medallist, 1825.

Barlow, Thomas (1607-91), Eng. prelate, was fellow and tutor at Oxford, where he was noted as a keen controversialist and casuist. He was provost of Queen's College and Bodley's Librarian, 1642 and 1660. He was made archdeacon of Oxford, 1661, and bishop of Lincoln, 1675. He was the writer of innumerable pamphlets and books, and a violent opponent of Rom. Catholicism. Through all the political changes of his long life he managed to retain all his clerical benefices and preferments. His works include *Gunpowder Treason Popery, Exercitationes aliquot Metaphysicæ de Deo, and Concerning the Invocation of Saints*.

Barlow, Sir Thomas (1845-1945), Eng. physician, graduated in medicine in 1873 at London Univ., after being educated at Owen's College, Manchester, and graduating in arts at London in 1867. Became Fellow of the Royal College of Physicians in 1880; president, 1910-15. By 1893 he had reached the foremost rank of medical consultants. Became Holme Prof. of Clinical Medicine at Univ. College;

Fellow of the Royal Society; and president of the International Medical Congress (1913). He was physician to the households of Queen Victoria and King Edward VII., 1901-10, and physician extraordinary to King George V. He was also fellow of the Royal Society of Physicians, Budapest; physician at the London Fever Hospital, and consulting physician to Univ. College Hospital, and Hospital for Sick Children, Great Ormond Street, London. His outstanding contribution to medical science was that which he made on infantile scurvy and its relation to rickets. This made his name known throughout the world—the condition, previously and improperly called scurvy-rickets, now being known as Barlow's disease. The benefits which this contribution has conferred on children throughout the world are incalculable.

Barlow, Thomas Oldham (1824-89), Eng. line engraver and mezzotinter, made R.A. 1881; he reproduced the works of his contemporaries, including Landseer, Turner, Millais.

Barlow, William Henry (1812-1902), Brit. engineer; he supported the use by engineers of the steel produced by the Bessemer process. The chief works on which he was engaged include the building of St. Pancras station, London, the Clifton suspension bridge, and the Tay bridge.

Barmecides, noble Persian family, whose sudden fall from greatness under the Abbasid caliphate is proverbial. Khalid ben Barmak was minister of Mansur, and his son Yahya tutor and later vizier to the great Harun, in whose reign the family reached their highest power and prosperity, his sons Fadl and Ja'afar enjoying high favour. In 803 the whole family, save one, were exterminated. The romantic but not improbable story is that Harun discovered that Ja'afar had betrayed the caliph's sister after a marriage which was to be purely formal. It is likely that Harun felt himself powerless in the hands of the family. The mock banquet or proverbial Barmecide feast is well known from the *Arabian Nights* 'Barber's Tale.'

Barmen, tn. of the Rhineland, Germany, on the Wupper and the Aix-la-Chapelle-Berlin main line. It is now administered jointly with Elberfeld under the name Wuppertal. It joins Elberfeld. It became one of the chief manufacturing tns. of modern Germany, a centre of the textile industry, especially ribbon weaving, of machinery, cutlery, plated goods, and buttons. Dyeing and bleaching, piano manufacturing, soap-making, and chemical works were also large industries. The tn. was partially destroyed by air attack on May 29, 1943, during the Second World War. Pop. 188,000.

Barmouth, seaside resort, Merionethshire, N. Wales, in Cardigan Bay, at the mouth of the Maw. Pop. 2500. Cader Idris lies across the Maw, and the vale of Llangollen and Dolgelly afford beautiful excursions.

Barn, see under FARM.

Barnabas, St., by descent a Levite of

the country of Cyprus, his first name being Joses, or Joseph. The name of B. (son of consolation) was given to him by the apostles as appropriate to his character and works of charity. Alexander, a monk of Cyprus, says that he was brought as a youth to Jerusalem to study under Gamaliel. He is first mentioned in Scripture in Acts iv. 34. He it was who first introduced St. Paul to the apostles. Later he induced him to leave Tarsus and come to Antioch. He is supposed to have been martyred in Cyprus, but many traditions take him to Milan, Rome, and Alexandria.

Barnabas, The Epistle of St. There is still extant an epistle ascribed to St. B. consisting of 2 parts, the first in Lat., the second in Gk. In the Gk. copy some parts are missing. The first is an exhortation, an argument to constancy in the belief and profession of the Christian doctrine. The second contains moral instructions. The N.T. is not quoted in it. Internal evidence shows that it was written at the time of the destruction of the temple. Origen and Clement of Alexandria believed it to be authentic, and Lardner was also of that opinion, but it is generally now believed to be pseudonymous, and to be written by a Christian writer somewhere about the year 120. See dissertation by W. Cunningham, 1877.

BARNACLE

Barnabites, religious order, founded about the year 1530 under the name of Regular Clerks of the Congregation of St. Paul; they are so called because they first met in 1538 in the cloister of St. Barnabas at Milan. Their prin. object was the education of the young. They were forbidden to accept preferment in the Church save at the express command of the pope. The order spread to France, Germany, Austria, and Spain. They were suppressed during the time of the Fr. Revolution, but returned in 1850. In 1880 they were expelled from France, but continued in the other countries mentioned.

Barnaby, Sir Nathaniel (1829-1915), Brit. naval architect, b. at Chatham of a

family of shipwrights. In 1854 he became an admiralty overseer, and from 1870 to 1885 he was chief naval architect in the offices of the controllers of the Navy. He pub. sev. works on shipbuilding.

Barnacle, Bernicle (*Balanus*), genus of marine crustacean of the order Cirripedia and family Balanidae. The testa is in 6 pieces, either conical or cylindrical. (See illustration, p. 91.)

Barnacle (bird), see BERNICLE GOOSE.

Barnard, Lady Anne (1750-1825), Scottish authoress, the daughter of the fifth earl of Balcarres, James Lindsay. Her beautiful ballad *Auld Robin Gray* was written, 1772, set to music by the Rev. W. Leves, and pub. in 1783. She only acknowledged the authorship in 1823 to Scott. See her letters with a memoir by W. H. Wilkins in *South Africa a Century Ago*, 1925; also D. Fairbridge, *Lady Anne Barnard at the Cape of Good Hope*, 1924.

Barnard, Edward Emerson (1857-1923), Amer. astronomer, educated at Vanderbilt Univ. and, in astronomy, at Lick Observatory. Prof. of astronomy of Yerkes Observatory at Chicago Univ. from 1895 to 1923. Made numerous observations of comets and compiled a collection of celestial photographs.

Barnard, Frederick (1846-96), Eng. artist; studied at Heatherley's Art School and in Paris. First work, set of charcoal drawings, 'The People of Paris.' Contributed to *Punch*, 1863-65; cartoonist to *Fun* for 2 years. His best-known work is his illustration of the household ed. of Dickens, 1871-79. 'Character Sketches' from Dickens and Thackeray; illustrations of *Pilgrim's Progress*, 1880. Also painter in oils.

Barnard, Frederick Augustus Porter (1809-89), Amer. scientist and educator, b. at Sheffield, Massachusetts; graduated at Yale, 1828. Teacher to the deaf and dumb at Hartford, Connecticut, and later (1832-38) at the New York Institute for the instruction of the Deaf and Dumb. At the outbreak of the Civil war he retired to Washington, and in 1864 was tenth president of Columbia Univ. Among his works are *Letters on Collegiate Government*, 1855; *Recent Progress in Science*, 1869.

Barnard, George Grey (1863-1938), Amer. sculptor, educated at the Art Institute of Chicago, and the École Nationale des Beaux Arts. He exhibited in the Salon, 1894, and, 1900, was awarded the gold medal at the Paris exposition. He was prof. of sculpture at the Art Students' League, New York, 1900-4. His works include: 'The Boy,' 1885; 'Cain,' 1886; 'A Monument to Democracy,' 1920, which comprises 400 figures in plaster; 'Adam and Eve,' 1923, in marble; 'Let there be Light,' 1925, in bronze. His bronze statue of Lincoln, unveiled at Cincinnati, 1917, raised much controversy.

Barnard, Henry (1811-1900), Amer. reformer of education, b. Hartford, Connecticut, educated at Yale; was a member of the Connecticut legislature and reorganised the state schools, 1837-42. In various offices he reformed education in Rhode Is., Wisconsin, and Maryland, and

was first commissioner of education to U.S.A., 1867-70. His publications are numerous, and he was founder and editor of the *American Journal of Education*, 1855-81.

Barnard, Mrs. Charlotte Alington, see CLARIBEL.

Barnard, Sir John (1685-1764), Eng. merchant, b. at Reading, brought up as a Quaker, but conformed to the Church of England when 19 years of age. He entered the counting-house of his father, a wine merchant in London, and was soon entrusted with the entire management. He was responsible for the withdrawal of the Bill which was to affect the interest of the wine merchant. Soon after he was elected M.P. for London, which he continued to represent for nearly 40 years, generally voting with the party opposed to the administration of Sir Robert Walpole. He was elected an alderman of London 1728, was knighted 1732, and was lord mayor of London 1737.

Barnard Castle, tn. of Durham, England, on R. Tees, 15 m. N.W. of Darlington. It contains the ruins of a thirteenth-century castle built by Barnard Balliol, grandfather of John Balliol, King of Scotland. B. C. School was founded in 1883. The Rokeby of Scott's poem of that name is 2½ m. distant. The chief manuf. is flax thread. Pop. 4000.

Barnard College, for women, was founded by President Frederick A. P. Barnard, of Columbia, in 1889, on the refusal of the trustees of Columbia College to admit women on equal terms with men. B. C. is affiliated with the Columbia Univ., and in 1910 it was agreed that the president of that univ. should, *ex officio*, be president, and a trustee of B. C. The students register in the univ. and read for degrees. In 1889 there were 36 students, which number had increased in 1928 to 991.

Barnardiston, Nathaniel Walter, Major-General (1858-1919), Brit. soldier. He was military attaché at Brussels in 1906, and in that year visited Gen. Ducarne, chief of the Belgian General Staff, to discuss the military measures that Great Britain would adopt in the event of a violation of Belgian neutrality by Germany. The conversations were in no sense a convention. Gen. Ducarne's marginal note to his précis of what took place made it clear that the sole object of the interlocutors was to enable each nation to make its military plans with full knowledge of each other's dispositions if Belgian neutrality were infringed. War did not in fact take place, but in 1912 a fresh menace arose and again conversations took place—this time between Lt.-Col. Bridges and Gen. Jungbluth—successors respectively of Col. (later Maj.-Gen.) B. and Gen. Ducarne—as to what Great Britain could do in a military sense in the event of an invasion of Belgium. The Ger. press endeavoured to make a case out of these conversations in 1914, when the records of them were found in the Belgian War Office.

Barnardo, Thomas John (1845-1905), Eng. philanthropist, b. in Ireland, and

came to study medicine at the London Hospital, where he became interested in the condition of destitute children. In 1867 he opened his first 'home of refuge' in Commercial Road, and in 1873 he founded a 'village home' of 52 cottages at Ilford, Essex, for training girls in home conditions. Large numbers of children, after education, have been successfully placed in Canada and other Brit. dominions. See J. W. Bready, *Dr. Barnardo: Physician, Pioneer, and Prophet*, 1930; A. E. Williams, *Barnardo of Stepney*, 1948.

Barnardo's (Dr.) Homes: National Incorporated Association, founded in 1866, with head offices in Stepney Causeway, E.1., having the charter 'No destitute child ever refused admission' and the motto 'For God and Country.' The objects of the homes were to rescue, train, and place out in suitable situations in life destitute, orphan, and forlorn children, irrespective of their age, sex, or creed; physical disability has been no bar to their admission, except in the case of the mentally defective and epileptic. Since its foundation, over 133,000 children had passed through its hands up to 1946. The average number in residence is about 8000.

The B. H. now have over 178 branches, consisting of separate cottages and households, as well as branches in Canada and Australia for immigrants; Receiving Houses, Isolation Houses, Service Girls' Home, Ever-Open Doors in the tns. of Belfast, Birmingham, Bradford, Bristol, Cardiff, Hull, Leeds, Liverpool, Newcastle, Plymouth, Portsmouth, Sheffield, and Southampton.

Some of the outstanding homes are the Girls' Village Home at Barkingside, Essex; the Watts Naval Training School, Norfolk; Boys' Garden City, Woodford Bridge, Essex; Dame Margaret's Home, Washington, Durham; Babies' Castle, Hawkhurst, Kent; homes for cripples and invalids at sev. spas; convalescent homes at Felixstowe and Hove; the Marie Hilton Crèche in Stepney Causeway.

Barnato, Barnett Isaacs (1852-97), Eng. financier, son of humble Jewish parents of Aldgate, educated under Moses Angel at Jews' Free School, Spitalfields; in 1873 went to S. Africa as conjurer and entertainer; later assumed the name of B., and traded as diamond dealer at Kimberley. In 1880 he estab. the London firm of B. Brothers; in 1881 floated the B. Diamond Mining Company, Kimberley. In 1888 amalgamated with De Beers Company, controlled by Cecil Rhodes. B. was a member of Kimberley divisional council from 1880; member for Kimberley in Cape Assembly, 1888 and 1894. He invested in mining and other property in the Rand (Transvaal), and was chief manipulator of the 'Kafir boom,' London, 1895, suffering heavy losses afterwards. B. drowned himself during a voyage from Cape Town. See H. Raymond's *Memoir*, 1897.

Barnaul, cap. of dist. of same name, Altai, R.S.F.S.R., at junction of Rs. Ob and Barnaul, 230 m. S.W. of Tomsk. It is the centre of a sugar-beet region with

sugar factories, flour-mills, and leather and textile industries. Pop. 148,000.

Barnave, Antoine Pierre Joseph Marie (1761-93), Fr. revolutionist, b. at Grenoble; became an advocate and early attracted attention in the tn. parlement. In 1789 he represented Grenoble in the States General, where for some time he had much influence as a leader of the popular party. He was one of the founders of the Jacobin Club, and successfully claimed the right of making peace or war for the National Assembly, in opposition to Mirabeau, who wished to leave it with the king. In 1791 he was one of the commissioners who brought Louis XVI. back from Varennes to Paris, and his sympathy seems to have been aroused, as after this he advocated more moderate and constitutional measures. In 1792 he was impeached on a charge of royalist sentiments, and guillotined in 1793. See *Life* by E. D. Bradby (2 vols.), 1913; also O. G. de Heldenstam, *The Letters of Marie Antoinette, Fersen, and Barnave*, Eng. translation, 1926; earlier *Lives* by Salvander (1883) and Janin (1860).

Barnburners, political faction in Amer. hist., so called about 1844 on account of their enthusiastic support of radical reforms, which was compared with the rigour of the Dutchman who burnt down his barn to destroy the rats. They grew dissatisfied with the scanty recognition they received in the Democratic national convention of 1848, and joined the Free Soilers in supporting the presidential candidature of Van Buren. In 1852 they compromised with their former opponents, the Hunkers, and were subsequently known as the Softs or Soft-shells.

Barnby, Sir Joseph (1838-96), Eng. musician and composer, b. at York; educated at Royal Academy of Music. In 1862 he became organist at St. Andrew's, Wells Street, London; in 1864 conductor of B.'s choir; conducted oratorio concerts at St. James's and Exeter halls; in 1872 succeeded Gounod as conductor of the Royal Albert Hall Choral Society; in 1875 became musical director at Eton College; and in 1892 principal of the Guildhall School of Music. He was knighted in 1892. He composed numerous hymn tunes, church services, anthems, vocal solos and trios, part-songs, and oratorial works, including the motet *King All Glorious*, the oratorio *Rebekah*, 1881, and *The Lord is King*, a setting of the 97th psalm.

Barnes, tn. of Surrey, England, situated on the r. b. of the R. Thames, 22 m. E. by N. of Richmond. Pop. 43,000.

Barnes, Albert (1798-1870), Amer. theologian, b. at Rome, in the state of New York. He was educated at Princeton theological seminary. After being in charge of a church in New Jersey, he became the minister of the first Presbyterian church at Philadelphia in 1830. He was tried for heresy, on account of the tone of some of his *Notes to the Epistle to the Romans*, but was acquitted. He was a gifted preacher, and latterly belonged to the new school of Presbyterians. He resigned, on account of failing eyesight, from

Philadelphia in 1867, and d. in that city on Dec. 24, 1870. He is best known for his notes to various books of the O.T. and N.T., which are admirably adapted for Sunday schools and Bible classes.

Barnes, Barnabe (1562-1619), Eng. poet, b. at Stonegrave, Yorkshire, son of a bishop of Durham. He was educated at Brasenose College, Oxford; went to France with the earl of Essex in 1591; became a friend of Gabriel Harvey, and late in life wrote a tragedy, *The Devil's Charter*, printed in 1607 and performed before James I. His works include *Parthenophil and Parthenope* (1593), a collection of sonnets, elegies, odes, madrigals; *A Divine Centurie of Spirituall Sonnets*, 1595; and *The Battle of Evesham*. He was clearly a very well-read man, for not only are there numerous classical allusions in his poems, but conventional It. conceits characterise the madrigals as well as imitations of 'Zodiac' imagery, so popular with contemporary Fr. amorous writers. Thus B. was to this extent thoroughly *à la mode*, but at the same time he was not without originality and is regarded as the legitimate precursor of Chapman, Donne, and the 'metaphysical' poets. He wants to storm the heights of Parnassus, and his impetuosity often involves him in incongruous imagery or other literary extravagances. Yet not seldom he reveals a senuous wealth of phrase, notably in his madrigals, and sometimes, though much more rarely, also a really happy consonance of idea and expression as in his best-known sonnet *Oh, sweet Content, where is thy mild abode?* and again he shows technical skill in the manipulation of both his unrhymed classical metres and his rhymed schemes. That his poems had considerable influence on Eng. writers generally is not to be doubted. The poems were ed. by A. B. Grosart in 2 parts, 1875.

Barnes, Ernest William, bishop of Birmingham since 1924; b. Apr. 1, 1874, eldest son of John Starkie B.; educated at King Edward School, Birmingham. At Trinity College, Cambridge, he had a distinguished mathematical career, being bracketed second wrangler, 1896. Ordained, 1902; canon of Westminster, 1918-24; master of the Temple, 1915-19; bishop of Birmingham, 1924. His reaffirmation (in face of growing Catholic disparagement) of the Darwinian evolutionary belief, and his prohibition in his diocese of the illegal practice of reservation of the sacrament (a practice tacitly admitting the doctrine of transubstantiation), brought him into conflict with Anglo-Catholics. On Oct. 16, 1927, when he was about to preach in St. Paul's, a London clergyman present called for his excommunication; and in 1930 he refused to defend himself in a civil court action by a recalcitrant presentee whom he had declined to admit. Publications: *Papers on Gamma Functions*, *Integral Functions*, *Linear Difference Equations*, contributions to the Transactions of the Royal Society, the Cambridge Philosophical Society, and the London Mathematical Society; also various sermons: *Should Such a Faith*

Offend?, 1927; *Scientific Theory and Religion* (Gifford Lectures), 1933; and *The Rise of Christianity*, 1947.

Barnes, George Nicoll (1859-1940), Eng. statesman. His political life was spent in labour and trade union politics. Was general secretary of the Amalgamated Society of Engineers, and chairman of the Parliamentary Labour party, which he represented in Lloyd George's War Cabinet. Entered Parliament in 1906 and sat for a Glasgow div. until 1922. Cabinet minister 1917-20 and member of Peace Conference, 1919. His greatest service was the draft proposals he prepared for the Commission on World Labour, which subsequently developed into the International Labour Office. He was created Companion of Honour in 1920.

Barnes, Harry Elmer (b. 1889), Amer. educationist, educated at Columbia Univ. and, for research work, at Harvard. He has held many fellowships and lecturerships in Clark Univ., Smith College, and Amherst College. Was historian to Panama Canal Commission, 1918; statistician to the War Dept. in 1918. In 1930, because of the greater freedom of expression it offered him, he resigned his college posts to join the editorial staff of the Scripps-Howard newspapers, and remained with them for 10 years. In 1937-38 he was also lecturer in education at the Teachers' College, Columbia Univ. Publications: *Sociology before Comte*, 1917; *History—its Rise and Development*, 1919; *Evolution of Penology in Pennsylvania*, 1922; *The New History and the Social Studies*, 1924; *Studies in American Imperialism* (7 vols.), 1928-36; *A History of Western Civilisation* (2 vols.), 1935; *An Economic History of the Western World*, 1937; *Social Thought from Lore to Science* (2 vols.) (with H. Becker), 1940; *The Four Great World Revolutions*, 1944.

Barnes, Joshua (1654-1712), Eng. scholar, b. in London. He was educated at Christ's Hospital, and afterwards went to Emmanuel College, Cambridge. He was elected regius prof. of Gk. at Cambridge in 1695; in 1700 he married Mrs. Mason of Hemingford, a widow lady with a good jointure, a large part of which he devoted to the publication of his Homer; in 1711 he wrote to Harley 3 letters, which are preserved in the Harleian collection (B. Mus. 7523), begging for preferment, but in vain. His widow erected a monument to his memory of Hemingford. His name is best known for his ed. of Homer, 1711, 2 vols. 4to, and of Euripides, 1694, folio. For his 'injudicious publications' and his quarrel with Bentley, see *Jebb's Bentley* in Eng. Men of Letters, 1881, pp. 35-6.

Barnes, Juliana, see **BERNERS**.

Barnes, Robert (1495-1540), Eng. reformer and martyr, educated at Cambridge. In 1526 he was condemned to abjure or be burnt for preaching a heterodox sermon. He was sent to Germany in 1535 to induce the Lutheran divines to approve of Henry VIII's divorce. He attacked Bishop Gardiner in a sermon at St. Paul's Cross, and in consequence of this was burnt.

Barnes, Thomas (1785-1841), Eng. journalist and editor of *The Times*. He was educated at Christ's Hospital and Pembroke College, Cambridge, taking his degree in 1808. He took up the profession of journalism in London, and was a member of the literary circle which included Leigh Hunt, Hazlitt, and Charles Lamb. He was at first an advanced Liberal, but his opinions had sufficiently changed to enable him to take over the editorship of *The Times* when Dr. Stoddart retired in 1817. He was responsible for the remarkable change in the outlook of the paper which took place between 1831 and 1835.

Barnes, William (1801-86), Eng. clergyman, philologist, and poet, *b.* at Rushay, Dorsetshire. In 1823 he went to teach in a school at Mere, Wiltshire; in 1835 became master of the grammar school at Dorchester; in 1847 was ordained and became curate of Whitcombe; in 1862 became rector of Winterbourne Came, where he spent the rest of his life. His Dorsetshire poems exhibit a deep love of nature, and a keen knowledge of his rustic neighbours. They are steeped in Dorset lore and written in the Dorset dialect. The 3 collections appeared under the names of *Poems of Rural Life in the Dorset Dialect*, with a *Dissertation and Glossary* (1844); *Homely Rhymes* (1859), and *Poems of Rural Life in the Dorset Dialect* (1879). His philological works include *Philological Grammar* (1854); *Se Gefyllta, an Anglo-Saxon Delectus* (1849); *Tiw; or, a View of Roots and Items of the English as a Teutonic Tongue* (1861); and *A Grammar and Glossary of the Dorset Dialect* (1864). Life by his daughter, Lucy Baxter ('Leader Scott'), 1887.

Barnet, urb. dist. and mrkt. tn. of Hertfordshire, England, 11 m. N. of London by rail. It is notable for its horse fair which is held in Sept. An obelisk near the tn. marks the site of the battle of 1471, in which the Lancastrians, under Warwick, who was killed in the fight, were defeated by Edward of York. Chipping B. is within the urb. dist., and New and East B. are suburbs. Pop. (1931) 16,000. Friern B., Middlesex—so called because the manor belonged to the friary of St. John of Jerusalem—about 3 m. S., is a separate urb. dist. Pop. 18,000.

Barnett, Henrietta (1851-1936), Eng. social worker, wife of Canon S. A. Barnett (*q.v.*). She started the Children's Country Holiday movement in 1878 and, soon afterwards, the London Pupil Teachers' Association, of which she was president from 1891 to 1907. Co-operated in the formation of the Whitechapel Art Gallery, which was opened in 1901, and collaborated with her husband in much of his work. Created D.B.E. in 1924.

Barnett, John (1802-90), Eng. composer, *b.* at Bedford; composed songs, part-songs, instrumental music, and operas. His works include: *The Omnipresence of the Deity*, 1830; *Lyrical Illustrations of the Modern Poets*, 1834; *The Mountain Sylph*, 1834; *Fair Rosamund*, 1837.

Barnett, John Francis (1837-1916), Eng.

pianist and composer, *b.* in London Oct. 16, studied at Royal Academy of Music, London, and Leipzig Conservatorium; became prof. at the Guildhall School of Music and the Royal College of Music. In 1861 he played at a Gewandhaus concert at Leipzig, and his first noteworthy composition, a symphony in A minor, was performed in 1864 by the Musical Society of London. His works, mainly cantatas, include: *The Ancient Mariner*, 1867; *Paradise and the Peri*, 1870; *The Lay of the Last Minstrel*, 1873; *The Raising of Lazarus*, 1876; *The Building of the Ship*, 1880; *The Wishing Bell*, 1893; *Liebeslied im allen Styl*, 1895. *D.* in London Nov. 24.

Barnett, Samuel Augustus (1844-1913), Eng. clergyman and philanthropist, *b.* at Bristol, becoming canon there, 1893. One of the founders and warden of Toynbee Hall (*q.v.*), Whitechapel, 1884-1906, becoming president 1906. Canon of Westminster, 1906; president of the Sunday Society, curate, St. Mary, Bryanston Square, 1867-72; vicar, St. Jude's, Whitechapel, 1872-94. Chairman, Whitechapel Board of Guardians, 1894, also Children's Country Holiday Fund. Select preacher, Oxford, 1895; Cambridge, 1899 and 1905. *B.* pub. *Practicable Socialism* (with his wife), 1888; *The Service of God*, 1897; *Religion and Progress*, 1907; *Towards Social Reform* (with his wife), 1909; *Religion and Politics*, 1911. See H. O. Barnett, *Canon Barnett: his Life, Work, and Friends*, 1918.

Barneveld, tn. in Gelderland, 17 m. N.W. of Arnhem, Netherlands; pop. 12,000.

Barneveldt, Jan van Olden (1547-1619), Dutch statesman, grand pensionary of Holland. He was *b.* at Amersfoort in Utrecht. He studied law and divinity at Heidelberg and The Hague, and at the latter settled down as an advocate in 1569. He was appointed one of the advocates of the court, and was chosen counsellor and pensionary of Rotterdam in 1576. In his capacity as advocate-general and grand pensionary, *B.* headed a deputation to England to make a formal offer of the revolted provs. of the Netherlands to Queen Elizabeth. *B.* now became leader of the republican party, opposed the war policy of Prince Maurice, and brought about a truce with Spain in 1609, which lasted 12 years. He took the side of the Arminians against the Calvinists, who were supported by Maurice. In 1616 *B.*'s influence was increased by his having obtained from James I. the restoration of the cautionary tns., which had been given up to Elizabeth as securities for the money which she had lent the states by the treaty of 1585. In 1618 a national synod, known as the Synod of Dort, was summoned to settle the great struggle between the Arminians and the Gomartites. *B.* and his friends Grotius and Hoogerbeets were arrested, and the trial of the prisoners commenced Nov. 19, 1618. *B.* was found guilty, and was beheaded in the courtyard of The Hague in May 14, 1619. See Motley's *Life of Barneveldt*, 2 vols., 1874.

Barney, Joshua (1759-1818), Amer. naval

officer, *b.* at Baltimore, Maryland, U.S.A. He entered the naval service, and at the age of 17 obtained the commission of lieutenant in the Amer. Navy. When in active service on board the *Saratoga* he was placed as prize-master of a captured Brit. ship, which in an almost sinking condition was recaptured by an Eng. 74-gun ship, and *B.* sent to England. In 1782 he escaped from prison and returned to America, where, as commander of a small ship of war, he captured a brig belonging to the Brit. Navy off Delaware. For this he received the thanks of the legislature of Pennsylvania and was promoted to the rank of commodore. He was afterwards sent with dispatches to Dr. Franklin in Paris and returned with the news of the signing of preliminary articles of peace between England and America, 1784. When war broke out in 1812, he joined in a land attack at Bladensburg, and received a wound in the leg from which he never recovered. He *d.* at Pittsburg.

Barnfield, Richard (1574-1627), Eng. poet, *b.* at Norbury, Shropshire, and spent most of his life at Stone, Staffordshire. He wrote sonnets and pastorals. His works include: *The Affectionate Shepherd*, 1594, a pastoral based on Virgil's second eclogue; *Cynthia, with certaine Sonnets and the Legend of Cassandra*, 1595; *The Encomion of Lady Pecunia*, etc., 1598, which contains 2 of his best songs, *As it fell upon a Day and If Music and Sweet Poetry agree*. These were reprinted in *The Passionate Pilgrim*, 1599, and long attributed to Shakespeare.

Barnoldswick, urb. dist. of W. Riding, Yorkshire, England, 8 m. from Skipton, on the Liverpool-Leeds Canal. Has cotton weaving industries. Pop. 12,000.

Barnsley, tn. of W. Riding, Yorkshirc, England, on R. Dearne, 12 m. N. of Sheffield. It is in a rich coal-mining dist., and has manufs. of textiles, glass, iron, needles, paper, wire, and boots and shoes, besides bleaching and dye works. The tn. dates from pre-Norman times, but contains few old buildings. It was incorporated in 1869, and has a fine public hall, a park of 20 ac., libraries, baths, etc. The B. Canal connects it with Leeds and Wakefield. The bor. was extended in 1921. It returns a member to Parliament. Pop. (estimated 1937), 72,500.

Barnstable: 1. Seaport of Devon, England, on R. Taw, 6 m. from the mouth, 34 m. N.W. of Exeter; pop. 15,000. It contains a fourteenth-century par. church, an old grammar school, endowed in 1649, and occupying part of a ruined monastery, at which the poet John Gay was educated, and some quaint old houses in Bontport Street. The riv. is crossed by a twelfth-century bridge of 16 arches. The silting up of the tidal harbour has robbed the tn. of its commercial importance, but there are manufs. of lace, gloves, and pottery (Barum ware). It was formerly a centre of broadcloth weaving. 2. Seaport and post tn., cap. of B. co., Massachusetts, U.S.A., is situated 74 m. S.E. from Boston, on the S. side of B. Bay, which opens into Cape Cod Bay. There is a bar across the mouth of the bay, with 6 or 7 ft. of water.

From 50 to 60 fishing and coasting vessels belong to the port. Pop. 8300.

Barnum, Phineas Taylor (1810-91), Amer. showman, *b.* at Bethel, Connecticut; entered a country store in 1823; went into the lottery business in 1828; in 1829 married and went to Danbury, where he ed. *The Herald of Freedom*. In 1834 he removed to New York and made a considerable profit by exhibiting Joyce Heth, supposed to be the nurse of George Washington. In 1841 he bought the Amer. Museum in New York, and made it famous by his collection of real and pretended wonders. In 1847 he acted as manager for Jenny Lind, and in 1871 estab. his 'Greatest Show on Earth.' He pub. an *Autobiography*, 1854, enlarged in 1888; *Humbugs of the World*, 1865; *Struggles and Triumphs*, 1869; and *Money-getting*, 1883. See his *Life* by Benton, 1902, and also M. R. Werner, *P. T. Barnum*, 1923, and H. W. Root, *The Unknown Barnum*, 1927.

Baroach, Broach, or Bharuch, anct. city and modern dist. in the N. div. of the Bombay Presidency, India. The city is situated on the r. b. of the Nerbudda, 203 m. N. of Bombay. It has cotton and flour mills. The dist. has an area of 1467 sq. m., and cultivates crops of cotton, millet, wheat, and pulse. Pop. of the dist. 300,000, of the tn. 48,000.

Baroccia, or Baroccio, Federigo (1528-1612), It. painter, *b.* and *d.* at Urbino, son of eminent sculptor. Studied under Battista Veneziano, and was patronised by Cardinal della Rovere at Rome, whose palace he ornamented with frescoes. After 4 years he returned to Urbino, and painted a picture of St. Margaret for the Confraternity of the Holy Sacrament. At the invitation of Pope Pius IV. he assisted in the embellishments of the Belvedere palace, on which Zuccherro was also engaged. Here he executed the Annunciation in fresco on one of the ceilings, and a picture of the 'Holy Virgin with the Infant Saviour, with Saints.' His other works include an altar-piece of the 'Deposition or Descent from the Cross' in the cathedral of S. Lorenzo at Perugia; a picture of the 'Last Supper for the church of Minerva; and the 'Visitation of the Virgin Mary to Elizabeth.'

Baroche, Pierre Jules (1802-70), Fr. advocate and minister of state, *b.* in Paris; became an advocate in 1823; in 1847 entered the Chamber of Deputies as member for Rochefort; in 1848 was elected to the Constituent Assembly; in 1850 became minister of the Interior, and in 1851 minister of foreign affairs. Having become a partisan of Louis Napoleon, he was appointed president of the Council of State after the *coup d'état* of 1851, and in 1863 he became minister of justice. At the fall of the second empire in 1870 he fled to Jersey, where he *d.*

Baroda: 1. Native state in Gujarat div. of Bombay, India. The ter. is scattered, but the total area is 8200 sq. m. It is ruled by a feudatory Mahratta chief, known as the gawkwar. The dist. is very fertile. Pop. (1941) 2,855,000. 2. Cap. city of above state, on R. Visvamitri.

248 m. N. of Bombay, with which it is connected by railway. It has fine water-works, constructed in 1892, and contains B. College, the palace of the gaekwar, known as Lakshmi Villas, the Naulakhi Wells, the state library, the Dufferin Hospital, an Anglo-vernacular school, etc. It has a large trade in grain, flax, cotton, and tobacco. See P. W. Sergeant, *The Ruler of Baroda* (London), 1928. Pop. 100,000.

Barograph, instrument by which the variations of atmospheric pressure are permanently recorded. An efficient B. for use in connection with a mercurial barometer is provided by placing a moving strip of photographic paper behind the upper part of the mercury column. The light is concentrated by a lens upon the top of the column, which partly obscures the paper slowly passing behind a narrow slit. The width of the paper unaffected by light thus gives a means of indicating the movements of the mercury column.

BAROGRAPH

The B. commonly used with barometers of the aneroid pattern consists of a system of levers by which the movements of the collapsible chamber are communicated to a pointer, which acts as a pen and makes records on a chart wound round a cylinder revolving by clockwork once a day or once a week.

Barometer, instrument for measuring the weight or pressure of the atmosphere. The action of a suction pump in raising water was explained prior to 1643 by the principle that 'nature abhors a vacuum.' Galileo had observed that water could not be raised by the ordinary pump more than about 32 ft., and he recommended the study of the matter to his pupil Torricelli, who made the following experiment in 1643: A glass tube, about 3 ft. long, closed at one end, is completely filled with mercury and inverted, the open end placed in a trough of mercury, and the thumb removed. The mercury at once falls in the tube to within 30 in. of the level of the mercury in the bath, the space above forming what is known as the Torricellian vacuum. As mercury is about 13½ times as heavy as water, Torricelli concluded that the force required to support the column of mercury would support a column of water of the same diameter and about 34 ft. high, and that the action of the pump and the sustaining of the column of mercury both depended on the pressure of the atmosphere acting

on one side of the liquid column. The validity of the conclusion was proved by Pascal, who caused Torricelli's experiment to be performed on the summit of the Puy de Dôme. The column of mercury was found to be 3 in. lower, showing that the pressure supporting the liquid diminishes with ascent to higher levels of the atmosphere. Pascal also performed experiments with water, oil, and wine, and found that columns were supported the heights of which were inversely proportional to the specific gravities of the liquids; and that in each case a weight of about 15 lb. of liquid was supported upon 1 sq. in. of surface. Any variations in the height of the Torricellian column are accounted for by variations in the pressure of the atmosphere, so that such an instrument, when suitably fitted up for permanent use, forms an efficient B.

Cistern Bs. The simplest form of cistern B. consists of a glass tube about 33 in. long, containing mercury and dipping into a cistern also containing mercury. It is fastened to a wooden stand, on the upper part of which is a brass scale indicating the height above the average level in the cistern. The instrument is liable to the 'error of capacity'; that is, any diminution in the amount of mercury in the tube raises the level in the cistern, and vice versa, so that the scale does not always indicate the correct height of the column. In *marine Bs.* this error is avoided by graduating the scale, not in true inches, but in spaces which have been arrived at empirically as representing the correct height. In *Fortin's B.*, the bottom of the cistern is made of leather, and can be pushed up by means of a screw until the surface of the mercury in the cistern touches the end of a fixed ivory point, which is the starting-point of the scale. The glass tube is encased in a brass cylinder with 2 slits about 6 in. long on opposite sides to enable the top of the mercury column to be plainly seen. A brass collar with a vernier scale slides over the scale on the brass cylinder; the collar is provided with 2 slits slightly wider than the slits in the cylinder, and the scale is adjusted by bringing the upper edge of the slits down to the topmost point of the convex curve at the top of the mercury column. It is necessary that the mercury column should be exactly vertical for the scale to give a correct reading; this is effected by a Cardan's suspension, in which the tube is fixed above its centre of gravity in a collar which swings on a horizontal axle pivoted in a surrounding ring, which in its turn swings on an axle at right angles to the first and pivoted in a fixed supporting ring; the tube can thus take up a plumb-line position whatever may be the movements of the support. Another error to which cistern Bs. are liable is due to *capillarity*, or the reluctance of the surface of the mercury—a liquid which does not 'wet' the glass—to rise to the height determined by pressure. This error may be diminished by using tubes of more than eight-tenths of an in. in diameter.

Siphon Bs. The simplest form of

siphon B. consists of a bent glass tube; one arm is about 36 in. long and is sealed, while the other arm is about 8 in. long and is open. Mercury is poured in and worked to the closed end until the long arm and part of the short arm are full. When placed with the closed end uppermost, the mercury falls until the level in the closed arm is about 30 in. above the level in the open arm. To make an observation,

FORTIN
BAROMETER

PRINCIPLE
OF WHEEL
BAROMETER

therefore, the height of the mercury in both arms must be taken, the difference giving the true barometric column. Owing to the subtraction, the error of capillarity disappears, and there is no error of capacity. The inconvenient nature of the observations, however, and the possibility of impurities affecting the mercury at the open end, constitute such disadvantages that the instrument is not in favour for exact work. In the Hooke or wheel B., the observations are rendered easier by placing a glass float in contact with the mercury, having attached to it a thread which passes over a pulley. The thread is pressed against the pulley by a

small weight which almost balances the float. The movement of the pulley is communicated to a pointer which sweeps around a graduated dial, which also bears such inscriptions as 'stormy,' 'set fair,' 'very dry,' etc., giving information of doubtful value. In Gay-Lussac's form of the siphon B. the 2 arms are joined by a capillary tube. When inverted for carrying, the mercury is nearly all contained in the longer arm, and the capillary tube prevents the entrance of air. In Bunten's improved form the entrance of a small quantity of air is made of no account by the provision of a funnel or 'air-trap' between the cistern and the top of the mercury column. The air-bubbles are entrapped in the funnel, and therefore do not find their way to the Torricellian vacuum.

Corrections. In mercurial Bs. for accurate work the scale is engraved on brass, the co-efficient expansion of which is accurately known. The increase in length of the scale due to a rise in temp. thus tends to make the reading lower than it should be. On the other hand, the mercury also expands on a rise in temp., its density therefore diminishes, and the height of the column supported by the atmospheric pressure is greater than at the standard temp., 0° C. or 32° F. The barometrical readings have therefore to be corrected for temp., and with many instruments tables are provided, indicating the corrections necessary to reduce the readings to 0° C. or 32° F. To apply the corrections for errors of capillarity it is necessary to know the internal diameter of the tube and the height of the *meniscus*, or curved surface. Reference to a table with respect to these 2 quantities will indicate the amount required to be added to the observed reading.

Variations in barometrical height are of 2 kinds, periodic and accidental. The periodic variations are those which occur with a fair amount of regularity at certain hrs. of the day. Accidental variations are those which depend on a variety of conditions: the direction of the winds, geographical position, and the amount of water vapour present in the air. In temperate lat. the accidental variations are by far the most important, and are so considerable as to render observation of any periodic variations very difficult. At the tropics, accidental variations are practically non-existent, and the daily fluctuations take place with great regularity. The cause of barometrical variations is the difference in the sp. gr. of the air occasioned by differences in temp. Thus the B. tends to fall from noon until about 4 o'clock, as the air becomes lighter from the heating effect of the sun; it then rises until it reaches its maximum at about 10 o'clock in the evening. In W. Europe, the warmest and lightest winds are those blowing from the tropics over the Atlantic Ocean; these usually affect the higher reaches of the atmosphere first, diminishing the total pressure, so that a fall in the B. usually indicates the advent of a moist S.W. wind, and therefore the possibility of rain. The B.

is in this way useful as a guide to the probable weather; in other lats., however, it by no means follows that a falling B. is an indication of rain or stormy weather.

Uses of the B. As indicated above, the B. may be used to foretell weather conditions if the peculiar circumstances of the region are known. It is also used as a hypsometer, or instrument to measure height above sea level, as the density of the air for a constant temp. is proportional to the pressure of the superincumbent atmosphere. The B. is also used in physical experiment and in industry to indicate the pressure of gases in terms of atmospheric pressure. Standard atmospheric pressure is understood, in physics, to mean the pressure which sustains at the sea level, and at a temp. of 0° C., a vertical column of mercury 760 mm. high. In engineering, the pressure of one atmosphere means a pressure equivalent to 15 pounds on each sq. in. of surface. It has been suggested that the standard pressure should be represented in terms of force as one million dynes per sq. cm., this being equivalent to a barometric height of 29.513 in. or about 750 mm. at Greenwich, the acceleration due to gravity at that place being taken as 981.17 cm. per sec. The pressure of 1,000,000 dynes per sq. cm. is known as a bar, though in the U.S.A. this name is given to a pressure of 1 dyne per sq. cm. The bar is used chiefly in meteorological work. See also ANEROID; METEOROLOGY. See F. C. Marvin, *Barometers and the Measurements of Atmospheric Pressures*, 1912; Sir R. T. Glazebrook (ed.), *A Dictionary of Applied Physics*, 1922-23; G. W. C. Kaye, *High Vacua*, 1927; London Meteorological Office, *The Observer's Handbook*. See also bibliography to article METEOROLOGY.

Barometz (Russian *barametz*, dimin. of *baran*, ram) prostrate hairy stem of a fern, *Cibotium barometz*, about which an extraordinary superstition arose. It was called Scythian lamb, and its shaggy appearance and crouching attitude gave rise to the fable that it was partly animal, partly vegetable, and devoured all plants in its vicinity.

Baron, word of uncertain origin, introduced at the Norman Conquest to denote the 'man,' or vassal, of a lord. Originally the term was of wide application, but in England the process of limitation began early. The word was first restricted to those who held land directly from the king by military tenure, and by the thirteenth century the div. of these into greater and lesser Bs. had become common. Magna Charta in 1215 provided that the lesser Bs. should be summoned to the Great Council only through the sheriffs, while to the greater Bs., i.e. nobility from earls downward, a special summons should be sent by the king. This summons gradually became the badge of peerage, restricting the privilege to the greater Bs. alone. Till this point the position of a B. was that of a holder of the king's land, but the personal note became dominant in 1387, when the creation of Bs. by letters patent was in-

augurated. In that year Richard II. created John de Beauchamp B. of Kidderminster. The practice, however, did not become general until the reign of Henry VI. The creation of B. by writ, formerly an ordinary proceeding, was almost entirely discontinued. The B.'s coronet (granted by Charles II.) is of ermine with 6 large pearls set round the chaplet. Bs. of the exchequer was the title long given to the 6 judges in the court of exchequer, and the name Bs. of the Cinque Ports shows the retention of the freer use of the word. It designated the chief officials and parl. representatives of the 5 great S. ports in the House of Commons. On the Continent the title was given a wider application than in Great Britain. In France only those bearing a name of historic note receive status from the title of B., and in Germany the title, which is handed down to all the children, became quite dissociated from all idea of possession of land.

Baron and Femme, or *Feme*, Norman-Fr. words used to denote husband and wife in their mutual relationship. In heraldry the words denote the bearing of the arms of husband and wife per pale, i.e. side by side on the same escutcheon, the husband's always being on the dexter side.

Baron, Bernhard (1850-1929), Amer. tobacco merchant and philanthropist; b. at Brest-Litovsk, Russia, of poor Jewish parents. His childhood was spent among the Don Cossacks at Rostov. His father, whose experience had imbued him with a horror of conscript life, took him to America to avoid his conscription. He began work as a boy in a New York tobacco factory, where he sometimes slept in a shed. He invented a cigarette-making machine, unmarketable in America, which he brought to England and sold for £160,000, 30 years after leaving Russia. In 1903 he bought the small tobacco business of Mmc. Carreras. For 5 years it made no profit; afterwards it became a limited company with B. as chairman. He d. worth nearly 5 million sterling, at Brighton, Aug. 1, 1929. His benefactions include £25,000 in 1927 to endow a pathological institute to bear his name; a gift of £50,000 for rebuilding of St. George's Jewish Settlement in the E. end of London; in 1928 a trust of £500,000 to be used for hospitals and homes for orphans and crippled children during the succeeding 20 years; in 1934 a gift of £10,000 was made from the B. B. Charitable Trust Fund to the Brit. Empire Cancer campaign, and in 1936 a gift from the same trust for new research laboratories for the Royal College of Surgeons.

Baronet, title created by James I. in 1611, to obtain funds for the defence of Ulster. Each B. was required to supply the funds for keeping 30 soldiers in Ireland (at the rate of 8d. per day) for 3 years. It was promised that the number of Bs. created should not exceed 200, and it was also stipulated that the honour could only be conferred on a man who had a clear revenue of £1000 from lands, and whose family had borne arms at least as far back

as his grandfather. It conferred the prefix 'Sir' on the B., and 'Lady,' or 'Dame,' on his wife, and gave him precedence over all other knights, but not over the younger sons of barons. In 1625 Charles I. instituted Bs. of Nova Scotia in Scotland. This was a scheme for the colonisation of that colony, and grants of land were made to the new Bs., who paid 3000 marks for the honour. The number, not to exceed 150, was never completed. In 1629 they received the right of wearing a badge, suspended by an orange-tawny ribbon, with a saltire azure, thereon an inescutcheon of the arms of Scotland, surmounted by an imperial crown, round the whole a motto, *Fax mentis honestæ gloria*. In 1707 they were created Bs. of the U.K.

Baronius, Cæsar (1533-1607), It. eccles. historian, b. at Sora in Naples, the son of Camillo Baroni and Porzia Feboria. He studied divinity and law at Naples, and afterwards at Rome, where he was the pupil of St. Philip Neri, whom he succeeded as superior of the congregation of the oratory, 1593. In 1596 he was made cardinal, and in 1597 librarian of the Vatican; but failed to become pope in 1605 owing to the opposition of the Spaniards. His most celebrated work, *Annales Ecclesiastici a Christo Nato ad Annum 1198* (12 vols. 1588-1607), was written in reply to the Protestant work entitled *Magdeburg Centuries*, and its object was to show that the doctrine of the Church of Rome was identical with that of the early Christian Church. Another work of B. worthy of note is *Martyrologium Romanum*, 1586. According to Mazzuchelli (*Scrittori d'Italia*, fol. Brescia, ii. pt. i. p. 387), there are 19 works of B. in print and MS.

Baron of Beef, large piece of beef consisting of both sides of the back, a double sirloin, sometimes weighing 100 lb. This huge joint was only served at great public entertainments, notably at civic feast at Guildhall, London. The origin of the name is unknown, but legend ascribes it, as well as Sir Loin, to a jest of Charles II.

Baronscourt, Irish seat of the duke of Abercorn in Co. Tyrone, N. Ireland, 3 m. S.W. of Newtown Stewart. Also the name of a London dist. between Earls Court and Hammersmith, on the Dist. Railway.

Barons' War, *The*, see under MONTFORT, SIMON DE.

Baroque (from Portuguese, *barroco*, rough pearl), term originally restricted to the jeweller's trade, but now chiefly used in architecture. The term signifies the extravagant, capricious, incongruous, but sometimes picturesque ornament of the late Renaissance. B. architecture, the decorative style of the eighteenth century, may be compared to the Louis Quinze style, but is differentiated by its clumsy forms, especially exemplified in eccles. buildings and in a contorted ornamentation of meaningless scrolls and shell-work. In this latter connection the word baroque is frequently used as a synonym for rococo, but strictly the latter term is applied to ornamentation of

the same period which, though inorganic and exuberant, yet has elements of beauty and artistic qualities; while the term baroque may imply repellent qualities. Many examples of B. architecture are supplied by the Jesuits—whence the style has sometimes been called the Jesuit style. See Sacheverell Sitwell, *Southern Baroque Art*, 1924.

Baroscope (Gk. *βάρος*, pressure, and *σκοπέω* to look), type of barometer which indicates only variations of the atmospheric pressure, but does not, as the ordinary barometer does, supply any quantitative data.

Barosma, **Buohu**, or **Bucku**, name of a genus of Rutaceæ found in S. Africa as an evergreen shrub. *B. crenata* is one of the Bucku plants of the Cape. The leaves are employed in medicine as a diuretic.

Barotac or **Barotag Nuevo**, tn. of Panay Is., Philippine Is., situated in a fertile dist. of Iloilo. Pop. 20,000.

Barotseland, former kingdom of Central Africa, in the Upper Zambesi. It now forms the dist. of N.W. Rhodesia, and is a native reserve, Europeans, except for missionaries, traders, and officials who have been approved by the paramount chief, not being permitted to settle. Lewanika, who d. in 1916, put B. under Brit. protection. He was succeeded as paramount chief by his son, Yeta III. The dist. is well watered and fertile, and supports a large pop., the Barotse being the most capable and adaptable of the N. Rhodesian natives. Many of them are Christians. The migration to the N. and S. Rhodesian and S. African mines of so many of the younger men involves their detribalisation with consequent hardship to their families, through the destruction of their social organisation. Lialui is the cap. and the residence of the chief, but Mongu, 7 m. away, is the chief station and Brit. residency. Other stations are Nalolo and Shesheke. There is a postal service from Lialui to Bulawayo. Consult D. W. Stirke, *Barotseland*, 1922.

Barousse, valley in the Hautes-Pyrénées, France.

Barozzi, or **Barocchi**, see VIGNOLA.

Barpeta, tn., Kāmrup dist., Assam, India. Pop. (chiefly Hindu) 10,000.

Barque, or **Bark**, originally any small ship, but now more particularly a three-, four-, or five-masted sailing vessel, with fore and main masts square-rigged, but mizzen-mast rigged fore and aft, i.e. in a line with the run of the ship. Formerly they were small vessels only, but later four-masted steel Bs. range between 2300-3000 tons.

Barquisimeto, cap. city of state of Lara, Venezuela, on B. R., 165 m. S.W. of Caracas. It is a bishop's see and contains a college, cathedral, gov. palace, etc. It stands in a fertile agric. and stock-raising dist., and does a large trade through its port, Tusacas. Pop. 36,500.

Barr, tn. in Bas-Rhin, France. It is 18 m. S.W. from Strasburg, and is noted for its mineral baths. Pop. 4000.

Barr, or **Barra**, formerly a petty kingdom of W. Africa, at the mouth of the

Gambia. This and some neighbouring kingdoms on the Gambia were founded by Amari-Sonko, a Mandingo warrior, apparently for the purpose of facilitating the operations of the traffic in slaves.

Barr, Amelia Edith (1831-1919), Anglo-Amer. authoress, *b.* at Ulverstone, in Lancashire, England; educated in Scotland, and after her marriage with Robert Barr went to Texas. Removed to New York in 1869 after the death of her husband. Among her works are: *The House on Cherry Street*, 1909; *Belle of the Bowling Green*, 1908; *Remember the Alamo*; *A Border Shepherdess*, 1887. See autobiography *All the Days of My Life*, 1913.

Barr, Archibald (1855-1931), Scottish inventor, *b.* in Renfrewshire. Educated at Paisley and Glasgow Univ., where he was regius prof. of civil engineering and mechanics, 1889-1913. Invented with Stroud naval range-finders, adopted by Brit. Admiralty and foreign govts.; also various range-finders for fortress and field service, electrical fire control instruments for use between fire control positions and gun stations of war-vessels (adopted by Brit. Admiralty), and a pump for producing high vacua. Also inventor of height-finders for the anti-aircraft services, torsion dynamometers and power meters, instruments for use in air surveying, and improvements in the optophone.

Barr, Robert (1850-1912), Eng. novelist, *b.* in Glasgow. Educated at Normal School, Toronto; headmaster of Central School, Windsor, Canada, till 1876. Then joined editorial staff of *Detroit Free Press*, his contributions to which were signed 'Luke Sharp.' In 1881 *B.* came to England, founded the weekly *Free Press*, and in 1892 founded the *Idler* with Jerome K. Jerome, remaining co-editor till 1895. Among his best works are *In the Midst of Alarms*, 1894; *A Woman Intervenes*, 1896; *Revenge!*, 1896; *The Countess Tekla*, 1899; *The Strong Arm*, 1900; *The Unchanging East*, 1900; *The Tempestuous Petticoat*, 1905; *Stranleigh's Millions*, 1908; *The Sword-maker*, 1910.

Barra, tn. about 3 or 4 m. E. of Naples. Pop. of commune 13,000.

Barra, is. of Inverness-shire, Scotland, near the S. extremity of the Outer Hebrides. Historically it is famous as the scene of the victory of Robert Bruce, 1308. Pop. 2000.

Barraokpur, tn. of dist. Twenty-four Parganas, Bengal, India, on R. Hugli, 15 m. N. of Calcutta. It is a European health resort and country residence of the viceroy. There were sepoy mutinies here in 1824 and 1857. The native name of Charnack is reminiscent of Job Charnock, the founder of Calcutta. Pop. 39,000.

Barracks, set of buildings with all conveniences for human habitation and generally used for the accommodation of units of the fighting forces and police. The nature, site, and construction of barracks were usually determined by the strategic or other employment of the troops, etc., which had to occupy them. Hence those of the sovereign's bodyguard were built in London and at places near

the king's residences; *B.* near the coast are constructed more in the nature of forts; whilst the sites of those at depots in the country are chosen more from health reasons. The *B.* include parade ground and open spaces for drill and manœuvres. *B.* are generally built in blocks, to accommodate 2 companies each, and are divided into officers' quarters, men's quarters, and quarters for married soldiers and sergeants. The officers' mess usually consists of a dining-room, ante-room, billiard-room, and offices. Each officer has his own private rooms, the number varying according to rank, and special accommodation is made for married officers. The married soldiers usually have separate houses each, with rooms varying in number according to the number of their children. The soldiers are catered for by the regimental institute, which consists of the canteen and the recreation establishment. Reading-rooms, coffee bars, gymnasiums, billiard-rooms, and other recreation rooms are provided in *B.* to make the life as comfortable and attractive as possible. There are separate buildings, constructed and set apart for hospitals, stables, stores, miniature rifle ranges, guard-rooms, cook-houses, schoolrooms for children, and in the larger garrisons, garrison schools and libraries.

Formerly accommodation was not provided for soldiers, who were accordingly billeted on the people. It was not till the end of the eighteenth century that permanent buildings for soldiers came to be built. Before the nineteenth century soldiers were accommodated in scattered billets, which was unsound from a tactical point of view when troops were needed to turn out suddenly against a threatened point or to proceed on special duty where speed was essential. At the headquarters of every fighting force there is a department charged with the duty of looking after *B.* in all their aspects, including prevention against fire.

Barracuda, **Barracouta**, or **Barracoota**, large pike-like fish of the family Sphyrænidæ and order Teleostei. *Bs.* are carnivorous, and some varieties are esteemed as a food, though at times they are poisonous.

Barracfranca, tn. of Sicily, situated 1470 ft. above the level of the sea, 10 m. S.E. of Caltanissetta, in the prov. of that name. Pop. 12,000.

Barrage: (1) Engineering: an artificial obstruction placed in a water-course to obtain increased depth of water. (2) Artillery: a curtain of shell-fire produced by a number of shells being fired simultaneously by guns on to a definite line. *A. B.* differs from a bombardment (*q.v.*) in that in the former the fall of the shells takes a linear formation, whereas in the latter they are grouped over an area. *B. fire* was introduced in the First World War, when as communications were difficult it became necessary for *B. fire* to be pre-arranged and carried out according to a definite time-table. The procedure was for artillery to 'put down' a 'creeping' *B.* on a certain line for a certain time

during which the infantry moved forward as far as possible under the protection of the falling shells. The B. was usually put down on an objective which the infantry prepared to assault as soon as the B. 'lifted.' At the time scheduled the B. would come down on the next objective, and the same procedure would be repeated until the B. had 'crept' to its final position, where it 'stood' for a time, and thus became a 'standing' B. Creeping Bs. were used to screen troops in retreat as well as in advance, and a 'flank' B. was used to give protection to troops on their flank. A combination of the creeping and flank B. was a 'box B.,' which gave all-round protection. See under ANTI-AIRCRAFT DEFENCE; ARTILLERY.

Barra Manza, tn. of Brazil, on the r. b. of the Parahiba do Sul, 70 m. N.W. of Rio de Janeiro. Pop. 12,000.

Barramunda, name applied to the Ceratodus, a diploid fish of the family Sirenoidae with a single lung. Its haunts are the rivs. of Queensland.

Barranquilla, cap. of prov. of same name, Bolívar, Colombia, on Magdalena R., near its mouth, 3 m. from its seaport, Sabanilla, and 18½ from the port Puerto Colombia. Standing at the head of the navigation of the riv., which is useless at its entrance into the sea, the tn. has a busy steamship traffic, and grew rapidly though suffering from periodical floods. It is the largest commercial centre in Colombia: has many manufs. and exports coffee and hides. There is a wireless station. Pop. (1942) 188,500.

Barrantes, Vincente (1829-98), Sp. poet and publicist, b. at Badajoz, but later removed to Madrid, where he entered literary and political life, holding sev. appointments in Spain and the Philippines. In 1872 he was made a member of the Sp. Academy. His works, for the audacity of which he was sev. times fined, include *Siempre Tarde*, 1851; *Juan de Padilla*, 1855-6; *La Viuda de Padilla*, 1857; *Narraciones Extrameñas*, 1872-3; *Cuentos y Leyendas*, 1875; *Guerras Pírricas de Filipinas*, 1878.

Barras, Paul Jean François Nicolas, Comte de (1755-1829), Fr. revolutionary, b. at Fox-Amphoux in Var, of an anc. noble family. In 1775 he entered the army, and went twice to India. When the Revolution commenced he became one of its warmest partisans, and was a member of the Jacobins' Club from its commencement. Representing Var in the National Convention, he voted for the death of Louis XVI.; and he also took an active part in the siege of Toulon. He opposed Robespierre, and was mainly instrumental for his downfall. On the 13th Vendémiaire (Oct. 5, 1795), the Convention appointed B. general-in-chief for the second time, and his success on this occasion was chiefly owing to Bonaparte, to whom he had confided the command of the artillery. The anarchists were put down and B. was nominated one of the five members of the Directory. On the 18th Fructidor (Sept. 4, 1797), he was again invested with dictatorial powers, and transported many of his opponents.

The affair of the 30th Prairial (May 18, 1799), however, shook the foundation of the Directory. Bonaparte, seconded by Sleyes, effected the revolution of the 18th Brumaire (Nov. 9, 1799), and was made first consul. After this the power of B. was annihilated. Implicated in a conspiracy, he was exiled to Rome, but returned to Paris in 1814. In 1815 he again left Paris, but returned on the disembarkation of Napoleon and took up his residence at Chaillot. See his *Memoirs*, pub. by Dumuy, 1895.

Barratry (from O.F. *baraterie*, fraud) is in Eng. law a term applied to the offence of inciting the subjects of the king to riot. The offence against law is actionable only when committed frequently, and at least 3 breaches of the law must be proved against the offender. In the case of a lawyer or solicitor offending in this way he is by the law of England unable to practise further. The offence in Scotland is not the same, but is the crime of a judge who barter justice for money, i.e. is guilty of corrupt practices. The offence of B. is also known in marine insurance: in that case it is an offence by the masters or crew of a ship which is to the detriment of the owners or insurers of that ship. It is usually insured against in marine insurance policies.

Barraux, vil. in the Fr. dept. of Isère, in the arron. of, and 23 m. from, Grenoble. On the Isère, upwards of a mile from B., is B. Fort, built by Emmanuel of Savoy in 1596 and captured by Lesdignières. Pop. 1200.

Barre, tn. of Washington co., Vermont, U.S.A., 6 m. S.E. of Montpelier, famous for its granite quarries. Pop. 11,000.

Barré, name given to a group of S. Amer. tribes of Arawakan stock, who occupy the country round the Upper Rio Negro, in N. Brazil, across the Casiquiare, Guiana, the Atabapo as far as Venezuela. They are an independent, progressive race, their language being spread throughout a wide region.

Barré, Isaac (1726-1802), Irish officer and politician, b. in Dublin, the son of a Fr. refugee; served under Wolfe, and was wounded at Quebec in 1759; entered Parliament in 1761, and consistently defended the rights of the colonies, notably in a famous speech against the Stamp Act in 1765. He was the originator of the term 'Sons of Liberty' applied to the Amers. In 1790 he retired owing to blindness consequent upon his old wound. He is one of those to whom the *Letters of Junius* have been ascribed.

Barrel, large wooden vessel for holding liquids or solids, with circular heads. The term is also given to various measures. A barrel of beer contains 36 imperial gallons, of wine 31½ gallons, of butter 224 pounds, etc. In the U.S.A. flour and beef are sold in the same way, a B. of flour containing 196 pounds, and one of beef 200 pounds.

Barrelier, Jacques (1606-73), Fr. botanist, was b. in Paris. He was educated for the medical profession, but abandoned it, and in 1635 took the vows of the order of Dominicans. In 1646 he was appointed assistant to the general of the order of

Dominicans, and in that capacity traversed S. France, Spain, and Italy. During his travels he collected plants, of which he made drawings, and had them engraved. He returned to Paris, 1672, to complete his work on botany, but *d.* in 1673. After his death his collections were dispersed, and some were burnt. The copper plates, however, were collected and pub. by Antoine de Jussieu, who supplied descriptions in the place of those which had been destroyed.

Barrel Organ, portable mechanical musical instrument with a limited number of tunes. Provided with hymn tunes, it was formerly used in some churches, but was ousted by the harmonium; at the end of the eighteenth century it was first used in the street. The organ has a wooden cylinder furnished with pegs or staples, which, when revolved, opens a series of valves to admit the air to a set of pipes, and thus produces the sounds.

Barren Flowers are more commonly known as male flowers. They bear stamens but not carpels.

Barren Island, name given to 4 different is. in various parts of the world. The first is a sandy is. off the S. shore of Long Is., King's co., New York. The second is an is. on the W. coast of Placentia Bay, off Newfoundland. The third is one of the group known as Hunter Is., off the N.E. point of Tasmania. The fourth is a volcanic is. in the bay of Bengal, situated to the E. of the Andaman Is.

Barrenness, see STERILITY.

Barrenwort (*Epimedium alpinum*), species of Old World Berberidaceæ, cultivated in Britain. It is a self-pollinated plant, with nectararies, and the seed has a membranous aril.

Barres, Auguste Maurice (1862-1923), Fr. politician and man of letters. After studying at Nancy he went in 1882 to Paris, and adopted the journalistic profession. He was elected a deputy for Nancy in 1889, and sat in the chamber till 1893. Later, returned for the Seine div. and elected member of the Académie Française. He was an individualist by conviction, and repudiated all social discipline. His works are obscure in many places, but his analysis is delicate, and his style, though often affected, is pure. A thorough-going Nationalist, he shared with Maurras in moulding the ideals of this party. The First World War gave him his opportunity, which he embraced with vigour. To the *Echo de Paris* he contributed daily for 4 years. His works include *L'Ennemi des lois*, 1893; *Le Culte du mot*, 1893; *Une Journée parlementaire*, 1894; *La Colline inspirée*, 1913; *L'Âme française et la guerre*, 1915; *Le Génie du Rhin*, 1921; *Un Jardin sur l'Oronte*, 1922. The first vols. of his *Chronique de la Grande Guerre*, appeared in 1931. See studies by J. N. Faure-Biguot (Paris), 1924, and A. Blanc-Perdier (Paris), 1925.

Barret, George (1732-84), Irish landscape painter. In 1764 he obtained a 50-guinea premium from the Society of Arts, London; was one of the original members of the Royal Academy, founded 1768;

and towards the close of his life was master painter to Chelsea Hospital. His landscapes are bold and natural in design, but his colouring is somewhat heavy. He painted also in water-colours, and executed a few etchings.

Barret, William (1733-89), Eng. surgeon and antiquary, *b.* at Notton, Wiltshire. At the age of 22 he passed his examination for a surgeon, and settled down to practise in Bristol. He determined to write a hist. of the city. This work is famous because of the number of forgeries with which Chatterton, 'the marvellous boy,' supplied B., and which the latter accepted without question. He was made a fellow of the Society of Antiquaries on Nov. 9, 1775, before the publication of his book. This appeared in 1789, as a quarto vol. of over 700 pages, with the title, *The History and Antiquities of the City of Bristol*, compiled from original records and authentic manuscripts, in public offices and private hands. But it met with such ridicule that B. was overwhelmed, and *d.* at Higham, in Somerset, in the following Sept.

Barrett, John (b. 1866), Amer. arbitrator, *b.* at Grafton, Vermont. Amer. minister to Slam in 1894-98, when he settled by arbitration large Amer. claims in that country. He was U.S. delegate in 1901-2 to the second Pan-Amer. Conference, Mexico; and 1907-20, director of the Pan-Amer. Union, which he developed as the prin. official agency for fostering the growth of Pan-Amer. trade. Publications: *Admiral George Dewey*, 1899; *Pan-American Union*, 1911; *Panama Canal—What it is—What it means*, 1913; and *Pan-America and Pan-Americanism*, 1922; *The Call of South America*, 1924.

Barrett, Lawrence (1831-91), Amer. actor, *b.* at Paterson, New Jersey. He made his first appearance on the boards at Detroit, Michigan, as Murad in *The French Spy* in 1853. In 1857-58 he was associated with the brilliant actor Edwin Booth; subsequently he became the leading member of his company, and worked with him from 1887 till his death. B. was a versatile actor and had a high understanding of his art. His best part was Cassius; he also took the leading parts in many Shakespearean plays. He wrote *Edwin Booth and his Contemporaries*, 1886.

Barrett, Sir William Fletcher (1844-1925), Eng. physicist. Educated in Manchester. In 1863 he was working under Prof. Tyndall. He did effective research work in alloys and especially on their electric and magnetic purposes. 'Stalloy,' a silicon-iron alloy used by electrical engineers, was his discovery. His prin. research work, however, was in the uses of the divining rod. Was lecturer in physics in the Royal School of Naval Architects, and later, prof. of physics in Dublin Univ. Also one of the founders of the Society for Psychical Research.

Barrett, Wilson (1846-1904), Eng. actor, *b.* in Essex. He first appeared at Halifax in 1864 in *East Lynne*. As manager of the Princess's Theatre he produced *The Lights of London* and *The Silver King*.

In 1884 he appeared in *Hamlet*, and later visited America and Australia. In 1895 he produced *The Sign of the Cross*.

Barrhead, tn. of Renfrewshire, Scotland, 7 m. S.W. of Glasgow by rail. Porcelain and sanitary appliances are manufactured, and it contains also cotton mills, calico-printing works, bleaching and dyeing works, engineering works, and shawl-weaving mills. Pop. 12,000.

Barri, Giraldu de, or **Sylvester Giraldu**, see GIRALDUS CAMBRENSIS.

Barrias, Louis Ernest (1841-1905), Fr. sculptor, was b. in Paris. He studied at first under Léon Cogniet, but recognising that sculpture was his true *métier*, he worked under Joffroy. He was awarded the Prix de Rome in 1865, and a medal at the Salon of 1870. His 2 works for the Salon of 1872, one in marble, the other in bronze, were of such excellence that he was awarded a first-class medal. He was awarded a medal of honour and a decoration for his piece at the 1878 Salon, entitled 'The First Funeral,' representing Adam and Eve bearing Abel's body.

Barriade, military term used for any obstruction formed to check the advance of an enemy. They may be constructed of palisades and earth or sand-bags, with loop-holes cut for firing, but as they are generally thrown up in haste any material to hand, such as loaded carts, heaps of stones, planking, felled trees, etc., is used. In 1358 Bs. were set up in the streets of Paris against the Dauphin Charles, and again in 1588 Henry IV.'s troops were prevented from entering Paris by the Bs. They were used again in Paris in the revolutions of 1848 and 1850.

Barrie, cap. tn. of Simcoe co., Ontario, Canada, on Kempenfeldt Bay, L. Simcoe, 64 m. N.W. of Toronto. It is a railway centre, and has manufs. of carriages, wool, leather, and machinery. Pop. 7800.

Barrie, Sir James Matthew (1860-1937), Scottish novelist and dramatist, president of the Society of Authors from 1923; rector of St. Andrews Univ., 1919-22; elected chancellor of Edinburgh Univ., May 30, 1930; created a baronet in 1913; b. May 9, 1860, at Kilmuir, in Forfarshire, was educated at Dumfries Academy and Edinburgh Univ. After some experience as a journalist in Nottingham he came to London and contributed to, among other papers, the *St. James's Gazette*, *British Weekly* (as 'Gavin Ogilvy'), *National Observer*, and *Speaker*. In 1887, he pub. his first book, *Better Dead*, and in the next year *Auld Licht Idylls* presented an idealisation of his native vil. as 'Thrums,' with its life and humour. The theme is not quite dropped in *When a Man's Single*, primarily a humorous account of journalistic life, and it is again the chief interest in *A Window in Thrums*, 1889. In 1891 came *My Lady Nicotine* and *The Little Minister*, which excellently showed B.'s whimsical humour, pathos, and control of action and dialogue. *Margaret Ogilvy* (about his mother), 1894, was followed by *Sentimental Tommy* and *Tommy and Grizel*, 1900. Other non-dramatic works of his are: *An Edinburgh Eleven*, 1889; *Scot-*

land's Lament, 1895; *The Little White Bird*, 1902; *Peter Pan in Kensington Gardens*, 1906; *Peter and Wendy*, 1911; *Half Hours*, 1914; *Who Was Sarah Fendley*, 1917; *Courage*, 1922; *Cricket*, 1926. *The Greenwood Hat: the Memoir of James Anon*, 1930, dealing with his early life, was written by him for private circulation. His *Farewell, Miss Julie Logan* (*Times Christmas Supplement*, 1931) is an example of the perfect short story. The fame of B. rests mostly on his plays, those of his maturity being full of wit, imagination, and fantasy. The following is a table of his dramatic works, with the dates of their first theatre presentation in London.

Richard Savage (with Marlott Watson), (1891); *Ibsen's Ghost*, or *Toole up to Date* (1891); *Walker*, London (1892); *Jane Annie* (comic opera, with Conan Doyle) (1893); *Becky Sharp* (1893); *The Professor's Love Story* (1894); *The Little Minister* (1897); *The Wedding Guest* (1900); *Quality Street* (1902); *The Admirable Crichton* (1902); *Little Mary* (tracing national ills to indigestion) (1903); *Peter Pan* (the most popular children's play of the century) (1904); *Alice Sit-by-the-Fire* (1905); *Pantaloon* (1905); *Josephine* (political skit) (1906); *Punch* (toy tragedy, a compliment to Bernard Shaw) (1906); *What Every Woman Knows* (1908); *The Twelve-Pound Look* (1910); *Old Friends* (1910); *A Slice of Life* (1910); *Rosalind* (1912); *The Will* (1913); *The Adored One* (Legend of Leonora) (1913); *Half an Hour* (1913); *Der Tag* (1914); *Rosy Rapture* (musical burlesque) (1915); *The New Word* (1915); *The Fatal Typist* (1915); *The Real Thing* (1916); *A Kiss for Cinderella* (1916); *Shakespeare's Legacy* (1916); *The Old Lady Shows her Medals* (1917); *Seven Women* (1917); *Dear Brutus* (a study of Might-Have-Beens) (1917); *A Well-Remembered Voice* (1918); *The Truth About the Russian Dancers* (1920); *Mary Rose* (1920); *Shall We Join the Ladies?* (an isolated First Act) (1921); *Barbara's Wedding* (1927). He wrote *The Boy David* especially for Elizabeth Bergner, who appeared in the title role in Edinburgh and London in 1937. See bibliography by H. Garland, 1928; also T. Moulst, *Barrie: a Critical Estimate*, 1936; J. Roy, *James Matthew Barrie: an Appreciation*, 1937; W. A. Darlington, J. M. Barrie, 1938; Patrick Chalmers, *The Barrie Inspiration*, 1938; D. Mackail, *The Story of J. M. B.*, 1941.

Barrier (Fr. *barrière*), in fortification, term applied to a chain of military posts protecting the frontiers of a country. It signifies also a wall of strong timbers enclosing an area (stockade), or protecting a passage. In some part of a B. is a gate usually formed of 2 parts, opening in the middle, and frequently musket-proof, being made of strong timbers in vertical and horizontal positions, with diagonal braces.

Barrier Act, act passed by the General Assembly of the Church of Scotland in 1697 providing that any proposed change in the church laws must be sanctioned by a majority of the Presbyterians. The

object of this act was to guard against hasty legislation in the church.

Barrier Reef, The Great, see GREAT BARRIER REEF.

Barrier Treaty, name given to 3 treaties which were drawn up during or immediately after the war of the Sp. Succession. It was essential to the Dutch that, in order to resist possible Fr. aggressions, they should have control of the 'barrier' fortresses of the Netherlands. The chief fortresses which the Dutch demanded were Ypres, Tournai, Mons, Charleroi, and Ghent. In return for a recognition of the Protestant and Hanoverian succession, Great Britain signed a treaty in 1709 by which she undertook that the Dutch should be provided with an adequate barrier of fortresses in the Netherlands. The number of fortresses was reduced by the second treaty to practically those already named (1713). In the treaty which was signed in 1714 by the emperor and Louis XIV. the Dutch received their barrier fortresses.

Barring-out, practice formerly common in schools, by which the boys barred the doors of the school against the master. The time chosen was usually a few days before the commencement of the vacations. Addison was the leader of a B. at the Grammar School, Lichfield, 1685 (see Johnson's *Life of Addison*); and at the High School, Edinburgh, in 1595 there was a serious B. in which a magistrate lost his life whilst endeavouring to force an entrance. In the statutes of Witton School, near Northwich, in Cheshire, founded by Sir John Deane, 1558, the observance of the custom by the scholars is directed.

Barrington, Daines (1727-1800), Eng. jurist, fourth son of John Shute B. He was called to the Bar in 1749, and made a pious Welsh judge in 1757. In 1785 he gave up all public employments except the place of commissary-general of the stores at Gibraltar. Of his writings the most important is *Observations upon the Statutes, chiefly the more ancient, from Magna Carta to the 21 Jac. I. c. 27*, first pub. 1766. Others are: *Researches respecting a North-west Passage*; papers on local antiquities in the *Archæologia*; and essays in the *Philosophical Transactions*. Many of his periodical publications were pub. in 1781 under the title of *Miscellanies on Various Subjects*.

Barrington, George (properly Waldron, George) (1755-c. 1840), Irish author, b. at Maynooth, Kildare; joined a band of strolling players in 1771, and later became a professional thief in London, moving in the highest circles. His most noted theft was that of a snuff-box worth £30,000 from Prince Orloff. In 1790 he was transported to Botany Bay, but was released after 2 of his 7 years' sentence, and became superintendent of convicts and later high constable at Paramatta, N.S.W. His works include: *A Voyage to Botany Bay*, 1801; *The History of New South Wales*, 1802; *The History of New Holland*, 1808. See R. S. Lambert, *The Prince of Pick-pockets*, 1830.

Barrington, John Shute, first Viscount

(1678-1734), Eng. polemical writer and politician, b. in Hertfordshire; called to the Bar in 1699; was one of the commissioners sent to Scotland to gain the favour of the Presbyterians for the Union; became commissioner of customs in 1708; entered Parliament in 1715. In 1720 he was made baron and viscount in Ireland. He was expelled from Parliament in 1723 for his connection with the Harburg lottery. Works include: *Essay upon the Interests of England in Respect to Protestants Dissenting*, etc., 1701; *Rights of Protestant Dissenters*, 1704-5; *Dissuasive from Jacobitism*, 1713; *Miscellanea Sacra*, 1725.

Barrington, Rutland (1853-1922), Eng. actor, b. at Fenge, son of J. G. Fleet (Barrington being a stage name), and nephew of Emily Faithfull. Educated Merchant Taylors' School; made his first appearance on stage at age of 21; thereafter joined the D'Oyly Carte management and played in all Gilbert and Sullivan operas except *The Yeomen of the Guard*. He wrote humorous articles for *Punch*, also one play.

Barrington, Samuel (1729-1800), Brit. admiral, son of Viscount B. Entered the Navy under Lord George Gordon in 1749; became a lieutenant in 1745; commanded the sloop *Weasel* in 1747; and later in that year, in the *Bellona*, captured the Fr. *Duc de Chartres*. He served in the Mediterranean and on the Guinea coast; in 1754-55 accompanied Commodore Keppel to N. America; in 1757 served under Sir Edward Hawke in the Basque Roads expedition; and in 1761 under Keppel at Belle Isle. In 1759, while commanding the *Achilles*, he captured the *Comte de St. Florentin*. He was made commander-in-chief in the W. Indies in 1778, where he defeated the Fr. under d'Estaing. He was in the action off Grenada in 1779, and was second in command to Lord Howe at the relief of Gibraltar in 1782. He was made an admiral in 1787.

Barrington, Shute (1734-1826), Eng. churchman, sixth and youngest son of John Shute, Viscount B., was b. at Becket, in Berkshire. He was educated at Eton and Merton College, Oxford. He was ordained in 1756, and appointed chaplain-in-ordinary to George III. in 1760. He was made canon of Christ Church in 1761, and took his D.C.L. in the following year. He was appointed a canon of St. Paul's in 1768, and bishop of Llandaff in 1769, of Salisbury in 1782, and of Durham in 1791. He was a defender of the Protestant establishment, and opposed to the acquisition of political power by the Rom. Catholics.

Barrington, William Wildman Shute, second Viscount (1717-93), Eng. politician, eldest son of the first Viscount B. After making the grand tour he returned to England in 1738, and in 1740 was elected M.P. for Berwick-on-Tweed. In 1745 he formulated a plan for a national militia, and in the same year took his seat in the Irish House of Lords. He was one of the lords commissioners of the Admiralty in 1746, in 1754 M.P. for Plymouth, and in 1755 a member of the

Privy Council. He was secretary at war in 1755, treasurer of the exchequer in 1761, treasurer of the navy in 1764, and in 1765 secretary at war again. He was joint postmaster-general from Jan. to Apr. 1782, and retired on a pension of £2000 per annum.

Barrios, Justo Rufino (1835-85), Guatemalan politician, b. at San Lorenzo, Guatemala. He took part in the unsuccessful liberal insurrection under Serapio Cruz against Cerna, the president of Guatemala, in 1867-69. He was obliged to flee to Mexico, but in 1871 he returned and defeated Cerna, and assisted in making Granados president. Two years later he overthrew Granados and took his place, being re-elected in 1876 and again in 1880. Seeing that his ideal of a union of Central Amer. states would never be attained by peaceful means, he invaded Salvador in an attempt to bring about his aims by force. He was, however, defeated and killed at Chalchurapa.

Barrister, member of that branch of the law which has the exclusive right to practise and be heard in the superior courts of law in England and Ireland. For the Scottish equivalent branch see **ADVOCATE**. The right to practise at the Bar is confined to the 4 Eng. Inns of Court (q.v.), viz. Lincoln's Inn, Inner and Middle Temples, and Gray's Inn, and to the King's Inns in Ireland. A student is 'admitted' to an Inn by passing a preliminary examination (excused for those who have passed certain univ. examinations), and paying fees. He then 'keeps' 12 terms by eating dinners in the hall of his Inn, 6 in each legal term, 3 for univ. members. On passing the examinations of the Council of Legal Education and paying fees he is 'called to the Bar' by the benchers of his Inn, who may refuse to admit. They also may 'disbar' or expel a barrister for misconduct. Until after the First World War clergymen, women, solicitors, or accountants in practice were not admitted, but now both women and solicitors can qualify. On his call or before, a B. usually passes a year as pupil in the chambers of a practising B. and if he intends to practise at the common law Bar usually joins a circuit (q.v.). Before undertaking a case he must be instructed in a 'brief' (q.v.) by a solicitor, but in criminal cases he may be engaged directly in open court. He drafts 'pleadings' (q.v.), gives opinions on the case, advice on evidence, etc., and it is his especial and peculiar function to conduct the case in court. A B. is not answerable for anything said by him in court so long as it is suggested by his instructions and is relevant to the case. He may not sue for his fees, but is not obliged to return them though he cannot attend the court. He is not liable for negligence. The attorney- and solicitor-generals are leaders of the Bar; king's counsels (K.C.s) are appointed by the lord chancellor on application; they are called 'within the Bar' and are said to 'take silk,' their gown of special form being of silk for dress occasions, when they also wear a full-bottomed wig (see

KING'S COUNSEL). The ordinary B. or junior Bar, wears a 'stuff' gown. Counsel do not wear wig or gown when appearing before justices of the peace.

Barron, Clarence Walker (1855-1928), Amer. financial editor and pub., b. at Boston, Massachusetts; educated in the Eng. high school in that city; and d. at Battle Creek, Michigan. He began his career by joining, in 1873, the staff of the Boston *Daily News*, in which his article on the debate between Wendell Phillips and William Lloyd Garrison attracted much attention. Joining the *Boston Transcript* in 1875, he founded, 12 years later, the Boston News Bureau, an agency publishing financial news in a daily bulletin. After founding a like agency in Philadelphia, he went to New York in 1901. Bought the *Wall Street Journal* in the same year and founded *Barron's National Financial Weekly* in 1921. Wrote among other books *War Finance*, 1919, and *A World Remaking*, 1920.

Barron, James (1768-1851), Amer. commodore, b. in Virginia; entered Amer. Navy in 1798; in 1806 surrendered the *Chesapeake* to the Brit. frigate *Leopard*. He was court-martialled and removed from the service for 5 years. In 1820 he challenged Decatur (an officer whom he suspected to be principally instrumental in keeping him ashore) to a duel, and mortally wounded him; he was wounded himself, but recovered, and in 1839 was senior officer of the Amer. Navy.

Barros, João da (1496-1570), Portuguese historian. In 1522 he was sent as governor to St. George d'Elmina or São Jorge da Mina, on the Guinea coast; in 1525, recalled to Lisbon, he was appointed treasurer to the colonial dept., and afterwards agent-general for the colonies. While he held this office he composed his work, *Asia portuguesa*.

Barrosa, vil. of Andalusia, Spain, on the coast, 16 m. S.E. of Cadiz. The scene of the victory of General Graham over the Fr. under Victor in Mar. 1811, being one of the first Eng. victories in the Peninsular war.

Barros-Arana, Diego, Chilean historian (1824-1907). He was prof. of geography at the univ. of Santiago, and Chile minister at Buenos Aires. He formed one of the commission which studied the delimitation of the frontier between Chile and the Argentine Republic. His works, which are in Sp., include: *General History of the Independence of Chile, 1854-1857*; *Elements of Physical Geography, 1881*; *General History of Chile, 1884*.

Barroso, Miguel (1538-90). Sp. painter, b. at Consuegra. According to Palomino, he was a pupil of Becerra, and distinguished both as architect and painter. Employed by Philip II. in the Escorial, he painted a number of frescoes in the chief cloister there, including 'Resurrection,' 'Christ appearing to the Apostles,' 'Descent of the Holy Ghost,' 'St. Paul Preaching.'

Barrot, Camille Hyacinthe Odilon (1791-1873), Fr. orator and statesman, b. at Villefort. He studied law in Paris, and was called to the Bar there. Though

remaining a supporter of monarchy, he was dissatisfied with the restoration gov.; in 1827 he joined the 'Aide-toi' association. He took a prominent part in the revolution of July 1830, being a member of the municipal commission of the Hôtel de Ville, and one of the 3 commissioners appointed to conduct Charles X. out of France. He was then appointed prefect of the Seine dept. He advocated a constitutional monarchy on democratic lines. In the movement of 1847, which culminated the next year in revolution, he was again prominent. The revolution came as a surprise to him, and he acquiesced in the republic, and accepted office, but he was soon dismissed. After the *coup d'état* of 1851, he retired into

sions of the departed. A vivid account of the building of the B. of Hector is given in the *Iliad*, and Herodotus gives a detailed description of a similar custom in connection with the burial of the Scythian chiefs. Amongst the Vikings it was a custom to place the dead man on the deck of his ship and erect the B. over it. The largest Eng. example is Silbury Hill, 130 ft. high. See W. Greenwell, *British Barrows*, 1878; O. G. S. Crawford, *Long Barrows and Stone Circles of the Cotswolds and the Welsh Marches*, 1925.

Barrow, riv. of Eire; rises on the N.E. side of Slieve Bloom Mts., Queen's Co., flows E. to border of co. Kildare, then S. With the Suir, which it joins 29 m. from the sea, and the Nore, which flows into it

SILBURY HILL, WILTSHIRE

private life. After the fall of the empire, Thiers nominated him president of the Council of State, but he *d.* after having held this position only a year.

Barrow (A.-S. *beorg*, hill or hillock), name given to the burial mounds erected by primitive peoples. Remains of Bs. have been found all over Europe, in N. Africa, Asia Minor, various other parts of Asia and N. America. The structure, size and internal arrangement of the Bs. differ widely. They were made of earth or stones, and the ground-plan was oval, round, or oblong. The long Bs. of the Stone Age in Great Britain contained one or more chambers entered by a passage under the higher and broader end of the B. They were from 200 to 300 ft. in length, with a width of from 60 to 80 ft. In Ireland round Bs. were the rule. The practice of B. burial was accompanied both by cremation and by inhumation. The introduction of cremation in the Stone Age is thought by some to have introduced the vogue of smaller Bs.—a distinguishing feature of the Bronze Age, in which cremation was common. In the Iron Age the size again becomes larger. With the remains were frequently buried the favourite animal and familiar posses-

2 m. above New Ross, it forms the estuary of Waterford harbour. Length 119 m. Navigable for vessels of 300 tons as far as New Ross, for barges up to Athy. Here it joins the Grand Canal.

Barrow, Cape, most northerly point of Alaska. There is a gov. station on the cape.

Barrow, Isaac (1630-77), Eng. divine and mathematician, son of the linen-draper to Charles I., educated at Charterhouse and Felsted; entered Peterhouse College, Cambridge, 1643, under his uncle, who was a fellow. The Presbyterians having taken possession of Peterhouse, B. removed to Trinity College, Cambridge. He became a fellow in 1647; took his M.A. 1652, and was made D.D. by royal mandate in 1670. He first intended to study physic, but turned to theology; gradually he was led to astronomy and geometry. Meanwhile he studied the classics and was recommended for the chair of Gk. at Cambridge; he lost it, being suspected of Arminianism. Then he went abroad (1655-59), travelling through Europe. In 1660 he was chosen Gk. prof. and in 1662 Gresham prof. of geometry, but this he resigned on his appointment to be Lucasian prof. of

mathematics, 1663. This he resigned (1669) in favour of his great pupil Isaac Newton. In 1672 Charles II. (whose neglect of him he celebrated in his well-known *Lat. lines*) appointed him master of Trinity College, and he exerted himself to form a library. He d. young considering his reputation, at the age of 47. He never married. His 2 mathematical works are: *Lectiones Opticae* and *Lectiones Geometricae*, both of which were esteemed by Newton. Among his theological works are: *Exposition of the Creed, Decalogue, and Sacraments* (1669). His treatise on the pope's supremacy is still admired as a specimen of controversy. An ed. of these was ed. by Napier with a memoir by Whewell, 9 vols., 1839.

Barrow, Sir John (1764-1848), Eng. diplomatist, writer, and patron of Arctic exploration, b. at Drayley Beck, Lancashire. He became a time-keeper in a Liverpool iron foundry, but managed to educate himself. After a trip to sea in a Greenland whaler he became a teacher of mathematics at an academy in Greenwich. Here he was fortunate enough to secure the interest of Sir George Staunton, who obtained for him (1792) the post of secretary to Lord Macartney, the first Brit. ambas. to China. He mastered the Chinese language and studied Chinese literature and science. On the appointment of Macartney to the governorship of the Cape of Good Hope, B. took part in the settlement of the affairs of that colony. From 1804 to 1845 he was second secretary of the Admiralty. He was made a baronet in 1835. He was a fellow of the Royal Society, and one of the chief founders of the Royal Geog. Society. His publications include: *History of Voyages into the Arctic Regions*, 1818; an autobiography, 1847; and various books of travel.

Barrow-in-Furness, seaport, manuf. tn., and municipal co., and parl. bor., Lancashire, Eng., 9 m. S.W. of Ulverston, 268 m. N.N.W. of London. Pop. 66,000. Here are situated the famous shipbuilding yards of Vickers Sons & Maxim, Ltd., the Bessemer steel works, and other large industries connected with iron and copper, which are found in the vicinity. There are also jute and flax factories, engineering shops, paper and pulp works, etc. There is an active trade at the port in imports of cattle, general merchandise, timber, flour, grain, coal, etc., and exports, among other things, of steel rails, pig-iron, and iron ore. The rise of B. from a fishing vil. to an active industrial centre dates from the discovery in 1840 of hæmatite ore at Park, near B. The establishment of mines and smelting works soon followed, and the construction of many miles of railway by the Furness Railway Co. The docks, 4 in number, cover an area of 280 ac. Noteworthy buildings are the town hall, erected at a cost of £80,000, and the picturesque ruins of Furness Abbey. B. returns one member to Parliament. The residential areas suffered severely from air attack during the Second World War, principally in May 1941; over 600 houses were de-

stroyed, and some 14,000 others damaged, also churches and schools.

Barrow Point, long sandy point on the N. coast of Alaska.

Barrow Strait, Canada, joins Lancaster Sound and Melville Sound. Average breadth 50 m. Discovered by Parry, and named by him after Sir John B. (q.v.).

Barraulet, see **HERALDRY**.

Barry, term in heraldry applied to a shield that is divided by horizontal lines into an even number of partitions of interchangeably disposed tinctures. According to the number of portions it is termed *B. of six, eight, or ten pieces*. *B. of six* is the most common, and figures in the armorial bearings of many noble families. *Barry-bendy* is the term used of a shield divided *B.* and *bendy*, i.e. by lines running from dexter chief to sinister base, etc., the tinctures being interchanged. *Barry-pyly* is the term applied to a shield divided into an even number of partitions by plices placed barwise across it.

Barry: (1) Is. in Bristol Channel. (2) Seaport of Glamorganshire, S. Wales, 7 m. S.W. of Cardiff, opposite B. Is. It has a tidal basin of 90 ac. between the mainland and the is., and large docks, opened in 1889, which cover 114 ac. and have accommodation for the largest vessels. There is an export trade in coal and iron, and the tn. is managed by a most progressive municipality. Pop. 39,000. (3) The name of a parish of Forfarshire, Scotland, 72 m. S.W. by W. of Arbroath. The golf links were acquired by Gov. in 1892 for military manoeuvres, etc. It has an area of 5328 ac. and a pop. of 6000.

Barry, Alfred (1826-1910), Eng. bishop, educated at King's College, London, and at Cambridge. Headmaster of Leeds Grammar School, 1854-62; prin. of Cheltenham, 1862; of King's College, London, 1868; examining chaplain to bishop of Bath and Wells, 1869; canon of Worcester, 1871; of Westminster, 1881; member of London School Board, 1871-1877; chaplain in ordinary to the queen, 1877; primate of Australia, metropolitan of New South Wales, bishop of Sydney, 1884-89; canon of Windsor, 1891; assistant bishop in W. London, 1897; rector of St. James's, Piccadilly, 1895-1900. Publications include: *Boyle Lectures*, 1876, 1877, 1878; *Life of Sir Charles Barry* (his father, q.v.), 1867; *Introduction to the Old Testament*; *Christianity and Socialism*, 1891; *Position of the Laity*, 1903; *The Christian Sunday*, 1904.

Barry, Sir Charles (1795-1860), Eng. architect, b. in Westminster, London. After serving his apprenticeship with a firm of Lambeth architects he travelled in Greece, Italy, Egypt, and Palestine. He started practice in London in 1820. His first important work was St. Peter's Church at Brighton. Subsequent notable designs were the Athenæum at Manchester, Halifax town hall, King Edward's Grammar School at Birmingham, and the Travellers' and Reform clubs in London. In 1835 B. was successful in the competition for the design for the new Houses of Parliament, and was knighted

by Queen Victoria at the opening of the Victoria Tower and Royal Gallery in 1852. He was elected R.A. in 1841, was a fellow of the Royal Society, and member of many foreign academies. He was buried in Westminster Abbey. See *Life* by his son, Bishop Barry, 1867.

Barry, Elizabeth (1658-1713), Eng. actress. She is said to have been the daughter of Edward B., a barrister, and to have been patronised by Lady Davenant, but there is no certain foundation for these stories. She was introduced to the stage by the earl of Rochester, making her first appearance in 1673 as Isabella, queen of Hungary, in the earl of Orrery's tragedy *Mustapha*. Though she showed no talent whatever on her first appearance, she was later universally considered to be one of the finest actresses of the time, and created over 100 roles. Her life was as immoral as her talent was great.

Barry, James (1741-1806), Irish painter, b. at Cork, the son of a coasting trader; made progress as a youth, and at 22 went to Dublin. Here he was introduced to Edmund Burke, who brought him to London, and soon sent him to Rome, where he remained 5 years. He returned to England, 1770, where in 1772 he proposed to the Royal Academy to decorate St. Paul's with historical pictures. The Royal Academy made the proposal to the chapter, but it was rejected. In 1775 he pub., in answer to Du Bos and Winckelmann, an *Inquiry into the Real and Imaginary Obstructions to the Acquisition of the Arts in England*. He painted 6 pictures for the Society for the Encouragement of Arts, etc. His most famous picture is that of the 'Victors at Olympia'. Canova said that this was sufficient to bring him to England. A.R.A., 1772; R.A., 1773. He was elected prof. of painting at the Royal Academy, but his quarrelsome spirit made him unpopular, and he was expelled (1799).

Barry, Sir John Wolfe Wolfe- (1836-1918), Eng. engineer, son of Sir Charles B., b. in London; educated at Glenalmond, King's College, London, and Trinity College. While under Hawkshaw, B. was engaged as resident engineer during construction of bridges over Thames, and of stations at Charing Cross and Cannon Street. Later he built Blackfriars, Kew, and Tower Bridges; carried out Earl's Court, Ealing, and Fulham extensions of Metropolitan Dist. railway; constructed B. Dock near Cardiff (largest in Great Britain), and other engineering works in various parts. B. visited the Argentine, 1872, and planned railway from Buenos Aires to Rosario. Consulting engineer on underground railways of Glasgow; 1903-5 royal commissioner of London traffic. Publications: *Railway Appliances* (Text-books of Science), 1876; *Lectures on Railways and Locomotives*, 1882; *The Tower Bridge*, 1894. Was consulting engineer to many railway companies. Died Jan. 22, 1918.

Barry, Lodowick, Eng. author, the author of a comedy called *Ram-Alley, or Merry Tricks*, first printed in 1611 and reprinted in Dodsley's *Old Plays*. For liveliness of

incident and spirit and humour in dialogue and character it is one of the best of the old Eng. dramas. Little is known with certainty about the author, but his first name is properly Lording, which was his mother's surname.

Barry, Comtesse du, see DU BARRY, MARIE.

Barry, Martin (1802-55), Eng. physician, studied in Edinburgh, Paris, Germany (under Tiedemann), and London. Special study, embryology; 1839 contributed 2 papers on the subject to *Philosophical Transactions*. In 1843 B. gave physiological lectures at St. Thomas's Hospital.

Barry, Sir Redmond (1813-80), Australian judge, educated at Trinity College, Dublin; barrister 1838. In 1839 went to Sydney; becoming shortly commissioner of court of requests in Melbourne, 1850, on formation of colony of Victoria, B. was solicitor-general; in 1851 became judge; 1855 first chancellor of Melbourne Univ.; knighted 1860; visited England 1862. He founded Melbourne Public Library and National Gallery.

Barry, Spranger (1719-77), Irish actor, b. in Dublin; son of a silversmith. He mismanaged his father's business so badly that he became bankrupt, and adopted the profession of an actor. His first appearance was made at the Theatre Royal, Dublin, on Feb. 15, 1744. He played for a time under Garrick, but in 1749 left Drury Lane for Covent Garden, and both houses played *Romeo and Juliet* in rivalry of each other simultaneously. B.'s performance of *Romeo* was considered by many to surpass that of Garrick. B. crossed to Ireland after a time, and opened theatres in Dublin and Cork, but returned to work with Garrick in 1767. He again went to Covent Garden, however, in 1774, where he played till his death. He had no tact, and was ignorant and lacking in judgment, but was nevertheless a great actor.

Barry Cornwall, see PROCTER.

Barry Railway Viaduct, across Taff R., Glamorganshire, Wales; spans 2 other railway lines and a canal. Length 1420 ft., height 112 ft.

Barrymore, John (1882-1942), Amer. actor, of a distinguished theatrical family, his real name being Blythe. He first appeared, in Chicago, in *Magda*, 1903, and 2 years later made appearance in London in *The Dictator*. He scored a success as Hamlet, in U.S.A., in 1923, and in London in 1925. He also acted for the films, a notable success being his performance in the double role in the film of Stevenson's *Dr. Jekyll and Mr. Hyde*. In talking films his best parts were in *Arsène Lupin*, *Moby Dick*, *Romeo and Juliet*, and *Svengali*. His autobiography *Confessions of an Actor* was pub. in 1926. See also biography by Alma P. Waters, 1942. His brother and sister, Lionel and Ethel Barrymore, also became leading Amer. actors, his sister, in 1928, opening the Ethel Barrymore Theatre in New York.

Bars, N.W. co. of Hungary, the cap. of which is Aranyos Marót. It contains the

2 small adjoining tns. of Ò Bars (Old Bars) and Uj Bars (New Bars), which are situated 57 m. to the N.N.W. of Budapest.

Barsi, or **Bursi**, tn. in the Sholapur dist. of Bengal, which is noted for its cotton. Pop. 18,000.

Barsine: 1. Also called Statira, the daughter of Darius Codomannus and the wife of Alexander the Great. After the death of Alexander, she was put to death through the instigation of Roxana, who feared that B. might give birth to a son, whose claims would clash with those of her own. (2) Daughter of Artabazus, satrap of Bithynia, and wife of Memnon, a Rhodian. At the fall of Damascus, 333 B.C., she fell into the hands of Alexander the Great, and became the mother of his son Hercules. She and her son were afterwards murdered by Polysperchon, by the order of Cassandra.

Bars Khotan, see **BARAS KHOTUN**.

Barstow, Emmuska, see **ORCZY, BARONESS**.

Bar-sur-Aube, tn. in the dept. of Aube, France, on the riv. of the same name. Manufs. brandy, wool, and cotton; exports grain and wine. Originally a Rom. fortress, destroyed by the Huns. Pop. 4000.

Bar-sur-Seine, tn. in the dept. of Aube, France, 19 m. S.E. of Troyes, situated on the l. b. of the Seine. In the Middle Ages it was a tn. of note. Pop. 3000.

Bart, Jean (1650-1702). Fr. naval officer, b. at Dunkirk, as a boy served under Admiral de Ruyter. Was in command of a frigate of the Fr. Navy against the Sp. in the Mediterranean Sea. In the war with England he was captured and taken to Plymouth; he escaped, however, and was made a captain by the Fr. king. In 1690 he took command of a 40-gun ship and helped Admiral de Tourville against the combined Eng. and Dutch fleets; he obtained command next year of a squadron that went up the North Sea and landed on the coast of Scotland, plundering sev. vils.; made an attack on Newcastle after the Fr. defeat at La Hogue. Retired after peace of Ryswick in 1697.

Bartan-Su, or **Bartine**, River, the anct. Parthenius (q.v.).

Bartas, Guillaume de Saluste Du, see **DU BARTAS**.

Bartenstein, tn. of the former E. Prussia, 34 m. S.S.E. of Königsberg (Kalinigrad), on the R. Alle. It is now incorporated in Lithuania. Pop. 10,000.

Barter, system of trading by the exchange of one commodity for another, as distinguished from the sale of commodities for money. It is the common method of exchange amongst primitive peoples, and is a phase in the economic hist. of all races. In civilised countries the custom became practically extinct with the establishment of the money currency. In law, B., or exchange, is a contract for the exchange of 2 commodities.

Bartheid, see **BARDEJOV**.

Barth, seaport of Pomerania, Germany, on the Hinnensee at the mouth of the B., 17 m. N.W. of Stralsund. The chief

industries are shipbuilding, brewing, and fish-curing. There is a thirteenth-century church. Pop. 8000.

Barth, Heinrich (1821-65), Ger. explorer, b. in Hamburg. After studying at the univ. of Berlin, he made his first expedition to Africa, visiting Tunis, Tripoli, and travelling down the valley of the Nile. In 1847 he again travelled in Egypt and the Near E. An account of these journeyings was given in his *Wanderungen durch die Küstenländer des Mittelmeeres* (1849). From 1849 to 1855 he was engaged with the Brit. expedition of exploration in Central Africa. His experiences during these years he described in his *Reisen und Entdeckungen in Nord- und Zentralafrika* (1849-58; Eng. translation, new ed., 1890). In 1863 he became prof. of geography at the univ. of Berlin. His collection of Central African vocabularies (1862-64) is of great value.

Barth, Karl (b. 1866), Ger. theologian. The leader and prophet of the New Reformation thought. B. has changed the whole outlook of Protestant theology on the Continent, where the reformed churches have acclaimed his message as an inspiration to renewed vigour. In the Ger. youth movement his chief work up to the present is *The Word of God and the Word of Man* (trans. by D. Horton, 1930). In this we learn that B., disillusioned alike of the redemptive influence of Socialism and of the ineffectiveness of evolutionary progress, and indeed of all human effort, abjures all religious systems which take man as their centre; or, in other words, the only hope for religion is that man should get back to God. In the language of theology, B. opposes to the familiar anthropocentric theology one that is theocentric, and against the immanence of God he sets His transcendence. In the place of a subjective faith based on experience which makes God little more than the projection of human hopes and desires, B. urges a surrender to a transcendent divine event. B.'s other works include a commentary on the Epistle to the Romans, and a work on dogmatics. See R. D. Hoyle, *The Teaching of Karl Barth*, 1930; J. McConachie, *The Significance of Karl Barth*, 1931.

Barthélemy, Auguste Marseille (1796-1867), Fr. writer of political verse, b. at Marseilles. After completing his education at the Jesuit College of Juilly, he went to Paris in 1822. Here he wrote a series of brilliant satires against the Bourbons. In 1826 was pub. his mock-heroic poem, *Le Villéiade*, written in collaboration with his friend Méry. This was an enormous success, as was also his *Napoléon en Égypte* (1828). The imperialistic sentiments of *Le Fils de l'homme* (1829) brought about his imprisonment, from which he was released by the revolution of 1830. This event he celebrated, with Méry, in *L'Insurrection* (1830). From 1832 his popularity declined, owing to his support of gov. measures distasteful to the Liberal party. His changes of front he attempted to justify in his phrase, 'L'homme absurde est celui qui ne change jamais.'

Barthélemy, Jean Jacques (1716-95), Fr. writer and antiquarian, b. at Cassis, in Provence. In early life he was educated for the Church, and spent much time in the study of Gk. and oriental languages, and antiquities, especially numismatics. In 1745 he became an assistant in the royal cabinet of medals, and in 1753 was appointed its director. He received a state pension which enabled him to carry on his research work, but the Revolution deprived him of office in 1789. He was denounced as an aristocrat in 1793, but was released. Citizen Paré, the *pro tempore* minister of the interior, offered him the place of chief librarian of the Royal, now National, Library, which he refused on account of his age. His best-known work is the *Voyage du jeune Anacharsis en Grèce* (4 vols, 1788), which has been trans. into many languages, the Eng. ed. being ed. by W. Beaumont (5th ed., 6 vols., 1817). A complete ed. of his works was brought out in 4 vols. with a biography in 1821.

Barthélemy Saint-Hilaire, Jules (1805-1895), Fr. politician and savant, friend and literary executor of Thiers, b. in Paris. After occupying a minor position in the ministry of finance, he became in 1838 prof. of Gk. and Rom. philosophy at the Collège de France. The revolution of 1848 again brought him into politics as a member of the Assembly. On the occasion of the *coup d'état* he was one of the patriots who suffered imprisonment. After his release he vacated his professorship and devoted himself to oriental studies. As a member of the Bordeaux Assembly, to which he was elected in 1871, he supported Thiers, and for some time acted as his secretary. In Jules Ferry's Cabinet of 1880-81 he was foreign minister. His chief works are his translations of Aristotle (1839-44), *Sur les Védas*, 1854; *Du Bouddhisme*, 1855; *Le Bouddha et sa religion*, 1866; *La Philosophie dans ses rapports avec les sciences et la religion*, 1889; and *François Bacon*, 1890. He also made a verse translation of the *Iliad*.

Barthez, Paul Joseph (1734-1806), Fr. physician, b. at Montpellier. Here he studied medicine and obtained his doctor's degree at the early age of 19. In 1756 he was employed as a physician to the army, but soon returned to Paris to edit in part the *Journal des savants* and the *Encyclopédie méthodique*. In 1759 he was appointed prof. at Montpellier, and became chancellor of the univ. in 1785. His chief work, *Nouveaux Éléments de la Science de l'homme* (1778), expounds his doctrine of vitalism. Amongst his other works are: *Oratio de Principio Vitali Hominis*, 1773; *Nova Doctrina de Functionibus Corporis Humani*, 1774; *Nouvelle Mécanique des mouvements de l'homme et des animaux*, 1798; and *Traitement des maladies goutteuses*, 1802. Appointed physician to Napoleon, 1802. Died of fever. Pub. posthumously, *Traité du beau*, 1807; *Consultations de la médecine*, 1810.

Barthold, Friedrich Wilhelm (1799-1858), Ger. historian, b. in Berlin. He studied at the univs. of Berlin and

Breslau, and in 1831 was appointed prof. of hist. at Griefswald. His chief publications are *Geschichte von Rügen und Pommern*, 1839-45, and *Geschichte der Deutschen Städte und des Deutschen Bürgertums*, 1850-52.

Bartholdi, Frédéric Auguste (1834-1904), sculptor, was b. at Colmar, Alsace, his father being of It. descent. His famous work is the Liberty statue ('Liberty enlightening the World') on Bedloe's Is., New York, commissioned by the Fr. Gov. and presented to the American nation to commemorate the centenary of its independence. This huge figure, 220 ft. high, was unveiled in 1886. Amongst B.'s other well-known works are the Lafayette statue, New York, 'The Lion of Belfort,' the monument to Vereiniger-Oriox, the Gaulish leader, and 'Grief.'

Bartholine, or Bartholin, Thomas (1616-1680), Dan. physician, son of Kaspar. He visited the most celebrated schools of Europe. In 1637 he went to Leyden, where he republished his father's *Institutiones Anatomicae*, with additions, in 1641. He also visited Paris, Montpellier, Padua, Malta, and Basle, where he took the degree of doctor of medicine, having chosen for his thesis *De Phrenitide*, 1646. In 1647 he was appointed prof. of mathematics in the univ. of Copenhagen, which in 1648 he exchanged for the chair of anatomy, which he held till 1661. In 1670 he was appointed physician to the king, and became librarian for the univ.; afterwards, in 1675, the king appointed him a member of the grand council of Denmark. He pub. numerous works on medical subjects, and was an ardent supporter of Harvey's doctrine of the circulation of the blood. See Muller's *Bibliotheca Medica*, 1776-78, and *Bibliotheca Anatomica*, 1774-77.

Bartholine, or Bartholin, Thomas (1659-1690), Dan. jurist, son of Thomas B. Studied at the univs. of Copenhagen, Leyden, Paris, Leipzig, and Oxford. Appointed prof. of hist. and civil law at Copenhagen, and held the offices of assessor of the consistory, secretary to the king, antiquary and keeper of the royal archives. His chief work is *Antiquitatum Danicarum Libri Tres*, 1689.

Bartholinus, Kaspar (1585-1629), Dan. scholar, b. at Malmö, Sweden, and d. at Copenhagen. He became prof. of rhetoric in the univ. of Copenhagen in 1611, of medicine in 1615, and of theology in 1624. His text-book, *Institutiones Anatomicae*, 1611, was trans. into Eng., Fr., and Ger., and was used throughout Europe during the seventeenth century.

Bartholomé, Paul Albert (1848-1928), Fr. painter and sculptor, b. at Thiverval, Seine-et-Oise. He studied in Geneva and later entered the studio of Léon Gérôme in Paris. He exhibited *genre* pictures at the Salon from 1879 to 1886, his best being 'Souper de vieillards,' 1808; 'Les Derniers Épis'; 'L'Aïeule coupant du pain pour ses petits enfants.' From 1891 he exhibited sculptures at the Salon. 'Aux morts,' 1899, now placed in the Père Lachaise cemetery, is one of his

finest pieces of sculpture. Largely self-taught, B. followed the classical and not the impressionist school. Among his later pieces may be mentioned 'Paris, 1914-18,' and a memorial to J. J. Rousseau in the Panthéon. He designed the Croix de Guerre and was elected president of the Société Nationale des Beaux-arts.

Bartholomew, Edward Sheffield (1825-1888), Amer. sculptor. He was b. in Connecticut, and became, in succession, a dentist, painter, and sculptor. He was director of the Wadsworth Gallery at Hartford, where there is a large collection of his works. He studied art in New York, and then lived in Italy till his death, at Naples. His best-known statues are, 'Youth and Age,' 'Sappho,' 'Ganymede and the Eagle,' and 'Eve Repentant.'

Bartholomew, Massacre of St., the name given to the massacre of Huguenots which commenced in Paris on St. Bartholomew's Day, Aug. 24, 1572, and spread through the provs. during the succeeding weeks. The total number of those killed has been estimated at figures varying from 5000 to 70,000. In Paris alone 1100 perished. The outrage owed its inception to the cruelty and cunning of Catherine de' Medici, who, as regent for her son Charles IX., after provoking the 8 years' conflict between the Catholics under the duke of Guise and the Protestants under the prince of Condé, during which both leaders lost their lives, lured the Huguenots into a sense of security by marrying her daughter Margaret to the Protestant Henry of Béarn (afterwards Henry IV.). She then worked upon the king's feelings in such wise as to convince him that Admiral Coligny, the Huguenot leader, had designs upon his life, and in a fit of passion he gave orders that Coligny should be killed and all the Huguenots with him. Catherine summoned a council, and St. Bartholomew's Day was appointed for the massacre. Coligny was enticed to Paris and murdered. His death was the signal for an orgy of slaughter. Prince Henry and the prince of Condé only saved their lives by pretended conversion to the Catholic religion. The pope celebrated the event by striking a special medal, proclaiming a year of jubilee, and other ceremonies. Rom. Catholic historians take a different view of the origin and causes of the massacre. They aver that only a few over-zealous Protestant historians claim that the Holy See was the accomplice of the Fr. court. It may be that the idea of the summary execution of the Protestant leaders, as a means of ending the civil discord which had provoked 3 religious wars in France, had long been nurtured in the mind of Catherine de' Medici. Catholics claim that the general opinion throughout France was that the king was compelled to kill Coligny and other turbulent persons in mere self-defence, especially as Coligny was trying to drag Charles IX. into a war with Spain. According to this view the massacre was entirely political and not the result of religious disturbances nor even due to religious incentives. But whether or no Catholic historians can sustain the posi-

tion that the massacre was committed in the name of the corrupt principles of Machiavellianism against a faction that was anathema to the court, there would appear to be some evidence that the Holy See looked on the Huguenots as mere rebels who weakened and divided France just at a time when Christianity needed all her strength to deliver a really effective blow against the infidel Turks; and that what Pius V. championed was an open and honest war waged by Charles IX. and the Guises against the Huguenots. In any case the majority of historians now deny that the massacre was premeditated. See White's *Massacre of St. Bartholomew*, 1867, and Acton's essay in his *History of Freedom*, 1907.

Bartholomew, St., one of the 12 apostles, commonly identified with Nathanael, was b. at Cana in Galilee, and introduced to Jesus by Philip. After the Crucifixion he is stated by various untrustworthy authorities to have preached in India, Armenia, and Asia Minor. According to tradition he was flayed alive and crucified at Albanopolis in Armenia, or Urbanopolis in Cilicia. His festival is celebrated on Aug. 24.

Bartholomew Anglicus, see GLANVILLE, BARTHOLOMEUS DE.

Bartholomew Fair was held annually in W. Smithfield, London, from 1133 till 1840 on St. Bartholomew's Day (Aug. 24, old style). It was at one time the chief cloth fair in the country, and an important market for cattle, pewter, and leather. A great feature of the fair was the large number of exhibitions, shows, performers of all descriptions, quack doctors, etc., which combined to make it one of the most widely popular affairs of its kind. After 1840 the exhibitions were held at Islington. It was proclaimed by the lord mayor for the last time in 1850 and abolished as a nuisance in 1855. See Morley's *Memoirs of Bartholomew Fair*, 1859.

Bartholomew's (St.) Hospital ('Bart.'s), Smithfield, London, was founded in 1123 by Rahere, a minstrel and favourite of Henry I., who was also prior and founder of the adjoining priory of the Augustinian Canons, in the church of which, St. Bartholomew the Great, his magnificent tomb is still to be seen. Within the grounds of the hospital is the auct. church of St. Bartholomew the Less. The priory and hospital were dissolved at the Reformation, but Henry VIII. refounded the latter in 1547. Rebuilt in 1730-66, it was extended in 1881 by the new buildings for the medical school, and from 1905 onwards by other considerable additions. Attached to it is a convalescent home at Swanley, Kent. The hospital contains paintings by Hogarth, Kneller, Reynolds, Lawrence, and Millais. Among the profs. of the medical school have been Harvey, Richard Owen, and Abernethy. The hospital suffered damage during air raids in the Second World War. On Sept. 9, 1940, a high-explosive bomb struck the basement and ground floor of the nurses' home in Little Britain, and later in the same month a bomb hit the hospital in

the part containing the anatomical lecture theatre.

Barthou, Jean Louis (1862-1934), Fr. statesman, b. Aug. 25. After practising law, he entered politics in 1889, being appointed deputy for the dept. of Basses-Pyrénées. From 1894 he held a succession of ministerial posts until he became premier in Mar. 1913. His Gov. lasted until Dec. of the same year, and B. served as minister without portfolio in Painlevé's Gov. during the First World War. After the war he was a protagonist of the policy to maintain vigorously all Fr. claims and guarantees as recognised in the peace treaties. From 1922 to 1926 he was president of the reparations commission, and then became minister of justice in Poincaré's Gov. of 1926. He later served under Briand, and was foreign minister in 1934 when, on Oct. 9, he was assassinated at Marseilles while in the company of King Alexander I. of Yugoslavia, who was also murdered. B. was the author of sev. books, including *L'Action syndicale* (1904), *Mirabeau* (1913), and *Lamartine Orateur* (1919).

Bartine, see **PARTHENIUS**.

Bartin, River, see **BARTAN**.

Bartizan, in architecture, small, overhanging turret, projecting from the angle at the top of a tower or from a parapet of a building; more commonly seen on castles on the Continent than in the United Kingdom.

Bartlett, Sir Ellis Ashmead (1849-1902), Amer.-Eng. politician, b. in Brooklyn, New York. He graduated at Christ Church, Oxford, in 1872. M.P. for Eye, 1880-84; for Ecclelland div., Sheffield, 1885-1902. He became civil lord of the Admiralty in 1885. He was a strong anti-Russian, and an enthusiastic supporter of Turkey. He fought for the sultan against Greece in 1897, and was taken prisoner by the enemy. He also served in 1899 when the Boer war broke out. Author of *The Battlefields of Thessaly* (1897).

Bartlett, John (1820-1905), Amer. publisher and compiler, b. at Plymouth, Massachusetts; was a bookseller and publisher in Cambridge, Massachusetts. In 1855 he pub. *Familiar Quotations*, and in 1894 a concordance to Shakespeare, much fuller than any previously pub.

Bartlett, John Russell (1805-86), Amer. author and antiquarian. He was appointed on the commission to determine the boundary line between the U.S. and Mexico (1850-54); and was secretary of state for Rhode Is. from 1855 to 1872. He wrote *The Progress of Ethnology*, 1847; *A Dictionary of Americanisms*, 1850; *Literature of the Rebellion*, 1866; *Primeval Man*, 1868. His bibliographical works include *Records of the Colony of Rhode Island and the Providence Plantations* (10 vols., 1856-65).

Bartlett, Paul Wayland (1865-1925), Amer. sculptor, b. at New Haven; educated there and at Boston. He began sculpture under Frémiet, and at the age of 14 exhibited at the Salon. In 1880 he entered the École des Beaux-arts, and he represented U.S.A. on the international jury of awards for sculpture at the Paris

Exposition of 1900. A chevalier of the Legion of Honour, 1895, he became an officer, 1908, and a commander, 1925. Among his most noted works are statues of Michelangelo, Columbus, and Benjamin Franklin, and one of Lafayette in the square of the Louvre; the pediment over the House wing of the Capitol at Washington, and 6 figures in front of the N.Y. public library.

Bartlett, Vernon, Eng. journalist, b. Westbury, Wilts, Apr. 30, 1894; educated Blundell's School, Tiverton. After service in the army 1914-16, he was successively on the staff of the *Daily Mail*, Reuters, and *The Times*, being foreign correspondent for the latter in Germany, Poland, and Italy, 1919-22. He joined the staff of the *News Chronicle* in 1934, and in 1938 entered Parliament as M.P. for Bridgwater. While being independent of party, his sympathies are Liberal. He broadcast regularly on foreign affairs from 1928-34, and again to listeners in the Empire and the U.S.A. during the Second World War. He has pub. a number of books, notably *Behind the Scenes of the Peace Conference*, 1919; *The World—Our Neighbour*, 1931; *Nazi Germany Explained*, 1933; *This is My Life*, 1938; *To-morrow Always Comes*, 1943; and *Go East, Old Man*, 1948.

Bartlett, William Henry (1809-54), Eng. artist, b. in London. He was apprenticed, as an architect, to John Britton. His sketches were almost entirely topographical. He provided the illustrations to Britton's *Cathedral Antiquities of England*, 1814-35; and illustrated *American Scenery* 1840; and *Canadian Scenery*, 1842, by N. P. Willis, after having travelled extensively in N. America. He wrote sev. works on Palestine and Egypt.

Bartók, Béla (1881-1945), Hungarian composer and pianist, b. at Nagyszentmiklós, Rumania (formerly in Hungary). By 1904 he had produced sev. works, including songs and piano pieces, all of which showed the influence of Strauss. These early themes bear the obvious impress of Hungarian popular melodies, and his *Kossuth* symphony of 1903 indicates the influence on B. of a strong contemporary national movement. This basis, however, was less suited to a national style in music than the much older peasant music and folk-songs, and B., who had been teacher at the Budapest Musical Academy since 1907, set out to search for old traditional melodies. His style soon showed the effect of this archaic music, which is mostly modal and rhythmic. But whereas his earlier work had met with unqualified success, this later work earned the appreciation only of a limited circle. Of this period are his *Deux Images* (1910), *Nénies* (1910), and the opera *Duke Bluebeard's Castle*. Discouraged, he withdrew from public life to devote himself to folk-lore studies and travel, returning with a large collection of Arab peasant music. Now his work became more individual and subjective, and there was a change in popular favour. His pantomime, *The Wooden Prince* (1917) brought him recognition, and the new

generation received his subsequent works with enthusiasm. After that date he exploited a new and rather perplexing expressionist style, e.g. in the piano sonata (1927), the second violin sonata, and the second string quartet. His compositions are fairly numerous and include (in addition to stage works) orchestral suites and other orchestral music, some choral music—e.g. *Cantata Profana*—sev. string quartets and violin sonatas, many piano compositions (including concertos), besides many vols. of arrangements of folk-songs. Also pub. *Hungarian Folk Music* (Eng. trans. by M. D. Calvocoressi, 1931).

Bartoli, Adolfo (1833-94), lt. author, b. at Fivizzano. He was associated in the editorial management of *Archivio storico Italiano*, 1856-59; director of the naval academies at Leghorn, Piacenza, and Venice; and prof. of literary hist. in the Istituto di Studi Superiori of Florence, 1874-94. He pub., among other works, a critical hist. of lt. literature down to the fourteenth century, *Storia della Letteratura Italiana* (8 vols.), 1878-89.

Bartoli, Daniello (1608-85), lt. Jesuit, b. at Ferrara, and d. at Rome. He entered the order of the Jesuits at the age of 15. He was commissioned by the father-general to write a hist. of the order, and it is for his *Istoria della Compagnia di Gesù* that B. is chiefly remembered. He was appointed rector of the Gregorian or Rom. College in 1671. A complete ed. of his numerous works appeared at Turin in 34 vols. (1823-44).

Bartoli, Pietro Santi (1635-1700), lt. painter and engraver, b. at Perugia. As an engraver he obtained a great reputation, more, however, from the subjects and the number of his prints than for any particular excellence of execution. He studied painting under P. Le Maire and under Nicolas Poussin, from whom he probably derived his great love of the works of anc. art. As a painter he did little beyond copying, in which he was so proficient that even Poussin himself had difficulty in distinguishing between his own pictures and the copies made of them by B.

Bartoli, Taddeo, or Taddeo di Bartolo (c. 1363-c. 1436), early lt. painter, b. at Siena. He was one of the greatest of artists in the period which preceded the Renaissance, and his chief care was expended on frescoes. Some of his best work, dating from 1414, is to be found in the municipal palace of Siena, and in the cathedrals of Pisa, Perugia, and Genoa. His favourite subject was the life of the Virgin, and one of his earliest works, 'The Virgin among the Saints,' 1390, is in the Louvre.

Bartolini, Lorenzo (1777-1850), lt. sculptor, b. at Vornò, near Florence. After acquiring considerable reputation as a modeller in alabaster, he went to Paris in 1797, where he studied painting under Desmarests and sculpture under Lenoir. His bas-relief of 'Cleobis and Biton,' 1803, gained the second prize of the Academy. After the fall of Napoleon, who had been his great patron, he retired to Florence, where he d. Amongst his best works are: 'Charity,' 'Pyrrhus hurl-

ing Astyanax from the Walls of Troy,' 'Hercules and Lichas,' and 'Faith in God.'

Bartolommeo di Pagholo del Fattorino, Fra (1475-1517), also known as **Baccio della Porta**. Florentine painter, b. at Savignano, near Florence, by the gate of San Piero Gattolino, hence his name 'della Porta.' He entered the studio of Cosimo Rosselli, where he came into contact with Piero di Cosimo and Albertinelli. He became a follower of Savonarola, and on the reformer's death renounced his profession and in 1500 joined the Dominicans at San Marco. However, he continued to paint in his convent, and about 1504 painted the picture in the Florentine Academy, 'Apparition of the Virgin to Saint Bernard.' In 1506 Raphael on a visit to Florence made the acquaintance of B., and the 2 artists influenced each other's work. B. also learnt much from Leonardo da Vinci, and later from Michelangelo. He was associated with his friend Albertinelli in many of his pictures; the fresco of the 'Last Judgment' (Santa Maria Nuova), 1498, was finished in the lower part by Albertinelli; and the 'Madonna and Saints' in the Pitti and the 'Assumption' in Berlin are among their joint productions. Some of his finest work is at Lucca, including the beautiful 'Madonna della Misericordia,' 1515; of his other well-known pictures, only a few can be mentioned: the 'Marriage of Saint Catharine' (in the Louvre), 'Saint Mark' (Pitti), and 'Saint Sebastian.' B. excelled particularly in draperies and in symmetry of composition. He is said to have been the first to use the lay figure. Consult the biographies of Leader Scott, 1880, and Gruyer (Paris, 1886), and Vasari's *Lives of Italian Painters*, 1895.

Bartolommeo, Veneto, or Veneziano Bartolommeo (d. 1461), lt. painter, b. in the early part of the 15th century. His works have scarcely anything in common with the Venetian school, though he signs himself a Venetian. Spent early years of his life in Florence and Perugia and appears to have been employed by the Medici family. He worked on the decorations of the Portinari Chapel in Santa Maria Novella, Florence, 1439-44, and is said to have used limbed oil as his medium. His paintings include an enthroned Virgin and Child with St. John the Baptist, St. Francis, and other saints. He d. at Florence May 15, sev. years after the death of Andrea del Castagno, whom Vasari erroneously accuses of having been his murderer. But few of his paintings are in existence, the most important being the enthroned Madonna in the National Gallery. Others ascribe to him frescoes of St. Francis and John the Baptist in the church of Santa Croce, Florence.

Bartolozzi, Francesco (1725-1815), lt. engraver, was a native of Florence. He was originally intended for his father's profession of silversmith, but his artistic bent led to his being instructed in painting. He studied engraving at Venice under Joseph Wagner. For a short time he lived in Rome, where he engraved a fine

set of plates from the life of St. Vitus. In 1764 he settled in England under the patronage of George III. He was one of the original members of the R.A., and executed for them, from Cipriani's design, the diploma which is still used. In 1802, at the invitation of the prince regent of Portugal, he became superintendent of an engraving school at Lisbon, where he d. Amongst his best works are 'The Silence' and 'Clytie,' after Annibale Carracci, and 'Venus, Cupid, and Satyr,' after L. Giordano. The famous actress, Madame Vestris, was his grand-daughter. See Tuer's *Bartolozzi and his Works*, second ed., 1885, and Baily's *Francesco Bartolozzi*, 1907.

Bartolozzi, Lucia Elizabeth, see VESTRIS.
Bartolus (1314-57), It. jurist. b. at Sassoferato. Studied civil law at Bologna and Perugia; was a doctor of civil law at the former, and a prof. at the latter univ. He had a rare knowledge of the jurisprudence of the imperial period of anc. Rome and his commentaries on Justinian's *Digest* are authoritative. Also wrote treatises on evidence and procedure.

Barton, vil. of the Isle of Wight, England, which gives its name to the formation known as the Barton Beds or Barton Clay (*q.v.*), the clays being well exposed here.

Barton, Andrew, Scottish naval commander and the hero of a popular ballad, was killed in a fight with 2 Eng. ships in 1511. Many of his operations savoured of piracy.

Barton, Benjamin Smith (1766-1815), Amer. naturalist and doctor, b. at Lancaster, Pennsylvania. He studied medicine and the natural sciences in Philadelphia, Edinburgh, and London from 1782 to 1788, and graduated at Göttingen. On his return to America he worked up a practice in Philadelphia, and in 1790 became prof. of natural hist. and botany in the college there, and thus was the earliest teacher of natural science in N. America. In 1802 he was elected vice-president of the Amer. Philosophical Society, and in 1809 president of the Philadelphia Medical Society. His works include *Elements of Botany*, 1812-14; *Collections for an Essay toward a Materia Medica of the United States*, 3rd ed., 1810; and *Flora Virginica*, 1812.

Barton, Bernard (1784-1849), Eng. poet, commonly known as the Quaker poet b. at Carlisle. For the greater part of his life he was a bank clerk at Woodbridge in Suffolk. He was the author of *Metrical Effusions*, 1812; *Poems by an Amateur*, 1818; and *Poems*, 1820. These works are distinguished by piety and pathos. He was a friend of Charles Lamb. See his *Poems and Letters*, 1849; new ed., 1853, with a memoir by Edward FitzGerald.

Barton, Clara (1821-1912), Amer. philanthropist, b. at Oxford, Massachusetts. During the Amer. Civil war she did relief work on battlefields and organised at her own expense the search for missing men. In the Franco-Ger. war of 1870, she associated herself with the International Red Cross of Geneva, since when she represented the U.S.A. at

many international conferences, and in 1898 did personal field work at Cuba and in the Anglo-Boer war of 1899-1902. She d. at Washington, D.C. Her publications include a *History of the Red Cross*, 1882; *History of the Red Cross in Peace and War*, 1898; *A Story of the Red Cross*, 1904; and *Story of my Childhood*, 1907. See C. Bacon-Foster, *Clara Barton* (Washington), 1918.

Barton, Sir Edmund (1849-1920), Australian statesman. He was b. at Glebe, near Sydney, New South Wales; called to the Bar in 1871. He was a leading figure in the legislative council and assembly, and Speaker 1883-87; attorney-general, 1889-91. He became leader of the Federation movement on the retirement of Sir Henry Parker in 1891, and founded (July 1893) the Sydney Federation League. Conference of Australian premiers at Hobart in Feb. 1895 resulted. The Federal Convention at Adelaide, 1897, appointed B. leader. In 1900 he was in England to watch the passage of the Commonwealth Bill through the Imperial Parliament; and he was first Commonwealth Prime Minister, 1901-3. In 1903 he retired and became senior puisne judge of the Federal High Court. He d. at Mellow, Blue Mountains, N.S.W., Jan. 6, 1920.

Barton, Elizabeth, commonly called the holy maid of Kent, was b. about the year 1506. She served at an inn in Aldington. After a severe illness in 1525 she became subject to hysterical ravings and fell into a state of religious mania. Archbishop Warham sent 2 monks to examine her, and one of these, Edward Bocking, or Bocking, was quick to see that she might be used as an instrument for reviving popular belief in the Catholic Church. He instructed her in the points at issue between his Church and Protestantism, and in the legends of the saints, and personally directed her prophesying to his own ends. In 1527 she became a nun at the priory of St. Sepulchre at Canterbury. In 1532 she opposed Henry VIII's intention to divorce Catherine and predicted his death within 7 months of his marriage with Anne Boleyn. The non-fulfilment of this prophecy brought about a loss of popular confidence; she was arrested and confessed that 'all that she ever said was feigned of her own imagination only, to satisfy the minds of those which resorted to her and to obtain worldly praise.' In 1534 she was executed at Tyburn, with Bocking and other accomplices, on a charge of high treason. See Burnet, *History of the Reformation in England*, 1737.

Barton, Sir Geoffrey (1844-1922), Brit. soldier. He entered the army in 1862; served with distinction in the Ashanti war, 1873-74, and in the Zulu war, 1879. He also went to Egypt (1882) with an expeditionary force, and was present at Kassassin and Tel-el-Kebir; and was again called to the front during the Boer war (1899-1902). He was wounded at Ladysmith and commanded the Krugersdorp dist. till 1902.

Barton, William Eleazar (1861-1930), Amer. theologian and clergyman, b. Illinois. Associate editor of the *Bibliotheca Sacra*, and, later, of the *Congregationalist*. Lectured on applied practical theology and ecclesiastical law. Among his works are *Life in the Hills of Kentucky*, 1889; *The Old World in the New Century*, 1902; *The History and Religion of the Samaritans*, 1906; *The Law of Congregational Usage*, 1915; *Congregational Creeds and Covenants*, 1917; *Safed and Kenturah*, 1921; *Immortality*, 1926.

Barton Clay, a name given to some beds of the Eocene strata which are well exposed in the cliffs of B. in Hampshire. They contain a variety of fossils of creatures of marine origin.

Barton-upon-Humber, anct. market tn. on the S. side of the Humber, Lincolnshire. At the time of the Norman Conquest it was one of the prin. ports of the Humber. The tn. contains 2 large churches, one of which is very old. There is considerable trade in corn, and bricks, tiles, ropes, sacking, sailcloth, and pottery are manufactured. Tanning is also carried on. Pop. 6300.

Barton-upon-Irwell, dist. of Lancashire, near Manchester, where the aqueduct constructed by Brindley conducts the Bridgewater Canal over the Irwell.

Bartsch, Johann Adam Bernhard von (1757-1821), b. and d. at Vienna; he received his education in the school of engraving at Vienna under Prof. Schmutzer. In 1781 he was appointed keeper of the prints of the royal collection, which led to the publication of his work *Le Peintre-Graveur* in 21 vols., 8vo., 1803-21, which is a description of the greater part of the works of the prin. engravers of Europe.

Bartsch, Karl Friedrich Adolf Konrad (1832-88), Ger. scholar, b. at Sprottau, Silesia. He was prof. of Germanic and Romance philology at Rostock (1858-71), and at Heidelberg (1871-88). He ed. numerous texts of Middle High Ger. and Provençal poetry, and pub. *Untersuchungen über das Nibelungenlied* in 1865, which he trans. into modern Ger. 2 years later. He also trans. the poems of Burns (1865) and Dante's *Commedia* (1867), while in 1874 he pub. a vol. of original lyrics. He also wrote critical works on the early literature and language of Germany and France.

Bartsch, Paul, Amer. naturalist, b. at Breslau, Silesia, Aug. 14, 1871; educated at the State Univ. of Iowa. He was appointed to the staff of the U.S.A. National Museum, Washington, and assistant curator and, later, curator, of marine invertebrates there. In 1899 he became prof. of zoology in the George Washington Univ. and then lecturer on medical zoology in the Howard Univ. Was Smithsonian representative in the Philippine expedition, 1907-9, and has represented that institution in many other expeditions. In the First World War he supplied a gas detector in chemical warfare. In 1920 he was Smithsonian delegate to the scientific congress at Honolulu. Author of numerous technical papers on biology.

Bartsia, genus of plants, chiefly herbaceous and semi-parasitic, belonging to the Scrophulariaceae, which grow in the N. temperate zone, on tropical mts., and in S. America. There are 3 Brit. species, of which *B. alpina* and *B. odontites* are 2. *B. maxima*, a native of Candia, grows to a height of 1½ or 2 ft.; *B. acuminata* is found in America.

Barttelot, Major Edmund Musgrave (1859-88), Brit. officer. He served in India, Afghanistan, and Egypt; joined the Stanley expedition for the relief of Emin Pasha (1887), and was murdered by one of his followers on a journey into the interior. Stanley brought a charge of cruelty against him, which was refuted by his brother, Major Walter G. B. B., in *The Life of Edmund Musgrave Barttelot*, 1890.

Baru, fluffy substance obtained from the sago palm *Saguerus saccharifer*, used for stuffing cushions and for calking boats.

Baruch (Heb., blessed), the son of Neriah, the son of Maaseiah, to whom Jeremiah dictated his prophecies, and who read the roll before the princes in the reign of Jehoiakim, about 606 B.C. During the siege of Jerusalem by Nebuchadnezzar, B. and his master were at first imprisoned, but were afterwards released and allowed to choose their place of residence; they afterwards went into exile in Egypt, c. 588 B.C. There is diversity of opinion concerning the close of his life. According to Josephus (*Antiq.* x. ix. 7) he went from Egypt to Babylon; but Jerome asserts that he d. in Egypt. See Jeremiah xxxii., xxxvi., xliii., xiv., and li.

Baruch, Bernard Mannes, Amer. economist, b. Aug. 19, 1870, son of Dr. Simon Baruch (q.v.). Going into finance B. was for many years a member of the New York Stock Exchange, and accumulated a large fortune. When the entry of the U.S.A. into the First World War was imminent, President Wilson made him a member of the advisory commission of the Council of National Defence. He became chairman of the committee on raw materials, minerals, and metals, and also head of the commission in charge of all purchases for the Allies. Wilson in 1918 made B. chairman of the War Industries Board, a body invested with vast power to co-ordinate Amer. industries for war-making purposes. After the armistice, he went to Paris with Wilson, who had him nominated a member of the Supreme Economic Council. As such, he played a leading part in drafting the economic and reparations sections of the treaty of Versailles. In 1919 he became a member of the Conference for Labour and Capital. During the Second World War he worked from 1943 as personal adviser to James Byrnes, then director of the Office of War Mobilisation. In Mar. 1946 he was nominated by President Truman as the Amer. member of the commission of 12 who formed the United Nations commission on atomic energy. B. is the author of *Making of Economic and Reparation Sections of Peace Treaty* (1920) and pamphlets on agric. and economic subjects.

Baruch, Simon (1840-1921), Amer. physician, *b.* at Posen, educated at the *.....* lum at Posen, and later, at the Medical College, Virginia. In 1889, after a distinguished career in New York, he diagnosed the earliest authenticated case of perforating appendicitis successfully operated on. He was the pioneer of scientific hydrotherapy in U.S.A. Piloted through the Legislature the bill which secured free public baths to the community, the first, the Livingston Bath, being opened in New York in 1901.

Barvas, parish of Lewis Is., Hebrides, Ross-shire, Scotland. Pop. 3000.

Barwick, John (1612-64), Eng. divine. He graduated at St. John's College, Cambridge, in 1635, and became M.A. in 1638. His loyalty to the Royalist cause obliged him to leave Cambridge; he communicated the designs of the rebels to Charles I., was charged with high treason and imprisoned in the Tower, 1650-2. At the Restoration, he became dean of Durham, 1660, and dean of St. Paul's 1661.

Barye, Antoine Louis (1795-1875), Fr. sculptor, *b.* in Paris. He studied sculpture under Bosio and painting under Gros. He is famous for his marvellous animal studies, which were the starting-point of a new type of art. Amongst these are the 'Lion Struggling with a Snake,' 'Lion Resting,' 'Theseus and the Minotaur,' 'Lapitha and Centaur,' and 'The Hunt of the Wild Ox.' There are sev. examples of his work in the gardens of the Tuileries. He was also successful with the human figure, as exhibited in his 4 groups, 'War,' 'Peace,' 'Strength,' 'Order.' He worked largely in bronze. See Ballin's *L'Œuvre de Barye*, 1890.

Baryta, barium monoxide (BaO), an earth occurring in the minerals barytes, or heavy spar, and witherite. The original name was *barote* (from *bapis*, heavy), but Lavoisier's alteration to *B.* has been universally adopted. It was at first thought to be an elementary substance, but prolonged investigation led to its being separated into the metal barium (*q.v.*), and oxygen. *B.* is formed when barium burns in air, or by heating barium nitrate until no more red fumes are given off. It may also be prepared by heating witherite mixed with charcoal to a white heat. It is a greyish-white solid, with sp. gr. about 5; it melts at 2000°. When heated with air barium peroxide (BaO_2) is formed. Baryta water is a solution of barium hydroxide in water. It is used as an absorbent for carbon dioxide.

Barytes, Barite, heavy spar, or barium sulphate, mineral, important as chief source of soluble barium compounds, and as a pigment under the name of permanent white. It derives its name from its high sp. gr. (4.5) as compared with other mineral sulphates or other minerals with the same general appearance. It occurs in rhombic crystals of varied forms, and may be artificially produced by acting upon baryta with fuming sulphuric acid. The natural sulphate is commonly found associated with lead and silver ores, and is prepared for use as a paint by being

finely ground, usually along with white lead, treated with sulphuric acid to remove iron salts, washed, and dried.

Baryton, also called *Viola di Bordone*, stringed musical instrument resembling in tone the viola da gamba. It was invented in 1700, and has now fallen into disuse. Haydn composed a large number of works for this instrument.

Bas, or Batz, is. in the Eng. Channel, off the N. coast of the dept. of Finistère, France. It is about 2½ m. long and 2 m. broad. The is. has 3 vils., a fine light-house erected on a hill 223 ft. above the sea level, 2 forts, and a haven, that of Kernoe. The chief occupation is fishing. Pop. 1200.

Bas, or Bas-en-Basset, tn. in the dept. of Haute-Loire, arron. Yssingeaux, France, on the l. b. of the Loire, 17 m. S.W. of St. Étienne. There are mineral springs; corn and the vine are grown, and there are manufs. of pottery, ribbons, and lace. Pop. 2600.

Bas, William, see *BASSE*.

Basalti, Marco, It. painter, *b.* in the Friuli, probably about the middle of the fifteenth century. He lived chiefly in Venice, where he was the rival of Giovanni Bellini, to whom he was even superior in some respects, especially in composition, in accessory groups, and in the management of the landscape or scene. Some of B.'s works are still among the most brilliant paintings extant in regard to colour. There are still sev. of his works in Venice. His masterpiece is the 'Calling of St. Peter and St. Andrew,' in the Academy of Venice, formerly in the old church della Certosa. There is a beautiful 'Descent from the Cross,' by B., in the Gallery of Munich.

Basalt, igneous rock. The Lat. *basaltis* is derived from an African word meaning a stone containing iron, and many varieties of the rock contain iron in the form of magnetite. Igneous rocks are broadly divided into acid rocks containing a large amount of silica, such as granite; and basic rocks, in which silica as quartz is absent, and a comparatively large amount of iron and magnesia is present. The most abundant member of the latter group is *B.*, which consists chiefly of plagioclase feldspar, augite, and olivine. Under the microscope the minerals augite and olivine appear embedded in a crystalline ground mass of plagioclase feldspar, augite, and magnetite. In older rocks the olivine is frequently altered in part to a fibrous green serpentine. *B.* rocks are of common occurrence in Iceland, Skye, Mull, Antrim, central France, Germany, Italy, Washington, Idaho, the Deccan, Sandwich Islands, etc. They represent lava which has exuded from fissures in the ground, and has spread over a considerable surface. The stresses to which the cooled rocks were subjected resulted in a network of cracks or 'joints' of a roughly hexagonal shape, similar to the cracks produced in dry mud under certain circumstances. Hence many of the basaltic rocks of N. Ireland and W. Scotland exhibit a columnar structure, as in the Giant's Causeway and Fingal's

Cave. B. was known to the anc. Egyptians and Romans, who used it for building purposes. In Rome it was introduced in the first century B.C., the black, green, and brown varieties having been identified. The basaltic plateau of Auvergne played a part in the controversy between the 'Vulcanists' and 'Neptunists' of the latter part of the eighteenth century. The 'Neptunists,' led by Werner, held that igneous rocks were produced by chemical precipitation from the ocean which covered the surface of the earth at one time. In 1752 Guettard, by a careful study of the B. rocks of Auvergne, showed that they were true lavas, not necessarily ejected from cone-and-crater volcanoes, but gradually extruded from fissures in the earth's crust and extending themselves in all directions.

Baschi, tn. in Umbria, Italy, on the Tiber. It is 29 m. N.N.W. of Perugia. Pop. 6000.

Bascinet, **Basinet**, or **Basnet**, light helmet, so called from its resemblance to a basin, generally without a visor, though the visor occasionally accompanied it. Bs. were worn in the reigns of Edward II., Edward III., and Richard II. by most of the Eng. Infantry.

Base (Gk. *basis*), foundation or starting-point. In geometry, the line or surface upon which a figure or solid stands. In games, such as baseball and prisoner's B., the station to or from which the player proceeds. In heraldry, the lower portion of a shield, often cut off from the remainder by a horizontal line. Any figure which is placed in this lower part is said to be in B., and if it does not occupy the central portion it must be distinguished as being in the dexter or sinister B. point. In architecture, the lowest member of a column upon which the shaft rests. In the military art, a secure position where the main supplies and reserve forces are kept, which is connected with the attacking forces by defended lines of communication. In chem. a B. is a substance which is capable of combining with an acid to form a salt. In inorganic chemistry, Bs. are usually oxides and hydroxides of metals. The term is most often applied to the oxides of the alkali metals and the alkaline earths which combine readily with water, forming hydroxides. A distinguishing feature is the power of turning red litmus blue. In organic chemistry, many substances exist, such as the alkyl compounds and the ammonia derivatives, which are capable of combining with acids to form organic salts.

Baseball, the national game of the U.S.A. It was founded on the old Eng. game of rounders, to which it is still very similar, but has now been reduced to a science and skill quite unknown in the former pastime. It is a game of comparatively modern origin, and one of the first mentions of it in literature may be Jane Austen's in *Northanger Abbey* (1798). The first club was formed at New York in 1845, and known as the Knickerbocker Club, and in 1865 another club, the Excelsior, was formed at Boston. After that

date its popularity increased, and to-day its followers number millions of all grades of society. The World Series B. Contests have been held since 1884, and in addition there are the National League and the Amer. League. The first professional club was formed at New York in 1871, and 5 years later the National League of Professional Baseball Clubs was formed, which to-day, working with the Amer. Baseball Association, holds a position equivalent to the M.C.C. in the cricket world. The game is played by 9 players on each side. The bat is round, and must not exceed 42 in. in length and 2½ in. in diameter at the thickest part. A player may choose what weight of bat suits him best. The average weight of bats used by big league players is 36 oz. The ball weighs about 5 oz. and is about 9 in. in circumference. The ground is in the form of a diamond, 90 ft. square. The first B. diamond was laid out in 1839 by General Doubleday, and his demarcation has not been altered. The rules were standardised in 1887. Bases are placed on each angle, and are known as home, first, second, and third bases. The ball is delivered with great swiftness by the pitcher, who stands within the diamond, to the batsman, who stands by the home base. The catcher is behind the latter, while the fieldsmen take up positions as first, second, and third basemen, the short stop, centre fielder, right fielder, and left fielder. The batsman must, after hitting the ball fairly, attempt to make the circuit of the bases at the angles of the diamond. If he succeeds he scores a run. He may stop at any base and try to steal on to the next while another batsman plays, but if he is touched by the ball away from the base he is out. He must always move on to make room for another base-runner. A batsman may be put out by failing to hit the ball after 3 attempts, in which case he is said to be 'out on strike,' and by being caught out by any of the fielders. Nine innings make up a game, unless the score stands at a tie at the ninth innings, in which case the game is continued till one or other of the teams is ahead at the end of the next innings played. An innings is closed when 3 men are out, and it is not necessary to wait until the whole side are out. This not only equalises the chances of both teams at batting, but of all the members of each team. In an ordinary game each player has from 5 to 6 chances at batting and to make runs, so that if he fails at the first attempt he has still other chances. The enjoyment of the players is not centred in the batting, for the fielding is so diversified and presents so many opportunities of distinction, that many players enjoy it quite as much as the batting. Upon the celerity and accuracy of the fielders' movements the whole game may turn. Then in the pitching there is art and skill required, to get curves, twists, and shoots on the ball. To such perfection have pitching and fielding been carried that in many professional games the score is rarely taken into double figures.

Baseball statistics (1939-47): *U.S.A. Championships—National League: Cincinnati Reds (1940); New York Yankees (1936-39, 1941, 1943); St. Louis Cardinals (1942, 1944); Chicago Cubs (1945); Brooklyn Dodgers, 1947. American League: Detroit Tigers (1940, 1945); Brooklyn Dodgers (1941); New York Yankees (1942, 1943, 1947); St. Louis Browns (1944); Boston Red Sox (1946). World Series: New York Yankees (1936, 1937, 1938, 1939, 1941, 1943); Cincinnati*

of a riv., but in inland warfare may be a mountain range or stretch of plain. The only essentials are that the base should command a line of open communications between the army and either the mother country or that of an ally. An army cut off from its B. of O. and a base cut off from its source of supplies are more or less useless; but in modern warfare, the development of paratroops and airborne troops and supplies has made it possible to operate within enemy territory or

THE BASEBALL DIAMOND

U, umpire; C, catcher; P, pitcher; 1B, first baseman; 2B, second baseman; 3B, third baseman; LF, left field; CF, centre field; RF, right field.

Reds (1940); St. Louis Cardinals (1942, 1944); Detroit Tigers (1945). *Wembley*: Canadian Army beat U.S. Army, 5-3 (Aug. 1942); U.S. Air Force beat U.S. Ground Forces, 7-0 (Aug. 1943); U.S. Army beat Canada, 6-3 (Aug. 1943). See M. V. Charnley (ed.), *Secrets of Baseball* (London and New York), 1927.

Base Fee, see ESTATE; FINES AND RECOVERIES.

Base of Operations, term used in warfare for the depot where everything required for the fighting army—munitions, food, transport, tanks, relief troops, etc.—is collected and organised before being sent to the front, and where the wounded can be attended until recovered or transported to their homes. The development of aircraft, however, has made it possible to transport wounded men immeasurably greater distances than in pre-aircraft days. The B. of O. is usually a seaport on the bank

enemy-occupied territory regardless of a B. of O., as, *e.g.*, in the case of Wingate's famous Chindits in the campaign to Burma in the Second World War. In the Franco-Prussian war of 1870 the Prussian B. of O., for instance, was the chain of fortresses which line the banks of the Rhine; in the South African war, 1899-1902, the Brit. base was Cape Town; in the First World War the base of the B.E.F. was Boulogne, of the Armée de l'Orient, it was Salonika; and, in the Second World War, Cairo was the base of the Brit. Eighth or Desert Army. Sydney was MacArthur's (*q.v.*) base. Rome was the allied base in the later stages of the campaign in Italy. *See also* *under* ARMY.

Basedow, Johann Bernhard, originally **Johann Berend Bassedau** (1723-90), Ger. educational reformer, *b.* at Hamburg and *d.* at Magdeburg. In 1753 he taught at Sorø, in Denmark, and in 1760 in a school

at Altona, which he was obliged to leave in the following year because of his heterodoxy. In 1762 Rousseau's *Emile* gained in him a strong admirer, and increased his desire to instruct youth according to nature in all things. In 1774 he pub. his *Elementarwerk*, infused with the theories of Rousseau; it was an illustrated school-book, pub. by contributions from influential and wealthy people. In the same year he opened his Philanthropin at Dessau to carry his theories into practice, but after 10 years he found himself unable to cope with it, owing to his restless and quarrelsome disposition. He then devoted himself to private tutoring, and the Philanthropin was closed 3 years after his death. He is noteworthy as the forerunner of Froebel and Pestalozzi, and his work as a reformer has had great influence on education throughout Europe.

Base Exchange, method of softening hard water. The water is run through a tube containing a form of sodium aluminium silicate (e.g. permutit), when the calcium salts which cause the hardness react to form calcium aluminium silicate; this is left in the tube and the water is softened. When the sodium aluminium silicate has all been converted into calcium aluminium silicate, the tube is filled with a strong solution of common salt (sodium chloride), and sodium aluminium silicate is re-formed. The calcium is converted into the very soluble calcium chloride, which dissolves in the water, and is run off to waste. The softener is then ready for action again.

Basel, Basle, or Bâle, second largest tn. of Switzerland, with pop. (1941) 162,000, two-thirds Protestants, lies on both sides of the Rhine, where France, Germany, and Switzerland meet. It is mentioned as a fort in A.D. 374 (the name means a royal residence, *Basilia*). The middle classes freed themselves from the dominion of the bishops and nobles and Austrian grand dukes, and in 1501 the tn. became a member of the Swiss Confederation. It was one of the literary centres of Europe, and so many books were printed at its presses between 1468 and 1500 that there are 324 in the library of the Brit. Museum. The univ. was founded in 1460 and became famous under Erasmus. In 1529 B. accepted the Reformation and became one of its chief centres. The picture gallery contains paintings by Holbein who lived at B. in 1515-26. The univ. library contains 433,000 vols. and 267,000 pamphlets. B. is one of the chief industrial and commercial centres in the country. There is weaving of silk ribbon and a flourishing chemical industry. B. is the seat of the Bank for International Settlements estab. in 1930.

Basel, or Bâle, canton of Switzerland, divided into 2 half-cantons in 1833 after civil strife between the peasants of the rural part and the citizens of the tn. The latter were worsted, and their share of the canton was limited to the tn. and 2 communes, Basel-stadt or Bâle Ville, area 14 sq. m., pop. (1941 census) 170,000, with constitution dating from 1889. The remainder of the canton comprising

Basel-land or Bâle Campagne has an area of 165 sq. m., mainly agric. land, and a pop. (1941 census) of 94,500, with constitution dating from 1892.

Basel, Council of, seventeenth œcumenical council, met in 1431, Eugenius IV. being pope and Sigismund emperor of the Holy Rom. Empire. The main purpose of the council was to conciliate the Hussites, but the pope refused to sanction the movement and ordered the council to be dissolved. This order was disregarded, as was also the order that the council should remove to Italy. The council ratified the right of the general council to exercise authority over the pope. It concluded a peace with the Hussites, known as the treaty of Prague, 1433. The council was œcumenical up to its twenty-fifth session, and the pope ratified only those of its decrees which dealt with the eradication of heresy and the peace of Christendom, and only those reforms which did not detract from the rights of the Holy See. In 1438 the council continued at Ferrara, having a brief prospect of union with the Gk. Church. The pope failed to appear and the council then issued a decree suspending him from office. He was formally deposed, and in 1439 Duke Amadeus of Savoy was elected in his place. Eugenius held his position, however, and re-assembled the council at Florence (1439). On his death a compromise was effected whereby the council directed the Church to obey the new Pope Nicholas V. See COUNCILS.

Base Line, in surveying, is a measured line which forms the side of a triangle, and of which the adjacent angles are also measured, so that the third point of the figure is easily determined. The country to be surveyed being thus mapped out in triangles, the details can be filled in without overlapping. In large surveys many B. Ls. are drawn, varying in length from 3 to 10 miles.

Basement, in architecture, is the lowest story of a building. Medieval and Renaissance palaces were built with Bs., which possessed a more massive, but plainer, exterior than the rest of the building.

Bassey, tn. of the Philippine Is. It is on the San Juanico Strait, Samar Is. Pop. 14,000.

Bashahr, one of the trib. hill-states of the Punjab, India, on the lower slopes of the Himalayas. Pop. 90,000.

Bashan is called by the Septuagint *Basán*, by Josephus and Ptolemy *Batanea* (Batanea). B. belonged to Gilead in the widest sense, but in a stricter sense it was distinguished from and situated to the N. of Gilead. B. bordered in the N. upon the Syrian dists. Geshuri and Maachathi; in the S. it did not reach to the It. Jabbok. Its W. boundary was the Jordan. The E. limits are undefined.

B. was a kingdom under Amoritical sovereigns who resided in Ashtaroth and in Edrei. Og was the last king of the Amoritical dynasty. In the battle of Edrei, about the year 1452 B.C., the Israelites smote Og, with his sons, and all

his people, until there was none left alive; and they possessed his land (Num. xxi. 33). Moses gave B. unto the half tribe of Manasseh, 1451 B.C. (Num. xxxii. 33). At the commencement of the Christian era B. belonged to the tetrarchia of Philippos, and afterwards to the tetrarchia of Agrippa II.

Bashaw, see PASHA.

Bashee Islands, group of is. situated between the is. of Luzon and Formosa, and producing sugar-canes, plantains, and yams. Pop. 10,000.

Bashford, Herbert (1871-1928), Amer. author and playwright, many of whose stories and poems deal with the Far West. He acted as a librarian, first at Tacoma, Washington, and then as state librarian of Washington, which latter appointment he resigned in 1901. Two of his plays were produced in his lifetime, *The Woman he Married* and *Taken In*.

Bashibazouke, irregular Turkish troops serving under the sultan and receiving their reward chiefly from plunder. They were greatly responsible for the Bulgarian atrocities of 1876.

Bashkiria, autonomous republic of the R.S.F.S.R., with an area of 40,020 sq. m. created in 1919, extending into the Ural Mts. in the E. of Russia. Pop. 2,700,000. Capital Ufa (pop. 250,000). About half the pop. are Bashkirs and Tatars, but the townspeople are mainly Russian. The Bashkirs are either settled and engaged in agriculture, etc., or nomadic, rearing cattle. They profess Mohammedanism.

Bashkirtseff, Marie (1860-84), Russian painter and diarist, was b. of wealthy parents at Poltava, Russia. At the age of 13 she instituted a diary which she continued to the time of her death, inscribing in it her joys and sorrows, her enthusiasms and her ambitions, above all, her passionate desire for immortal fame. She was endowed with a beautiful voice and considerable literary gifts, but chose painting as her final expression in the arts, and her picture of 'The Meeting,' 1884, may be seen now in the Luxembourg. She travelled much in Rome, Nice, Paris, and other continental tns., establishing for herself a reputation as a woman of society and culture, but when only 24 she succumbed to consumption. See Mathilde Blind, *A Study of Marie Bashkirtseff*, 1892; *The Journal of Marie Bashkirtseff*, trans. by Mathilde Blind (2 vols.), 1890; *The Letters of Marie Bashkirtseff*, trans. by Mary J. Serrano, 1891; Dormer Creston, *Fountains of Youth*, 1936.

Basi, tn. of the Punjab, India, 140 m. S.E. of Lahore. Pop. 14,000.

Basic English, a 'pocket English' with a vocabulary of some 850 words. The first work on 'basic'—or British-American-Scientific-International-Commercial English—was written by I. A. Richards of Cambridge, and later of Harvard Univ., and C. K. Ogden of the Orthological Institute at Cambridge. Its advocates contend that it can give the sense of anything which may be said in Eng. Actually it was found that 1000 words were needed to put the N.T. into B. E. This is a remarkably small vocabulary, but even

normal Eng. has reduced its vocabulary by discarding most of the inflections and its subjunctive mood. In 1943 Mr. Winston Churchill persuaded the Cabinet to set up a committee of ministers to report on B. E., with a view to inquiring into the possibilities of extending the use of Eng. as an international language—in which latter respect it has a great advantage, as an easy language for foreigners to learn, over Esperanto, Volapük, Ido, Novial, and Solresol. A similar idea was under consideration in 1939, when the Gov. appointed a committee of the Economic Advisory Committee to examine the methods of teaching simplified Eng. to those who did not speak the language, but the war broke out soon afterwards and the committee never met. B. E. would, no doubt, be of some value in Brit. colonial territories in developing the policy of stimulating educational advance among backward peoples. B. E. has made headway in many countries as a quick method of giving some facility of expression in Eng. The Local Examinations Syndicate of Cambridge Univ. include texts in B. E. as options in Eng. literature for the Oversea Junior Certificate and they regularly set examination question papers, in B. E., on the Basic N.T. In 1947 the Crown purchased the copyright of B. E. for £23,000. See C. K. Ogden, *Basic English and its Uses*, 1943; *The Basic Dictionary* (for translators), 1932.

Basidu, **Basidom**, or **Bassadore**, port at the N.W. extremity of Kishm Is. in the Persian Gulf. It was ceded to Great Britain in 1817, and used as a naval base in the suppression of piracy.

Basil, name applied to sev. species of Labiatae. The sweet B., *Ocimum basilicum*, grows in India and is cultivated as a pot-herb; *Calamintha acinos* is the common B., and *C. clinopodium* the wild B. The B. famed in romance and art is the *Ocimum basilicum*; it is immortalised in Boccaccio's *Decameron*, in Keats's poem, and in Holman Hunt's painting of 'Isabella and the Pot of Basil'.

Basil, or **Basilius** (Βασίλειος) (A.D. 326-79), commonly called St. B., and on account of his learning and piety surnamed the Great; b. at Caesarea, studied at Antioch and Constantinople. Libanius was his master, or more probably, his fellow student. He went to Athens where he met Gregory of Nazianzus; returned to Cappadocia, 355, and taught rhetoric; travelled in Syria, Egypt, and Libya, visiting the monasteries; he was so pleased with the lives of the monks that he determined to found a monastery in Pontus. At the death of Eusebius, 370, he was chosen bishop of Caesarea; he refused to embrace the doctrine of the Arians, and in consequence was much persecuted by the Emperor Valens. His works were issued in Gk. by Frobenius at Basel, 1532, with a preface by Erasmus. See J. N. W. B. Robertson, *The Divine Liturgies of John Chrysostom and Basil the Great*, 1894; E. F. Morison, *St. Basil and his Rule*, 1912; R. J. Deferrari (trans.), *Letters of St. Basil*, 1926.

Basil, Monks of St. St. Basil, about the year 358, when he retired to Pontus, founded a monastery for himself and his followers, and drew up its regulations, which were soon adopted in other monasteries. All who followed it styled themselves of the order of St. Basil, and St. Basil's Rule was the parent of that one afterwards framed by St. Benedict. In 1057 the order was introduced in the W. In Spain the monks of St. Basil follow the Gk. ritual, and in Italy the Lat.; there are or were many in Russia. The order is never known to have existed in England.

Basilan Is., the largest is. on the Sula Archipelago, separated from Mindanao Is. by the strait of B. The cap. is Isabela, and the pop. about 12,000.

Basilica (Gk. *Βασιλική*), a royal residence), name given by the Romans to public buildings with spacious halls, often surrounded with wide porticoes, and used for

ELEVATION OF BASILICA

the administration of justice, and for business purposes. The first one built in Rome was the B. Porcia, 184 B.C., and they continued to be erected until the beginning of the fourth century A.D. The B. consisted of a large roofed building, supported on columns. The roof rose high above the other part of the structure, which consisted of 2 galleries, called porticus, placed one above the other, and round the internal sides of the central building. The porticus was covered with a lean-to roof. At the end of the central part of the interior a raised platform formed the tribunal for a magistrate. The central space corresponded to what we call the nave of a church, and the porticoes to the aisles. It is probable that Rome possessed basilicæ in all the different fora of the city. The B. Ulpia formed a part of the Forum Trajanum, and a B. of the Corinthian order, was discovered on the Palatine Hill. The temple of Peace in the forum has been called the B. of Constantine. It is in Pompeii, however, that the most perfect B. of antiquity exists. Many of the early Christian churches of Rome were built in the style of the basilicæ. Modern basilicæ are still found in It. tns., and are used for civil purposes.

Basilica (*Βασιλική*, *Βασιλικὸς νόμος*), Gk. code, begun c. A.D. 876 by the Em-

peror Basilius I., and completed by his son Leo VI. the philosopher, and pub. in 60 books, in 887. It was revised by the order of Constantine VII., about A.D. 945.

The B. comprised the *Institutes*, the *Digest* or *Pandect*, *Code*, *Novellæ*, and the *Imperial Constitutions* made after the time of Justinian, in 60 books, which are subdivided into titles. The extracts from the *Digest* are placed first under each title, then the constitutions of the *Code*, and next the extract from the *Institutes* and the *Novellæ*. The B. does not contain all that the *Corpus Juris* contains, but it contains some things which are not in the *Corpus Juris*. An ed. of the larger part of the B., by Fabrot, was pub. at Paris in 1647, 7 vols.

Basilicata, one of the original 16 *compartimenti* of the It. kingdom. It formed part of anct. Lucania on the gulf of Tarentum, and its chief tn. is Potenza. It corresponds to the prov. of Potenza. Pop. 469,560.

Basilicon (Gk. *Βασιλικόν*, royal), name sometimes applied to sev. resin ointments, consisting of yellow wax with lard and rosin, or of Burgundy pitch, suet, and turpentine. It is usually known as *ceratum resinæ*, or resin cerate.

Basilicon Doron (Gk., royal gift) is the title of a book written by James VI. of Scotland in 1599 for his son, Prince Henry. In it he expounds his theory of the divine right of kings.

Basilides (fl. A.D. 125), founder of a Gnostic sect, lived in Alexandria under the Emperors Trajan and Hadrian. In his doctrines he reflected Zoroaster, but his tendency towards asceticism was discarded by his later followers. He taught the doctrine of emanation, beginning with the emanation of mind from Abraxas, the Supreme Power, down to the creation of 365 worlds by a number of angelic powers. There were 365 emanations, a mystic number constantly occurring in this religion; the name Abraxas itself being a corruption of Abrasax, a Gk. word of which the letters are computed to make the number 365. Little is known of the life of B., who d. c. A.D. 130.

Basilisk, name given by the Gks. and Romans to an imaginary creature possessing the power of killing by means of its deadly glance and burning, poisonous breath. The name has been given by zoologists to a genus of tree lizards of the family of *Iguanidæ*, which are perfectly harmless. They are to be found in Central America, where they are considered to be edible. *Basiliscus mitratus* is the most common species, and is noted for its scaly helmet.

Basilius I., the Macedonian (d. 886), emperor of Constantinople; at the age of 25 became a favourite of the Emperor Michael III., who made him his colleague. B. murdered him, and was proclaimed emperor. He ruled wisely, and began to compile the code of laws completed by his son Leo (see *BASILICA*). He dismissed Photius (q.v.) and re-estab. the patriarch Ignatius; fought with the Saracens; helped to convert the Russians, but

quarrelled continually with the Rom. Church; left a book of advice (*Κεφάλαια Παρανευτικά*) to his son Leo.

Basilius II. (d. 1025), son of Emperor Romanus II., at whose death the crown was usurped by Phocas, who, 6 years after, was killed by John Zimisce; the latter took the crown, but acknowledged as his successors B. and his younger brother, Constantine. In 975 they were proclaimed emperors under their guardian B. the Eunuch; warred with the Saracens, Bulgarians, Slavonians, the Emperor Otho III., the Longobard dukes of Benevento. In 1014 B.

from the place of his birth. He studied at Oxford, Paris, and Athens; he brought home with him sev. Gk. manuscripts, and was promoted by Grosseteste to be archdeacon of Leicester. He introduced what were thought (by Matthew Paris, who writes of him) to be Gk. numerals, but which were neither Gk. nor Arabic.

Basingstoke, mkt. tn., parl. and municipal borough of Hampshire, Eng. It is the terminus of the London and Hants canal. It has manufs. of agric. implements, clothing factories, etc. The remains of the castle destroyed by Cromwell in 1645 may be seen, and traces of

W. F. Mansell

BASILICA OF S. AMBROGIO, MILAN

This church was severely damaged in the Second World War.

defeated Samuel, king of the Bulgarians. Vladimir, grand duke of the Russians, married B.'s sister and received the baptism, 988, abolishing paganism. B. was succeeded by his brother Constantine as sole emperor.

Basilosauros, former name for a fossil animal found in the Eocene of N. America, New Zealand, Europe, and Egypt. It is a mammal of the order Cetacea, and is allied to the dolphins and porpoises. See ZEUGLUDON.

Basin: 1. Term used in geography to indicate the whole tract of country drained by a certain riv. 2. In geology, term applied to depressions of the strata occasioned by synclinal dips, especially such as are on a large scale. The tertiary Bs. of London, Hampshire, and Paris rest on chalk, and the coal basin of S. Wales rests on old red sandstone.

Basing, or **Basingstoke**, John (d. 1252), Eng. scholar, who received his name

Rom. occupation have been found. Area of parish 4195 ac. Pop. 14,000.

Baskerville, John (1706-75), Eng. printer, b. at Wolverley in Worcestershire. Having a talent for calligraphy and carving in stone, he kept a writing school in Birmingham. In 1745 he entered the japanning business, making a fortune by improvements in the process. Soon after this he experimented in typefounding, and produced types far superior in distinctness and elegance than had previously been used. He then estab. his own printing-house, publishing a *Virgil* in royal quarto, a *Terence*, *Horace*, etc., all being fine specimens of typography. But as the sale did not justify his hopes, he did not print many works. Specimens of the B. press have long been rare.

Basket, vessel of willow twigs, rushes, cane, or other materials, used for the purpose of holding, carrying, and protecting articles. The etymological derivation

of the word is obscure, the connection with the Lat. *bascanda* being now discredited. The probable derivation of 'basket' from *bascanda* through O.F. *basche* is supported by Wyld, *Universal English Dictionary* (1932, 1936). In older times other things than Bs. were made in B.-work, the shields, huts, and boats of the early settlers in Europe being of osier-work, plastered with clay. From the earliest times down to the middle of the nineteenth century no considerable changes in B.-work have taken place. In the latter half of the nineteenth century, however, the character of B.-work was greatly changed, cheap goods made in Europe driving out the old small domestic wares, whilst in the higher types of work chairs, tables, etc., were produced of considerable beauty and utility. Of late years the Eng. B. trade has been somewhat better; the Basketmakers' Company, which still exists, is one of the oldest craft guilds of the city of London. Vegetable and fruit Bs., and protective wicker cases for fragile goods, are the prin. articles made in B.-work. No machinery is used in the making of Bs., and consequently a certain amount of natural aptitude, as well as considerable training, is required to make an expert workman.

Certain species of willow are the most largely used materials for B.-making. Large quantities are grown in Europe, and exported to Great Britain and the U.S.A., but no rods surpass in suitability those of England. The finest specimens are grown in Leicestershire and Nottinghamshire, and the valleys of the Thames and Trent. In the early years of the nineteenth century the Eng. industry was given an impetus by a premium offered by the Society of Arts. The most extensive Eng. willow plantation is at Thurleston, near Leicester, and is 100 ac. in area. Sev. continental varieties have been introduced into this plantation with considerable success.

Willows are divided into 'osier' and 'fine' varieties. They are sorted into various sizes, and soaked in tanks to render them pliable, with the exception of the 'uprights,' for periods varying with the size of the rods from half an hour to a week. The 'brown stuff,' or unpeeled rods, are used for the coarser work, whilst the 'white stuff' and the 'buff,' which is boiled before peeling, are used for the more delicate work. When necessary the rods are divided into 'skains' of different sizes by a 'cleaver,' a wedge-shaped tool, then by a kind of spoke-shave, and trimmed off by a flat piece of steel with a cutting edge at each end. Other tools used by a B.-maker are a shop knife; a picking-knife, to trim off the ends; 'bodkins,' flat triangular pieces of iron; shears, and a 'dog' for straightening the sticks. The employer supplies a screw-block, or a vice, and a lapboard. These comprise all the tools used, but a common round B. can be made with no other tools than a bodkin and a shop knife. In making a B. the bottom sticks are first woven together, forming the 'slath,' or foundation of the B. The uprights, stouter rods than the

'woof' of the B., are then fixed into the slath, and the other rods woven in and out between them till the required height is reached. The ends which then project are turned down alternately inside and outside the B., thus fastening and completing it. A lid is then made in the same way as the bottom of the B., and is fastened on by pieces of twine or a hinge formed by rods.

Other materials used in making Bs. are cane (*Calamus viminalis*), whole or made into skains, whilst the central pith of the cane is largely used in Great Britain and Europe in the manuf. of wickerwork furniture. From splints of various species of bamboo the Chinese and Jap. manuf. Bs. which are marvellous in beauty and delicacy of finish. Bs. are also made from the fronds of the Palmyra palm. In Spain and Algeria fruit Bs. are made from esparto fibre, in the Seychelles from the fronds of palms, and in other places cuscus grass, straw, and various species of pine are used.

The chief centres of the industry in England are London, Thurleston, Basford near Nottingham, and Grantham. Fr. Bs. from the Verdun dist. and Aisne dept. are imported into Great Britain, but in much smaller quantities than formerly. Belgium, Sonnefeld in Saxony, and Japan, all produced large quantities of Bs. and basket-work before the Second World War. Ordinarily the chief importers into this country are Japan and France, and an increase in the quantity of Jap. goods imported before the First World War was counterbalanced by a heavy decrease in imports from France. The Board of Trade returns give a monthly average value of imports of Bs. and basketware in 1938 of £14,000, but the imports fell away during the years of the Second World War. Consult T. Okey, *An Introduction to the Art of Basket-Making*, 1932; C. Crampton, *Cane-work*, 1935.

Basket Ball, game played by opposing teams of 5 with an inflated ball, resembling a football. It may be played in the open air or on a covered floor in a space not exceeding 3500 sq. ft. At each end of this oblong space is fixed a pole, 10 ft. in height, to which is suspended from metal rings, 18 in. in diameter, a 'basket' or net bag. The object of each team is to throw the ball into the opponents' basket, or goal, and to guard their own goal from the opposing team. Each team may use 5 substitutes; 2 points are awarded for a goal, except penalty (1 point). The ball, which is about 30 in. in circumference and 20 oz. in weight, must be played with the hands and may not be kicked. Any kicking, or intentional rough play, such as tackling or shouldering, is regarded as a foul; the penalty is 1 or 2 free throws to the opposing team, from a distance of not less than 15 ft. from the basket. The game was invented in 1891 at a sitting by James Naismith, of the Y.M.C.A. at Springfield, Massachusetts.

Basket-fish, name given to echinoderms, of the class Ophiuroidea. They resemble star-fish in appearance, having the same

number of arms, and obtain their name from their habit of coiling these arms over their mouths when they fear danger.

Basking Shark, or Sun-fish (*Selache maximus*), mackerel shark, one of the largest fishes extant, being sometimes 30 ft. in length. It belongs to the family Lamnidae and order Selachii. Its popular name is derived from its habit of basking near the surface of the water. Despite its great size and strength it is harmless unless attacked.

Basle, see **BASEL**.

Basnage, a celebrated Protestant Fr. family: (1) Nicolas, a religious refugee, who came and settled in Norwich, where he had a congregation. Afterwards returned to France. (2) Benjamin (1580-1652), son of above, pastor of his father's church at Carentan; a zealous defender of the Reformed Church in France. (3) Antoine (1610-91), son of above; after the revocation of the edict of Nantes escaped to Holland. Died at Zutphen, where he had a pastoral charge. (4) Samuel (1638-1721), son of above, b. at Bayeux; preached here at first, but escaped to Holland with his father. Died at Zutphen. He wrote voluminously in Fr. and Lat. (5) Henri (1615-95), youngest son of Benjamin, b. at St. Mère Eglise; studied for the bar, and became one of the most eloquent advocates in the parliament at Rouen. His works were pub. at Rouen, 2 vols. fol., 1776. (6) Jacques (1653-1723), son of above, the most celebrated of his family. Studied at Saumur under Tanaquil le Fèvre and at Geneva and Sedan. Received into the ministry at Rouen, 1676. In 1685, when the church was closed, he received permission to retire to Holland; settled at Rotterdam; was acquainted with many scholars of all countries, including Bayle; he was esteemed by Voltaire. His works were principally theological. (7) Henri (1656-1710), son of Henri above, b. at Rouen, followed the profession of his father. On the revocation of the Edict of Nantes took refuge in Holland, where he d.

Basoche, or **Bazoche**, a corporation of the clerks of the parlement of Paris which existed from about 1302 until the time of the revolution. Philip the Fair is supposed to have been the founder, and to have granted the members certain privileges, among them exemption from the jurisdiction of the common law.

Basque Roads, Action in the, a naval engagement in the Basque Roads, below the is. of Aix, near Rochefort, where the Fr. fleet of 14 ships was attacked by Lord Cochrane, in command of the fireships, and Lord Gambier, Apr. 11-12, 1809. There was a panic among the Fr. sailors, 12 ships ran aground, and 4 were destroyed. Cochrane thought that the victory would have been more complete had he received more active support from his superior, Gambier. The latter was accused of negligence at a court martial, but was acquitted, and Cochrane was obliged to retire on half-pay. See H. G. M. Chatterton, *Memorials of Gambier*, 1861.

Basques (Sp. *Vascongados*), race of

people dwelling on the slopes of the Pyrenees, occupying on the S. the Basque provs. of Vizcaya, Alava, and Guipúzcoa, and Navarre in Spain; on the N. the 2 Fr. departments of Bayonne and Mauléon. Bilbao (pop. 176,000) is the cap. of the Sp. Basque region. The word B. is derived from the Lat. *Vascones*, which word in its Germanic form, *Wascones*, has also given a name to the Gascons, an entirely different people. Perhaps no race has raised so much discussion as to its origin as that which we are now considering, and the question is still unsettled. There is no doubt as to the extreme antiquity of the Basque settlements on the Pyrenees. Moreover, place names throughout Spain, Sicily, Sardinia, and Corsica bear a strong resemblance to Basque names, and may sometimes be explained from Basque derivations. It is thought that the Basque race is connected with the anct. Iberian or Celtiberian, and was dispersed over the dists. named above. Some, however, deny the connection of the B. with the Iberi of the Romans, and make them an indigenous people who have never extended over larger regions than their present quarters. A third theory connected them with the fair-skinned African races, and would carry their origin back through some of the Berber tribes, through the anct. Libyans to a people represented on the Egyptian monuments. Lastly, may be mentioned a theory deriving them from the inhabitants of a lost Atlantic continent, represented also by the Guanches of the Canary Is., and by a certain fair-skinned W. African race. The B. themselves are fairer than the peoples of the S., but darker than the N. races. The race is by no means pure, and a large range of types is found. As in complexion, so in stature, they occupy an intermediate place between the N. and S. Europeans. Their skulls are both dolichocephalous and brachycephalous, and have certain peculiar characteristics. Collignon tells us that the Basque type differs from all those he knows of Europe and N. Africa. The B. know themselves by the name *Euskaldunak*, a word formed from the name of their language *Euskara*. The origin of this word is uncertain, but the most probable meaning is 'speaking plainly.' Their tongue stands alone among the languages of Europe, as the only remaining example of a consistent incorporative and agglutinative tongue. Though no close connection is to be traced, it shows affinity with the Finnic and Magyar families, which are simply incorporative, and the N. Amer. incorporative and polysynthetic languages. Morphologically, it occupies a position between these 2 groups, constituting a separate class. It is, as has been said, agglutinative, modifications of meaning and grammatical relations not being expressed either by prepositions or by inflections. Instead, there is a system of post-fixing, various additions being made one after the other. Thus, *zaldi*, 'horse'; *zaldia*, 'the horse'; *zaldiak*, 'the horses'; *zaldiaren*, 'of the

horse,' etc. There is a lack of general and abstract terms, though an abundance of particular terms. The personal pronouns, *ni*, 'I'; *hi*, 'thou'; *gu*, 'we'; *zu*, 'you,' bear a superficial resemblance to the Hamitic languages. Basque has no genders except in the verb, where a suffix is added to show the sex of the person addressed. Thus *eztakinat* means 'I do not know it, woman'; *eztakiat* (for *eztakikat*), 'I do not know it, man.' The verb incorporates with itself not only the pronoun, but also the direct and indirect complements. Thus there are separate forms for 'I give it,' 'I give it to you,' 'I give them to you,' etc., varying according to the sex of the person addressed. The regular verbal conjugations for the transitive and intransitive are now used but rarely, being reserved for the verbs 'to have' and 'to be' respectively. The language has, on the other hand, developed a conjugation by combining auxiliaries with the participles of all the other verbs. Thus instead of saying *dakust*, 'I see it,' the form is *ikusten dut*, 'I have it in seeing.' Originally, there were but 2 tenses, the present and the imperfect, but a conditional future has now been formed. There are no clearly defined moods. Syntax is simple, as in all agglutinative languages, and the phrases are short. Composition is used to such an extent that many phrases originally distinct have now become confounded. The dialects vary considerably, 25 in number, in 8 divs., which can be again reduced to 4 main dialects, those of Gulpuzcoa and Viscaya (Spain) and Labourdin and Souletin (France). The hist. of Basque literature is short as no ant. monuments remain. The first printed book in the language was the *Lingvæ Vasconum Primitiæ*, a collection of poems by Bernard d'Eschepare. Next to this comes the trans. of the N.T. by Licarrague, acting under the instructions of Jeanne d'Albret (La Rochelle, 1571), which ranks as the great classic of the language. Before the nineteenth century there existed no national literature, but attempts have been now made to form one. The few hundreds of vols. printed in Basque consisted chiefly of trans. from Fr., Sp., or Lat. The B. are of a religious nature, and their country has produced 2 great champions of the faith, Ignatius Loyola, founder of the Society of Jesus, and Francis Xavier, the great missionary. Most of their older literature, though no MS. exists older than the eighteenth century, is religious. Their legends and *pastorales*, a kind of open-air drama, are mainly derived from the Fr. The B. have ever shown the ability to retain their independence. Though the Roms. conquered them, they did not assimilate them in any way. The Visigoths did the same and no more. At the beginning of the tenth century the B. to the S. of the Pyrenees were brought into the kingdom of Navarre, but they still retained their *fueros*, or assemblies, in which they ruled themselves to a great extent. An unsuccessful attempt to abolish the *fueros* was made in 1832, but they were finally done

away with in 1876. The B. are engaged in agriculture and fishing, and many of them have emigrated to the Newfoundland cod-fisheries. Their great agility was remarked in the eighth century, and still remains a characteristic. They make excellent soldiers and sailors, and their ant. renown as pirates is continued by their success as smugglers. They are extremely conservative in dress, customs, and tradition. The dress of the men is simple, consisting generally of the knickerbockers, girded with a large red belt, open waistcoat, short tight coat, and carelessly tied kerchief round the neck, the whole surmounted by the national *beret*, a red or blue cap. Pelota (q.v.) is a popular game with the B. The number of B. in Europe is about 600,000 of whom about 125,000 are in France, and the rest in the Sp. provs. Of late years there has been a great deal of emigration, especially to S. America, where it is estimated that there are at present no fewer than 200,000 B. scattered over the Argentine Republic, Mexico, and Cuba. Under the republic (1931) the 3 Basque provs. formed the *Pais Vasco* with its own assembly. In the Civil war (1936-39) the Basque Gov. threw in its lot with the Republicans, but the B. were defeated by General Franco, and their country occupied in 1937 by the Nationalists (as General Franco's followers were then called). All their privileges and linguistic rights were suppressed. See under SPAIN—*Spanish Civil War*, 1936-39.

Bibliography.—LANGUAGE AND LITERATURE: W. Webster, *Basque Legends* (including Basque poetry), 1879; E. H. J. Vinson, *Essai d'une bibliographie de la langue basque*, 1891; H. Gavel, *Éléments de phonétique basque*, 1920; P. Lhande, *Dictionnaire basque-français et français-basque*, 1926-38; W. J. Entwistle, *Spanish Language* (with Basque), 1936. GENERAL: K. W. Fedden, *The Basque Country*, 1921; P. S. Ormond, *The Basques and their Country* (chiefly the Fr. provs.), 1925; R. Gallop, *A Book of the Basques*, 1930; T. C. Smith, *San Sebastian and the Basque Country*, 1935.

Basra, or Bassora, or Bussora: 1. A div. and liwa of Iraq and formerly a Turkish vilayet of Mesopotamia. The dist. of B. include also the liwas Amara and Muntafik, the total area being 53,580 sq. m. and the pop. (est. 1935), 783,000 (Basra, 286,000; Amara, 265,000; Muntafik, 232,000). 2. A city of Iraq, on the W. bank of the Shatt-el-Arab, the united stream of the Tigris and the Euphrates, in 47° 34' E., and 32° N., and the port of Iraq. It is surrounded by a wall 10 m. in circumference, and 20-25 ft. thick. Before the First World War B. did considerable transit trade between Turkey, the Persian dominions, and India, and after steamer communication with Bagdad and Bombay was instituted its prosperity considerably increased. After the war, notwithstanding difficulties incident to a newly created state, the trade continued to increase. Its chief exports are dates, wool, and barley; its imports textiles, sugar, tea, coffee, indigo, rice, etc. The settled pop. cannot

be estimated with any exactitude, as it is frequented by merchants and nomadic tribes, but according to the 1945 census it was slightly over 400,000. It has been the residence of a Brit. consul since 1898. The ruins of the anc. Bassora, formerly a centre of learning, founded by the Caliph Omar in 636, lie about 9 m. S.W. of the tn. The legendary tomb of Ezra, the prophet, is on the r. b. of the Tigris at some 15 hours' stonishing distance from B. It is a picturesque tomb in a setting of palm trees, and is annually visited by a large number of Jewish pilgrims from all parts of Iraq. During the First World War Britain found it necessary to occupy the ter. at

the Chaldees, Babylon, and Kish, there being special railway facilities for visitors to these places of great archaeological interest. There is also a steamship service for passengers and cargo between B. and Bagdad, and cars are available for motoring through Iraq and Persia. There is an airport and seaplane station. (See also Iraq.) In 1923, a modern automatic telephone system was brought into operation at B. and an up-to-date wireless station, equipped with thermionic transmitter. This station is in regular communication with Cairo and Beirut, and accepts commercial traffic from European countries, the Middle East, and America.

BAS-RELIEF

A group from the Elgin Marbles, British Museum.

the head of the Persian Gulf in order to secure freedom of action in that area and to impress the Arab pop., and wharves and railway sidings were constructed for military purposes. An Indian div. was dispatched to the scene and arrived in Oct. 1914, but as soon as war was declared on Turkey in Nov. these troops were landed near the mouth of the Shatt-el-Arab. At this time Turkish forces were at B. and they were hurried down to oppose the Indian troops. The Turks were defeated and retreated hurriedly, and B. fell to the invaders on Nov. 21, 1914. For the remainder of the war B. was the base of operations in Mesopotamia. B.'s modern port installations were of great value to the Allies in the Second World War. It handled expeditiously the export of millions of tons of oil from the Persian oil-fields, and forwarded vast quantities of materials and arms to the Russian battle front. The Iraqi state railway system consists of a metre gauge line from the port of B., which is the port of Iraq, to Bagdad, a distance of 354 m. The main B.-Bagdad line runs through the anc. sites and remains thereon of Ur of

Bas-relief, or low-relief, term used to denote forms of sculpture which project very little from the background. The lt. terms *basso-rilievo*, *mezzo-rilievo*, and *alto-rilievo* were used at the time of the Renaissance according to the degree of projection from the surface forming a background. These terms fell out of use, and 'B.' became the general term to signify all 'relief' sculpture, as distinguished from sculpture in the round. The anc. Egyptians appear to have been the earliest people to practise this art, but the Persians, Assyrians, and Babylonians also represented their exploits and divinities in this way. The figures shown in these early Bs. are stiff and regular in outline. After the time of Crassus, the marble sarcophagi at Rome were usually decorated at the ends with B., many well-known legends being thus portrayed. The Elgin marbles in the Brit. Museum, which belong to the class formerly known as *alto-rilievo*, are the best anc. example of this class of art, whilst the Bs. of Donatello, Canova, Flaxman, and Thorwaldsen were noted in later ages. **Bass** (lt. *basso*, low) is a musical

term denoting the lower part in the harmony of a composition, the lowest pitched of a class of instruments, or the lowest male singing voice. The B. part is only surpassed by the melody in the freedom of its movements and the richness of its effect. It contains more frequently the fundamental notes of the chords, and the 'organ-point' is formed on it. The ordinary compass of the B. voice is from F below the stave in the B clef to D above it. Mozart gave it great prominence in opera as a solo part.

Bass, or **Basse**, name applied to any perch-like fishes of the sub-order Acanthopterygii. The Eng. varieties are marine, while the Amer. comprise sev. fresh-water fish. The common bass of the family Serranidae is known as *Labrax lupus*, receiving its specific name from its wolf-like voracity; it is common to the Mediterranean. Two species of black B. afford sport for Amer. anglers; they are the *Micropterus salmoides* and *M. dolomieu* of the sun-fish family, Centrarchidae. Nearly all B. are edible.

Bass, term for the inner bark of a lime-tree; hence the word is applied to certain articles made of fibre, such as a hassock, basket, or door-mat. The word is common in Scotland, where it is used chiefly with regard to door-mats.

Bass Clef, see CLEF.

Bass, Double, see DOUBLE BASS.

Bass, Figured, see THOROUGH BASS.

Bass, Fundamental, see FUNDAMENTAL BASS.

Bass, George (d. 1812), Eng. explorer, b. at Asworthy, Lincolnshire. He was apprenticed to a surgeon at Boston, Lincolnshire; joined the navy and became surgeon to H.M.S. *Reliance*. In 1795 he sailed to Australia, and explored the coast of New S. Wales and Tasmania with Flinders, 1795-1800. B. Strait owes its name to him.

Bass, Great and Little, 2 ledges of rock off the coast of Ceylon in the bay of Bengal. Both have lighthouses.

Bass, Ground, see GROUND BASS.

Bass, Michael Thomas (1799-1884), was son of J. M. B. of the brewing firm of Burton-on-Trent. He acted as traveller for the firm at first. He sat in Parliament as a Liberal, 1848-83. He declined a baronetcy and a peerage, both of which were afterwards conferred on his son M. A. Bass.

Bass, Thorough, see THOROUGH BASS.

Bassadore, see BASIDU.

Bassandynne, Bassendynne, or **Bassinden**, **Thomas** (d. 1577), Scottish printer, book-binder, and bookseller at the Nether Bow, Edinburgh. He printed the earliest trans. of the N.T. produced in Scotland in 1576, and also an ed. of Lindsay's works. See Dobson, *History of the Bassandynne Bible*, 1887.

Bassano, city in the prov. of Vicenza, Italy, on the R. Brenta. The bridge over the riv., 180 ft. long, was built by Palladio, as was also one of the 6 gates in the walls surrounding the tn. In the centre of the tn. is the tower of Ezzelino, which now contains an armoury and a library; the 35 churches of the city contain some fine

paintings. The vine and the olive are cultivated, and there are extensive silk mills, and manufs. of cloth, paper, porcelain, straw hats, and wax. On Sept. 8, 1796, Bonaparte defeated the Austrian general Wurmsers near B., and Murat derived the title of duke of B. from the city in 1809. In the Second World War the anct. cathedral sustained slight damage to the windows; the cloisters of S. Francesco suffered direct hits; the wooden Ponte Vecchio (old bridge) was blown up by partisans; and the Palazzo Ezzelini was slightly damaged. Pop. 17,000.

Bassano, commonly called **Giacomo da Ponte** (1510-92), It. painter. He was sent by his father to Venice to study the Venetian school of painting. His work met with success, and Tasso and Ariosto sat to him for their portraits. His best works are the 'Entombing of Christ' at Padua, and the 'Seizure of Christ.' He had 4 sons: (1) Francesco, commonly called the younger B. (1548-91), studied under his father, and achieved considerable reputation, practising at Venice. In a fit of delirium he threw himself out of a window and was killed. (2) Giovanni (1553-1613), known as a copyist of his father's work. (3) Leandro (1558-1623), distinguished himself as a portrait-painter, but painted historical and sacred subjects occasionally. (4) Girolamo (1560-1622), employed by his father in copying, but contributed an original piece of 'St. Barbara and the Virgin' at Bassano.

Bassantini, or **Bassington, James** (d. 1568), Scottish astronomer, educated at Glasgow, and afterwards travelled, but finally settled in Paris, where he taught mathematics and astronomy. He wrote works on mathematics, astronomy, and arithmetic, some of which are now only known by the titles which have been recorded. One of his works which was best known was a *Discours astronomique*, Lyons, 1577, which appears to have been trans. into Lat. by de Tournes (Torne-sius) under the title of *Astronomia J. Bassantini, Scotti*, Geneva, 1559, reprinted 1613. His planetary system is that of Ptolemy.

Basse, or **Bas, William** (c. 1583-1653), Eng. poet. He was a retainer of Sir Richard Wenman of Thame Park, Oxfordshire. He wrote on country life; the author of *Sword and Buckler*, 1602; *Great Brittaines Sunnes-set*, 1613. He is remembered for his epitaph on Shakespeare, and for a song quoted in Walton's *Compleat Angler*.

Bassedau, Johann Berend, see BASEDOW, JOHANN BERNHARD.

Bassée, La, a tn. in Pas-de-Calais, France, near Lens. It occupied an important strategical position in the operations on the W. front in the First World War, figuring repeatedly in the official communiqués in the course of the great battle of Flanders or, in Brit. nomenclature, the first battle of Ypres, in Oct. 1914, when the allied line ran along the Yser and through Ypres, L. B., and on to Arras. The Bavarian crown

prince, after some five days' fighting, succeeded in advancing from L. B. to Neuve Chapelle, but that point proved to be the limit of the Ger. advance. Pop. 34,000.

Bassein, seaport of Lower Burma, and cap. of the dist. of B., on the riv. of that name. Prin. export is rice, and, coal, salt, cotton goods, etc., are imported. Pop. 37,000.

Bassein, tn. in the presidency of Bombay, India, 28 m. N.E. of Bombay. It was ceded to the Portuguese by the king of Gujarat in 1534, and remained in their possession until taken by the Mahrattas in 1739. It was taken over by the Brit. in 1818. Pop. 9600.

Basses-Alpes, see ALPES, BASSES-
Basses-Pyrénées, see PYRÉNÉES, BASSES-

Basset, Fr. breed of medium-sized hound with a long body, short crooked legs, and heavy head, which was introduced into England for the first time in the early seventeenth century. It was formerly used in the baiting of badgers, but is now employed in deer-hunting and in hare-hunting, in which it shows its persevering but slow nature. There are both smooth and rough-haired varieties, but the colouring is usually tan on the head and black and white on the body.

Basse-terre: (1) Seaport of the W. Indies, on the S.W. coast of the is. of St. Christopher, of which it is the cap. Pop. 12,000. (2) Cap. of Guadeloupe. Pop. 13,600.

Basset Horn (It. *corno di bassetto*), wind musical instrument invented in Germany in 1770. It is similar to a clarinet in fingering, but contains additional low notes. The scale embraces nearly 4 octaves, from C, the second space in the bass, to G in altissimo, including every semitone; but its real notes, in relation to its use in the orchestra, are from F below the bass staff, to C, the second ledger line above the treble. 'Corno di Bassetto' was an early pseudonym of G. Bernard Shaw.

Bassett, John Spencer (1867-1928), Amer. historian, b. at Tarborough, N. Carolina, U.S.A. Educated in N. Carolina and specialising in hist. he became prof. of Amer. hist. at Smith College, Mass., from 1906 to 1914, when he became head of the hist. dept. at the same institution, holding this post until 1921. He wrote many books dealing with the hist. of his native state and, in addition, the following: *The Life of Andrew Jackson*, 1911; *A Short History of the United States*, 1913; *Our War with Germany*, 1919; *The Lost Fruits of Waterloo*, 1919; *The Life of Martin Van Buren*, 1926.

Bassia, genus of tropical plants of the order Sapotaceæ found chiefly in India. *B. butyracea*, the Indian butter-tree, grows to a height of 50 ft., and its seeds yield a fat-like substance akin to vegetable butter. *B. longifolia*, the Indian oil-tree, has a yellowish fruit which gives valuable oil for lamps and soap, and is used in cookery by poor Indians. The flowers are fleshy and edible, the wood is hard and durable as teak. *B. latifolia*, the mahua, mahwa, or mowa, has hard

and strong wood, and the flowers yield by distillation a strong intoxicating spirit. *B. pallida* produces a gutta-percha.

Bassières, Jean Baptiste, Duke of Istria (1768-1813), Fr. marshal. In the Constitutional Guard of Louis XVI. he took part in the Sp. war. He won honour in the E. Pyrenees and the Moselle. In 1796 he served under Napoleon as captain during the It. campaign. A distinguished career saw his return with Napoleon from Acre and Aboukir, when he was second-in-command of the Consular Guard. He was made marshal of France in 1804, and was created duke of Istria 5 years later.

Bassigny, dist. in the former prov. of Champagne, France, now forms parts of the depts. of Haute-Marne, Meuse, and Aube. Its chief tns. were Langres, Chaumont, and Bourbon-lès-Bains.

Bassinden, Thomas, see BASSANDYNE, THOMAS.

Bassington, James, see BASSANTIN, JAMES.

Basso Continuo, It. for thorough-bass (q.v.).

Basso di Camera, a double bass, or contra bass, reduced in size and power but not in compass. It has 4 strings, 2 of gut and 2 covered with silver wire, all proportionately thicker than those of the violoncello, and tuned in fifths, to the same literal notes as the violin, but 2 octaves lower than the latter.

Bassompierre, François de (1579-1646), marshal of France and cap.-general of the Swiss Guard, b. in Lorraine of a noble and military family; became a favourite of Henry IV.; took part in the civil wars (mostly of religious origin), appointed cap.-general of the Swiss Guards; under Louis XIII. ambas. to Spain; 1626 sent to England by Richelieu to enforce the marriage treaty between Henrietta Maria and Charles I. in so far as it related to toleration of Rom. Catholic worship. Supported Marie de' Medici against Richelieu, at whose instance he was arrested and sent to the Bastille for 12 years; released at Richelieu's death; d. of apoplexy 3 years afterwards. See *Mémoires du Maréchal de Bassompierre*, 1723; *B.'s Embassy to England*, 1819.

Basso Narok, see RUDOLF LAKE.

Bassoon (Fr. *basson*, Ger. *Fagott*, It. *fagotto*), wood-wind instrument with a double-reed mouthpiece, forming the bass of the oboe family. Its direct ancestor was the bass pommer, which was straight and 6 ft. in length; the tubes of which the B. is formed resemble a bundle, hence the Ger. and It. names for the instrument. It consists of 5 pieces, joined together into a wooden tube 93 in. long, which has a conical bore tapering from a diameter of 1½ in. at the bell to ¾ in. at the reed. The pieces are known as the bell, the long joint, the wing, the butt, and the crook, to the last of which the mouthpiece is attached. The performer holds the instrument in a diagonal position, passing its strap around his neck; the notes are produced by 7 holes, and 16, 17, or 19 keys. The mechanism and fingering are intricate. From an acoustic point of

view the B. is badly constructed, but in practice it affords the artist a scope surpassed only by the stringed instruments. Its compass comprehends 3 octaves, rising from B flat below the bass staff. It has been a favourite instrument with all the masters save Handel, sev. having written concertos for the B., with orchestra. The range of the *double B.* is roughly an octave below that of the B. The double B. was introduced into England by Handel. It is not much employed and, unlike other members of the oboe family, it has never reached a standard form.

them honourable terms. The fort was demolished in 1701. The rock is now private property, being farmed for the sea-fowls that breed there.

Bass Strait, sea channel, 140 m. wide and 180 m. in length, separating Australia and Tasmania. It is studded with is., chief of which are King Island and the Furneaux Islands (*q.v.*), included in the state of Tasmania. Navigation is difficult as a result of the numerous coral reefs. The strait was discovered in 1798, and named after George Bass (*q.v.*).

A, Modern French.

BASSOONS

B, Modern German.

Bassora, *see* BASRA.

Bassora Gum, name given to a gum derived from plum and almond trees, and often used to adulterate gum tragacanth; came originally from Bassora or Basra.

Basso-rilievo, *see* BAS-RELIEF.

Bass Rock, conical insular rock at the mouth of the frith of Forth, 3 m. from N. Berwick. It is about a m. in circumference, and rises to a height of 315 ft. It has an imposing aspect, with its precipitous lofty walls; a cavern runs from the N.W. to the S.E., which is explorable at low tide. It is inaccessible save on one shelving point on the S.E. side. Purchased by the Eng. Gov. in 1671 from the Lauder family, the castle was converted into a state prison, in which sev. eminent Covenanters were confined. The rock was held for King James II. by 16 Jacobites (4 of them former prisoners on the rock) against a small army of King William III. After a siege of 3 years (1691-94) the plucky but diminutive garrison were compelled to surrender from starvation. Their resistance secured

Bass Tuba, another name for the B. saxhorn in F or E flat. It is sometimes applied to the euphonium.

Bass Viol, or *Viola da Gamba*, the bass instrument of the viol family. It had six strings. The name B. V. was often given to its successor, the violoncello.

Bassus, genus of hymenopterous insect of the family Braconidae. They are closely allied to the ichneumon flies, have 4 wings, long and narrow bodies, and frequent the flowers of umbelliferous plants.

Bast, in its 2 forms soft and hard, constitutes what is known in botany as phloem. The soft B. consists of sieve-tubes, companion-cells, and parenchyma cells, and the sieve-tubes are employed in carrying food material from the leaves to the rest of the plant; the hard B. is composed of long, narrow B. fibres resembling wood fibres, and parenchyma cells. In commerce the B. fibres of flax, hemp, and jute are sold for various purposes.

Bast, Friedrich Jakob, Ger. scholar. b. in the state of Hesse-Darmstadt, c. 1772. He afterwards studied in the univ. of

Jena, under Profs. Griesbach and Schutz. His first literary essay was a commentary upon Plato's *Symposium*, which was followed in 1796 by a specimen of an intended new ed. of the letters of Aristænetus. B.'s literary labours were devoted to verbal criticism.

Basta, Georg, Baron von Sult (1550-1607), Austrian general, *b.* at Rocca, S. Italy. He served under Alexander Farnese in the Low Countries, 1589-90, and occupied Transylvania in 1598. In 1603 and 1604 he suppressed risings which were due to his rapacious and cruel administration.

Bastan, *see* BAZTAN.

Bastar, or **Bustar**, feudatory state of the Central Provs. of India. The R. Indravati traverses it, there are many hills and forests and some dense jungle, and the whole dist. is unhealthy and ill populated. The cap. is Jagdalpur, and the pop. of the state 500,000, chiefly Hindus and aboriginal tribes of Gond origin. These latter tribes worship the deities of the Hindu pantheon, along with their own national goddess, Danteswari.

Bastard, person *b.* out of lawful wedlock and (where allowable) not subsequently legitimated. By the Eng. law a child *b.* during the marriage of his parents is legitimate, even if the child is begotten out of matrimony. The fact of birth during marriage or within a certain time after the husband's death raises a strong presumption of legitimacy, rebuttable only by proof of non-access on the part of the husband. By the Scottish law and most continental systems, which are based on the canon and civil laws, a *B.* may be legitimised either by the subsequent marriage of his parents, or by special dispensation not affecting the rights of third parties. In 1926 the Eng. law was assimilated to the Scots law by the Legitimacy Act of that year, under which an illegitimate child can become legitimate on the subsequent marriage of the parents, provided at the time of birth both were free to marry. The father of a legitimated child must, at the time of the legitimating marriage, be domiciled in England or in Wales. The rights of succession to property acquired by legitimization are, however, confined to dispositions made after legitimization took place. Civilly the *B.* is *filius nullius* for most purposes, and is therefore heir to none of his reputed ancestors and entitled to no share of the personal property of his reputed parents if they die intestate. Nor has he a surname until he acquires one by reputation. But Eng. law admits a *B.* to be the son of his putative father and his natural mother for purposes of maintenance. A *B.* takes as his primary settlement for public assistance purposes the place where he was *b.* but a legitimate child takes his father's *bp.* The Eng. law relating to the maintenance of *Bs.* is to be found in a number of statutes, the nature of the changes in the law indicating that no settled principle has regulated our legislation on this subject. By the Bastardy Laws Amendment Act, 1872, the mother of a *B.* may summon the

putative father before petty sessions within 12 months after the birth of the child, or at any later time if he is shown to have contributed to the child's support within 12 months, and the justices, on the mother's evidence being corroborated, may adjudge the man to be the putative father and order him to pay a weekly sum for its maintenance. Such order becomes invalid after the child attains 16. An appeal lies to quarter sessions. The mother only may apply for such an order, though in case of her death or incapacity or omission to apply before the child becomes chargeable to the poor rate, the public authority concerned may proceed against the putative father. The custody of a *B.* belongs to its mother in preference to the putative father.

Bastard Bar is a name sometimes employed erroneously in speaking of the baton sinister (*see under* BATON).

Bastard Palm, *see* MELITTIS.

Bastardy, Declarator of suit which holds in Scottish law for the disposal of the effects of a deceased illegitimate child. The recipient of the estates must receive a deed of gift from the Crown to state that he is entitled to them, and the defender is represented by any person or persons who could pretend to heirship if the owner had been *b.* in wedlock.

Bastennes, Fr. vil. in the dept. of Landes. It is noted for its rich asphalt mine and 2 mineral springs.

Basti, or **Busti**, *tn.* of the United Prov., India, 115 m. from Lucknow; pop. 11,500.

Bastia, *tn.* and seaport on the E. coast of the is. of Corsica, 95 m. N.E. of Ajaccio, the present cap. *B.* was formerly the cap., and still has the chief trade, mainly in soap, leather, liqueurs, and wax. Pop. (1940) 53,000.

Bastian, **Adolf** (1826-1905), Ger. traveller and ethnographer, *b.* at Bremen. He was educated as a physician, but in 1851 he started on the first of his many voyages. This first voyage lasted for 8 years, and he travelled round the world. Between 1864 and 1866 he visited the Indian Archipelago and Japan, the desert of Gobi, the Ural and Caucasus Mts., and the Caspian and the Black Seas. He was created prof. of ethnology and administrator of the ethnological museum at Berlin, and later was president of the Berlin Anthropological Society. He organised the station of Chinocho on the coast of Loango, and completed the ethnographical collections of the Royal Museum at Berlin. Between 1875 and 1891 he undertook journeys to Oceania, Central and S. America, and from central Asia to America. He wrote numerous standard books on ethnology and anthropology, his chief work, *The Peoples of Eastern Asia*, being pub. in 1866-71.

Bastian, **Henry Charlton** (1837-1915), Eng. biologist and physician, *b.* at Truro. He was educated at Falmouth and at Univ. College, London. He was assistant curator in the univ. museum 1860-63, and 1864-66 head officer in Broadmoor Criminal Lunatic Asylum. In the latter year he was appointed lecturer on pathology and assistant physician at St. Mary's

Hospital, in 1875 prof. of pathological anatomy at Univ. College, and 1887-95 prof. of medicine and clinical medicine. His more important works include: *Modes of Origin of Lowest Organisms*, 1871; *Evolution and Origin of Life*, 1874; *Brain as an Organ of Mind*, 1880. He advocated the theory of spontaneous generation.

Bastiat, Claude Frédéric (1801-50), Fr. economist, b. at Bayonne. Educated at Saint-Sever and Sorèze colleges, and in 1818 entered the counting-house of his uncle. In 1825 he retired to a property at Mugron, of which he became the owner on the death of his grandfather. Here he passed his time in farming and study until the revolution of 1830, which he welcomed. He became a *juge de paix* for his canton in 1830, and in 1832 a member of the General Council for the Landes. He followed the progress of Cobden's Anti-Corn-Law League, and formed a parallel association in France. After the revolution of 1848 he was elected to the constituent and legislative assemblies. He d. at Rome, Dec. 24, of a lingering disease. His pamphlets against Socialism and Protection are considered to be masterly; his great economic work was cut short by death.

Bastide, Jules (1800-79), Fr. politician, b. in Paris. He studied the law, but after a time became a timber merchant. He was a member of the Fr. Carbonari, and took part in the revolution of 1830. He was given an artillery command in the National Guard after the 'July days,' but for his share in the riot on the occasion of General Lamarque's funeral in 1832 he was sentenced to death, and fled to London. He was acquitted on returning to Paris in 1834, and after founding the *Revue nationale* in 1847 with P. J. Buchez, he became minister of foreign affairs in 1848.

Bastide-de-Claurance, tn. of Basses-Pyrénées dept., France, 13 m. S.E. of Bayonne. It has copper and iron-mining industries. Pop. 2000.

Bastide-de-Serou, tn. of Ariège dept., France, 9 m. N.W. of Foix. The chief industry is the making of glass-melting pots, for which yellow and grey clay is found in the neighbourhood. Pop. 1600.

Bastien-Lepage, Jules (1848-84), Fr. painter, b. in the vil. of Damvillers, in the Fr. dept. of Meuse, on Nov. 1. In 1867 he went to Paris to the École des Beaux-arts, where he studied under Cabanol. He exhibited in the Salons of 1870 and 1872, but without any conspicuous success. In 1874, however, his 'Song of Spring,' a study of rural life, attracted attention, and his succeeding pictures estab. his fame. In 1874 he gained a third-class medal with his 'Portrait of my Grandfather,' and in the following year his picture 'Angels appearing to the Shepherds' gained the second Prix de Rome. His picture called 'The Hayfield,' which he first exhibited at the Salon of 1877, and which is now in the Luxembourg, is a typical example of his truthful and simple style. He was now recognised as the leader of a school, and he gained the cross of the Legion of Honour in 1879 by his portrait of Mme

Sarah Bernhardt. He exhibited in the Royal Academy of 1880. His health, which had been failing him ever since he served under the painter Castellani as a *franc-tireur* in the war, broke down, and he went to Algiers to recuperate. He grew worse, however, and returned to Paris, dying on Dec. 10. See study by G. Clausen, with memoir by A. Theuret, 1892.

Bastille, Fr. name for any castle with towers, but as a proper name it signifies the old state prison and citadel of Paris. This was built about 1370 by Charles V., but came to be used as the place of confinement for persons of rank or political importance. It was cordially detested by the populace as an emblem of tyranny. The capture of the B. on July 14, 1789, was the commencement of the Fr. Revolution. The mob, after attempting to negotiate with the governor, Delaunay, attacked it, and by the help of artillery captured it. Delaunay was lynched as he was being taken to the *Hôtel de ville*, and the B. was completely destroyed by the mob. A column in the Place de la Bastille now marks its site.

Bastinado (Sp. *bastón*, cudgel), European name for an oriental form of punishment which consists in inflicting blows with a stick upon the victim, generally on the soles of his feet, sometimes on his back.

Bastion (Fr., from It. *bastione*), in fortifications, is a mass of earth which stands out from the rampart of which it forms the main portion. Bs. are faced with turf, or stone, and consist of 2 flanks, which serve to protect the neighbouring Bs., and 2 faces, which meet in an angle towards the enemy, and command the outworks and the ground in front. The fifth side, which is open to the interior, is known as the gorge.

Bastwick, John (1593-1654), Eng. physician and religious zealot, b. at Writtle, Essex. Opposed to Rom. Catholic ceremonial, he incurred the anger of Iaud by his *Elenchus Religionis Papistice* and *Flagellum Pontificis et Episcoporum Latialium*, which were ordered to be burnt. B. was fined and imprisoned. For later works he was fined £5000, pilloried and had his ears cut off, and was sentenced to imprisonment beyond the seas. These proceedings were reversed by Parliament in 1640.

Basurhat, or Bussirhat, tn. of Bengal, 30 m. from Calcutta; pop. about 15,000.

Basutoland, African native ter. in the E. of S. Africa, bounded on the N. and W. by the Orange Free State, on the S. by Cape Province, and on the E. and N.E. by Natal. The surface is mountainous, and the average height above the sea is 6000 ft. The Maluti Mts. and the Molappo Mts., which are parallel to the Quathlamba Range, divide the country into 3 almost equal dists.; the headwaters of the Orange R., the Tugela R., the Komet Spruit, the Caledon R., and the Senka R. lie in B. The Maletsunyane Falls (660 ft.) are the twelfth highest waterfalls in the world. The climate is healthy and invigorating, but cold in winter, and the average rainfall is about

32 in. per annum, most of it falling in the summer. B. is the best grain-producing country in S. Africa, and maize, Kafir corn, and wheat are grown over an area of some 730,000 ac. The ponies of B. are hardy and sure-footed, whilst sheep and cattle are also reared in large numbers. Mule-breeding has been introduced. The chief mineral is coal; iron and copper are also present. Considering the mountainous nature of the country, the roads

RASUTO

A typical policeman

are good, but there are no railways, except for a line that crosses the W. border to connect Maseru with Bloemfontein. Wool, mohair, cattle, and hides are the chief exports, also wheat, and Kafir corn. There are few forests, and much of the country is uninhabitable. Whites are not allowed to settle without special permission. The natives are intelligent, industrious, and brave. The area of B. is 11,716 sq. m., and pop. (1936 census) is 562,300 (natives, 559,300; whites, 1400; Asiatics and others, 1600).

History. The Basuto of Basutoland are commonly believed to have been the remnant of a number of tribes which were dispersed by the wars waged by Mosellkatze, king of the Matabele, in the early part of the nineteenth century. Their earliest ruler was Moshesh or Moshoshoe,

who welded his dispersed tribesmen into a political unity. Moshesh is the Basuto national hero, and Thaba Bosiu or Bosigo was the scene of his triumph against the Zulus and others. No other spot in B. carries so much of the hist. of the nation as this small mt. where Moshesh first took his stand against his foes, and where all the paramount chiefs of the past lie buried. Thaba Bosiu, which still shows the remains of its old fortifications, rises abruptly from the plain, crowned with waves of sand, and is scaled by a few zigzag paths from a ravine. Here, in July 1827, Moshesh defeated the Aman-gwate Zulus; in the critical moment of the battle the Matlana regiment, led by Moshesh himself, fell on the enemy's flank and hurled them down the ravine. In 1852 war broke out between Moshesh and the Brit., and the Basuto were defeated by Sir G. Cathcart at the battle of the Berea Mountain, Moshesh making his submission. Boundary disputes with the Orange Free State arose in 1856, and the hostilities which accompanied the dispute only ended with the treaty of Aliwal in 1858. Seven years later war again broke out between the Basuto and the Boers, and Moshesh sought the protection of the Brit. gov. Sir Philip Wodehouse, while declining to intervene, sent a Brit. commissioner to Thaba Bosiu, the Basuto cap., to adjust the difficulties, but without success, and, in the end, Moshesh had to sue for peace from the Boers. In 1866 he ceded part of his ter. to the Boers, and acknowledged himself to be a subject of the Orange Free State. War again re-occurred and the Basuto again appealed to be taken under the authority of the Brit. Crown. In 1868 Wodehouse was authorised to recognise Moshesh and his people as Brit. subjects and to incorporate their ter. as a Brit. possession. A proclamation to that effect was issued on Mar. 12, 1868, which day is commemorated as a public holiday, 'Moshoeshoe's Day.' The country remained, however, in a very unsettled state until in 1871 it was annexed to Cape Colony by an Act of the Cape Legislature, but was not made subject to the general law of the colony. The Basutoland Disannexation Law of 1883 brought the ter. under the immediate authority of the Crown, and so it has remained, being governed by a resident commissioner under the direction of the high commissioner for Basutoland, Bechuanaland, and Swaziland. In 1891 B. became a member of the Customs Union. No disturbances occurred during the Boer war. B. is not included in the Union of S. Africa, on which, however, it is economically dependent, and suggestions made from time to time by S. African politicians that the Basutos should throw in their lot with the Union have so far fallen on unresponsive ears, although a clause in the Act of Union makes provision for the possible future inclusion of all High Commission Territories. In the First World War the Basuto offered to raise fighting regiments, an offer that was, however, declined. They voluntarily raised £50,000 for

presentation to King George V., who, in 1919, was visited by Griffiths Leretholi, then paramount chief of the Basuto. In the Second World War, besides raising a fund for the purchase of a Spitfire Squadron, Basuto to the number of 10,000 formed part of the African Auxiliary Corps, which served in the Middle East. Basuto pioneers in this corps served in Italy where they carried supplies for the Fifth Army on the Salerno front, and laid tank tracks. Others served in the Army Fire Service at Beirut. Seciso Griffiths, great-great-grandson of Moshesh, became paramount chief in 1940, but *d.* the same year. His son, Bereng, the future chief, was *b.* in 1937.

See the standard hist. by Sir G. Lagden, *The Basutos*, 2 vols., 1909; also D. F. Ellenberger, *History of the Basuto*, 1912; E. A. T. Dutton, *The Basuto of Basutoland*, 1923; Sir Alan Pim, *Report on the Financial and Economic Position of Basutoland* (I.L.M.S.O.), 1935.

Basyl, or **Basyle** (Gk. *βάσις*, base, *ἄλγ* matter), name formerly in use to indicate a metal or group which acts as a base.

Bat, or (popularly) **Flittermouse**, or **Reermouse**, mammal of the order *Chiroptera*, nearly related to the *Insectivora* (hedgehogs, shrews, etc.), but differing from them in having the power of bird-like flight. The fore-limbs are greatly developed, and between each of the 4 fingers is a skin expansion which extends to the side and the hind legs; another expansion spreads from the tail to the hind legs. The thumb does not share in the flight-modifications, and is clawed, its uses being those of attachment and occasional efforts to walk. The shoulder girdle and breast-bone are large, the latter extended to a keel, while the pelvic girdle is small.

BAT

L, tragus; TH, thumb; MC, metacarpal; IFM, interfemoral membrane; T, tail.

The bones of the limbs have large medullary cavities, but other bones are slight, and the ribs are flattened. The females have either 1 or 2 pairs of thoracic mammae, and give birth usually to a single offspring, which they carry with them during flight and which are *b.* blind. The visual sense in the fully grown *B.* is strong, contradicting popular opinion, while the senses of smell, taste, and hearing are present to a large degree. *Bs.* are highly sensitised, the membranes of the nose and the wings being filled with numerous nerves in addition to blood-vessels; the experiments of Abbé Spallan-

zani in 1775 proving that *Bs.* deprived of sight and hearing are yet able, in a room across which have been stretched a number of strings, to fly without coming into contact with one of them. Many have curiously shaped fleshy appendages called nose-leaves round the nose and mouth, and these are peculiarly sensitive. The ears of all *Bs.* are large, prominent, and mobile. *Bs.* inhabit all parts of the globe except the coldest regions, but

LONG-EARED BAT

abound in the tropics. In habit they are nocturnal, sleeping during the day head downwards, holding to some object with their curved claws. They hibernate in belfries, caverns, and forests, and in some cold climates, such as that of Canada, they migrate to warmer places for the winter season. At twilight they search for food, which in most species consists of insects, in others of fruit, and in a minority of the blood of mammals. They are classified according to the food they eat into *Megachiroptera*, or frugivorous forms, and *Microchiroptera*, or insectivorous forms. To the first class belong the *Myotis* *edulis*, or flying fox, the largest known species, which sometimes measures 5 ft. across the wing; *Epomophorus* of Ethiopia; *Cynonycteris* of the Egyptian pyramids. To the second class belong the genera *Rhinolophus*, or horse-shoe *B.*; *Nycterus*, or leaf-nosed *B.*; *Megaderma*, of which *M. lyra*, the lyre-bat, attacks other *Bs.*, frogs, and small mammals, and sucks their blood; *Vespertilio*, the common naked-faced *B.* of most countries; *Vesperugo*, of which *V. pipistrellus*, the pipistrelle, is well known; *Synotis*, of which *S. barbastellus* is the barbastelle. There are in all nearly 100 genera of *Bs.* and among others should be mentioned the true vampires, or blood-suckers; these belong to the *Desmodus* and *Diphylla*, and will attack even men and horses; the genus *Vampyrus*, to which the repulsive *V. spectrum* is attached, consists strangely enough of frugivorous and insectivorous animals. In Britain there are a dozen species of *Bs.*, contained in seven genera.

The power of Bs. to detect and avoid obstacles when flying in the dark has recently been reinvestigated. Contrary to Spallanzani's results mentioned above, it is now known that the ears form an essential part of the mechanism. Squeaks pitched so high as to be inaudible to the human ear are emitted through the B.'s mouth or nose. Each squeak, which is of very short duration (2/100 sec. or less), produces an echo when it is reflected from an obstacle. The echo is received by the ears, and the interval from the time of emission of the squeak indicates the distance of the obstacle; the longer the interval, the greater the distance. The process has been termed echo location, and resembles the echo sounding device used on ships to determine the depth of the sea. It is paralleled by the use of electromagnetic ('wireless') waves in radar. Some blind humans appear to have similar powers of echo location. See Barrett-Hamilton's *History of British Mammals*, vol. 1, 1910; *Catalogue of the Mammals in the British Museum*, 1912; also the vol. on *Mammalia* by F. R. Beddard in the *Cambridge Natural History*, 1902. For echo location see *Nature*, clvi. 490 (1945), and clviii. 46 (1946).

Bataan, prov. of Luzon, Philippine Is., on the W. of the bay of Manila; pop. 65,000. The defence of B. Peninsula by U.S. forces under Gen. MacArthur against the Jap. armies from Jan. to Apr. 1942 will go down in hist. as a great military exploit. It shed undying lustre on Amer. and Filipino arms, and gained valuable time for the Allies. Gen. MacArthur was assisted by 2 Amer. senior officers, Maj.-Gen. Jonathan Wainwright and Brig.-Gen. Albert M. Jones, the former taking command after Gen. MacArthur had flown to the defence of Australia. The defence of B. Peninsula, besides shattering illusions about the invincibility of the Jap. Army and Air Force, against the immense preponderance in men and equipment which the Jap. enjoyed here, held up at a most critical juncture in the war other very large Jap. naval, military, and air forces which could otherwise have been used much earlier against Sumatra, Java, or other important positions held in the allied cause. It gave time for recovery of Amer. naval strength after the disaster of Pearl Harbour, and for the re-grouping of Brit. naval and air forces; and it was a serious setback to the Jap. strategical plan of rapid action and shock tactics. Off the S. point of the peninsula and in the entrance channel to Manila Bay lies the small rocky is. of Corregidor. This is., which was well fortified with 16-in. guns, was the last Amer.-Filipino position to fall. See also PACIFIC CAMPAIGNS IN SECOND WORLD WAR.

Batac, or **Batag**, tn. of Luzon, Philippine Is., in the prov. of Ilocos Norte, near Laoag. It is situated in a fertile dist., and has sugar factories. Pop. 20,000.

Bataille, Henri (1872-1922), Fr. dramatist. Studied painting at the Ecole des Beaux Arts, Paris, but was so successful

with his first vol. of poems, *Le Beau Voyage* (1905) that he gave up painting for literature. Turning to drama he produced a successful play, *La Lépreuse*, in 1896, and enhanced his international reputation with *Maman Colibri* (1904), *Le Scandale* in 1909, and, later, with *La Vierge folle* (1910), *Les Flambeaux* (1913).

Bataks, see BATTAS.

Batala, or **Butala**, tn. of the Amritsar dist. in the div. of Lahore, India; pop. 27,000.

Batalha, tn. in Estremadura, Portugal, 7 m. from Leiria. It contains a famous Dominican convent, and received its name from King John I.'s victory at Aljubarrota in 1385. Pop. 4,000.

Batan, seaport of Panay Is. in the Philippines. Pop. 14,500.

Batang, or **Battam**, is. opposite Singapore, in the Malay Archipelago.

Batang, China, see BAAFU.

Batangas, tn. of Luzon, Philippine Is., cap. of the B. prov., and 58 m. S. of Manila. A well-built tn., it was founded in 1581, and contains a palace, the residence of the alcade. It has a considerable trade in native produce with Manila. The prov. itself is mountainous in character. The pop. of the prov. is about 345,000; of the tn., 50,000.

Batara, name given by D'Azara to the bush shrakes which form the genus *Thamnophtilus*. They come from S. and Central America, and belong to the family Formicariidae. The males are usually black above, whitish-brown beneath, and in length do not exceed 13 in. *T. navius* has a rounded and comparatively short tail; *T. vigorosus* has a large reddish crest, blackish at the apex.

Batatas, genus of Convolvulaceae, now included in *Ipomoea* (q.v.), found in warm countries. The name is from *batata*, Sp. form of a Haitian word, and the plant is a native of tropical America (*batata* equals potato, name misapplied to *Solanum tuberosum*). About a score of species are known, chiefly from tropical America. *Batatas edulis* is the sweet potato, largely cultivated in the hotter parts of both hemispheres. In the E. and W. Indies, where they grow, our common potato, *Solanum tuberosum*, is called the Irish potato, to distinguish it from the sweet potato or B. The tuberous roots are sweet, mealy, and wholesome, but slightly laxative, and are eaten as potatoes, plants which became their substitute in Europe and appropriated their name.

Batavi, anct. race of Celts or Gers., mentioned by Tacitus as a branch of the Chatti, a Ger. tribe. They inhabited the land between the Rhine, Waal, and the Maas, called the Insula Batavorum. When subject to the Roms, they received advantages from them, and their cavalry was used by their conquerors.

Batavia, city of the Netherlands E. Indies situated in prov. of same name, in the N.W. coast of Java. It is near the mouth of the Tjiliwong, or Jaccatra, the latter name also being that of the tn. on the site of which B. was built by the Dutch early in the seventeenth century. The

tn. was for many years proverbially unhealthy, for the early Dutch colonists had made, as it were, miniature Holland of B., the tn. being intersected by a network of canals. What added to the unhealthiness of the tn. in its earlier days was the city wall, but this was demolished early in the nineteenth century when B. fell into the hands of the Fr. The Brit. occupied it from 1811 to 1816. A new tn. (Wetevreden) has been built inland on higher and more healthy ground about 22 m. from the old, and as the bay on which B. stands is yearly becoming more shallow, the new port of Tanjong Priong was constructed (1880), 6 m. to the N.E. Higher education is given at the Gov. Univ. at B., which has 4 faculties: Law (1924), Medicine (1927), Academy for Indonesian civil servants (1938), and Arts (1940). The old tn. contains the town hall, exchange, and the offices of the great firms, but is only visited by Europeans during business hours. The suburbs are tropical garden cities. The products of Java and the other is. are shipped at B. and those of Europe and E. Asia imported. B. was the scene of serious disorders in Nov. 1945 during the Indonesian nationalist revolt. Dutch and Ambonese troops were prominent in these disorders. (See further under JAVA.) Pop. (city), 440,000; (prov.), 3,000,000.

Batavia, cap. of Genesee co., New York, U.S.A., situated on Tonawanda Creek, about 40 m. N.E. of Buffalo. Manufs. farm implements. The state institute for the blind is situated here. Pop. 17,000.

Batavian Republic, the name by which the Netherlands were known from May 16, 1795, till June 8, 1806, i.e. from the conquest of the country by the Fr. till the appointment of Louis Bonaparte as king of Holland.

Batchian, Batshian, or Bachan, is. of Netherlands E. Indies; one of the Ternate group of the Molucca Archipelago, S.W. of Halmahera Is. Area 850 sq. m. It is mountainous and fertile, but is only inhabited on the coast. It was captured from Spain in 1610. The chief tn., Batchian, has a pop. of 2000.

Bateman, Sir Frederic (1824-1904), Eng. physician and scientific writer. He graduated, 1850, at Aberdeen Univ., and became a fellow of the Royal College of Physicians, 1876. Author of *Aphasia and the Localisation of Speech*, 1870; *The Idiot: his Place in Creation*.

Bateman, John Frederic La Trobe (1810-89), Eng. civil engineer, b. near Halifax. His life work was the construction of reservoirs and waterworks. Owing to his suggestion, Manchester obtained its water supply from Lake Thirlmere, and Glasgow from Loch Katrine. He also superintended the construction of the waterworks of many other large tns., and was responsible for the water schemes of Buenos Aires, Naples, and Constantinople.

Bateman, Kate Josephine (1842-1917), Amer. actress, b. at Baltimore, daughter of Hezekiah B. (see below, BATEMAN,

SIDNEY). Her first appearance on the stage was at the age of 4, in *The Babes in the Wood*, but later she played chiefly in Shakespearian and classical drama, with her father as her manager. She acted at the St. James's Theatre, London, in *Richard III.* in 1851; and in other leading parts from that date until 1909. From 1892 she conducted a school of acting. Died in London, Apr. 8, 1917.

Bateman, Sidney Frances (1823-81), Eng. actress and dramatist, *née* Cowell, brought up in Ohio, where her family had settled. She became the wife of Hezekiah B. (1812-75), Amer. theatrical manager, and coming to London in 1870 assisted her husband in managing the Lyceum Theatre until 1875; later she managed the Sadler's Wells Theatre. Her 2 most popular plays were *Self*, a comedy, and a tragedy, *Geraldine*.

Bateman, William (c. 1298-1355), bishop of Norwich, and founder of Trinity Hall, Cambridge. Pope Bonedict XII. appointed him dean of Lincoln about 1340. During the wars in France he undertook diplomatic negotiations between Edward III. and the Fr. king, 1343-54. In 1344 he succeeded Antony Beke as bishop of Norwich, and was consecrated by the pope at Avignon.

Bates, Arlo (1850-1918), Amer. author, b. at E. Machias, Maine. Educated at Bowdoin; some time editor of *Boston Sunday Courier*. Author of *A Wheel of Fire*, 1885; *Sonnets in Shadow*, 1887; *The Philistines*, 1889; also books on the teaching and writing of Eng. and the study of literature.

Bates, Harry (1850-99), Eng. sculptor, b. at Stevenage, Herts. Having won, after 4 years' study, the travelling scholarship of £200 at the Academy Schools, he went to Paris in 1883 to study under Rodin. In 1892 he was elected A.R.A. 'Love and Life' is considered his masterpiece.

Bates, Henry Walter (1825-92), Eng. naturalist and explorer, b. at Leicester, Feb. 8. His father was a manufacturing hosier, and his son entered the business, but in 1844 he met Alfred Russel Wallace, and in 1848 they sailed together in a trading vessel to Pará. They had practically no money, but hoped to sell their collections when made. B. was 11 years in the country, made his way up the Amazon for 1400 m., and discovered 8000 new species of insects. In a paper which he read to the Linnean Society on the insect fauna of the Amazon valley, he stated and solved the problem of mimicry. His best-known work is *The Naturalist on the Amazons*, 1863.

Bates, Herbert Ernest, Eng. novelist, b. 1905; educated at Kettering Grammar School. He began life as a journalist, and pub. his first novel, *The Two Sisters*, at the age of 20. Since then have followed a number of novels, in which various aspects of country life are depicted with a sensitive touch. They include *Catherine Foster* (1929), *Charlotte's Row* (1931), *The Fallow Land* (1932), *The Poacher* (1935), *A House of Women* (1936), *Fair Stood the Wind for France* (1944). He has also

written short stories and essays. He served in the R.A.F. in the Second World War, and his experience was the source of his poignant stories of service life, originally pub. under the pseudonym 'Flying-Officer X.' A wartime episode is also the subject of his novel, *The Cruise of the Breadwinner* (1946), notable for its play of character and the descriptive truth of the writing.

Bates, Joshua (1788-1864), Amer. financier, b. at Weymouth, Mass. Sent to London in 1815 to take charge of business for Gray & Son; met the Barings, and formed a partnership with John Baring; B. eventually became senior partner of Baring Bros. & Co. During the Civil War he used his influence against the Confederate states.

Bates, Katherine Lee (1859-1929), Amer. prof., b. at Falmouth, Massachusetts; educated at Wellesley College, at which she became prof. of Eng. literature. Among her works are *Hermits Island*, 1891; *American Literature*, 1898; *America the Beautiful and other Poems*, 1911; *In Sunny Spain*, 1913; *The Retinue and other Poems*, 1918; *Sigurd, our Golden Collic and other Comrades of the Road*, 1919; *Yellow Clover* (in memory of Katherine Coman), 1922; *The Pilgrim Ship*, 1926.

Bates's Case (or the 'Case of Impositions'), famous case in Eng. constitutional hist., which came before the court of exchequer in 1606. In that year James I. directed the collectors of customs to demand a duty of 5s. per cwt. on imported currants, in addition to the 2s. 6d. granted by the Statute of Tonnage and Poundage. John Bates, a merchant of the Levant Company, refused to pay the additional duty, on the ground that it had not been granted by Parliament; but a unanimous decision of the 4 barons of the court of exchequer, under Chief Baron Fleming, was soon given for the Crown on process against him by information. The decision, which created a dangerous precedent, was entirely subversive of liberty, but, apart from the fact that in those days judges could be dismissed at the royal pleasure, Eng. constitutional law had not reached that stage of development which later, under Coke and Hale, estab. for all time what is known as the 'rule of law.' See 2 State Trials, 371; S. R. Gardiner, *History of England* (l. 449), 1883-94; *State Papers, Domestic*, xlviii. 109, 116, xlix. 10; and l. 1.

Bateson, Mary (1865-1906), Eng. historian, b. at Robin Hood's Bay; daughter of a master of St. John's College, Cambridge. Educated at Newnham, of which she became a fellow. Her main interest was the study of the hist. of the Middle Ages, especially that of the constitutional and legal problems offered by the hist. of municipalities and borough customs. Among her contributions of most importance were 'The French in America' (*Cambridge Modern History*, vol. vii.); on the 'Laws of Breteuil' in the *English Historical Review*, 1900; *Bale's Index Britannicæ Scriptorum* (1902) (in colla-

boration with W. B. L. Poole); and papers on historical criticism and investigation, including a review of publications on the hist. of England in *Jahresbericht der Geschichtswissenschaft*, 1906.

Bateson, William (1861-1926), Eng. biologist, b. at Whitby. Educated at Rugby School and St. John's College, Cambridge, he was early attracted to biological studies. He became Silliman lecturer at Yale in 1907; prof. of biology at Cambridge, 1908-9; director of John Innes Horticultural Institution at Merton Park, Surrey, 1910; Fullerian prof. of physiology, Royal Institution, 1912-14; president of the Brit. Association for Advancement of Science, Australia, 1914; trustee of Brit. Museum, 1922. In addition to his various papers on biological subjects, he pub. books entitled *Materials for the Study of Variation*, 1894; *Mendel's Principles of Heredity*, 1902; *Problems of Genetics*, 1913.

Bath, in its original sense, is the plunging of the body into water, fresh or salt, hot or cold, but the meaning is now extended to the application of some unusual substance to the body or the alteration of the enveloping atmosphere. The institution of bathing is of Eastern origin, and among many oriental peoples was a religious rite. It was practised among Jews, Buddhists, and Muslims, and prevailed among the Gks. at an early period, and was subsequently valued by the Romans. The spread of the custom came through the Romans, who never formed any colony throughout the Old World without building Bs. These were often magnificent structures and closely resembled in number of chambers and uses the modern Turkish B.; they were used as lounges by the Romans, who resorted to them daily for rest and recreation. In England to-day the Turkish B. is popular on account of its stimulating influence on the system, but many other forms of bathing are common. In the Turkish B. the bather passes from one warm-air room to another until he perspires from every pore, then undergoes a shampoo, ending with being sprayed with warm water, steadily decreasing in heat until it runs cold. Hot-air Bs. may also be impregnated with such substances as sulphur or eucalyptus; brine Bs. are common to some places; electric Bs. are water Bs. into which currents of electricity are introduced; animal Bs. consisted in wrapping the body in the hide of a newly killed animal, or in insertion of part of the body in the yet living animal; mineral Bs. are common to spas all over Europe.

See W. P. Gerhard, *Modern Baths and Bath Houses*, 1908; P. Négrier, *Les Bains à travers les âges*, 1925; A. W. S. and K. M. B. Cross, *Modern Public Baths*, 1930.

Bath, city, municipal co., and parl. bor. of Somersetshire, situated in the valley of the Avon, 107 m. W. of London. Pop. 69,000. B. is built in a natural amphitheatre, and as the character of its buildings and streets corresponds with the beauty of its situation, it has an appearance equalled by no other Eng. city. These advantages, and especially the

therapeutic efficacy of its medicinal spring, have long made B. the resort of fashion. The houses of B. are all built of the white freestone known as Bath stone (*q.v.*). The numerous and handsome public buildings of B. include the assembly rooms, the pump-room, the city markets, and the guild hall. The abbey church is one of the finest specimens of Perpendicular Gothic architecture. The present building was begun in the reign of Henry VII., the original foundation dating back to 775. The Rom. Catholic priory church is a handsome building with a spire 200 ft. high.

F.A.-Reuter

THE WEST FRONT OF BATH ABBEY

On the right is the pump-room.

B. has a park and numerous open spaces, many educational establishments, a museum, theatre, hotels, etc. The chalybeate springs are beneficial in gout, rheumatism, cutaneous diseases, etc. Half a million gallons flow every day from the hot springs of B., the only natural hot springs in Britain and the richest in radium emanation. Their temperature ranges from 117° to 120° F. The great Rom. bath occupied a hall 110 ft. by 68. The Royal Baths were opened by the Earl of Ypres in 1916, the Bath St. wing in 1919, the Old Royal Baths, entirely reconstructed, in 1927. All the baths belong to the corporation, and full details will be found in *The Book of Bath*, issued by it. B. is of great antiquity; it was called *Aquæ Sulis* by the Romans. Magnificent remains of the Rom. baths exist. Richard I. granted the tn. its earliest existing charter, confirmed by Henry III. and extended by George III. B. was

most famous in the days of 'Beau' Nash, M.C. from 1704 to 1761. The follies and vices of the city have frequently been commemorated by Fielding, Smollett, Anstey, etc. B. is, with Wells, the seat of a diocese, returned 2 members to Parliament from 1295 to 1918 and now returns 1. The city suffered severely from air raids during the Second World War, particularly in the so-called 'Baedeker raids' in Apr. 1942. Over 200 buildings of architectural or historic value were either destroyed or seriously damaged, including the Royal Crescent, the Circus, and the assembly rooms. The anct. windows of the abbey were also smashed. See F. Harrison, *The City of Bath*, 1924; C. M. Spender and E. M. Thompson, *Bath*, 1922; G. Home and E. A. Foord, *Bristol, Bath, and Malmesbury*, 1925; E. Sitwell, *Bath*, 1932; B. Little, *The Building of Bath*, 17-1947, 1948.

Bath, co. seat of Sagadahoc co., Maine, U.S.A., on the W. bank of the Kennebec R., 36 m. N.E. of Portland. It has a good harbour, and shipbuilding is the prin. industry. Other manufs. are iron, brass, and lumber, and there is a trade in ice, coal, and iron and steel. Pop. 10,235.

Bath, Knights of the, Brit. order of knighthood, whose origin is uncertain, though it is traditionally attributed to Henry IV., who bestowed the order on 46 knights on the day of his coronation. It was allowed to lapse from the time of Charles II. until the reign of George I., when it was revived, and the number limited to the king and 37 knight-companions. It was formally instituted in 1815, and in 1847 it was extended to civilians. The order now consists of 3 classes: the members of the first class are knights of grand cross (G.C.B.); those of the second class knights commanders (K.C.B.), and those of the third class companions (C.B.). Each of the classes is subdivided into military, civil, and honorary members. The dean of Westminster is dean of the order. The ribbon of the order is crimson, and the badge a gold-white cross (military), gold oval (civil); the motto is 'Tria juncta in uno.' The 2 first classes also wear a star.

Bath-brick, name given to the cakes of siliceous sand used for scouring vessels, cleaning knives, etc. These cakes are made from the sand of the R. Parret, and manufactured at Bridgwater, in Somerset.

Bathgate, a mkt. tn. of W. Lothian, Scotland. Coal, freestone, and limestone are found in the neighbourhood; there are also paraffin works and a distillery. Pop. 8,500.

Bathometer, or **Bathymeter** (Gk. *βαθός*, deep, *μέτρον*, measure), name applied to an instrument used in deep-sea sounding, especially for one when the depth is inferred by the force of gravity.

Báthori, or **Battori**, name of an eminent Hungarian family, from the better-known branch of which sev. illustrious personages have sprung. Stephen B., b. in 1532, so distinguished himself in the army that he was unanimously elected to the sovereignty of Transylvania in 1571, on the

death of John Sigismund Zapolya, nephew of the king of Poland. In 1575 he was elected to succeed Henry of Valois on the Polish throne, and was crowned at Cracow in 1576. The internal condition of Poland at this time was unsatisfactory, dissension being rampant, but Stephen soon effected a great improvement. He declared war against the tsar of Muscovy, and emerged the victor. He *d.* suddenly at Grodno in 1586. Stephen's nephew, Sigismund B., became prince of Transylvania in 1581. He freed the land from the Turkish power, but out of mere caprice resigned his dominions to the Emperor Rudolph II., who in return created him a cardinal, and gave him 2 principalities in Silesia. He changed his mind, and on being invited by the Transylvanians, returned, but his luck and talent forsook him. Many times defeated and disgraced, he was sent to Prague by the emperor, and *d.* there in 1613. Elisabeth B., niece of Stephen, and wife of Count Nadassy of Hungary, is notorious as a type of inhuman cruelty. The rumours current that she used to murder young girls to bathe in their blood were shown to have some foundation in 1610, when it was discovered she had killed over 600 girls. She was shut up in Osej fortress, and *d.* there in 1614. For the connection of this case with the 'werewolf' tales, see the *Book of Were-Wolves* by S. Baring-Gould.

Bathos (Gk., depth), term which indicates the descent from lofty thought in speech or writing to the commonplace or ridiculous, either inadvertently or intentionally.

Baths, Science of, see **BALNEOLOGY AND BALNEOTHERAPEUTICS**.

Bathsheba, wife of Uriah, and mother of Solomon. King David, seeing her one day from the roof of his palace, bathing in a court, coveted her. Not daring openly to commit adultery, he dispatched Uriah, with a letter commanding his destruction, to Joah, who was besieging Rabbath Ammon. His device succeeded. He wedded B., and Nathan rebuked him. She attained the full splendour of queen-mother when Solomon bowed down before her. (2 Sam. xi., xii.)

Bath Stone, name of a species of oolitic limestone, so called because it is found near Bath. It is used for building. When quarried it is soft, but though it becomes hard on exposure to the air, it is not very durable.

Bathurst: (1) Prin. tn. of the W. dist. of New S. Wales, on the S. bank of the Macquarie R., in 32° 25' S. and 149° 42' E. It is the centre of the chief corn-growing dist. in N.S.W. There are gold, silver, and copper mining, railway works, coach factories, tanneries, flour mills, and manufs. of boots and shoes. Pop. 12,000. (2) The cap. of the Brit. colony of Gambia, W. Africa, on a marshy is. at the mouth of the Gambia R.; the only export of importance is the ground nuts which are the staple product of the colony and are used in the manuf. of margarine. Pop. (1931) 14,370.

Bathurst, Allen, Earl (1684-1775), *b.* at Westminster; entered Trinity College,

Oxford, 1699. Entered Parliament for Cirencester, 1705; promoted union with Scotland and opposed Marlborough; made a peer, 1711; appointed treasurer to George III. (then Prince of Wales) until death of George II., 1760. Received a pension of £2000 and was advanced to an earldom; he was a friend of Pope, Swift, and Addison. Henry, his son (1714-94), was made chief justice of the common pleas, 1754, and lord chancellor, 1771, with the title of Baron Apsley; resigned 1778.

Bathurst Island, one of the Parry Is., of N. Australia, 120 m. W. of Port Essington. It lies between Cornwallis Is. on the E. and Melville Is. on the W. Discovered by Captain Parry in 1819. Length about 30 m. It is partly covered with forests and partly unproductive.

Bathybius (Gk. *bathu*, deep, *bios*, life), name applied to a silmy mass discovered in great depths of the ocean and first described by Huxley in 1868. *B. haeckelii* was supposed then to be a new organic mass. *Proto-bathybius* was the name given by Dr. Bessels in an Arctic expedition of 1876 to a similar substance found in Smith's Sound. The *Challenger* expedition of 1872-76 disproved the theories of Huxley and Haeckel, showing B. to be caused by the addition of alcohol to the sulphate of lime in the sea-water.

Bathycles, anct. Gk. sculptor, of Magnesia on the Meander in Lydia. He is thought to have lived in the sixth century B.C. B. was the artist who made the throne of the Amyclæan Apollo at Amyclæ, near Sparta.

Bathymeter, see **BATHOMETER**.

Batignolles, arron. in the N.W. of Paris; formerly a tn.

Batik (Malay *batik*), process for colouring fabrics, originating among the Dutch E.-Indian natives, and subsequently used in Europe for velvet, velours, and similar fabrics. The design is covered with melted wax, and the uncovered portions dyed, the wax then being dissolved in boiling water.

Batiste, material made of fine linen or cotton lawn; in France the term is applied to cambric. The inventor of the material was a certain Baptiste of Cambrai.

Batley, tn. in the W. Riding of Yorkshire, N. of Dewsbury. It is a municipal bor., since 1868, included in the parl. bor. of Dewsbury. The prin. manuf. of B. is woollen goods; it is the headquarters of the heavy woollen trade, in pilots, druggists, shoddy, etc. Pop. 35,000.

Batman, weight used in the E. which varies according to the locality. In Aleppo and Smyrna it is equivalent to 16 lb. 15 oz. 14 dr. avoirdupois; the greater Turkish B. is about 157 lb., the lesser about 39 lb.

Batman (Fr. *bat*, pack-saddle), term used in the Brit. army for the soldier-groom or servant of an officer, originally the man who was in charge of a bat-horse, or baggage animal.

Batman, John (1800-40), reputed founder of Victoria, was a settler in Van Diemen's Land. He formed a company to colonise Port Phillip, and proceeded thither in 1835. He obtained from the

aborigines a tract of 600,000 ac., including the present site of Melbourne, but on returning home his title to the land was declared invalid.

Batna, fort. tn. in Algeria, on the Biskra railway, 65 m. S.S.W. of Constantine. It is near the splendid cedar forests of Mt. Tugurt. Altitude 3471 ft. Pop. 17,000.

Batn-el-Hajar (womb of rocks), dist. of the Nile valley of Nubia. It stretches for a distance of about 95 m., and has many lofty granite hills.

Batolites (Fr. *bâton*, a stick, Gk. *λίθος*, stone), genus of long bivalve fossil shells which occur as rocks in the Alps in the Cretaceous system. They are Lamelli-branchs, and are allied to the *Hippurites*.

Baton (Fr. *bâton*, a stick), short staff or club. The name is applied to sev. articles. The short staff presented to every Brit. field marshal by the king, as the symbol of authority, is known as a B. The long staff which is carried by the drum-major of an infantry regiment is also so called, as is the truncheon of a policeman. As a musical term, the B. is the thin stick which is used by the conductor of an orchestra or choir to conduct the performance. **Baton** (baston, baton, or batun) sinister is a term used in heraldry to indicate illegitimacy. It is a diminutive of the bend sinister, being one-fourth of its width, and does not extend from side to side of the shield. It came into use in England in the fifteenth century to mark the illegitimate descendants of the royal family.

Batoni, **Pompeo Girolamo** (1708-87), It. painter, b. at Lucca. His father was a goldsmith, and Pompeo had thus an early opportunity of displaying his ability for design. He estab. himself in Rome, where he studied Raphael and the antique. In a few years he obtained the first name in Rome, and lived there until his death, for 40 years, without a rival, with the exception of Mengs. B. was equally renowned in his time as a portrait painter, and in historical subjects.

Baton Rouge, cap. of Louisiana, U.S.A., on the l. b. of the Mississippi. It is situated on a high bluff, and has a college, an arsenal, and a penitentiary. On Aug. 5, 1862, the Confederate forces under General Breckenridge suffered a heavy defeat here. Pop. 34,700.

Batony, tn. in prov. of Csanád, Hungary, 25 m. E.N.E. of Mako; pop. 13,000.

Batou Khan (d. 1254), Tartar emperor, grandson of Genghis Khan, ruled over Russia and Bulgaria. He laid waste Hungary, and in 1252 acquired Moscow.

Batrachia (Gk. *βατραχίος*, frog-like), term that is frequently used synonymously with the class Amphibia, i.e. frogs, toads, newts, salamanders, etc., and sometimes with the order Anura, which consists of frogs and toads alone.

Batrachomyomachia (Gk. *βατραχός*, frog, *μῦς*, mouse, *μαχί*, battle), Gk. poem consisting of 294 hexameter verses, which is ascribed to Homer, but attributed by Plutarch and Suidas to Pigres of Haliarnassus. The *Battle of Frogs and Mice* is a parody on the *Iliad*.

Batrachus, architect and sculptor of Laconia, who lived in the time of Augustus. Pliny tells a story of B. and his fellow countryman Saurus. He says, 'Being very rich, they built at their own cost 2 temples to Jupiter and Juno at Rome, enclosed by the porticoes of Octavia, hoping for an inscription; but this being refused them, they introduced their names in another manner, by carving a lizard (Saurus) and a frog (B.) in the centre of the Ionic volutes of the columns, one in each volute' (Pliny, *Hist. Nat.*, XXXVI. iv. 11).

Batshian, see **BATCHIAN**.

Batta (Kanarese *bhatta*, rice in the husk), extra money added to the pay of a Brit. officer in India. It varied according to place and circumstances.

Battalion, tactical and administrative unit of command in a military force. In the Brit. Army only the infantry and tanks are organized in Bs. Engineers train, and, less frequently, cavalry are also organized, in Bs. in some countries, and tanks in most, if not all, cases. The war strength of a Brit. infantry B. is 1000, or, counting all ranks, 1096, and the colonial garrison strength about 860. This number is, theoretically, the largest that can be controlled in action by one commander. The war strength of a B. of other countries is between 500 and 1000. Before the First World War 8 companies formed a Brit. B., each with a captain and 2 lieutenants; for tactical purposes 4 companies formed a half-B., commanded by a major. A modern Brit. infantry B. is divided into 5 companies: a headquarters company, 3 rifle companies, and a machine-gun company. The headquarters consists of the commanding officer, the second in command, the adjutant, the intelligence officer, the training officer, and the supply officer. The bandmaster and sergeant-major of a B. are warrant officers not holding king's commissions. Machine-gun Bs. were formed during the First World War, but have been abolished in the Brit. Army. In some armies 2 or 3 batteries of artillery constitute a B.; in others they are called a group. The cavalry equivalent in most armies is the squadron, as it is in the air force. In general the term is also used to signify the unit commanded by a major, but in the Brit. Army a B. is commanded by a lieutenant-colonel.

Battam, see **BATANG**.

Battas, **Battaks**, or **Battahs**, race of people which inhabit the central highlands of Sumatra, from the volcano Ophir northwards as far as Achi. Their national centre is Lake Toba. The B. are akin to the Malay race; some were independent and remained heathen until 1908, whilst some were under Dutch dominion and Mohammedans. The B. till the soil, and grow rice and maize; they also keep cattle, horses, goats, and pigs. Their prin. occupation consists in the manuf. of ironwork, earthenware, and cloth. The houses are built of wood, covered in with the ribs of palm-leaves. The vils. were formerly fortified by earthen walls and bamboo palisades. The people are

distinguished by their unwillingness to give up old customs. They are of middle height and light brown in colour, with long black hair. A great part of the Bs. were converted to Christianity by Protestant missionaries, and slavery, cannibalism, and other barbarous customs and the endless civil wars were suppressed by the Dutch Gov., which since 1910 has ruled the whole of the tribes. Peaceful as a rule, the B. have no lack of courage on occasion. They have also a written language and literature. See D. Réal, *The Batiks of Java*, 1924.

Batten, commercial term for various kinds of sawn timber smaller than a plank, usually 12 or 14 ft. long, 7 in. broad, and 2½ in. thick. The term is also used in connection with narrow wooden strips used in shipbuilding.

Battenberg, name of a Ger. aristocratic family, which became extinct about 1314. The seat of the family was near B., a small place in the Prussian prov. of Hesse-Nassau. In 1851, Alexander, the younger son of Louis II. of Hesse, marriedmorganatically the Polish Countess Julia Theresa von Hauke, who was then created Countess of B. In 1858 she was given the rank of princess, and her children were permitted to call themselves Princes and Princesses of B. The eldest son of the marriage, Louis Alexander, was b. in 1854. In 1884 he married Princess Victoria, daughter of Louis IV. of Hesse and of Princess Alice, daughter of Queen Victoria. (See MILFORD HAVEN, MARQUESS OF.). He d. in 1921, leaving 2 sons, George Louis Mountbatten (1892-1938), earl of Medina and second marquess of Milford Haven, and Lord Louis Earl Mountbatten (q.v.). The second son of Julia, Countess of B. was Alexander Joseph, who was prince of Bulgaria, 1879-86, and d. in 1893. The third son, Henry Maurice was b. in 1858, and married Beatrice, youngest daughter of Queen Victoria, in 1885. He d. in 1896, when returning from service with the Brit. troops in the Ashanti war. He had 3 sons and a daughter, Victoria Eugénie, who married King Alfonso XIII. of Spain in 1906. The fourth son of the Countess of B., Francis Joseph, was b. in 1861, and married the daughter of Nicolas I. of Montenegro in 1897. The only daughter of the countess of B. was Marie Caroline, who was b. in 1852 and married Gustavus Ernest, prince of Erbach-Schönberg, in 1871.

Batter, in architecture, the wall of a building which recedes as it rises, so that the B.-rule, or plumb-line, falls within the base. The walls of wharves usually batter.

Battering-ram, military engine employed in anct. times to cause a breach in the walls of a besieged place. Two kinds of Bs. were used, one kind being suspended in a frame, the other in movable on wheels or rollers. The ram consisted of a large beam, or spar, with a massive metal head; it was usually set in motion by means of cords passing over pulleys. A roof or screen generally protected those employing it. Bs. were often made of great weight and size.

Battersea, suburb of S.W. London, England, on the Surrey side of the Thames, spanned near here by the Chelsea, Albert, and B. bridges. B. Park, which was commenced in 1852, has an area of 185 ac., and the Albert Palace, opened in 1885, is also in B. Many factories, foundries, and engineering works are in the suburb. Lord Bellingbrooke was b. in B., and here the duke of Wellington fought a duel with Lord Winchelsea in 1829. A metropolitan municipal bor. of the co. of London, B. sends 2 members to Parliament, and has a pop. of 160,000.

Battersea, Cyril Flower, first Baron (1843-1907). Eng. politician, b. at Streatham and educated at Harrow and Trinity College, Cambridge. He entered Parliament in 1880, representing first Brecknock, 1880-85, and afterwards S. Bedfordshire, 1885-92. He was junior lord of the Treasury, under Gladstone, in 1892, and was created a peer in the same year.

Battery, see under ARMY and ARTILLERY.

Battery, Assault and, see under ASSAULT.

Battery, Electrical, see ACCUMULATOR and CELL.

Bathýányi, name of a Hungarian family, which traces its descent to A.D. 884. It numbered among its members some of the most illustrious men of Hungary. In 1526 Francis B. distinguished himself in the battle of Mohács, and Balthazar B. in the Turkish wars of the same century. Count Casimir B., b. in 1807, was minister of foreign affairs in Hungary during the insurrection of 1849. After the disaster of Vilayos he fled with Kossuth into Turkish ter., and afterwards he went to Paris, where he d. in 1854. Count Louis B. was b. at Pressburg in 1806, and entered the army as a cadet, but subsequently adopted a diplomatic career. He was appointed president of the ministry when Hungary at length obtained one in 1848. Despite his moderation as a member of the diet, he was arrested in Jan. 1849, when the Austrians entered Pest. He was condemned to be hanged on Oct. 6, 1849, but by wounding his neck with a dagger he prevented this form of execution. He was, however, shot.

Battiadæ, Cyprian dynasty of 8 kings. They were: Battus I. (c. 630 B.C.), Arceilaus I., Battus II., Arceilaus II., Battus III., Arceilaus III., Battus IV., and Arceilaus IV. (d. about 450 B.C.). The last-named is the subject of 2 of Pindar's odes. The hist. of the dynasty may be found chiefly in Herodotus.

Batticaloa, cap. tn. of dist. of B., Ceylon, situated on a small is. off the E. coast. It has an excellent harbour and a good trade, particularly in coco-nut products. Area of dist. 13,060 sq. m.; pop. of dist. 193,000; of tn. 11,000.

Battislini, Mattia (Barone di Poggio Casalino (1858-1928), It. singer known by the title 'La Gloria d'Italia.' His debut in 1878 at the Teatro Argentina in Rome brought him an engagement immediately for the It. opera in Buenos Aires. Thereafter he toured in all the prin. thes.

of S. America and Europe and attained fame as one of the greatest dramatic baritones in the world. B. created many important roles, and his friend Massenet re-wrote for him the tenor part in *Werther*.

Battle, mkt. tn. and par. in the co. of Sussex, situated 6 m. N.W. of Hastings. It was anciently called Epiton, but after the battle of Hastings in 1066, which was fought near here, its name was changed to B. It contains the ruins of B. Abbey, built by William I. on the spot where King Harold was killed. The site of the abbey is occupied by a modern residence, in which some of the abbey ruins have been included. After the First World War it was sold and became a school for girls. In 1930 the building was burned down. The tn. has an agric. trade. Pop. 3600.

Battle, fight between armed forces, whether large or small, on land, sea, or in the air. A B. is termed general when both armies are brought fully into action; if only a considerable portion of each it is partial. When only small sections are engaged it is called a skirmish. A commander may choose to act on the offensive or defensive, or to combine both, according to circumstances; judgment in decision, skill in preparing the plan of B., and promptness in varying it as required, are the marks of a great leader.

Battle, Wager of, see TRIAL BY COMBAT.

Battle Abbey, The Roll of, list of the barons who fought on the side of William I. at the battle of Hastings. It is supposed that at the end of the battle a list was made of his chiefs, who numbered 629, and among whom the titles and property of the defeated were distributed. Really, however, it is of later date than the Conquest—some say that it was compiled as late as the fourteenth century, its purpose being (it is alleged) to show which families 'came over with the Conqueror.' The Duchess of Cleveland ed. *The Roll of Battle Abbey*, with notes, etc., in 3 vols., 1830. Consult also Walcott, *History of Battle Abbey*, 1867.

Battle-axe, weapon which has been in use from primitive times. The head was originally made of stone, then of bronze, and finally of iron or steel; some varieties could be held with one hand, while others required two. The pole-axe, or halberd, is merely a B. with a long handle.

Battle Creek, city in Calhoun co., in the S.W. of Michigan, U.S.A., on the Kalamazoo R., 48 m. from Grand Rapids. It was settled in 1831, and became a city in 1859. Lying in the centre of a rich fruit and grain producing dist., it is known for the manuf. of health foods. It has also large works for making agric. implements, railway cars and locomotives, and pumping engines, besides a fine medical college and sanatorium. Pop. 44,000.

Battle Honours, devices or distinctions employed to memorialise outstanding episodes in the hist. of an army or a regiment. These devices take various forms, the commonest being the emblazoning of the names of battles or campaigns on regimental colours. Other

forms are the granting of special badges, mottoes, and titles (such as 'Royal'), distinctive items of uniform (such as the bearskin of the Scots Greys, and the back-badges of the Gloucestershire Regiment). The custom is derived from the grant of 'augmentations of honour' to a knight's coat-of-arms in the Middle Ages. In the Brit. Army all B. H. are granted by the king, and are pub. in Army Orders and recorded in the monthly Army List, at the head of each regimental list. In the U.S.A. names of battles are not placed upon the colours, but are emblazoned upon streamers attached to the colour-pike, just below the head. In the Brit. Army, Royal Artillery units commemorate some particular episode in their subtitles, e.g. '25th Medium Battery (Battle Axe Company)' whose forerunners were a company of artillery which served with distinction at the capture of Martinique in 1809, and was presented with a battle-axe, which it still possesses. The 1st Foot Guards were granted the title of Grenadier Guards to commemorate their service at Waterloo. The 3rd Hussars are allowed an extra drum-horse to carry some drums captured from the Fr. at Dettingen; the 2nd Gurkhas (Brit. Army) carry a 'truncheon' to commemorate their service at the siege of Delhi during the Indian mutiny. It is a practice in most armies to decorate the regimental colours with medals, etc., but this is not permitted in the Brit. Army. B. H. are also painted upon regimental drums.

John H. Stone

THE BATTLEMENTED TOWER
OF SWANSEA CASTLE

Battledore and Shuttlecock, game played 2000 years ago in China, and still popular. It consists in batting the shuttlecock, a cork base surrounded by feathers, with parchment rackets, the game being to keep the shuttlecock in the air as long as possible.

Battelford, tn. at the confluence of the

Battle and N. Saskatchewan Rs., Canada. From 1876 to 1883 it was the seat of gov. for the N.W. Territories, but was then superseded by Regina. Fighting took place here during Riel's insurrection in 1885. A branch railway connects B. with the Canadian Pacific.

Battlement (O.F. *bataillement*), wall erected round the top of a fortified building consisting of rising parts known as cops or merlons, and intervening spaces called crenelles. The soldiers fired from the embrasure while taking refuge behind the merlon. In architecture Bs. are still erected for artistic effect.

Battleships, the heaviest class of warship, classified as capital ships, and including also battle cruisers, which latter, however, are nominally faster boats, being more lightly armoured. Armour plate was first used by the Fr. in 1859 after their experience of the power of shore batteries in the Crimean war; but these ironclads, as they were called, were none the less built of wood, covered with 4-in. wrought-iron plates—a tribute to the increasing power of shell-fire. The *Warrior*, of 9000 tons displacement and 44-in. plates, launched in 1860, was England's earliest ironclad. Three years later the ironclad was superseded by the ship with revolving turrets, the *Royal Sovereign* being the first of this type, and its armament was the standard main armament of a B. for many years. Guns were soon invented, however, which could pierce the armour carried by such vessels as the *Devastation* and others, of which the plate varied from 8 to 12 in., with turrets protected by 14-in. plating; whence later ships had a still greater thickness of armour, and still more powerful guns. The next development was a ship capable of firing in all directions from central batteries and, therefore, not dependent upon broadsides. Most subsequent developments have been due to increase in gun power, and vessels of larger displacement have had to be built to carry the heavy armament. The *Dreadnought*, completed in 1906, is generally held to be the type from which the modern B. has been evolved. She was 490 ft. in length, of 17,900 tons displacement, had 10 12-in. guns in 5 turrets, and many smaller guns, was plated with improved resisting substitutes for wrought iron, and was capable of a speed of 21 knots.

At the outbreak of the Second World War the Brit. Navy had 12 Bs. and 3 battle cruisers—the latter including the *Hood*, then the most powerful B. in the world (see HOOD, THIS), having a displacement of 42,000 tons; the *Repulse* (32,000 tons and armed with 15-in. guns), which was sunk by the Japs. in 1942, and the *Renown* of similar tonnage and equipment. Seven more Bs. were then being built, all of 35,000 tons and armed with 14-in. guns. *Nelson* and *Rodney*, completed in 1927, have a displacement respectively of 33,500 and 35,900 tons, and carry 9 16-in. guns. At the end of the war there were 17 Bs., the additions being *King George V.* (1940), *Howe* (1941),

Anson (1941), *Duke of York* (1941), all 35,000 tons displacement, and armed with 10 14-in. and 16 5.25-in. guns; *Temeraire* and *Lion* both completed (1943), each 40,000 tons displacement, and armed with 9 16-in. and 12 6-in. guns; and the *Vanguard* (1944) with similar main armament to the last 2 ships. The Washington Treaty (q.v.) prescribed 35,000 tons and 16-in. calibre as the limitations on size of Bs. and their guns, and, under the Anglo-Ger. naval agreement, 1937, these limitations were repeated. The provision designed to preserve the distinction between cap. ships and 'light surface vessels' (or cruisers), and to make effective the agreed restrictions on the latter, was from 10,000 to 17,500 tons displacement and from 8-in. to 10-in. calibre of guns. Japan, however, broke away from the Washington Treaty limitations, and, as a consequence, a further agreement was signed in June 1938 by Great Britain, America, France, and Germany limiting the calibre of gun in cap. ships to 16-in., as before, but increasing the permissive tonnage to 45,000.

The U.S. Navy, as at Jan. 1939, had 15 Bs., Japan was said to have 9, France 5, and Germany 5. The U.S. Gov. had then made provision for 6 new Bs.—2 for completion by 1942, and 4 by 1947, and it was also then decided to build ships of 45,000 tons in future. But this programme was settled before America entered the war; and by 1944 America had 23 cap. ships and 2 battle cruisers. No details were available concerning Japan's intentions, but the construction of 46,000-ton ships, carrying 18-in. guns, was rumoured. In the result her large new cap. ships were soon sunk by the Allies, and it might seem well estab. that in construction they were marked by grave defects. France was a party to the protocol which provided for the limitation of cap. ships up to 45,000 tons, but the Fr. Gov. subsequently announced that they would not build ships over 35,000 tons unless other continental powers exceeded that tonnage. The *Richelieu*, laid down in 1935, is a 35,000-ton B., as, too, the sister ship, *Jean Bart*, which, however, was half wrecked at Casablanca. Germany, strictly speaking, had no Bs., excepting 3 very old vessels of the *Hannover* class, which she was allowed to retain after the First World War, and which were then little more than training ships. In 1939 Germany had projected 2 35,000-ton ships, but at that date the largest Ger. warships actually in commission were the 26,000-ton *Gneisenau* and the sister ship *Scharnhorst* (q.v.) completed in 1938, officially classified as battle cruisers. Next to these in size were the 3 so-called pocket Bs. of the *Deutschland* class, of 10,000 tons displacement, and so lightly armoured that they were really no more than armoured cruisers. (See ADMIRAL GRAF SPEE.)

The *Vanguard*, the most recently built Brit. B., was launched on Nov. 30, 1944, and commissioned in Aug. 1946. It is a 42,500-ton ship, is somewhat shorter and broader than the *Hood* (q.v.), with a superstructure rising like a fortress more than

80 ft. above the water-line. It has a main armament of 8 15-in. guns, and a secondary armament of 16 5-25-in. guns, besides numerous 6-barrelled and single-barrelled Bofors. It has the latest radar equipment and embraces results of exhaustive research in every other sphere of ship armament and design. Thus the ship incorporates many lessons of the recent war in machinery damage control. A distinctive feature also is the streamlining of the funnels, the result of tests to evolve a design which would prevent the funnel gases from interfering with gunfire. The main power for propulsion and the many intricate services originates in boilers that incorporate a new system of high-efficiency oil-burning. There are on board information rooms where men can study; a cinema, with tiered seating for 200, and even soda fountains. Laundry, cooking, bakery galleys, and the air conditioning plant are all powered by electricity. *See also* CRUISER; NAVY AND NAVIES.

Battori, *see* BATHORI.

Battue (from Fr. *battre*, to beat), method of killing game, such as hares, pheasants, etc., by having them driven out of cover by beaters towards the spots where sportsmen are stationed to fire. In war or civil strife the term has often been applied to the slaughter of helpless crowds.

Batum, or **Batoum**, tn. in the Georgian Republic of the U.S.S.R., on the E. shore of the Black Sea. Three million pounds of tea are produced annually and excellent Turkish tobacco and a host of exotic flowers, but much fever is prevalent from May until July. It has a vast industrial quarter and 135 tanks contain oil brought hither by pipe lines or tank cars from Baku. But because the Soviet restrains both imports and exports with great rigour, shipping has dwindled and prosperity declined. Pop. (1939), 71,000.

Baturin, tn. of Chernigov Region, Ukrainian S.S.R., on R. Selma, 63 m. E. of Chernigov. From 1669 to 1708 it was the headquarters of the hetman of the Ukraine Cossacks. Pop. 3600.

Batz, tn., dept. Loire-Inferieure, France, situated on the coast, 50 m. N.W. of Nantes; has salt-pans and interesting antiquities. Pop. 2000.

Batz, is., *see* BAS.

Bauan, or **Baun**, tn. in Batangas, prov. Luzon, Philippine Is., at the head of Batangas Bay, 50 m. S. of Manila. Cacao, oranges, indigo, sugar-cane, and rice are grown; manufs. palm-fibre mats and hats, bamboo baskets, and cotton fish nets. Pop. 40,000.

Baucéant, *see* BEAU SÉANT.

Bauchi, hilly prov. of N. Nigeria, notable for its tin mines which are situated chiefly on the plateaux. Bauchi is the cap., and other tns. are Bukuru, the S. terminus of the railway from Kano, Ngaruta, and Leri. Pop. about 1,000,000, mostly Hausas.

Baucis, *see* PHILEMON AND BAUCIS.

Baudelaire, Charles Pierre (1821-67), Fr. poet, b. on Apr. 9 in Paris, the son of François B., a civil servant under the First Empire. After his father's death his

mother was married to Colonel Aupick, who was on good terms with his son-in-law, and saw that he was well educated at Lyons and at the Collège Louis le Grand in Paris. At the age of 20 B. was sent on a visit to India, but soon returned as he came into a small patrimony in 1842. Thereafter he lived an uneventful and retiring life in the bohemian and literary circles of Paris until 1864, when he endeavoured to set himself up in Belgium as a lecturer. His health had been undermined, however, and grew steadily worse. He returned to Paris, suffering from general paralysis, and d. on Aug. 31, 1867. His first vol. of poems, *Les Fleurs du Mal*, was pub. in 1857, and the author and publisher were prosecuted by the Gov. on account of the impropriety of certain poems which were omitted from the second ed. in 1861, their place being taken by 35 new poems. His poetry is simple in form and rich in vocabulary. It sprang from a keen delight in the sensual and passionate aspects of life, but subject at the same time to a critical analysis, combined with a mystical perception. It offended many people at the time on account of its extreme romanticism, and B.'s reputation also suffered on account of his way of life, in which he flouted conventional morality. During his lifetime he was esteemed more for his trans. from Edgar Allan Poe, a work which he carried out to perfection. His poetry, however, gradually gained a firm recognition, and his influence was such that he became the leader of the younger Fr. poets, and he is now recognised as the greatest of the poets of the later phase of the Fr. romantic movement. In addition to his poems, his only other considerable original work was *Petits Poèmes en prose*. He also wrote a number of stories and critical and miscellaneous essays.

Theophile Gautier's *Life of B.* was trans. into Eng. in 1915; also B.'s *Intimate Journals*, trans. by C. Isherwood (London and New York), 1930, and *The Letters of Charles Baudelaire to his Mother, 1833-66*, trans. by Arthur Symons, 1928. *See also* A. S. Patterson, *L'Influence d'Edgar Poe sur Charles Baudelaire*, 1903; J. Ivière, *Études: Baudelaire* (with others), 1911; G. T. Mines, *The Influence of Baudelaire in France and England*, 1913; P. Quennel, *Baudelaire and the Symbolists*, 1930; also studies on B. by A. Symons (1920), L. P. Shanks (Boston, 1930), L. Soupault (Paris, 1931), and E. Starke (1933).

Baudin, Charles (1784-1854), Fr. admiral, fought in the Napoleonic wars. In 1838 he distinguished himself by the capture of San Juan de Ulloa (or Ullua).

Baudissin, Wolf Heinrich von (1789-1878), Ger. writer, was for some time secretary to the embassy in Vienna, and later in Paris. Afterwards, however, he gave all his time to the study of literature. He modernised the language of much Ger. primitive literature, and also trans. Shakespeare and other Elizabethan dramatists, also Molière and Goldoni.

Baudouin, Manuel Achille (1846-1917), Fr. lawyer, b. at Tours, advocate general at Lyons, 1880; procurator general at

Limoges, 1885; advocate general at the court of cassation in 1880, and president of the civil tribunal of that court 3 years later. Prominent as procurator general in the revision of the Dreyfus trial. In 1913 became general president of the court of cassation.

Baudrillart, Henri Joseph Léon (1821-1892), Fr. economist, son of Jacques Joseph B. (1774-1832), a writer on forestry. As a member of the Academy of Moral and Political Science he was entrusted with an inquiry, the results of which were pub. in his *Agricultural Population of France*, 1885. He was prof. of political economy at the École des Ponts et Chaussées.

Baudry, Paul Jacques Aimé (1828-86), Fr. painter, b. in Vendée. He won the Prix de Rome in 1850. His subjects were mythological or decorative, but he painted one historical picture ('Charlotte Corday after the death of Marat'). His best work was his mural decorations in the Paris opera house, the château de Chantilly, and the Cour de Cassation. His works are marked by graceful design and rich colouring rather than by strength or originality.

Bauer, Bruno (1809-82), Ger. theologian and historian, b. at Eisenberg, Germany, and educated at Berlin, where he became a licentiate of theology in 1834. In 1839 he was transferred to Bonn, but within the next 2 years pub. works on the Gospels expressing such unorthodox views that his licence to teach was withdrawn, and he retired to Rixdorf to spend the rest of his life in study and authorship. His theories on the origins of the Gospels are, briefly, that St. Mark's was written in the time of Hadrian, and that from this the others were constructed a century later by Gentile converts, who then passed them off as genuine apostolical documents. B. also wrote histories of the eighteenth century and of the Fr. Revolution.

Bauer, Caroline (1807-77), Ger. actress, b. at Heidelberg. She made her début in 1822. In 1829 she was married morganatically to Prince Leopold of Coburg, then widower of the Princess Charlotte and afterwards king of the Belgians. Their union was unhappy, and came to an end in 1830. Returning to the stage for some years, she finally left it in 1844 to marry a Polish count. She wrote 2 vols. of theatrical reminiscences and memoirs.

Bauer, Otto (1881-1938), Austrian Socialist statesman, b. in Vienna. A doctor of laws of Vienna Univ. With Dr. F. Adler he founded a paper called *Der Kampf*, 1907. He was prisoner of war in Russia 1915-17. Made under-secretary to Victor Adler in 1918; on latter's death almost immediately afterwards, B. succeeded him as foreign secretary, Nov. 12, 1918. In this capacity he saw the inauguration of the republic; resigned, July 1919. He continued to hold an influential position in Austrian politics, until, in 1934, his opposition to Dr. Dollfuss made it advisable for him to leave Austria, and seek refuge in Czechoslovakia. He later went to Paris, where he d. After leaving Austria, he wrote the book,

Between Two World Wars. Other works: *Die Nationalitätenfrage und die Sozialdemokratie*, 1907; *Bolschewismus oder Sozialdemokratie?*, 1920; *Die österreichische Revolution*, 1923; *Der Kampf um Wald und Weide*, 1925.

Bauernfeld, Eduard von (1802-90), Austrian dramatist, b. at Vienna. His irrepressible humour, and his sense of the ridiculous both in circumstances and people, make him the Molière of the Viennese stage. *Leichtsinn und Liebe*, *Bürgerlich und Romantisch*, *Das Liebes Protokoll*, and *Moderne Jugend*, are the best known of his comedies.

Baugé, tn., cap. of a canton, dept. Maine-et-Loire, France, on R. Couanon, 23 m. N.E. of Angers. The Fr. defeated the Brit. under the duke of Clarence here in 1421. Pop. 3000.

Bauhin, Gaspard (Kaspar Bauhinus) (1550-1624), Swiss botanist, b. at Basel. He is said to have held the offices of prof. of Gk., of anatomy and botany, and of the practice of medicine, dean of the faculty of medicine, chief physician to the tn., and rector of the univ. His chief works were: *Phytopinax*, Basel, 4to, 1596, and *Prodromus Teatri Botanici*, Frankfurt, 1620. He also made collections of the synonyms of the botanical writers who had preceded him. The latter appeared in his *Pinax Teatri Botanici* in 1623, of which a second ed. was pub. in 1671, forming a complete key to the botanical knowledge of the day.

Bauhin, Jean (1541-1613), Swiss botanist and physician, b. at Basel, brother of Gaspard B. His father (an Amiens Protestant and refugee) placed him with Leonhard Fuchs (q.v.), the famous botanist, and afterwards with Konrad Gesner (q.v.), the great naturalist, whom he accompanied in excursions through Switzerland. He visited sev. other parts of Europe for the purpose of becoming acquainted with their vegetable productions, and with a view to collecting materials for his *Historia Plantarum*, afterwards pub. In 1566 he fixed himself at Basle, where he was elected prof. of rhetoric.

Bauhinia, genus of tropical Leguminosae named by Linnaeus after the 2 botanists, Bauhin. The leaves are generally divided into twin lobes, but the genus is chiefly remarkable for its twining plants which twist in and out in an intricate manner. *B. porrruta*, the Jamaica mt. ebony, is so called because its wood is sheathed in black.

Baul, tn. of Venezuela, in state of Zamora, 60 m. S. of San Carlos; pop. 10,000.

Baumann, Oskar (1864-99), Austrian traveller, b. in Vienna; in 1885 journeyed with Long up the Congo R. to Stanley Falls; the following year he explored Fernando Po, and 2 years later ascended the mt. of Kilimanjaro. During 1892-93 he led an expedition to Lake Victoria and explored the surrounding dist.; in 1896 he was made consul at Zanzibar. He pub. sev. works on his explorations.

Baumannshöhle, stalactitic cavern in Harz Mts., Brunswick, Germany, on Bode R., 5 m. S.E. of Blankenburg. It contains numerous fossil remains.

Baumbach, Rudolf (1840-1905), Ger. poet and novelist, b. at Kranichfeld. Among his best works are the epic, *Zlatorog*, 1877; the novel, *Trug-Gold*, 1878; book of lyrics, *Lieder eines fahrenden Gesellen*, 1878; and fairy story, *Ks war einmal*, 1889.

Baume-les-Dames, tn., dept. Doubs, France, on R. Doubs, 18 m. N.E. Besançon; cap. of an arron.; pop. 3200.

Baume-les-Messieurs, vil. in Jura dept., France, 6 m. N.W. of Lons-le-Saulnier. Pop. 400.

Baumgarten, Alexander Gottlieb (1714-1762), Ger. aesthetician, b. at Berlin. He studied at Halle, and became a warm admirer of Wolff's philosophy. B. applied himself to logic, on which he afterwards gave lectures at the Orphan Institution of Halle. He invented the word aesthetics, which he applied to the theory of taste, or the science of the beautiful. He divided the science of aesthetics into theoretical and practical; he developed his ideas first in his treatise, *Disputationes de nonnullis ad poema pertinentibus*, 1735, and in his *Æsthetica*, 1750. The other works of B. are *Metaphysica*, *Ethica Philosophica*, *Initia Philosophiæ Practicæ*. In 1740 B. was appointed prof. of philosophy at Frankfurt-on-the-Oder, where he d.

Baumgarten-Crusius, Ludwig Friedrich Otto (1788-1842), Ger. theologian, b. at Merseburg; studied at Leipzig Univ. From 1812 until his death he was prof. of theology at Jena. He was an authority on the hist. of Christian dogma, and his books on the subject include *Grundzüge der Biblischen Theologie*, 1828, and *Kompendium der Dogmengeschichte*, pub. 4 years after his death.

Baumgärtner, Andreas, Baron von (1793-1865), Austrian scientist and politician, b. at Friedberg, Bohemia, and studied at the univ. of Vienna, where he became prof. of physics. He was later minister of commerce and of finance, 1851. He pub. *Die mechanische Theorie der Wärme*, 1864; *Naturlehre*, 1823, and other works.

Baumgärtner, Gallus Jakob (1797-1869), Swiss statesman, b. at Altstätten. He studied at Freiburg and Vienna, and promoted the revision of the constitution of the cantons, 1831. He was a leader of the Liberals till 1841, when he joined the Ultramontane party. His writings are on historical subjects and include: *Die Schweiz in ihren Kämpfen und Umgestaltungen von 1830-50*, 4 vols., 1853-66.

Baumgärtner, Karl Heinrich (1798-1886), Ger. physician, b. at Pforzheim, and d. at Baden-Baden; he became clinical prof. at Freiburg, 1824-62. He is known for his original studies in embryology and the circulation of blood.

Baun, see BAUAN.

Baur, Ferdinand Christian (1792-1860), Ger. theologian, b. near Stuttgart. In 1825, while prof. in the theological seminary at Blaubeuren, he pub. his first important book, *Symbolik und Mythologie oder die Naturreligion des Allertums*. Next year he was appointed prof. of theology at Tübingen, where for some time he wrote mainly on mythology and allied subjects.

Das manichäische Religionssystem appeared in 1831; *Apollonius von Tyana* in 1832. But meanwhile he was coming under the influence of Hegel, whose philosophy of hist. he adopted. Between 1835 and 1847 he estab. what is known as the Tübingen school, the teachings of which were so opposed to orthodox tradition that they aroused antagonism. B. contended that the only genuine epistles of St. Paul are those to the Galatians, Corinthians, and Romans, and that these prove him to have been in opposition to Peter. B. also argued in his book on the Gospels (1847) that those, written in the first and second centuries, were adaptations from an earlier gospel, and show a desire on the part of the redactors to reconcile the opposing factions. His main argument is that Peter tried to estab. a Jewish Christianity, while Paul worked on broader lines, and that their differences influenced Christian literature for 2 centuries.

Bautain, Louis Eugène Marie (1796-1867), Fr. theologian, b. at Paris; educated at the École Normale. He became prof. of philosophy and later also of literature at Strasbourg. In 1828 he resigned to take orders, but remained in Strasbourg until 1849, when he was transferred to Paris as vicar of the diocese, and remained there until his death. He was strongly opposed to rationalism.

Bautzen, or **Budissin**, tn. of Upper Lusatia, Saxony, Germany, on R. Spree, 31 m. N.E. of Dresden. The cap. of an administrative dist. It is surrounded by turreted walls, and contains a cathedral. Has manufs. of textiles, leather, paper, and metal. Napoleon defeated the Allies here in May 1813. Pop. 40,500.

Bauxite, earthy compound of aluminium oxide, iron oxide, titanic acid, and water, in varying proportions; found in the S. of France (taking its name from Les Baux, near Arles), in Brit. Guiana (the chief Brit. source of supply), in Ireland (Antrim), and in the S. United States. Its colour varies according to the proportion of oxide. B. is valuable for the production of aluminium and its salts, of which it is the chief commercial source. As it resists heat well it is used for making crucibles and fire-bricks. See C. S. Fox, *Bauxite*, 1927; N. V. S. Knibbs, *The Industrial Uses of Bauxite*, 1923.

Bavai, tn., dept. Nord, France, 13 m. S.E. of Valenciennes. The anct. Bagacum, cap. of the Nervii. It has iron-works and marble quarries. Pop. 1800.

Bavaria (Ger. *Bayern*), Ger. state, which in area and pop. was of most importance after Prussia in the pre-war Ger. Federation. It is divided into 2 unequal parts, the one B. proper, which occupies at least eleven-twelfths of the whole area, and the other the Palatinate of the Rhine, which is divided from B. proper by the states of Baden and Hesse. B. proper is surrounded by ranges of mts. on 3 sides, the W. side being bounded by Württemberg, Baden, and Hesse. The country consists mainly of an extensive plateau, which has an average height of nearly

2500 ft. It belongs principally to the basins of the Danube and the Main. The Danube is navigable during its course of about 200 m. through B., and receives numerous tributaries, amongst which may be named the Iller, the Lech, the Isar, and the Inn, the Naab, and the Wörnitz. The Palatinate is bounded on the N. and W. by a lofty range of hills, on the E. by the Rhine, and on the S. by Alsace. The climate of B. varies considerably. Taken on an average, it is rather colder in winter than in Great Britain, but a good deal warmer during the summer and the autumn. The area of the 2 divs. taken together is 29,285 sq. m. It is divided into 8 provs.: Upper B., Lower B., Upper Palatinate, Upper Franconia, Middle Franconia, Lower Franconia, Swabia, and the Palatinate. In 1920 the former duchy of Coburg became part of B. by plebiscite. The total area is 29,486 sq. m., and the pop. (est. 1939) 8,280,000. Munich (pop. 828,325 in 1939) is the cap., and there are 4 other tns. with 1939 pops. of over 100,000 (Nuremberg, Augsburg, Ludwigshafen, and Würzburg). In the 1946 series of new states (Länder), founded by the occupation authorities, the Rhine Palatinate was included in Land Rhine-land-Palatinate (Fr. zone). Education was much improved before the Nazi regime, and the power which the clergy formerly had over the schools had been considerably decreased. There are 2 Rom. Catholic univs. and 1 Lutheran. Almost three-fourths of the pop. are Rom. Catholics, and the state is divided into 2 archbishoprics and 6 bishoprics. Protestants form nearly one-fourth of the pop., the remainder consisting principally of Jews.

Agriculture. The main products of the country are rye, oats, wheat, barley, and millet, hemp, flax, fruit, and the vine. Tobacco is also produced in some quantities, and the Palatinate produces large quantities of sugar-beet. In Central Franconia hops are produced. In the provs. of Swabia and Upper Bavaria, cattle-rearing forms the chief occupation of the people, the country here being more suited to pasture land than for the production of good crops. Almost one-third of the whole area of Bavaria is given up to forest lands. The land is held principally by peasant proprietors.

Mineral Wealth. The chief minerals of B. are coal, iron-ore, graphite, and salt. The sale of the latter used to be a gov. monopoly, which was abolished in 1867. Coal is found in almost all parts of B. There are also quarries of marble, gypsum, and good building stone. Quicksilver mines in the Palatinate still produce a good output. Porcelain clay is also found and ranks amongst the finest in Europe.

Industry. The chief pre-war industry of B. was brewing. There were more than 5000 breweries, and the output of beer was more than 100,000,000 gallons per annum, the greater part being consumed within the country itself. Roughly one-sixth of Germany's cotton industry was centred in B., and it was slowly recovering

its pre-1914 prosperity. In addition, there was a fair porcelain industry, and hardware, wooden toys, glass, cement, and spirit were also manufactured. Nuremberg was the centre of the hop trade; Augsburg of the cotton trade. The chief exports (pre-war) were corn, hops, beer, wine, potatoes, and cotton goods; the imports were mainly sugar, tobacco, cocoa, coffee, and raw cotton. The state railways and the roads were in good condition before the war, and the canal system much developed. Telegraphic and telephonic communications were also good.

E.N.A.

BAVARIAN PEASANT

Constitution. On Nov. 28, 1918, B., which had been a constitutional monarchy, was declared a republic. B. was a member of the Ger. Reich, and abided by the Weimar Constitution (1919-32), under which it was governed by a Diet elected by universal suffrage. The Diet was a single chamber with a minister-president whose powers were limited, and the whole gov. could be dissolved by popular vote. Foreign policy, railway, postal, and telegraphic systems were administered by the Reich. Ten delegates (one for every 700,000 inhabitants) represented B. in the Reichsrat.

History. The original inhab. of B. were probably of Celtic origin. Just previous to the beginning of the Christian era they were conquered by the Romans, and included in a Rom. prov. After the decline of the Rom. power they suffered from the inroads of the barbarians, and were ultimately conquered by the Franks. Their

dukes, during the later part of the Dark Ages, seem to have been under the control of the Frankish kings and emperors. By Charles the Great, B. was incorporated in the Carolingian empire. During the centuries which followed, B. was the scene and the cause of many quarrels between rival princes, until towards the end of the eleventh century it passed into the hands of the family of Welf. The first Welf with difficulty retained it, and passed it on to his sons, but his grandson, holding both B. and Saxony, was deprived of B., which for a short time passed back into

united B. William IV. keenly supported the Catholic Church, and was able to a very great extent to repress the progress of the Reformers. His son followed his policy, and was succeeded by William the Pious, who had been trained by the Jesuits. His son, Maximilian I., placed B. on a strong basis, reformed it internally, took an active part in the Thirty Years war, and regained for his country the addition of the Upper Palatinate. He d. in 1651, leaving B. strong and able to take her place in the councils of Europe, a thing which internal strife had forbidden

BAVARIA

the hands of the imperial family, only, however, until 1156, when it was restored to Henry the Lion, the great-grandson of the first Welf. But Henry the Lion did not hold the duchy for long; in 1180 he was placed under the imperial ban, and deprived of his lands, which were given to a duke of the Wittelsbach family. Under the early Wittelsbachs B. increased in prosperity, but its means of territorial expansion were declining owing to the growth of neighbouring states. During the thirteenth and fourteenth centuries the possibility of B. becoming one of the great Ger. powers was stopped by the div. of the duchy into 2, and again after a short union into 6. For some time the hist. of B. is simply the record of the quarrels and wars which were the outcome of these divs. Until the beginning of the sixteenth century B. remained disunited, until in 1504 it regained its unity under Albert the Wise. After his death, again a partial div. took place between his sons, William IV. and Louis; after Louis's death, 1545, William IV. again ruled over a

during the past 4 centuries. The next reign was taken up in a judicious attempt to allow the duchy to recover from its exhaustion after the Thirty Years war. Under Maximilian's son this work was carried out, but Maximilian Emmanuel unfortunately sided with France during the Sp. Succession war and shared in the defeat at Blenheim in 1704. His dominions, lost for the time, were only restored in 1714 in a ravaged and exhausted condition. On the death of the Emperor Charles VI., untaught by the experience of 1702-14, Charles Albert devoted all his strength and power to an attempt to win from Maria Theresa the crown of Austria. Semi-successful at first, he d. in the midst of failure (1745), and his successor got back the ancestral possessions only by giving unconditional acknowledgment of the Pragmatic Sanction. For a short while B. was again allowed to attempt to recover. And in 1777, on the extinction of the Bavarian line of the Wittelsbachs, the succession passed to the elector palatine (Charles Theodore), and the

Palatinate and the duchies of Julich and Berg were united to B. This directly led to the war of the Bavarian Succession. The revolutionary wars found B. a prey to the alternate attacks of France and Austria. In 1805, however, B. was made into a kingdom by Napoleon, the title being vested in the ducal elector. B. now remained a firm ally of Napoleon until 1813, when, by a change of sides, it was confirmed by the victorious allies in all the benefits and advantages given it previously by Napoleon. In 1818 Maximilian I. presented his people with a constitution, attempting to reconcile the demand for political freedom with his newly acquired kingly rights. He started political and religious reforms and was a much-loved monarch. He d. in 1825 and was succeeded by his son, Ludwig I. He made Munich a centre of culture and art, but parliament opposed the expenditure on art, and this opposition of the Catholic party, the Ultramontanes, was inflamed by the king's love for Lola Montez, a dancer of Sp. extraction. This led to Ludwig's abdication in 1848 in favour of his son, Maximilian II. For the religious hist. of this period, see DÖLLINGER, IGNAZ VON. During the Austrian-Prussian war B. helped Austria, and had to pay indemnity to Prussia and concede a small amount of ter. In 1870 it placed its army under the command of the Prussians, and by the treaty of Versailles (1871) became an integral part of the Ger. empire with certain privileges. Ludwig II., who had succeeded to the throne in 1864, was through his madness forced to abdicate and committed suicide in 1886. His brother, Otto, also insane, became king, but Ludwig's son, Luitpold, reigned as regent until 1912. This regency marks a period of prosperity until the World War of 1914. Ludwig III. had succeeded his father as regent and on Nov. 5, 1913, was crowned king. On the same day 5 years later a Socialist meeting was held in Munich to protest against the continuance of the war. This was the beginning of the Nov. revolution, and on Nov. 8, 1918, a Soviet Gov. was set up under Kurt Eisner (q.v.). Ludwig III. fled the throne and on Nov. 13 abdicated. With the communistic Spartacists on one side and the bourgeois Majority Socialists on the other Eisner was forced to call a general election for a Bavarian constituent assembly. On Feb. 21, 1919, while on his way to the assembly, Eisner was assassinated. Chaos ensued, and out of it arose a coalition gov. with Hoffmann, a Majority Socialist, as minister-president. Owing to communist agitation Hoffmann was forced into retirement, and a Communist Soviet Republic was proclaimed in Munich by Ernst Toller, Landauer, and Levine. Hoffmann, however, was supported by Prussian troops. Munich was starved into surrender and on May 1 capitulated. After a week of bloodshed, the Hoffmann gov. was restored. Landauer was murdered, Levine court-martialled and shot, and Toller imprisoned. B. now became the centre of conservative reaction, and many of the

counter-revolutionaries of the unsuccessful Kapp revolt in Berlin (1920) sought refuge in Munich. Hoffmann was succeeded as minister-president by the bourgeois von Kahr, who, however, resigned in 1921 as a result of a conflict with the allied commission over the disbanding of the citizen guard. Count Lerchenfeld took office, but in 1922 was succeeded by von Knilling. Von Kahr, a man of strong monarchist sympathies, was made general commissioner in 1923, and he planned with General von Lossow, military dictator appointed by the Reich, and with Colonel Seisser, chief of police, to establish Bavarian nationalism. This triumvirate broke negotiations with the Reich, but were embarrassed by a movement having similar aims, only without any monarchist intentions, led by Hitler and Ludendorff. Both parties planned a march on Berlin, and Hitler forced Kahr and Lossow to join him. They went back upon their word, but when the Hitler group collapsed from its own indecision, Kahr's hopes of a dictatorship were also doomed. General von Seeckt was appointed by the Reich to restore order in B., and he came to an agreement, called the peace of Homburg, with the Bavarian minister-president, von Knilling. Later von Knilling resigned, and a coalition gov. was formed, of which Dr. Held took the lead. His policy was a vigorous assertion of Bavarian rights, while remaining, however, within the Ger. Federation. After Hitler's accession to power, the fortunes of B. were merged with those of Germany as a whole. During the Second World War Augsburg, Munich, and other tns. were heavily bombed by the R.A.F., and eventually B. was conquered by the Amer. Third Army under General Patton, which entered Regensburg in Mar. 1945. After the war B. was administered as part of the Amer. and Fr. zones of occupation. See WESTERN FRONT IN SECOND WORLD WAR.

Bavaria, Statue of, a colossal bronze statue, personifying Bavaria, executed by Ludwig von Schwanthaler, 1802-48, which stands nearly 63 ft. high in front of the Ruhmeshalle at Munich.

Bawean, Bawian, or Bavian Island, is off the Malay Peninsula, situated between Borneo and Java. The dist. is hilly with fertile valleys and hot springs; it is a Dutch possession. It was occupied by Jap. forces during the Second World War. Pop. 30,000.

Bawtry, tn. of W. Riding, Yorkshire, England, 8 m. S.E. of Doncaster, by rail. Pop. 1200.

Bax, Sir Arnold Edward Trevor, Eng.

composer, b. 1883, son of Alfred Ridley Bax, F.S.A. He studied composition and pianoforte at Royal Academy of Music, B., who is among the most interesting and important of Brit. composers, has been described as a Neo-Romantic, his work being characterised by a mystic feeling that owes much to long residence in the W. of Ireland. Has written almost every musical form except opera, many of his compositions being based on Irish folklore and Celtic legends. Among his many musical works may be mentioned his choral work, *Enchanted Summer*, the cantata *Fatherland*, the symphonic poems, *The Garden of Fand*, *Tintagel*, and *November Woods*, also 7 symphonies, *Overture to a Picaresque Comedy*, *London Pageant*, and numerous other publications. Oxford Univ. awarded him the degree of D.Mus. in 1934 and Durham Univ. in 1935. He was knighted in 1937, and in 1942 was appointed Master of the King's Music. His vol. of memoirs, *Farwell, My Youth*, was pub. in 1943.

Bax, Clifford, Eng. dramatist and poet, b. 1886, third son of Alfred Ridley B., F.S.A.; educated privately. He studied painting at the Slade, and lived abroad for some years until, abandoning painting, he turned to literature and drama. His first play to be produced was *The Postmasters of Ispahan* in 1912. Among subsequent productions were *Polly* in 1923, *Midsummer Madness* in 1924, *Mr. Pepys* in 1926, *The Venetian* and *The Immortal Lady* in 1931, *The Rose without a Thorn* in 1932, and *The House of Borgia* in 1935. His numerous publications include, in addition to plays, *Inland Far* (memoirs) in 1925, a monograph on Leonardo da Vinci in 1932, his collected poems, *My Muse*, in 1932, *Evenings in Albany* in 1942, and a novel, *Time with a Gift of Tears*, in 1943.

Bax, Ernest Belfort (1854-1926), Eng. journalist and philosopher. He studied philosophy in Germany, where he acted as a foreign correspondent during 1880 and 1881. In 1885 he was the co-founder with William Morris of the Socialist League, and for a time assisted in the editing of the *Commonweal*. He later joined the Social Democratic Federation, and became the ed. of its organ, *Justice*. His works on historical and socialistic subjects include *Ethics of Socialism*, 1889; *German Society at the Close of the Middle Ages*, 1894; in conjunction with William Morris, *Socialism, its Growth and Outcome*, 1894; *The Peasants' War in Germany*, 1899; *Essays in Socialism*, 1906; *The Last Episode of the French Revolution*, 1911. Later works include: *Problems of Men, Mind, and Morals*, 1912; *German Culture, Past and Present*, 1915; and *The Real, the Rational, and the Alogical*, 1920. His vol. of *Reminiscences and Reflections* appeared in 1918.

Baxa, see BUXA.

Baxar, or **Buxar**, tn. situated on the S. bank of the Ganges in the Shahabad dist., Bihar, India. Here Mir Kasim was defeated by Sir Hector Munro, 1764. It is of literary interest as the residence of writers of Vedic hymns. The trade is in

sugar, cotton, and cotton goods. Pop. 14,000.

Baxter, Richard (1615-91), Eng. divine, b. at Rowton in Shropshire, and studied under Richard Wickstead. B.'s ambition to attend a univ. was not realised. Made a brief stay at court, where he was well received, but he found the life unsuitable. Ordained deacon at the age of 21 by the bishop of Worcester; appointed to the grammar school at Dudley; became assistant to a clergyman at Bridgnorth; went as preacher to Kidderminster, the scene of his famous ministry. While siding with the Parliamentarians in the Civil war (he accepted a chaplaincy to

BAX

the Parl. army), he was a supporter of the constitutional principle of the authority of 'King-in-Parliament,' and opposed the execution of the king. He held a middle course between the Episcopalians and Presbyterians and was an advocate of 'moderate Episcopacy.' On the restoration of the monarchy he was appointed one of the king's chaplains and was twice offered a bishopric. He presented to the conference at the Savoy a reformed liturgy. On the passing of the Act of Uniformity of 1662, he was the first to give the lead to the 'ejected 2000,' and was later the first to suffer imprisonment. His brutal treatment and trial by Judge Jefferies have been immortalised by Macaulay. He retired to Acton, but after the indulgence of 1672 he returned to London. Among his best known works are: *The Saints' Everlasting Rest*, 1650; *The Reformed Pastor*, 1656; *A Call to the Unconverted*, 1657; *Care of Church Divisions*, 1670; *Methodus Theologiae*, 1681; *Catholic Theology*, 1675. He left an autobiography, *Reliquiae Baxterianae*—a favourite work with Johnson and Coleridge. This has been abridged and ed. by J. M. Lloyd Thomas as *The Autobiography of Richard Baxter* (1925, Everyman ed. 1931). Orme prefixed a life to his ed. of B.'s works in 23 vols. 1830; lives by Dean Boyle (1883) and

Dr. Fred. J. Powicke, 2 vols. (1924 and 1927).

Baxter, William (1650-1723), Eng. philologist, nephew of Richard B., *b.* at Iamlogan, in Shropshire. Pub. an ed. of Horace and a *Glossarium Antiquitatum Britannicarum*.

Baxterians, a name formerly applied to the followers of Richard Baxter, the non-conformist divine. His 2 most noted adherents were Dr. Philip Doddridge and Dr. Isaac Watts.

Bay, name applied to sev. species of the genus *Laurus*, or laurels, and also to plants which somewhat resemble laurels. The sweet B. (*Laurus nobilis*) is an evergreen plant which grows in S. Europe, and was used as the victor's laurel of olden times. The aromatic leaves are used for culinary purposes, and the berries for veterinary medicine. Red B., or *Laurus carolinensis*; white B., or *Magnolia glauca*; loblolly B., or *Gordonia lasianthus*, are natives of N. America.

Bay (Fr. *bayer*, to gape), name given to an inlet of the sea that is wider towards the open sea and narrower as it advances into the mainland. The term is often used where gulf would be more appropriate, a gulf being deeper and less variable in width than a B. In theory the character of Bs. or gulfs as territorial or free is a matter of measurement, the material point being the width at the mouth; but by anct. usage certain Bs. or gulfs, such as Conception in Newfoundland, Chesapeake, Delaware, and Cape Cod B. (Amer.), and Canale (Fr.), have a national character, though far wider than 6 m. at their entrance (6 m. being the conventional limit, as laid down in 1891 by the Institute of International Law for territorial waters generally). Various views have been expressed by jurists, e.g. defensibility from the shore, the range of one cannon shot from shore to shore (or 3 m.), a cannon shot from each shore (or 6 m.), an arbitrary distance of 10 m., and so on, so that obviously there is no agreement and could be none on a question which has become increasingly baffling with the development of aircraft and submarines.

Bayá (*Ploceus baya*), bird of the family Ploceidae or weaver birds (*q.v.*); common to India and Ceylon.

Bayadère (Portuguese *baileadeira*, female dancer), name given to the trained dancing-girls of India, the nautch girls. Some of the pantomimic dancers are attached to the Hindu temples.

Bayamo, or San Salvador, a city on the R. Cauto, in the S.E. of Cuba, founded by Diego Velázquez in 1513. Once the prin. city in the is., its trade was restricted by the choking up of the riv. by a flood in 1616. Pop. 9000.

Bayamon, tn. of Puerto Rico, situated in a fruit-growing dist., inland about 12 m. from San Juan. It was the cap. of the is. in the sixteenth century. Pop. 37,000.

Bayana, or Biana, tn. of Rajputana, India, formerly a fort, which still contains anct. ruins. Pop. 9000.

Bayan-Khara-ula Mts., Mongol name of an extensive range in E. Asia. The dist. is

little explored by Europeans, and the existence of these mts. was long only known from Chinese geographers, according to whom they lie in the centre of the E. Asian table-land, W. of Lake Kuku Nor, between 35° and 38° N. lat. and 96° and 100° E. long.

Bayard, the horse of the 4 sons of Aymon; he appears in Tasso's *Rinaldo*, Ariosto's *Orlando Furioso*, and Boiardo's *Orlando Innamorato*; the name is also given to a horse in Scott's *Lady of the Lake*, and is frequently applied to any spirited horse.

Bayard, Pierre du Terrail, Seigneur de, known by the honourable appellation 'le bon chevalier, sans peur et sans reproche' (the good knight, without fear and without reproach) (1475-1524), *b.* at the château de B. in Dauphiné, of a great military family; placed as a youth in the household of the duke of Savoy; 1494 accompanied Charles VIII. against Naples and distinguished himself at the battle of Fornovo, after which he was knighted; served in the It. wars of Louis XII.; present at the battle of the Spurs, where he was taken prisoner; the youthful Francis I. was knighted by B. on the field of battle at Marignano, 1515; mortally wounded when defending Bonniwet against an army of Charles V. See S. Shellabarger, *The Chevalier Bayard* (New York and London), 1928.

Bayard, Thomas Francis (1828-98), Amer. statesman, *b.* at Wilmington, Delaware. In 1848 he began to study law, and was called to the Bar in 1851; he was a senator, 1869-85, and became secretary of state, 1885-9. He was the leader of the Democratic party in the Senate, and was many times proposed as President. He was U.S. ambas. to Great Britain, 1893-7. See Edward Spencer, *Public Life and Services of Thomas F. Bayard*, 1880.

FLOWER

BAYBERRY

Bayazid, tn. of Turkey, near the Persian frontier and Mt. Ararat, 155 m. N.W. of Tabriz. Pop. 2000.

Bayazid I. and II., see BAJAZET.

Baybay, tn. on the W. coast of Leyte,

Philippine Is., 45 m. direct S.W. from Tacloban, the cap. of the prov.; pop. 37,000.

Bayberry, also called **Candleberry**, or **Wax Myrtle**, evergreen shrub found in the U.S.A., the W. Indies, and Cape Colony, the species being (U.S.A.) *Myrica*, especially *M. cerifera*; (W. Indies), *Eugenia acris*, a species of pimento; and (S. Africa) *Alcúrites triloba*, candle-nut tree. The last-named also grows in the Moluccas, in India, and elsewhere. The leaves of the B. are fragrant when bruised; in the W. Indies they are used for making bay rum. The berries are covered with greenish-white wax, which is collected by boiling and skimming, refined, and used

Bayern, see **BAVARIA**.

Bayeux, episcopal city of the dept. of Calvados, Normandy, France, on the R. Aure, 17 m. N.W. of Caen. It has manufs. of lace, china, and textiles, and also trades in agric. produce. During the Second World War it was occupied by the Gers., and on June 8, 1944, was the first tn. to be liberated by the allied forces following the invasion of Normandy. Pop. 8000. See also **BAYEUX TAPESTRY**.

Bayeux Tapestry, roll of linen 20 in. wide and 231 ft. long, preserved in the anct. bishop's palace of Bayeux, Normandy, upon which are worked in coloured woollen thread the events connected with the invasion and conquest of England.

BAYEUX TAPESTRY
Panel showing the death of Harold.

for making candles and scented soap. The candles while burning are very fragrant. (See illustration, p. 151.)

Bay City, cap. of B. co., Michigan, U.S.A., near the mouth of the Saginaw. It is the largest lumber-manufacturing centre in the States. Its industries include cement and alkali works. There are also coal mines and beet-sugar factories in the vicinity. Pop. 48,000.

Bayer, Gottlieb Siegfried (1694-1738), Ger. scholar, son of Johann B., b. at Königsberg; studied the oriental and Chinese languages. Some of his works were pub. in the *Memoirs of the Academy of Petersburg* and the *Acta Eruditorum*. His *Opuscula* were pub. with a life by Klotz, Halle, 1770.

Bayer, Johann (1572-1625), Ger. astronomer, b. at Rhain in Bavaria, followed the profession of a lawyer at Augsburg. In 1603 he pub. a chart of the stars, *Uranometria*, in which he included 12 new constellations of the S. hemisphere, and employed letters of the Gk. alphabet in star nomenclature. His S. constellations are said to have been derived from the observations of a Dutch navigator.

It is not, strictly speaking, tapestry, as it is worked in sampler fashion. The work is divided into 72 compartments, with descriptions in Lat., and the crude colours still retain their freshness. Various conjectures as to its origin have been made, tradition assigning it to Matilda, wife of William the Conqueror; it was more probably worked for his half-brother, Odo, bishop of Bayeux, a view which gains support from the fact that 3 of Odo's followers mentioned in Domesday Book are among the very few named figures in the tapestry. It was first mentioned in the fourteenth century, when an inventory was made of the goods in Bayeux Cathedral, which it adorned. In 1724 a drawing of a portion of it was presented to M. Lancelot, a member of the Académie des Inscriptions, and this led to public knowledge of the work. In 1803 it was sent to Paris by order of Napoleon for a short inspection, but was shortly after returned, and in 1816 Charles Stothard was sent by the Eng. Society of Antiquaries to make an accurate copy of it. His drawings of it were pub. in the sixth vol. of *Vetusta*

Monumenta in 1819. During the 1939-45 war the tapestry was placed in safe keeping first in Bayeux, and later in a château near Le Mans. After the allied invasion of Normandy the tapestry was taken to Paris by the Gers. and placed in a basement in the Louvre, from which it was recovered intact in Aug. 1944. See Jules Comte's *Tapisserie de Bayeux*, 1878; Rev. J. C. Bruce's *Bayeux Tapestry Elucidated*, 1855; and F. R. Fowkes's *Bayeux Tapestry*, 1898.

Bayf, Jean Antoine de, see BAIF, JEAN ANTOINE DE.

Bay Islands, group of is. off Honduras, discovered by Columbus in 1502. The largest is., Roatan, is 30 m. long by 9 m. broad. They were occupied by Brit. settlers in the seventeenth century, but not formally annexed until 1852. In 1859 they were ceded to Honduras. Their prin. produce consists of coco-nuts, bananas, and other fruit, which are exported to the U.S.A. Pop. 5000.

Bayle, Pierre (1647-1706), Fr. critic and philosophical writer, b. on Nov. 18 at Carlat-la-Comte, S. of France. He was the son of a Calvinist minister, and was brought up in this faith, but while at the Jesuit College of Toulouse, he made a profession of the Rom. Catholic faith, which he revoked less than 2 years later, returning to Calvinism. For this reason he withdrew, in 1670, to Geneva to study, and 5 years later he was appointed to the chair of philosophy at the Protestant univ. of Sedan. When this univ. was suppressed by Louis XIV. in 1681, he became prof. of philosophy at Rotterdam. He lost his professorship in 1693 as a result of controversy, and devoted himself to the compilation of his great dictionary, the first vol. of which under the title *Dictionnaire historique et critique* appeared in 1695, completed in 1697. The uniqueness of this work, its grace of style, the erudition and learned scepticism which it displayed, enhanced his reputation, already considerable, and a second ed. appeared in 1702. There have been many subsequent eds., notably that by P. des Malzeaux, Amsterdam, 1740, to which a life of B. was added. Among B.'s earlier works were controversial writings on theology, his letter on comets, and particularly the *Nouvelles de la république des lettres*, a species of periodical which he pub. over a number of years, devoted to literary criticism. See H. E. Smith, *The Literary Criticism of Pierre Bayle*, Albany, 1912.

Baylen, see BALEN.

Bayley, Sir Steuart Colvin (1836-1925), Brit. administrator, son of William Butterworth B., a director of the old E. India Company. First educated at Eton, but transferred to the E. India College at Haileybury and then entered the Bengal civil service. Rendered valuable services in the Behar and other famines in 1878 and later. Was Brit. resident at the Nizam's court at Hyderabad, 1881; lieutenant-governor of Bengal, 1887-90.

Baylis, Lilian Mary (1874-1937), Eng. theatrical manager. She was associated

with the introduction in 1914 of Shakespeare's plays as a permanent programme at the Old Vic Theatre, London, of which she was lessee and manager since 1898. She also leased the Sadler's Wells Theatre when it was rebuilt and reopened in 1931. Her productions here of opera in Eng. alternated with those of Shakespeare at the Old Vic. She began her career as a child violinist, and as such played both in Great Britain and in S. Africa. C.H., Hon. LL.D.

Bayliss, Sir William Maddock (1866-1924), Eng. physiologist, b. at Wolverhampton, son of an iron manufacturer. Early studied medicine, but did not complete his studies, preferring research work, which he did under Ray Lankester and Burdon Sanderson at Univ. College from 1881. Resumed medical work, studying physiology under Sanderson and later under Schäfer. It was the scientific rather than the merely anatomical side that appealed to him, and he resolved to abandon medical qualification and confine himself to physiology. Took natural science and physiology at Oxford, and after obtaining his degree resumed work under Schäfer at Univ. College, and applied himself to research with John Rose Bradford, notably in the electrical phenomena accompanying secretion. Soon after this he began research work at Guy's Hospital in the electrical phenomena of the heart and the action of the nerves on the heart and, later, carried out important research work on the vasomotor nerves (also with Bradford). As prof. of general physiology at Univ. College he took part in the teaching there. Wrote numerous papers dealing with physico-chemical problems of physiological importance, and also on the action of enzymes. His *Principles of General Physiology* (1914) is a work of outstanding significance, and reveals a catholicity of study besides a profound knowledge of its prin. topic. In 1911 he was awarded the royal medal of the Royal Society and in 1922 the Copley medal. Member of numerous foreign academies and societies.

Bayliss, Sir Wyke (1835-1906), Eng. painter, b. at Madeley; studied at the Royal Academy. He became president of the Royal Society of Brit. Art. 1888, and was knighted in 1897. His talent was directed chiefly to the delineation of interiors of cathedrals and churches.

Baylor University, Baptist educational institute, situated at Waco, Texas, formerly at Independence in the same state. It was chartered in 1845 and removed to Waco in 1882. It has about 2500 students.

Bayly, Ada Ellen, see LYALL, EDNA.

Bayly, Thomas Haynes (1797-1839), Eng. ballad-writer and dramatist, b. at Bath; educated at Winchester and Oxford. His plays and novels are now little read, but he is remembered for his once popular songs with their mild sentimentality, such as *She wore a Wreath of Roses*, *We met—'twas in a Crowd*, and *Gaily the Troubadour*. His most successful play was *Perfection*. He also wrote

2 novels, *A Legend of Killarney* and *The Aylmers*, 1827.

Bayne, Alexander (d. 1737), Scottish jurist, first prof. of law in Scotland; son of John B. of Logie in Fife. Became an advocate at the Scottish Bar, 1714; in 1722, prof. of Scots law at Edinburgh; ed. and wrote sev. works on Scots law.

Bayne, Peter (1830-96), Scottish journalist and author. He graduated at Marischal College, Aberdeen, and studied theology for the ministry at Edinburgh. He became editor of the *Edinburgh Witness*, 1856; the *Dial*, 1860-62; and of the organ of the Eng. Presbyterian Church, the *Weekly Review*. He was also associated with the *Christian World*. He wrote the *Testimony of Christ to Christianity*, 1862; and *A Life of Luther*, 1887.

Baynes, Thomas Spencer (1823-87), Scottish writer and editor, son of a Baptist minister at Wellington, Somerset. He was sent to Edinburgh Univ., where he was a pupil, and afterwards assistant, of Sir William Hamilton. In 1850 he became editor of the *Edinburgh Guardian*, and in 1853 was appointed assistant editor of the *Daily News*. Six years later he became prof. of logic, metaphysics, and Eng. literature at St. Andrews Univ. From 1873 to 1881 he was sole editor of the ninth ed. of the *Ency. Brit.*, and even when his health obliged him to resign part of his responsibility to Robertson Smith, he still continued to write, his best-known article being that on Shakespeare, since reprinted with other essays, in *Shakespeare Studies*. His other works include an *Essay on the New Analytic of Logical Forms*, 1850.

Bay of Islands: (1) Co. of New Zealand on the E. coast of North Island, named from a bay of irregular coastline on the E. side, containing numerous is., but forming a spacious and safe harbour. (2) Settlement on a large bay of the same name on the W. coast of Newfoundland, N. of St. George's Bay. It is noted for its scenery and its herring fisheries.

Bayonet, name of a short spear-like weapon of varying lengths. When not in use it is carried in a scabbard; when in use it is fixed to the muzzle of the rifle, and forms the thrusting weapon of the infantry. The original weapon is thought to have been invented at Bayonne in the seventeenth century; it was triangular in section, and had a tapering point.

Bayonne: (1) City of Basses-Pyrénées, Gascony, France, at the confluence of the rvs. Adour and Nive, 3 m. from the sea, 4 m. N.E. of Biarritz, and 18 m. N.E. of the Sp. frontier at Fuenterrabia. The rvs. divide it into 3 parts, Great and Little B., and Saint-Esprit. The harbour admits vessels of 2500 tons, but is rendered difficult of access by the bar on the Adour. The depth at its entrance at high water is 16-19 ft. The city is well built, with good quays and promenades, a medieval cathedral, and a fine citadel by Vauban. Chief industries, shipbuilding, leather dressing, distilling, and manufs. of pottery and chocolate. It was formerly famous for its hams. The city has been frequently besieged, but never taken. It

was the anct. Rom. Lapurdum. Pop. 32,000. (2) City of Hudson co., New Jersey, U.S.A., on New York and Newark Bays, 6 m. S.W. of New York. It lies just S. of Jersey City, from which it is separated by the Morris Canal, and opposite Staten Is., from which it is separated by the Kill van Kull. It is residential, but has manufs. of boilers, chemicals, paint, borax, etc., and petroleum refineries. Pop. 79,000.

Bayou (Fr. *boyau*, channel), a term originally applied in some of the S. states of N. America to a branch of a riv. or lake, but now sometimes loosely applied to streams of various descriptions.

Bay Psalm-Book, the first book pub. in the Amer. colonies. It appeared in 1640, under the guidance of Richard Mather, Thomas Welde, and John Eliot, and was a rendering into verse of the Psalms.

Bayreuth, see BAIREUTH.

Bay Rum, aromatic liquid, obtained by mixing oils of bay with alcohol, water, and oils of pimento and orange peel. It is of value as a perfume and cosmetic.

Bay State, name applied to the state of Massachusetts, U.S.A., which was estab. in 1628-30 as the Massachusetts Bay Colony.

Bayswater, dist. of London N. of Hyde Park. It is 4 m. W. of St. Paul's, and is situated on the Metropolitan District and Central London railways. Pop. 7000.

Bayida or Bahinda Steppe, desert of Nubia, Egyptian Sudan, in the bend of the Nile, N. of Khartoum, which contains sev. rocky mts. and sparse vegetation.

Bay Window, name given to a window, projecting from the front of a building, and forming part of a rectangle or polygon. If semicircular it is called a bow window. B. ws. were introduced into England about the end of the wars of the Roses, and were very common in Tudor houses. A very fine example is that of the banqueting-hall at Hampton Court. A B. W. well above ground supported by a bracket or corbel, is properly termed an oriel.

Bayse, see BAISE.

Baytown, see ROBIN HOOD'S BAY.

Baza (Rom. *Basti*), tn., prov. of Granada, Spain. It is the seat of a bishop, and was prosperous under the Moors. It is situated in a fertile valley which produces hemp, flax, fruit, and grain, and is famed for its red wines. Pop. 16,000.

Bazaar (Persian *bazar*, market), oriental name for a market-place, where various objects are exposed for sale. In the W. the term has been extended to shops which sell fancy goods, and to sales of fancy articles which are contributed gratuitously for charitable or religious purposes.

Bazaine, François Achille (1811-88), marshal of France, entered the Army as a private soldier in 1831, served in Algeria, and in 4 years became lieutenant, with the cross of the Legion of Honour. In 1839 he was a captain, and a few years later brigadier-general. He distinguished himself in the Crimean war and was

made governor of Sebastopol on its capture. Gaining fresh laurels in Italy (1859) he was appointed to a command in the Mexican expedition. Here, however, he was accused of mixing up political and personal aims with his generalship, and on returning to France in 1867 was coolly received by Napoleon III. In 1870, at the outbreak of the Franco-Ger. war he was appointed to command the 3rd Corps, and afterwards the whole Army, of the Rhine. He has been blamed for the defeat of Spicheren, when he allowed General Frossard to be beaten unsupported. B. retreated with his army to Metz, where the Prussians hemmed him in. MacMahon's attempt to relieve Metz ended at Sedan. Then came a series of obscure negotiations by B., which have never been fully explained, but which ended in his surrendering with 140,000 men; setting his besiegers free just in time to crush the great effort then made to relieve Paris. In 1873, after B.'s return from captivity in Prussia, he was court-martialled for dereliction of duty, and condemned to degradation and death, but the sentence was commuted to 20 years' seclusion. Being imprisoned in the Ile Sainte-Marguerite, he escaped thence in 1874. Fourteen years later he d. in exile at Madrid. *See* E. Peyron, *Le Cas de Bazaine*, Paris, 1905, and R. Christophe, *La Vie tragique du Maréchal Bazaine*, 1948.

Bazalgette, Sir Joseph William (1819-1891). Eng. civil engineer, b. at Enfield, Middlesex. He became chief engineer to the London Metropolitan Board of Works (1855-89); he superintended the construction of the London drainage system, 1858-75; and the Thames embankment, 1862-74. He was knighted in 1874.

Bazard, Amand (1791-1832). Fr. Socialist, b. in Paris. About 1820, while holding a small gov. appointment in that city, he organised a secret society modelled on the It. Carbonari, but a premature outbreak upset their plans and sent leaders into hiding. During enforced seclusion B. changed his projects. Conceiving that a social reform on Saint-Simonian principles would effect more than armed revolt, he began in 1828 an enthusiastic Socialist propaganda. For a time the movement succeeded, and the leaders, B., Rodrigues, Enfantin, and Carnot, quarrelled amongst themselves, and in the course of a dispute between Enfantin and B. the latter was struck down by apoplexy, and d. a few months later.

Bazardjik, or **Dobritch**, tn. in Bulgaria in the S. Dobrudja, on the railway from Constanza to Varna. Pop. 14,500.

Bazas, Fr. tn. in the dept. of Gironde, on the Beuve. Pop. 4300.

Bazeilles, vil. near Sedan, France. It was utterly destroyed with great loss of life during the Franco-Ger. war. The house where the last cartridges were fired is preserved as a memorial. Pop. 1170.

Bazentin, vil. 5 m. S.W. Bapaume, France. During the battle of the Somme in July 1916, the vil. was the

scene of hard fighting before it fell to the Brit. forces.

Bazhenov, Vassili Ivanovitch (1737-99), Russian architect, b. at Moscow. Attended School of Architecture at Moscow, 1751; one of the first pupils at the Academy of Fine Arts; came to Paris 1761 and was a pupil of Rival; went to Rome; returned to St. Petersburg, 1765. Taken into the service of the Empress Catherine, began the rebuilding of the Kremlin at Moscow, but this was not finished.

Bazigars, gipsy tribe, found all over India, bearing different names in various localities. Like European gipsies they are divided into clans, each with its own 'king.' They live by juggling, dancing, fortune-telling, basket-making.

Bazin, René François Nicolas Marie (1853-1932). Fr. writer, b. at Angers; studied law at the univ. of Paris, and was appointed to the professorship of law at Angers in 1878; elected to the Fr. Academy in 1904. His novels deal with provincial life, and he also pub. books of criticism and travel. The following may be noted: *Stéphane* (his first novel), 1884; *Une Tache d'encre*, 1888; *Sicile*, 1892; *Humble Amour*, 1894; *Terre d'Espagne*, 1896; *La Terre qui meurt*, 1899; *Donatienne*, 1903; *Charles de Foucauld*, 1921; *Le Comte de Triplet*, 1924; *Balthus le Lorrain*, 1926; *Fils de l'Eglise*, 1927.

Bazoche, *see* BASOCHE.

Baztan, or **Bastan**, valley in the Pyrenees to the N. of Pamplona in Spain. It produces Indian corn, wheat, pulse, and flax, has meadows and forests, and is drained by the riv. Bidassoa.

Bdellium, gum-resin obtained from some species of *Commiphora*, genus of Burseraceae. It occurs in masses, sometimes as large as a walnut, and is of a yellow, red, or brownish colour. Other species of the same genus yield myrrh, which B. resembles in taste and in medicinal effect.

Beach, Sir Michael Edward Hicks, *see* ST. ALDWYN, EARL.

Beach, Thomas Miller (1841-94), known as Major le Caron, Eng. spy, b. at Colchester. In 1861, at the outbreak of the Amer. Civil war, he went to New York and enlisted with the Federalists. He served till 1865, and then joined the Fenian organisation, supplying the Brit. Gov. with information. In 1867 he became a paid spy, retaining his active membership of the Fenian Society, in which capacity he remained in America till 1888.

Beaches, Raised, terraces near the sea coast which were formerly beaches, but were later raised to constitute dry land. They consist of gravelly, sandy, and shelly deposits. Such beaches are to be found in England and Ireland, but more often in Scotland, many of the coast tns., e.g. Nairn and Cromarty, being built upon them. In S. America they occur in some places at so great a height as 1200 ft. above the present sea level.

Beachy Head, cape in England, on the Sussex coast, between Eastbourne and Seaford. Its altitude is about 575 ft.,

and it forms the termination of the S. Downs. The Bell Tout lighthouse, 285 ft. above sea level, erected in 1831, was replaced in 1902 by a lighthouse at the base of the cliff, 125 ft. high. The battle of Beachy Head was fought on June 30, 1690, and gained by the Fr. fleet, commanded by the Comte de Tourville, over the allied Eng. and Dutch fleets, under the earl of Torrington and C. Evertsen. The view from the head in clear weather extends to the Isle of Wight and France.

Beacon (O.E. *bēacen*, a sign), originally a fire lighted on a high hill, or tower, for the purpose of sending messages over some long distance, or an alarm or warning. The name has been given to lofty hills, such as Dunkery B., the highest point of Exmoor, B. Hill, a height N. of Boston Common. Upon these lofty eminences the B. fires were formerly lighted, and the towers and cressets are still to be seen. The word now technically means a floating buoy, an unattended light, or any structure used for warning or guidance. The B. is built of stone, iron, or concrete, and is erected in the track of shipping in rivs., estuaries, or the open sea. One type of Eng. B. is constructed of iron plates, closely fitted together and surmounted by an iron mast, which bears a triangle or ball, etc. The B. for a sandbank is an iron tube sunk in the sand, and fitted with another tube or mast to carry the B. The Monkstone situated in the Bristol Channel is a stone tower, which is ascended by a stone stair and railed round at the top. The B. on Holy Is. is a stone obelisk. In some few cases Bs. are lighted by gas, a pipe being laid under the water and carried up to the lantern, or it may be supplied from a tank, which holds a supply of compressed gas for 4 or 6 weeks. At Stornoway the B. is built close to a lighthouse, and is lighted by a beam of light projected from the lighthouse, which by means of apparatus on the B. is reflected seaward.

Beaconsfield: 1. Mkrt. tn. in Bucks, England. It is 10 m. from Windsor and 23 from London. It is noted as the home of Edmund Waller, the poet, and of Edmund Burke; both are buried here. The earl of B. took his title from the tn. Pop. 4800. 2. Gold-mining tn. in Tasmania. 3. Tn. in Griqualand W. 3 m. from Kimberley, S. Africa, built close to the diamond mines. It is now part of the municipality of Kimberley.

Beaconsfield, Benjamin Disraeli, Earl of (1804-81), Eng. statesman and man of letters, b. at 6 John Street, Bedford Row, London, on Dec. 21. He was the son of Isaac D'Israeli, the descendant of a family of Levantine Jews. He was baptized into the Christian Church in 1817, and was educated privately. At the age of 17 he was articled to a firm of solicitors, and later entered at Lincoln's Inn in 1824, where he kept 9 terms. In 1826 he pub. the first part of *Vivian Grey*, a second part of which appeared in the following year. He quitted England in 1828 and spent 3 years in the E. In 1837 he entered

Parliament, having previously unsuccessfully contested High Wycombe in 1832 and 1834 and Taunton in 1835. Over the election at Taunton he quarrelled with O'Connell, and for some time there was talk of a duel between O'Connell's son and himself. Disraeli wrote a letter to *The Times* giving his version of the quarrel. During the decade 1830-40 he wrote a number of novels, and lived a fashionable life in the society of his time. He was credited with a number of extravagances in dress, and to such an extent was this remarked on later that he wrote to the press denying that he had committed such extravagances. He pub. a number of political pamphlets, and made no secret of the fact that he intended to go far as a politician. In 1837, on the death of William IV., a fresh election took place, and he was invited to contest Maidstone, for which constituency he was returned in that year, with Mr. Wyndham Lewis as his colleague. In Dec. of the same year he made his first speech in Parliament, and it was on this occasion there occurred that famous scene when, howled down by the House, he threw defiance in its face and warned the mockers that the day would come when they would hear him. In 1839 he pub. *Count Alarcon: a Tragedy*, and in the same month he married the widow of his late colleague, Wyndham Lewis. In her he found the sympathy and courage which were to be so necessary an asset in his life. With her fortune he was able to buy an estate at Hughenden. From the time of his failure in Parliament he awaited his opportunity, known in the House only for the bitterness with which he attacked the Whigs. By 1842 he was the leader of the Young England party. But in 1846, in Jan. of that year, by his famous onslaught against Sir Robert Peel in the Corn Law debates, he became the virtual leader of the Conservative party, though nominally it remained under the leadership of Lord George Bentinck. In 1844 had appeared *Coningsby*, in 1845 *Sybil*, and in 1847 *Tancred*, 3 political novels which were intended to explain the origin and the positions and duties of the great political parties. In 1852 as leader of the House and chancellor of the exchequer, he introduced a free trade budget which was defeated because of the extension of the house tax and income tax. On this memorable occasion he gave utterance to the dictum 'that England does not love coalitions.' In 1858 he again returned to office, but the 'fancy franchises' drove him and his party out of office for 7 years, during which he added to his reputation as a debater and a politician. In 1867 he came back into office in the third Derby administration, and then came one of the most striking political incidents, the 'leap in the dark' which 'dished the Whigs.' In that year he introduced a Reform Bill more democratic and sweeping than anything which the Liberals had introduced. In the next year he succeeded Lord Derby as the head of the administration, but at the end of the year, not having a majority, he resigned. In 1870 he pub. *Lothair*.

In 1874 he began his second administration, an administration noted chiefly for its foreign and imperial policy; in 1875 he acquired the half rights in the Suez Canal; in the following year he proclaimed Queen Victoria empress of India, and in the same year retired to the House of Lords as earl of B. The Bulgarian atrocities did not excite him to pity, but rather made him declare in face of the threatened aggression of Russia that our policy was to support to the best of our ability the sinking fortunes of Turkey. When the aggression became still more threatening he sent a fleet to the Dardanelles, voted money for war purposes, and stationed an Indian contingent at

BENJAMIN DISRAELI
EARL OF BEAUCONSFIELD

Malta. In 1878 followed the Congress of Berlin, which raised him to the greatest height of his power, and gave Russia all she wanted, and England 'peace with honour.' The wars in Afghanistan and Zululand, together with the commercial depression, gave the opposition their opportunity, and the 'imperial' policy was condemned at the general election of 1880. A large Liberal majority was returned and the Gov. resigned. In the same year appeared the novel *Endymion*. On Apr. 19, 1881, Disraeli *d.* It was proposed that he should be buried in Westminster Abbey, but the terms of his will had forbidden that, and he was buried at Hughenden. It is primarily as a statesman that his fame lives, his role as novelist being by way of understudy to the greater part. It is doubtful whether the novels, which are in many ways autobiographical, faithfully reflecting the mystical cynicism of his politics, would survive on their own merits. But they are by no means unread to-day. In manipulation of plot and in vividness of characterisation, he showed con-

siderable skill. But the purpose of his novels was always political; they revealed the dishonesty of contemporary politics, even if he himself, as has been said, was not guiltless in bringing about such state of affairs. Certain it is that *Vivian Grey* (1827) was a remarkable production for a man of 23 years of age. Yet its success was a matter of indifference to the author, for he left the country immediately afterwards to tour the Lat. countries. On his return he resumed writing, and in a period of 5 years produced a considerable number of books, beginning with his *Vindication of the British Constitution* and continuing with a number of his less known novels: *The Young Duke* (1831), *Contarini Fleming* (1832), *Alroy* (1833), *Venetia* (1837), and *Henrietta Temple* (1837). His most characteristic novels were *Coningsby* and *Sybil*, and they were strong because they were ancillary to his political convictions. As a member of the Young England party, he wanted to attack the gov. policy generally as being a break with Tory tradition. These 2 books appeared just before the Corn Laws were repealed, and they reiterated, but with greater eloquence, the opinions he had expressed in his *Vindication*; and it is clear that he used the novel form because the latter book had attracted so little attention. The lesson he tries to convey in the 2 novels is that the Tory Govs. right from the Revolution to the time of the Reform Bill, 1832, were oligarchies which had whittled away the king's prerogatives. *Coningsby*, like *Sybil*, is notable for his championship of the rights of the peasantry, which Disraeli held to have been encroached on by the Poor Law; but *Sybil* went further, and embodied his horror of the misery and squalor of the lives of the working classes in the industrial north, and there is no doubt it was effective propaganda for the cause of factory reform. In a word, the 2 novels were an expression of the new Tory gospel of the Young England party, which was the assertion of the king's prerogative and the freedom of the Church, and also of the co-equality of the rights of labour and property—which latter doctrine was so eloquently voiced in his famous 'Charist' speech, alluded to in one of the novels. Finally, *Coningsby* is also a moving plea for the Jewish race. Disraeli's *ed.* (1849) of his father's *Curiosities of Literature*, which is still read, is notable for a preface containing an account of his own family. His *Life of Lord George Bentinck* (1852) is a political study of the protectionist issue and, further, gives his answer to the legend propagated by Bentinck that Peel had hounded Canning to his grave. As a writer, Disraeli is always informative and interesting, and his style, if mannered and turgid, contains brilliant phrases and shrewd maxims. The authoritative life is that by Molyneux and Buckle, pub. in 6 vols. 1910-20, new and rev. ed. in 2 vols., 1929; see also biographical studies by T. E. Kebbel (1888), J. A. Froude (1890), H. E. Gorst (1897), E. T. Raymond (1925),

Sir E. Clarke (1926), A. Maurois (1927), D. L. Murray (1927); *Letters of Disraeli to Lady Bradford and Lady Chesterfield, 1873-1881*, ed. marquess of Zetland, 2 vols., 1929; D. C. Somervell, *Disraeli and Gladstone*, 1925.

Beadle (also **Bedel**, A.-S. *byddell*, a summoning officer), official whose function has had many variations. Originally, in Saxon times, he called householders to the moot. After the Conquest he was an officer both of the manor and of the church, but gradually developed into a par. constable. The univ. bedels, once important functionaries, now figure in official processions. At Oxford Univ. there are 4 bedels, the junior being the vice-chancellor's attendant and mace-bearer. At Cambridge Univ. there are 2 bedels, called esquire bedels, who bear maces before the vice-chancellor. In the Scottish Church the B. attends on the minister when divine service is being held.

Beadon, Sir Cecil (1816-81), Eng. administrator. He was educated at Eton and Shrewsbury, and entered the Bengal civil service at the age of 18. Later, he held important secretarial posts, ultimately becoming, at the instance of Lord Canning, lieutenant-governor of Bengal.

Beads, ornaments which have been used for decoration and barter from remote times, beautiful examples being found in early Egyptian tombs. At the present time they are still the medium of exchange with barbaric nations. They are made of gold, gems, coral, glass, etc. The manuf. of glass B. in Britain is carried on chiefly at Birmingham; on the Continent Venice is noted for the enormous variety and quantity of B. made there. In the process of manufacturing glass B., the glass is blown into a bulb, and drawn out into long tubes. The B. are then pinched or cut off, and heated in cylinders which rotate. To prevent the sticking together of the B. sand and ashes are put into the cylinders. See J. B. Littlejohn, *Beadcraft*, 1930.

Beadsman, see **BEDESMAN**.

Bead-tree, *Melia azedarach*, tropical plant cultivated for its flowers, which resemble the lilac.

Beagle, variety of Eng. hound, used in hare-hunting, there being a good number of packs in Great Britain and Ireland. It has a keen scent, powers of endurance, and intelligence. It is 10-16 in. in height, has long, thin, pendulous ears, a deep chest, and strong widely set shoulders. The coat is thick and flat and of the usual variety of colours of the hound.

'**Beagle**,' H.M.S., name of a brig of 235 tons, which, in 1831, was sent by the Brit. Gov. on an expedition, under the command of Captain Fitzroy, to survey the S. extremity of America. Charles Darwin, as a young man of 22, accompanied the expedition as honorary naturalist on the staff. The voyage lasted from Dec. 27, 1831 to Oct. 2, 1836, and an account of it was pub. by Darwin in 1839 under the title *A Naturalist's Voyage round the World*; or, *A Journal of Researches into the Natural History and*

Geology of the Countries visited during the Voyage of H.M.S. 'Beagle.' Darwin also contributed to the official narrative of the voyage.

Beak, see **BILL**.

Beaked, in heraldry, indicates that a bird has a bill which is of a different colour from the rest of its body.

Beaker (Gk. *Beke*, wine-jar), cylindrical or conical vessel made of annealed glass used in chemical operations for making solutions, in analyses, and for various other purposes.

Beal, Robert (1541-1601), Eng. diplomatist and antiquary. His early life is shrouded in some obscurity. At an early age he was by reason of his beliefs compelled to leave England during Mary's reign until Elizabeth's accession. He became Walsingham's secretary in 1570. He entered Parliament in 1572, and it devolved upon him to read to Mary Queen of Scots her death warrant. His works are voluminous, and include *Discourse after the Massacre of St. Bartholomew's*, of which he was an eye-witness; *A Book respecting Ceremonies, the Habits, the Book of Common Prayer, and the Power of Ecclesiastical Courts*; and *The Order and Manner of the Execution of Mary, Queen of Scots*.

Beal, Samuel (1825-89), Eng. scholar, b. at Devonport; educated there and at Cambridge; ordained 1852, and became a naval chaplain on board H.M.S. *Sybil*, which went to the China station. B. spent his spare time in acquiring the language; acted as naval interpreter during the war of 1856-58, and continued his studies after settling in England. His works include *The Travels of Fah-hian and Sung-yun*, 1869; *A Catena of Buddhist Scriptures*, 1871; *The Legend of Sakya Buddha*, 1875; *Texts from the Buddhist Canon*, 1878.

Beale, Dorothea (1831-1906), Eng. educationist, daughter of a London physician. In 1857 she was appointed head of the school for clergymen's daughters, in Westmorland, and 1858 took charge of the Ladies' College at Cheltenham, which she raised in a few years to very high rank. She was a deeply religious and broadminded person who did much to improve women's education.

Beale, Lionel Smith (1828-1906), Eng. physician and physiologist, b. in London; studied at King's College, where he afterwards held professorships in the medical schools (1853-96). He wrote many medical works, some of which go beyond the technical range, such as *The Mystery of Life*, 1871; *Life and Vital Action in Health and Disease*, 1875; and *Vitality and Natural Religion*, 1900.

Beale, Mary (1632-97), Eng. portrait painter, daughter of a clergyman. Cradock by name. She was taught painting by Sir Peter Lely. Her husband, Charles B., was a painter and colour-maker.

Beam (from O.E. *beam*, a tree; cf. horn-beam and whitebeam), a piece of timber, as a house-beam, a weaver's beam, etc. The cross-timbers of a ship are her beams, so that when she heels over she is 'on her

beam-ends'; hence the phrase signifying distress or difficulty.

Beam Wireless, system of wireless communication designed to increase the reliability of radio-telegraphy. It is the antithesis of omni-directional wireless, and is not affected to the same extent by atmospherics. A simple transmitting aerial, consisting of a single wire, radiates its energy in all directions, i.e. it 'broadcasts,' and only a very minute portion of this energy can be picked up at a particular point within its range. For a reliable point-to-point telephone service between 2 widely spaced countries it is necessary to concentrate the energy into a narrow 'beam' of waves, and various methods have been devised to bring this about. As early as 1900 Hertz used a parabolic metal reflector in exactly the same way that this type of reflector is used to concentrate light waves into a beam. The mechanism of electro-magnetic wave propagation is such that the physical dimensions of the reflecting system must be very large compared with the wavelengths involved. Hence this method is confined to use on very short wavelengths, say, below 0.1 metre. The formula for determining the angle of the beam is: Number of degrees = $275 \cdot 1/d$, where 1 length of aerial (invariably made equal to half the wavelength), and d = diameter of parabola opening (Fig. 1A).

FIG. 1A. PARABOLIC REFLECTOR FOR ULTRA-SHORT WAVE

L, Aerial length equalling half of wavelength.
D, Diameter of parabola opening.

For example, if the mouth of the parabola were 5 metres (16 ft. 6 in.) and the wavelength 0.1 metres, the beam width would be approximately $2^\circ 45'$. Unfortunately, such small wavelengths are not suitable for long-distance communication, and the longer wavelengths involved (10 to 100 metres) would require parabolas of hundreds of feet diameter—an impracticable proposition. However, this method finds its application in the extremely short wavelengths, of the centimetre order, which are of great importance in modern navigational aids (see RADIO-LOCATION).

Another method of bringing about directive properties of an aerial system

is to use a number of aerials grouped in an 'array.' The type of aerial known as a 'dipole,' the physical length of which is half the wavelength being radiated, gives a radiation pattern in the form of 2 main 'lobes' on either side of the wire (Fig. 1B).

FIG. 1B. RADIATION DIAGRAM OF A DIPOLE
L, Aerial Length

By placing sev. dipoles side by side and 'feeding' all of them in phase, the radiations add up in a line at right angles to the line of dipoles, and subtract at the angles towards the sides. Fig. 1C shows this for 4 dipoles, the main lobes of radiation being about 36 in. wide. This aerial system is known as a 'broadside' array. It is also possible to feed the dipoles in such a phase as to radiate the maximum energy *in line with the aerials*, and no energy at right angles to it; this is known as an 'end-fire' array. By using more dipole elements, the beam can be concentrated still further; for example, 16 dipoles suitably arranged would be used to achieve a beam width of about

FIG. 1C. CONCENTRATION OF ENERGY BY THE USE OF FOUR DIPOLES

8 in. It must be remembered that this only concentrates the beam in the horizontal plane. If it is desired to do likewise in the vertical plane, the same principle must be applied by arranging a suitable number of dipoles stacked one above the other. Since the spacing between dipoles must also be half a wavelength, the number of dipoles that can be stacked in this way is limited by practical considerations. For wavelengths of about 25 metres, 8 dipoles could be accommodated vertically on 500-ft. masts, giving a beam width in the vertical plane of approximately 20° . A 24-dipole broadside array is shown, diagrammatically, in Fig. 1D. It is usual to employ a 'reflector,' consisting of an exactly similar array placed a quarter of a wavelength behind the main aerial. This prevents radiation from one side and increases it on the useful side. About 30 per cent reflection can be achieved in

this way. The actual direction of radiation depends on the disposition of the masts supporting the array, and for a comprehensive transmitting service the number of aërials employed is formidable. An attempt to provide movable masts was made by the Philips Radio Company

FIG. 1D. 24 DIPOLE BROADSIDE ARRAY

at Eindhoven, Holland, where the supporting framework was carried on a circular rail track. Even so, with the multiplicity of wavelengths that must be used together with the large number of countries to be served, this device would not give much alleviation in the number of aerial arrays required, and a beam wireless station is usually an enormous affair.

All forms of intelligence may be carried by beam wireless—telegraphic, telephonic, and photographic. In the United Kingdom, all 3 services are handled by Cable and Wireless Ltd., with the exception of 2-way telephone conversations, which are handled by the G.P.O. Each station comprises 2 units—one for transmitting and one for receiving—usually spaced widely apart in order to obtain the best site conditions. Both sending and receiving stations are connected by land-line to the central office of Cable and Wireless Ltd. (Eleetra House, London), which handles all the traffic, both outgoing and incoming. The 2 main transmitting stations are situated at Ongar and Dorchester, with the complementary receiving stations at Brentwood and Somerton respectively. Each station has many transmitters, and a world-wide service is maintained at all hours of the day. At some periods it is not possible, through ionospheric conditions, to cover a particular link in one direct beam. In these cases, automatic wireless relay stations have been installed where the original signal is picked up and re-radiated on a more suitable wavelength and course. An example of this is the London-Montreal service, which can be routed via the relay station installed on Ascension Island. The 2-way telephone service maintained by the G.P.O. employs an exactly similar set-up, the 2 separate conversations being combined at the central office (Faraday House, London), and thence connected in the usual way to any telephone subscriber. See also WIRELESS TELEGRAPHY.

Beaminstor, anct. mrkt. tn. and par. of Dorset, 6 m. from Bridport, situated on the Brit. It is mentioned in Domesday Book. Pop. 2000; rural dist. 8000.

Beamish, mining centre of Durham, 10 m. from Newcastle-on-Tyne.

Beamish, North Ludlow (1797-1872), Irish writer, b. at Cork; wrote on military subjects. Among his works of antiquarian value is a summary of Rafn's researches into the early Scandinavian discovery of America.

Beam-tree (*Pyrus aria*), species of Rosaceæ which grows to a height of 20 to 40 ft. in Europe and Asia. The leaves are ovate, with serrated edges, and are white and downy underneath; the flowers grow in terminal corymbs, and the small red fruit resembles a haw. It is acid and astringent, and is sometimes called sorb or service-berry. The wood is used in turning, and beer is made by fermentation of the fruit.

Bean, name given to the seeds of various plants, chiefly to those of the order Leguminosæ. The common or broad B. is known as *Vicia faba*, or *Faba vulgaris*, and has many varieties. The Fr. or kidney B. is *Phaseolus vulgaris*, and the scarlet runner *P. multiflorus*; both of these plants are grown in England, and the pods are eaten as vegetables. The latter is also used as an ornamental climber. *P. lunatus*, the Lima B., is a native of S. America, with broad flat pods, and short flat seeds. *P. mungo*, the mungo B. or green gram, and *P. radiatus*, the black gram, are Bs. which are given to horses. *Dolichos biflorus* is also called the horse-gram in India, and is excellent food for cattle, while the pods of *D. lablab*, the lablab B., are cooked for human consumption after the manner of kidney beans. Both *Glycine soja* and *G. hispida* yield soya Bs. (q.v.). *Cerantia siliqua* is the Mediterranean species known as the locust or carob B.; *Vigna sinensis* is the cherry-B. or cow-pea of tropical Asia; *Mucuna utilis*, the tropical velvet-bean; *Canavalia ensiformis*, the sword or sabro B. of India; *Physostigma venenosum*, the ordeal B. of Calabar.

Of a few plants which are not leguminous, but whose seeds are known as Bs., may be mentioned *Nelumbium speciosum*, the Egyptian or sacred B. eaten in Cashmere; *Strychnos ignatii*, St. Ignatius's B., with poisonous properties; *Menyanthes trifoliata*, the bog- or buck-B. of Europe, Asia, and N. America. The bean-caper is an E. plant, *Zygophyllum fabago*, whose flower-buds are eaten as capers.

Bs. have value as food on account of the nitrogenous or proteid matter they contain. As forage for horses, cows, sheep, and pigs they have fattening and heat-giving properties. The enemies to which they are subject are 2, fungi and insects. When attacked by fungus the Bs. can still be used as rich manure, and if by the B. aphid, or black dolphin, they can often be saved by having their tops cut off. They grow best in warm, light, well-manured soil, and enrich the ground themselves for future use.

Bean-feast, name derived from an old custom prevalent in W. Europe in connection with Twelfth Night festivities. A bean was hidden in a cake, and the person who got the slice containing it was 'king' of the revels. Though the festival was a religious one (the feast of the Epiphany), it was an adaptation from paganism. The bean-king (or he who had the good luck to get the slice of cake with the bean) was master of the revels (cf. lord of misrule). Originally he may have reigned for the 12 days from Christmas to Twelfth Night, his chief function being to perform the propitiatory rites to ensure good weather. During the Rom. Saturnalia, said to have been estab. by Tullus Hostilius (c. 650 B.C.), but probably older, children drew lots with beans to decide who should be king. This was a winter festival, and with alteration of date was christianised into the feast of the Three Kings. See Brand's *Popular Antiquities of Great Britain* (Hazlitt's ed., 1905), under 'Twelfth Night.'

Bean Goose (*Anser segetum*), species of European wild goose with a short, black and red beak, which obtains its name from the resemblance of the upper nail of its bill to a horse-bean, or else from the fact that it eats the beans sown in the spring. It is of a grey colour, and breeds largely in the Hebrides.

Bean-king's Festival, see BEAN-FEAST.

Bean-tree, species of 2 genera of Leguminosæ which occur in the tropics. *Castanospermum australe*, also known as the Australian chestnut, has edible seeds which resemble chestnuts in flavour when roasted. *Erythrina corallodendron* is the other species, which is a native of Jamaica.

Bear, Bere, or Beer, a common name for the 4-rowed variety of barley (q.v.).

Bear, genus of widely distributed carnivorous (often omnivorous) mammals of the family Ursidae and div. Arctoidea. They are large, ungainly animals, with short tails, shaggy fur, plantigrade feet, curved claws which are non-retractile, broad elongated heads ending in a snout. Their usual method of progression is on all fours, but they are capable of walking upright with a clumsy, shuffling gait, and most of them are climbers. They do not attack man unless provoked, but when roused they are ferocious; in their strong arms they can hug a human being until suffocated. Though they sometimes eat flesh, they prefer fruit and honey, and some species are fond of termites, or white ants. Most Bs. eat largely during the summer months, and then hibernate, coming out again in the spring in a weak but fierce state. During the winter months the cubs are b., and unless carefully guarded by their watchful mothers they fall a prey to the greed of their fathers. The young are blind at birth.

The various species have many dissimilar points. The brown B. (*Ursus arctos*) is spread through all the int. dists. of Europe, from the Arctic circle to the Alps and Pyrenees, and is also found in Asia. It is about 6 ft. long and 3 ft. high at the shoulders, yet it can easily climb rocks and trees; it can attain the age of

50 years. The fur of this animal is of a yellowish colour in youth. The Amer. black B. (*Ursus americanus*) is a smaller species than the brown B., of which it is thought to be a variety. It is an object of veneration among the Indians. The grizzly B. (*U. horribilis*) is a native of N. America; it is large, strong, and fierce, has powers of endurance, and is a great hunter. The polar B. (*U. maritimus*), found in the Arctic regions, is the largest species, attaining a height of 9 ft., and lives on seals and fish. The spectacled B. (*U. ornatus*) is a smaller species with ringed eyes, found in the Andes; and the sloth B. (*Melursus labiatus* or *ursinus*) dwells in mountainous parts of India and lives chiefly on termites.

BROWN BEAR

Bear Animalcules, see TARDIGRADA.

Bear-cat, see PANDA.

Bear, The Great and Little, see URSA MAJOR and URSA MINOR.

Bear-baiting, sport consisting of teasing a tethered bear by setting dogs to bite it or by beating it with sticks. The bear was often blinded beforehand. It was in favour with the anc. Roms., and was popular in England from Norman times down to the eighteenth century. Private bear-gardens, or baiting-places, were kept by nobles and gentry, besides those provided by caterers for popular amusement, such as the famous 'Bankside,' where the charges were 'a penny for admission, a penny at the entry of the scaffold (i.e. stage), and a penny for quiet standing.' Mary Tudor and Elizabeth were both fond of witnessing this sport. The Privy Council in 1591 ordered all theatres to be closed every Thursday, because baitings generally took place on that day, and actors could not be allowed to prejudice such entertainments by their competition. Another favourite day was Sunday, which was a further reason for the Puritan interdiction of such sports. Bear-baiting and bull-baiting were finally banned by Act of Parliament in 1835.

Bearberry (*Arctostaphylos*), genus of Ericaceae which grows in Alpine regions and in N. America. *A. alpina*, the black B., is not so common as the evergreen *A. uva-ursi*, red B., or bear's whortleberry, but both grow in mountainous parts of England and Scotland.

Bear Lake, Great, freshwater lake in the N.W. of Canada. Its shape is irregular, and it has an area of over 11,000 sq. m. The water is transparent and abounds with fish, especially the so-called herring salmon. It has an outlet in the Great Bear R., which flows into the Mackenzie.

Bear River, stream about 450 m. long, rising in the Rocky Mts., and flowing after a circuitous course through Utah and Idaho, into Great Salt Lake. On its banks are mineral springs containing magnesia.

Beard, name given to a growth of hair on a man's cheeks and chin. The fashion of the B. varied considerably in various times and countries. Though Pliny says the Romans did not begin to shave until A.D. 454, yet in later times the first day of shaving was considered as the entrance to manhood and was kept with festivities. Caesar says that the ancient Britons left the hair long only on the upper lip. The Saxons wore Bs., but the Normans shaved the whole of the face. The sepulchral monuments of kings and nobles show that for many centuries the B. was in fashion, but since the seventeenth century the practice of shaving has become more and more general in Europe and America.

Beards in S.W. Arabia. In S.W. Arabia clean-shaven faces that could grow Bs. are considered effeminate, and are frowned upon by the tribesmen. According to the ulema the B. may not be shaved but can be trimmed. Moustache only is rare and considered not unmanly, but to be in imitation of Christians and, as such, indicates a townsman of Lahaj or Aden and a bad Muslim. Some seyyids in the Hadhramaut shave the B. This is not approved by the tribesman, but the seyyids look upon shaving as a sign of civilisation. To seize a man's B., or even to flick it is considered a deadly insult. 'God burn his beard' is a frequent exclamation of dislike. The B. is touched or held when swearing by God or as a mark of silent reproof. Trimmings from the B. are carefully concealed as it is considered that their possession by an enemy, who might burn them, is a grave danger. To kiss the tip of the fingers and then to touch another's B. with them is a mark of suppliancy and respect. An Arab will describe his B. as his *sherraf* or personal honour. The B. is regarded as a mark of distinction and masculinity. 'Abu Dagan' (father of a chin-tuft) is a nickname of respect applied to men with particularly well-grown Bs. The oath 'by the beard of the Prophet' is a powerful one. Frequently, before pronouncing judgment, the B. will be touched held or stroked in a contemplatory gesture. An Arab will seize his B. between thumb and forefinger to emphasise his remarks in a quarrel. Beardless youths often imitate the gestures of their bearded seniors,

holding invisible Bs., nor is the gesture considered comic.

Beard, Charles Austin (b. 1874), Amer. historian, b. Knightstown, Ind., U.S.A. Educated at various Amer. univs. and at Oxford Univ., England. Was prof. of politics at Columbia Univ. 1915-17; adviser to the Institute of Municipal Research, Tokyo, Japan, 1922; adviser to Viscount Goto, Jap. minister of the interior, after the great earthquake of 1923. Among his prin. works are: *Introduction to the English Historians*, 1906; *American Government and Politics*, 1910; *Economic Interpretation of the Constitution*, 1913; *Contemporary American History*, 1914; *History of the American People* (with W. C. Bagley), 1918; *History of the United States* (with his wife), 1921; *The Rise of American Civilisation* (with his wife), 1927.

A DECORATION FROM BEARDSLEY'S
'LA MORTE D'ARTHUR'

Beard, George Miller (1839-83), Amer. physician, b. in Connecticut. After serving in the U.S. Navy for some years he settled in New York and became famous as a specialist on the treatment of nervous diseases, on which he wrote sev. works, his last being the *Study of Trance*, 1882.

Beard, John (1716?-81), Eng. actor. He received a musical training and gained some reputation as a singer at Covent Garden. Loss of hearing caused his career to come to an end in 1767. Some of Handel's finest tenor parts were composed for B.

Beard, Thomas (d. 1632), Eng. divine. He was educated at Cambridge. Soon after the acceptance of the rectory of Hengrave, Suffolk, B. became headmaster of Huntingdon hospital and grammar school, where he was Oliver Cromwell's schoolmaster. He wrote *The Theatre of God's Judgements*, which contains an account of Marlowe's death.

Bear'd Grass, name given to a species of *Polygonum*. This genus of Gramineae is seldom found in Britain and is a native of warm and tropical countries.

Bear'd Moss (Fr. *barbe de vieillard*) belongs to the genus *Usnea* of lichens. It creeps over stems and branches of trees, hanging down in thick trails, whence its name.

Beardsley, Aubrey Vincent (1872-98), Eng. artist, b. at Brighton, d. of consumption at Mentone. Worked for various illustrated papers at the age of 20; and next year illustrated the *Morte d'Arthur*, which at once assured his fame. He was art editor of the *Yellow Book*, but was elbowed out of that position; he joined with Arthur Symonds in 1895 to edit the *Savoy*, a rival to the *Yellow Book*. He illustrated *The Rape of the Lock*, Oscar Wilde's *Salomé*, *Made-moiselle de Maupin*, and Ernest Dowson's *Pierrot of the Minute*. He was at work on initial letters for *Volpone* 3 weeks before he d. His line drawings were delicate and exact, and showed that fastidious elegance that appears even in the most grotesque of his drawings. He worked almost entirely in black and white. See Arthur Symonds, *Aubrey Beardsley*, 1898; R. Ross, *Aubrey Beardsley*, 1908.

Bearer Securities, in commerce or banking practice, any draft, cheque, bill, note, etc., the presentation for payment of which by the bearer entitles him to receive a certain sum of money. Most B. S. have become negotiable by custom; but in order to be so negotiable in Great Britain an instrument must be customarily transferable in this country, like cash, by mere delivery. In the case of Eng. instruments it has been held that they cannot become negotiable by custom and usage except by the ant. law merchant (*q.v.*), and that modern usage cannot make an instrument negotiable. But the better opinion is that this is no longer good law; and it has now long been decided that debenture bonds payable to bearer have by modern usage become negotiable instruments.

Bearing, the direction of a line drawn from one point to another, is a term usually employed for the points of the compass; e.g. if the point B. is due N.W. of A. it is said to bear N.W. of A. and its B. is said to be N.W. To take B. is to ascertain the points of the compass on which points lie.

Bearings, see BALL BEARINGS.

Bear-leader is a term used jestingly of a person who is in charge of a young man of wealth when making a tour of the world, or of one who acts as guide to a celebrity. It arose from the custom of leading about a tame bear, nuzzled and on a chain, for entertainment.

Béarn, anct. prov. of France, now included in the dept. of Basses-Pyrénées. Its cap. was Pau.

Bear's Breech, name sometimes given to the genus of Acanthaceae known as *Acanthus* (*q.v.*).

Bearsden, a residential suburb of Glasgow. Pop. 14,000.

Bear's Foot (*Helleborus foetidus*), species of Ranunculaceae in Europe; related to the Christmas rose.

Bear's Grease, or **Bear's Oil**, name applied to various pomades which are said to promote the growth of hair. B. G. is believed to strengthen the hair. These preparations are usually manuf. from beef-marrow, lard, spermaceti, or a vegetable oil, together with an agreeable scent.

Bear's Whortleberry, see BEARBERRY.

Bearded, Marcus Samuel, first Viscount (1853-1927), Eng. oil magnate. Began in a modest way of business as a representative in Japan for the shipment of oil from Baku to the E. In 1897, he secured cap. from the Rothschilds for the purpose of grouping a number of concerns under the style of the Shell Transport and Trading Company, which, later, became amalgamated with the Royal Dutch Petroleum Company. Was lord mayor of London in 1902.

Beas, or **Bias**, riv. of the Punjab, India. It rises in the Himalayas and flows into the Sutlej. The Beas and lower Sutlej formed the Hyphasis, which marked the farthest progress of Alexander the Great.

Beast, Number of the, see APOCALYPTIC NUMBER.

Beastlings, see BEESTINGS.

Beatenberg, or **Saint Beatenberg**, summer health resort situated on the wooded heights to the E. end of the lake of Thun, Switzerland.

Beath or Baith, par. of Scotland, situated in the co. of Fife. It is 5½ m. N.N.W. of Aberdour. Most of its inhab., numbering 4400, are engaged in its coal and iron mines.

Beatification, the act by which the Pope permits a 'venerabilis servus Dei,' one whose name has been brought forward as worthy of B., i.e. to be entitled to be called 'blessed' (*beatus*). The privileges contain various limitations, and B. is generally only preliminary to canonisation (*q.v.*).

Beating the Bounds, or **Perambulation**, is a custom common to sev. European nations under different forms. In England, on Holy Thursday or Ascension Day, the clergyman of the par., with some officers and boys, still continues to walk in procession to each of the different par. boundaries, and when there the boys beat the boundaries with peeled willow-wands in order to remember their location. Sometimes the boys themselves were the objects of castigation and received a little money for their pains. This ann. ceremony, held to preserve the limits of a par., may be compared with the Rom. festival, Terminalia, celebrated on Feb. 23. In Scotland, alternative names are 'riding the marches' and 'common riding.' At Shrewsbury it was called 'bannering,' and

the custom was kept up till the middle of the nineteenth century. In recent years there has been a revival of the custom in some parts, including some in the city of London. See Brand's *Popular Antiquities*.

Beaton, or Bethune, Cardinal David (1494-1546), Scottish prelate, younger son of John B., or Bethune, of Balfour in Fife. He went to France to study civil and canon law, and in 1519 was appointed resident for Scotland at the Fr. court. In 1533 B., now prothonotary apostolic (a high office in the church), was sent as an ambas. to France to treat for a league with the Fr. king and a marriage between James V. and Princess Magdalene. In 1537 he procured the papal bull for the erection of St. Mary's College at St. Andrews; in 1538 became a cardinal, and 1539 primate of St. Andrews. At the death of James V., 1542 B. produced a will in which he was stated to be appointed regent for the infant daughter of the dead king; this was a forgery, and James, earl of Arran, became regent. B. still had great influence, and with the help of the nobles forced the regent to abjure the doctrine of the Reformation. The following year Mary Queen of Scots was crowned, and B. became chancellor. In 1546 he tried and condemned George Wishart to be burnt. He opposed the designs of Henry VIII. of England for the marriage of Mary to his son Edward, and that monarch characteristically expressed a desire that B. should be assassinated, and B., after witnessing the marriage of his illegitimate daughter to the earl of Crawford, was put to death by a party of reformers.

Beaton, Bethune, or James (d. 1539), Scottish prelate, uncle of Cardinal David B., was lord treasurer of Scotland, archbishop of Glasgow, 1509; chancellor, 1513; and archbishop of St. Andrews and primate, 1522. As one of the regents during James V.'s minority, he was a chief mover in the Fr. alliance. Patrick Hamilton and other reformers were burned during his prinary. He d. 1539. Another James B. (1517-1603), was a nephew of the cardinal. He was in the confidence of Mary of Lorraine when regent, and was the last Rom. Catholic archbishop of Glasgow, 1552 to 1560, when he fled to France, taking with him the archives of the see, which have never been recovered.

Beatrice (1266-90), daughter of Folco Portinari, a wealthy Florentine. She is identified with the girl of 8 years of age whom Dante met at her father's house on May Day, 1274, when he himself was 9 years old. He relates the story of his love for her in the *Vita Nuova*. It is probable that he did not declare his passion, and that they did not meet many times. She married Simone de' Bardi, and d. on June 9, 1290. She remained Dante's inspiration, and the *Paradiso* tells of their meeting in paradise.

Beatrice, Princess (1857-1944), youngest daughter of Queen Victoria. In 1885 she married Henry Maurice, Prince of Battenberg. (See **BATTENBERG**.) She had 3

sons, the eldest of whom was made marquess of Carisbrooke, and her daughter, Victoria Eugénie, married King Alfonso XIII. in 1906, and was queen of Spain until her husband's abdication in 1931. Her second son, Leopold, d. in 1922, and her third son, Maurice, d. of wounds received during the war in 1914. Her sons, in 1917, took the name of Mountbatten.

Beatrice, a city and co. seat of Gage co., Nebraska, U.S.A. It is situated in the valley of the Big Blue R., and has a trade in dairy produce. Pop. 10,880.

Beattie, James (1735-1803), Scottish poet and philosopher, b. at Laurencekirk in Kincardine; entered Marischal College, Aberdeen, where, in 1760, he became prof. of moral philosophy and logic. In 1770 he pub. his *Essay on the Nature and Immutability of Truth, in Opposition to Sophistry and Scepticism* to confute Hume. Johnson, always zealous for Christianity, praised it at the expense of Hume, who estimated the ephemeral effusion at its true worth, and refrained from answering it, beyond saying that he 'had not been used like a gentleman.' George III. received B. with great warmth, and his fortune was made. Sir Joshua Reynolds introduced B. in a metaphorical painting as the Defender of Truth, with Hume and Gibbon skulking low with diabolical faces. In 1771 B. pub. *The Minstrel*, a poem for which alone he is remembered, and in 1773 received a pension. He d. of palsy. Life by Sir Wm. Forbes, 1807.

Beattie, William (1793-1875), Eng. doctor, poet, and classical scholar. He was b. at Dalton, Annandale. He entered Edinburgh Univ. as a medical student in 1812. For 14 years he attended the duke and duchess of Clarence. He practised at Hampstead for 18 years, and afterwards travelled in Switzerland and the land of the Waldenses. He pub. illustrated works on the Danube and Switzerland.

Beattook, vil. situated 2 m. S.W. of Moffat, in N. Dumfriesshire. It forms the junction on the railway for Moffat.

Beatty, David, first Earl (1871-1936), Brit. admiral, b. Jan 17, second son of David Longfield B., of Borodale, co. Wexford; educated at the Royal Naval Academy, Gosport, and entered the Navy as a cadet in 1884. He became lieutenant, 1892; and served in Egypt and the Sudan with the naval brigade—being in the expedition to Dongola in 1896 (received D.S.O.), and being present (1897-98) at the battles of Atbara and Khartoum. Became commander, 1898. In the expedition to China in 1900 on account of the Boxer rebellion, he was wounded, and promoted captain. He was made rear-admiral in 1910, and in 1912 became naval secretary to the First Lord of the Admiralty (Winston Churchill). In 1913 he took command of the battle-cruiser squadron, and, when the First World War broke out, he conducted the first move at sea against Germany—the raid into Heligoland Bight, Aug. 28, 1914. On Jan. 24, 1915, at the Dogger Bank he intercepted von Hipper, coming

to bombard the E. coast. The same year he was made vice-admiral. He again encountered von Hipper at the battle of Jutland, May 30, 1916, whose fleet he successfully deflected from its course. This indecisive battle was followed by some div. of opinion in the Fleet as to the merits of Jellicoe and B., and the controversy spread to the press. Even the publication of Sir Julian Corbett's last vol. of the *Official History of the Great War Naval Operations* (1920) did not satisfy public opinion. In his *The Jutland Scandal* Admiral Sir Reginald Bacon (q.v.) accused B. of incompetence and inexperience. Two other books, *The Truth about Jutland* by Admiral Harper, who was entrusted with the task of producing a report on the battle, and *The Riddle of Jutland* by Admiral Harper and Langhorne Gibson, expressed the view that the conduct of the battle by Jellicoe was wise and well judged, while B. was criticised for neglecting the training of his command in gunnery and signalling, and for the rashness of his handling of it in action. See also JUTLAND, BATTLE OF. On Jellicoe becoming First Sea Lord, Dec. 1916, B. was made commander-in-chief of the Grand Fleet, a position he held till the end of the war. On board his flagship, the *Queen Elizabeth*, at Scapa Flow in the Orkneys, Nov. 16, 1918, he received from Rear-Admiral Hugo von Meurer the surrender of the Ger. Grand Fleet, which von Reuter soon afterwards sank. In 1919 he was made admiral, and admiral of the fleet; he also became First Sea Lord of the Admiralty. Between then and 1927, he conducted the reduction of the Navy to a peace footing; and he was Brit. delegate to the Washington Conference on the Limitation of Armaments, 1921. In May 1901 he married Ethel, daughter of Marshall Field of Chicago, by whom he had 2 sons. He was awarded the G.C.B. and O.M., and held many foreign decorations. His peerage was conferred on Sept. 27, 1919, when he took the title of Earl Beatty, Viscount Borodale, and Baron Beatty of the North Sea and of Brooksby.

Beaucaire, tn. in the dept. of Gard, S.E. France. It is situated on the Rhône, at the head of the canal de B. The manufs. are silk, woollens, and leather. There are stone quarries in the neighbourhood. Pop. 9000.

Beauce, co. in the prov. of Quebec, Canada. It lies to the S.E. of the prov., on the N. frontier of the U.S. The Notre Dame Mts. are in the dist. and also Lake St. Francis.

Beauce, La, is a dist. in central France, with an area of 2800 sq. m. It includes part of Eure-et-Loir and Loir-et-Cher.

Beauchamp, name of an anct. and noble family of England. The founder, Walter de Beauchamp, obtained large estates in Worcestershire by his marriage with the daughter of one of the Conqueror's barons; from him descended William of Elmley (whence this family is styled the Beauchamps of Elmley), whose marriage with the heiress to the earldom of Warwick in 1268 brought Warwick Castle and

the earldom to his son. Of the B. earls of Warwick commemorated in the famous B. Chapel in St. Mary's Church, Warwick, the prin. was Guy the 'black cur of Arden,' the enemy and executor of Piers Gaveston, and one of the lords ordainers in the opposition to Edward II. He d. in 1315. His sons, Thomas and John, were 2 of the first garter knights, and Thomas was one of the Lords Appellant, and imprisoned in the B. Tower of the Tower of London. The last B. earl of Warwick d. in 1445, and his sister, Anne, brought the earldom to the Nevilles on her marriage with Richard, the king-maker. The present Earls B. are descended from William Lygon (1747-1816), who claimed descent through the female line from a cadet branch of the anct. family, the Bs. of Powyck. The viscounty of B. of Hache, granted to Edward Seymour, Lord Protector Somerset, belonged to a distinct family in Somersetshire. The title remains with the marquess of Hertford, and the name in the family of the B. Seymours.

Beauchamp, Alphonse de (1767-1832), Fr. historian, b. at Monaco; joined the Sardinian army, and was imprisoned for refusing to serve in the war against the Fr. Republic. He came to Paris and obtained a gov. post at the ministry of police at the head of the press bureau. In 1806 he pub. his historical work, *Histoire de la Vendée et des Chouans*, which led to his retirement to Rheims. He returned to a post in 1811, which he resigned at the Restoration. Other works are: *Vie du général Moreau*, 1814; *Mémoires secrets et inédits pour servir à l'histoire contemporaine*, 1825. He only revised Fouché's *Mémoires*, often attributed to him.

Beauchamp, William Martin (1830-1925), Amer. ethnologist and clergyman, b. at Coldenham, N.Y. Among his works may be named *The Iroquois Trail*, 1892; *Aboriginal Chipped Stone Implements of New York*, 1897; and *History of the New York Iroquois*, 1905.

Beaulerk, Topham (1739-80), the friend of Samuel Johnson, and member of the famous Club. He was a grandson of the first duke of St. Albans. His wit, his taste in literature, and knowledge as a man of the world, endeared him to Johnson, and he figures largely in Boswell's life. See also John Forster's *Life of Goldsmith*, 1854.

Beaufort: (1) cap. tn. of Carteret co., N. Carolina, U.S.A. It is situated at the mouth of Newport R., S.W. of Cape Lookout, has a good harbour, and is a summer resort. Pop. 3000. (2) Cap. tn. of B. co., S. Carolina, U.S.A., situated on Port Royal Is., on the B. Riv., 16 m. from the sea. It has a harbour. Its climate has made it a popular winter resort. The 'rock-river' phosphate beds near B. are important. The tn. was first permanently settled, 1710, and was named in honour of Henry Somerset, duke of Beaufort. Pop. 3000.

Beaufort, tn. in the Maine-et-Loire dept., France, with a trade in corn, fruit, and linon. Pop. 3000.

Beaufort, name of a noble Eng. family, members of which were earls and dukes of Somerset and earls and marquesses of Dorset; also the title of a dukedom, borne by members of the family of Somerset, descended from the Bs. The name of B. was borne by the children of John of Gaunt by Catherine Swynford, who were legitimated after their parents' marriage in 1396. Of these, John (*d.* 1410), earl of Somerset and marquess of Dorset, was a supporter of Richard II. against the lords appellants; Thomas (*d.* 1426), duke of Exeter, was one of Henry V.'s generals; Henry (*d.* 1447) was bishop of Winchester and cardinal (*see* BEAUFORT, HENRY). Margaret was daughter of John, third earl of Somerset (1403-44) (*see* BEAUFORT, MARGARET). Three successive Bs., earls and dukes of Somerset, were killed or beheaded during the wars of the Roses, supporting the house of Lancaster. Charles, the illegitimate son of one of these—Henry, third duke of Somerset, beheaded after Hexham, 1464—was a favourite of Henry VI., and made earl of Worcester; his descendant, Henry, fifth earl, was a loyal supporter of Charles I., and was made a marquess in 1642; in 1682 the third marquess was made duke of B., the title now held by the tenth duke.

Beaufort, Henry (c. 1377-1447), Eng. cardinal and bishop, was the son of John of Gaunt and Catherine Swynford, *b.* out of wedlock but legitimated in 1397 (*see* BEAUFORT, family). He entered the Church and was made bishop of Lincoln in 1398, and on Henry IV. attaining the throne he became chancellor, 1403, and bishop of Winchester, 1404. He was also chancellor in 1413, and in 1424. During the reign of Henry V. and the minority of Henry VI. he was the leader of the party opposed to Humphrey, duke of Gloucester, especially in the matter of making peace with France. In 1426 he was made a cardinal by Martin V., for whom he had voted in 1417 at the Council of Constance, and was sent as papal legate to conduct a crusade against the Hussites in Hungary and Bohemia. He crowned Henry VI. as king of France in 1431. Charges were made against him by Gloucester, and attempts to deprive him of his see failed. He refounded and endowed the hospital of St. Cross near Winchester, which still exists, and on sev. occasions advanced large sums of money to the crown. He *d.* at Wolsey Palace, Winchester. *See* L. B. Radford, *Henry Beaufort*, 1908.

Beaufort, Louis de (*d.* 1795), Fr. historian. Little is known of his life. He was one of the first writers who questioned the trustworthiness of the classical historians in the early hist. of Rome. His works include: *Dissertation sur l'incertitude des cinq premiers siècles de l'histoire romaine*, 1738, second ed., 1750; *Histoire de César Germanicus*, 1761; and *La République romaine*, 1766.

Beaufort, Margaret, Countess of Richmond and Derby (1443-1509), was the daughter of John, Duke of Somerset (*see* BEAUFORT, family), and married, in 1455, Edmund Tudor, earl of Richmond, by

whom she was mother of Henry, earl of Richmond, afterwards Henry VII., whose title to the throne came to him through his mother as descendant of John of Gaunt. After her husband's death she married Henry, son of the duke of Buckingham, and Thomas Stanley, earl of Derby. She founded the Lady Margaret professorships of divinity at Oxford and Cambridge, and founded by will St. John's and Christ's Colleges, Cambridge. *See* E. M. Routh, *Lady Margaret*, 1924.

Beaufort Scale, scale of numbers for recording wind velocity at sea, invented in 1805 by Admiral Sir Francis Beaufort. It consists of the numbers from 0 to 12, each number representing a certain strength or velocity of wind from calm to hurricane. The International Meteorological Committee have long adopted the scale as a part of the code for communicating weather conditions. The numbers wind represented, and velocity in m.p.h. are as follows: 0, calm, 0; 1, light air, 1-3; 2, slight breeze, 4-7; 3, gentle breeze, 8-12; 4, moderate breeze, 13-18; 5, fresh breeze, 19-24; 6, strong breeze, 25-31; 7, high wind, 32-38; 8, gale, 39-46; 9, strong gale, 47-54; 10, whole gale, 55-63; 11, storm, 64-75; 12, hurricane, above 75.

Beaufort Testimonial, result of a subscription raised in 1860 to commemorate the services of Sir Francis Beaufort (1774-1857), rear-admiral, to the Brit. Navy. It took the form of an ann. prize awarded to the cadet of the Royal Naval College who, as a candidate for the rank of lieutenant, passed most successfully his examination in navigation and kindred subjects.

Beaufort West, tn., cap. of B. W. div., Cape prov., S. Africa, 339 m. N.E. of Cape Town on the line to Kimberley. It lies 2792 ft. high, on the S. slopes of the Nieuwveld Mts., and is the largest tn. in this part of the Great Karroo. Pop. (tn.) 5000.

Beaugency, tn. of France in the Loiret dept., situated on the r. b. of the Loire, which here is spanned by a bridge of 26 arches. It is about 16 m. S.W. from Orleans. The manufs. are woollens and leather, and a trade is carried on in grain, wheat, and wine. Pop. 3300.

Beauharnais, Alexandre, Vicomte de (1760-94), Fr. general, *b.* in Martinique, was descended from an ant. noble family in Orléannois. In 1779 he married Joséphine Tascher de la Pagerie, afterwards the first wife of Napoleon, by whom he had Eugène de B. (*q.v.*), and Hortense, wife of Louis Bonaparte, king of Holland, and mother of Napoleon III. B. served in the Amer. war of Independence, came to France and joined the revolutionary party. He was secretary to the assembly, and commanded the army of the Rhine, 1793; his failure to relieve the siege of Mainz, and the suspicion attached to his noble birth, brought on him the enmity of the Committee of Public Safety, and he was tried and guillotined.

Beauharnais, Eugène de (1781-1824), son of Viscount Alexandre B.; at his father's death his mother, Joséphine,

married Napoleon Bonaparte. Eugène accompanied Bonaparte to Italy and Egypt, and was made a prince of the empire, and appointed viceroy of the (so-called) kingdom of Italy; he married, in 1806, the daughter of the king of Bavaria. After suffering defeats from the Russians and Austrians, he retired with his family to Bavaria.

Beauharnois, co. of S.W. Quebec. The St. Lawrence forms its N. boundary. Its area is 250 sq. m., and it is drained by the R. Chateauguay. Its chief tn. is of the same name, and its pop. 20,000, tn. 3500.

Beauharnois, Charles, Marquis de (d. 1749), Fr. governor-general of Canada (1726-47). His task was to maintain the then Fr. colony of New France, as it was called, against Eng. designs, and to do all in his power to encourage Fr. immigration. Fr. tradition, however, seemed to look upon New France mainly from the strategic standpoint, and but little attention was paid to its political or social development. B. tried to promote the movement of Canadian expansion towards the W. of the country, and to that end he commissioned the valiant Pierre de la Verendrye, an explorer and native of Three Rivers, then commanding officer at Lake Nipigon, to organize an expedition, in 1731. The result of this expedition was the establishment of a number of trading posts between Lake Superior and the Saskatchewan R. The rivalry between the Fr. and Brit. colonists in commerce, however, led to a renewal of war, and B. set to work to strengthen the Fr. position by building new forts among which was Fort Ticonderoga on Lake Champlain. He returned to France in 1746.

Beaujeu, Fr. tn. in the Rhône dept., about 27 m. from Lyons. Pop. 2400.

Beaujolais, dist. forming part of Rhône-et-Loire, specially famous for its production of burgundy.

Beaujoyeux, Balthazard de, see BALTAZARINI.

Beaulieu, a Fr. winter resort in the Alpes-Maritimes, 4 m. from Nice. It possesses a good harbour. Pop. 2000.

Beaulieu (pronounced Bewley), par. of S. Hampshire, England, on the estuary of the R. B., about 5 m. from Southampton and 6 m. from Lymington. It has an abbey, now in ruins, founded by King John, which sheltered Margaret of Anjou after the battle of Barnet. Pop. 1000.

Beaulieu, Walter Edward Douglas Scott Montagu, Baron Montagu of (1866-1929), Brit. motoring pioneer, son of Lord Henry Scott Montagu and grandson of the fifth duke of Buccleuch. Educated at Eton and Oxford, and trained in engineering in railway workshops. In 1915 was adviser on mechanical transport to the Indian gov. Later took up aviation.

Beaulieu (pronounced Bewley), tn., Inverness-shire, Scotland, 10 m. W. of Inverness. Here are the remains of the Cistercian priory of St. John, 1230, and the site of Lovat Castle. Pop. 800.

Beaumarchais, Pierre Augustin Caron de (1732-99), Fr. dramatist, b. at Paris, son of a watchmaker; he was brought up as a

watchmaker, and also showed great skill in music, playing the harp and guitar. His proficiency in watch-making as shown by a watch with a new escapement, which B. had made for Mme de Pompadour, attracted the notice of Louis XV., and he was admitted to court. His fame as a writer rests on his plays, and principally on *Le Barbier de Séville* (1775), and *Le Mariage de Figaro* (1784), on both of which operas have been written. The character of Figaro was a happy invention, and the plays are full of wit and well constructed. He holds a high place as a satirist, and is considered perhaps the best of the Fr. dramatists of the eighteenth century.

Beaumaris, port and mkt. tn., also the cap. of Anglesey, Wales. It is situated on B. Bay, to the N. of Menai Strait. The harbour is safe and roomy. The tn. is frequented by summer visitors, who are attracted by the golf links and the sea-bathing. There are slate quarries in the neighbourhood. The castle was founded by Edward I. in 1295. Pop. 1700.

Beaumes-de-Venise, tn. of Vaucluse, France. It has mineral resources, cultivates the vine and mulberry, and contains an old Rom. church. Pop. 1200.

Beaumont, co. seat of Jefferson co., Texas, U.S.A. Incorporated in 1881, it has a pop. of 59,000. Chief industries are oil, steel, lumber, shipping, and agriculture.

Beaumont, tn. in the prov. of Hainault, Belgium, about 15 m. from Charleroi. There are marble quarries and iron works in the dist. Pop. 2200.

Beaumont, tn. in Puy-de-Dôme, France, situated at a distance of 2 m. from Clermont-Ferrand, the cap. of the dept. Pop. 2300.

Beaumont, Eon de, see EON DE BEAUMONT.

Beaumont, Francis (1584-1616), Eng. poet, third son of Francis B., a judge of the Court of Common Pleas, b. at the family seat of Grace Dieu, in Leicester. He entered, at the age of 10, Broadgate's Hall (now known as Pembroke College), Oxford; but his father d. in 1598, and he left without taking a degree. He became a student at the Temple, 1600, but paid little attention to law. He records in a poetical epistle his intimacy with Ben Jonson and other men of literary pursuits who frequented the Mermaid Tavern; here probably he met John Fletcher, with whom his name is associated. Their friendship was close, and they lived together until B., in 1613, married Ursula, daughter of Henry Isley, of Sundridge in Kent, by whom he had 2 daughters. He was buried in Westminster Abbey. The masterpieces of B. and Fletcher are *Philaster* and *The Maid's Tragedy*. Fletcher is generally regarded as having contributed the vivacity, and B. the judgment, the latter's duty being often to correct the overflows of Fletcher's wit. The purest characters in their plays are not free from an admixture of coarseness, while chastity is overwrought and put to absurd and gratuitous trials, so that some of the freshest and loveliest passages are

found side by side with fantastic affectations. It has been generally said that B.'s only certain individual play is *The Masque of the Inner Temple and Grayes Inn*, but more recent criticism (e.g. E. H. Oliphant's *The Plays of Beaumont and Fletcher*, 1927) restores to B. much which other circles denied him. Other work assigned to B.'s sole authorship is the *Induction*, with *The Triumph of Honour* and *The Triumph of Love in Four Plays* (or *Morall Representations*) in one, printed 1647. Among other plays, B.

FRANCIS BEAUMONT

and Fletcher produced *Four Plays* in one, 1608; *A King and No King*, 1611; *Cypids Revenge*, 1611 (?); *The Knight of the Burning Pestle*, 1611; *The Maidens Tragedy*, 1611; *Phylaster*, 1611; *The Coxcomb*, 1612-13; *What at Several Weapons*, 1614; *The Scornful Ladie*, 1616; possibly *The Tragedy of Thierrey King of France*, and his brother Theodore, 1616; and *The Little French Lawyer*, 1620. B. may have co-operated with Massinger in *The Lovers of Candy*. See also FLETCHER, JOHN.

Eds. of B. and Fletcher: A. Dyce, 11 vols., 1843-46; A. H. Bullen, 4 vols. (incomplete), 1904-12; A. Glover and A. R. Waller, 10 vols., 1905-12; G. P. Baker, *Select Plays*, Everyman's Library, 1911. See also G. C. Macaulay, *Francis Beaumont, a Critical Study*, 1883; C. M. Gayley, *Beaumont the Dramatist*, 1914; U. M. Ellis-Fermor, *The Jacobean Drama*, 1936.

Beaumont-Hamel, vil. of France in the dept. of the Somme. The vil. and its immediate neighbourhood were the scene of heavy fighting in the battles of the Somme and Ancre in 1916. The position was a difficult one to attack, by reason of the quarries and excavations in which large bodies of Gers. could remain concealed and practically immune from artillery fire. In the Somme battle, on July 1, the 8th Army Corps, under General Sir Hunter Weston, comprising

the 4th, 31st, and 29th Divs., together with the Newfoundlanders, a force of 50,000 men in all, were detailed to make the assault on this part of the line. In the 31st and 4th Divs. were the 1st E. Lancs, 1st Rifle Brigade, 8th Warwick, 1st Hants, 1st Somerset and 6th Warwick regiments, whose immediate objective was the capture of the Serre-Grandcourt Ridge so as to provide a defensive flank for operations lower down the line. The Somersets advanced farthest, but ended with both their flanks exposed, while, at the same time, the attack N. of B.-H. was entirely held up. The advance on the right was made by the 2nd Dublins, 2nd Seaforth's, 2nd Essex, and 1st Lancasters, whose repeated efforts, however, enabled them to make no headway beyond their own front trenches and only a few men got over the Ger. line. Only 2 of the battalions of the 4th and 31st Divs. remained intact. The 29th Div., which had made hist. in the Gallipoli campaign of the previous year, attacked on the right of the 4th Div., with the 86th and 87th Brigades in the first line, the spear-head of the attack falling on the 2nd Royal Fusiliers and the 1st Lancs Fusiliers. The leading Brit. infantry were quickly up to the Ger. front line, but there they found their further advance thwarted by dug-outs filled with Ger. soldiers. Thus the attack by the whole corps had failed, with severe losses all round, and the sole course was to abandon the attack by nightfall and to hold a defensive line. At the battle of the Ancre in the following Nov., however, the Brit. forces gained a considerable victory by capturing the vil. The credit for this reversal of the fortunes of war fell to the 51st Highland (Territorial) Div. and the Royal Naval Div. (Infantry), who took the vil. by storm with all its network of caverns, a great quantity of machine guns and some 1500 members of the garrison.

Beaumont, Sir George Howland, Eng. baronet, seventh of the auct. family of the Bts. of Stoughton Grange, Leicestershire, was b. in 1753, and educated at Eton. He was a distinguished amateur of the arts and friend of artists, possessed himself considerable skill as a landscape painter, and was one of the most munificent donors to the Brit. national collection of pictures. He d. in February, 1827, without issue.

Beaumont, Jean Baptiste Élie de (1798-1874), Fr. geologist, b. at Canon. He went to England with a view to preparing a geological map of France after the publication of Greenough's map, 1820. The result was later seen in the map pub. by him and Dufrenoy, 1840, his greatest service to geology. He was engineer in chief, 1833, and inspector-general of mines, 1847. He was perpetual secretary of the Academy of Sciences, 1853, in succession to Arago. His theory of the origin of mt. ranges, *Notice sur le système des montagnes*, 1853, is not now accepted, but it was of great value from the detailed researches he made in its preparation.

Beaumont, Sir John (1583?-1627), Eng.

poet. He was *b.* in Leicestershire, an elder brother of Francis B., and educated at Oxford, which he entered in 1596. He was knighted in 1603. His patron was the duke of Buckingham. In religion he was a Puritan. His best-known poem is *Bosworth Field*, first pub. 1629. Among his friends, not the least intimate was Michael Drayton. He was buried at Westminster Abbey. See his *Works*, ed. A. B. Grosart, 1869.

Beaumont, Joseph (1616-99), Eng. poet. He was *b.* at Hadleigh, Suffolk, and was educated at the local grammar school. He subsequently entered Cambridge. His poems include an epic *Psyche, or Love's Mystery*, 1648.

Beaumont-sur-Oise, tn. in the dept. of Seine-et-Oise, France, on the Oise, about 18 m. from Paris. It has a trade in grain, cattle, and cheese. Pop. 5000.

Beaumont-sur-Sarthe, tn. in the dept. of Sarthe, France, on the riv. of the same name, and about 15 m. S. of Alençon. Pop. 1700.

Beaune, tn. in the dept. Côte-d'Or, France. Its manufs. are white metal, oil, vinegar, and casks. It is the centre of the burgundy wine trade. Its buildings include the churches Notre Dame and Saint Pierre, both of the twelfth century. In the eighteenth century there were seven monastic buildings in the tn. besides a Benedictine abbey and a Carthusian convent. B. appears as a fortified place as early as the seventh century and for some time was the cap. of a separate duchy. United to Burgundy in 1227, it became the first seat of the Burgundian Parliament and was the residence of sev. of the dukes. Pop. 12,000.

Beaune, Florimond de (1601-52), Fr. geometer and friend of Descartes, *b.* at Blois. He commented on Descartes's geometry, is noted for his problem on curves, and invented sev. astronomical instruments.

Beaune-la-Rolande, tn. in the dept. of Loiret, France. It is of great antiquity, was devastated by the Eng. in the Middle Ages, and its church was rebuilt by Charles VII. Here the Fr. under d'Aurelles de Paladine, were defeated by the Gers., Nov. 28, 1870. Pop. 1700.

Beaupréau, tn. in the dept. Maine-et-Loire, France, situated on the Èvre, about 28 m. from Nantes. Pop. 3500.

Beauregard, Pierre Gustave Toutant (1818-93), Amer. general, *b.* at New Orleans. Appointed general, Aug. 1861, he commanded the Confederate Army at Shiloh, 1862, after A. S. Johnston's death in the battle and withdrew to Corinth, which position he defended against Halleck for a month. From Sept. 1862 till May 1864 he defended Charleston and then defeated Butler at Drury's Bluff. He surrendered with Johnston after the campaign against Sherman in 1865. See A. Roman, *Military Operations of General Beauregard*, 1883.

Beauregard-l'Évêque, com. in Puy-de-Dôme, France, noted for an anct. building erected by the bishops of Clermont as a house of recreation. Pop. 800.

Beaurepaire, vil. in the dept. Isère, France, on the Suzon and Auron Rs., 18 m. from Vienne. Silk-throwing is carried on, and there are tanyards and cutlery works. Pop. 3000.

Beau Séant, or **Bauceant**, banner belonging to the knights templars in the thirteenth century. It was an oblong flag with the design in white and black.

Beausobre, Isaac (1659-1738), Fr. Protestant divine, studied at Saumur. After the revocation of the Edict of Nantes he fled to Holland and thence to Germany, where he was a favourite with Frederick William I.; he lived at Berlin 46 years. He wrote critical and historical work on the N.T.

Beausset, vil. in the dept. of Var, France, 11 m. from Toulon. Earthenware is manufactured and there is a trade in oil, wine, and corn. Pop. 1800.

Beauty, that quality in visible objects in consequence of which their colours and forms are agreeable to the human mind. Though at first applied to objects perceptible by the sight, an easy transition extended the meaning of the word to include the other senses. By a further extension, beautiful has become merely a term of praise synonymous with admirable, e.g. beautiful language. See *ÆSTHETICS*.

Beauvais, tn, cap. of the dept. Oise, France. It is situated at the junction of the Avelon and Thérain, in a beautiful valley. It is an anct. place, having been known to the Rom., who called it *Cæsaromagus*. Its cathedral, begun in 1247, is famous, and the stained-glass windows from the 13th to the 16th century are specially noted. B. is famous for its heroic defence against Charles the Bold in 1472, when the garrison being reduced to 300 men, the women took up arms under Jeanne, called *Hachette* from the weapon with which she armed herself. The siege is still commemorated every year by a procession in which the women precede the men. It was at B. that the Brit. airship *R. 101* came down in flames in Oct. 1930. The centre of the tn. was severely damaged and partly destroyed by bombing during the Second World War. The manufs. are tapestry, carpets, gold and silver lace, brushes, etc. Pop. 19,000.

Beauvoisis, or **Beauvaisis**, dist. of France, formerly comprised in the gov. of Picardy, then of the Ile-de-France; now part of the arron. of Beauvais in the dept. of Oise.

Beaux-Arts Institute of Design, Amer. school of fine arts situated in New York, and modelled after the analogous society in Paris. It was founded in 1916 by the Society of Beaux-Arts Architects to teach the fine arts, at the lowest practicable cost, to students with the view of carrying the student beyond the academic stage to that of practical application; and, further, to bring about co-operation among the different art schools of the U.S.A.

Beaver (*Castor*), name applied to a genus of rodents of the family Castoridae. There are only 2 species, *C. fiber* and *C. canadensis*; the former is a native of

Europe, and the latter of N. America. They are related to squirrels and prairie dogs, and are noted for their intelligence, their skill in building houses and dams, their glossy fur, and glands which secrete castoreum, used in medicine. In length they are about 1 to 2 ft., while the broad, flat tail is about another foot long; their feet are webbed. Their food consists of the bark of trees and occasionally they eat fruit. They live in large communities in burrows or lodges near the banks of a stream, for in habit they are aquatic. To obtain wood, both for building and for food, they gnaw round the bases of trees until they fall, when they float them down

BEAVER

stream to their houses. When the wood near home is exhausted they construct canals and dams so that they may bring into their power the wood beyond their reach at the time, and in this way whole tracts of land are deprived of timber and covered with water. The European *B.* seldom construct dams, but *C. canadensis* by its construction does much damage. Their houses, or lodges, are built on the banks of streams or on small is., and are made of twigs, moss, and grass plastered together with mud, and the entrance passage is often protected by piles of sticks. The *B.* is hunted on account of its fur, the fatty castoreum, and its flesh—especially that of the tail—and is in danger of total extermination. See E. R. Warren, *The Beaver*, with full bibliography (London and Baltimore), 1927.

Beaver, Sir Philip (1766-1813), Eng. naval captain. At the age of 11 he accompanied Captain Joshua Rowley in the *Monarch*. He joined a scheme of colonisation in Bulama Is., near Sierra Leone, but the venture proved disastrous.

Beaverbrook, Sir William Maxwell Aitken, first Baron, of Beaverbrook, New Brunswick, Canada, and of Cherkley, Surrey, was b. May 25, 1879, third son of the Rev. Wm. Cuthbert Aitken, minister

of Newcastle, New Brunswick; who was son of Robert Aitken, of Torpichen, W. Lothian. W. M. Aitken was at an early age in business at Halifax, Nova Scotia. In 1907 he became a stockbroker in Montreal where in 1910 he began what ended in the amalgamation of all the Canadian cement-mills—making £1,000,000 on the deal. Then he came to England; and, as Conservative parl. candidate, won Ashton-under-Lyme, 1910. He became private secretary to A. Bonar Law (q.v.) and was knighted June 20, 1911. Early in the First World War Aitken was at the Front—in the capacity of the Canadian Gov.'s 'Eye-Witness'; and he was made a baronet 1916, and a peer in 1917 after Lloyd George had become Premier. He was chancellor of the Duchy of Lancaster and minister of information, 1918-19. Afterwards he turned his attention to the management of newspapers. Having already a considerable share in the London *Daily Express*, he now took sole charge of that organ; he then estab. the *Sunday Express*, and bought the *Evening Standard* from the Hulton group. On the defeat of the Conservative party at the polls, May 1929, he launched his 'Empire Free Trade' policy. During the Second World War he was appointed minister for aircraft production in the Churchill Gov. in May 1940. He at once put in hand a programme for a greatly increased output of essential types of machine, particularly Spitfires, Hurricanes, and Whitley bombers. In Aug. 1940 he was made a member of the War Cabinet; minister of state, 1941; minister of supply, 1941-42. Publications: *Canada in France* (2 vols.), 1916-17; *Success*, 1921; *Politicians and the Press*, 1925; *Politicians and the War* (2 vols.), 1928-32; *The Resources of the British Empire*, 1934. See lives by F. A. Mackenzie, 1931, and W. J. Brittain, 1941.

Beaver Dam, tn., Dodge co., Wisconsin, U.S.A. It is situated on B. Lake, 65 m. W. of Milwaukee. Its manufs. are wool, cotton, metal goods. Wayland Academy is a Baptist college in the tn. Pop. 10,000.

Beaver Falls, tn., B. co., Pennsylvania, U.S.A.; it lies 32 m. N.W. of Pittsburgh on a plateau above the B. R. It has a large manuf. of iron and steel goods of all descriptions. The Presbyterian Geneva College is now at College Hill close by. Pop. 17,000.

Beaver Rat, name given in Australia to the native water-rat of the genus *Hydromys*, family Muridae, and order Rodentia. These small mammals are related to voles, hamsters, and lemmings.

Beaver-tree, sweet bay, or swamp laurel, the *Magnolia glauca*, growing in swampy ground from Massachusetts to Florida. It has evergreen leaves and round fragrant white flowers.

Beawar, tn. in the dist. of Ajmeer-Merwara, Rajputana, India, situated 30 m. from Ajmeer and is a centre of the raw cotton trade. Pop. 22,000.

Beazley, Sir Charles Raymond, Eng. geographer and historiographer, b. at Blackheath, Apr. 3, 1808; educated King's College, London, and Balliol College, Oxford; fellow of Merton College

1889-90, and research fellow 1897-1910. He was Lowell lecturer at Boston, 1908, member of the Brit. Univs. delegation to France, 1910, 1921, and member of advisory committees of the Brit. Labour party for international affairs and education. He was prof. of modern hist. at Birmingham Univ., 1909-33, and between 1930 and 1937 he made 5 lecture tours in Germany. He was knighted in 1931. His pub. works include: *James of Aragon*, 1890; *Dawn of Modern Geography* (3 vols.), 1897, 1901, 1906; *Voyages and Travels of the Sixteenth and Seventeenth Centuries* (2 vols.), 1902; *John and Sebastian Cabot*, 1898; *Voyages of Elizabethan Seamen*, 1907; *Notebook of Medical History*, 1917; *Nineteenth Century Europe*, 1922; *The Road to Ruin in Europe*, 1932.

Bebeerine, or **Bibirine**, extract of the bark of the greenheart, *Nectandra rodigii* or *leucantha*, of Gulana, the native name for which is *bibiru*. Its efficacy as a tonic and febrifuge was discovered in 1835 by a doctor in Demerara, Hugh Iodice, and its properties chemically analysed by Sir D. MacLagan, 1841.

Bebek, bay and small tn., on the W. shore of the Bosphorus, some 6 m. from Istanbul. An eighteenth-century palace of the sultans overlooks the beautiful bay.

Bebel, Ferdinand August (1840-1913), Ger. Socialist and leader of the Social-Democratic party, b. at Cologne. He worked as a turner at Leipzig, joined the Working Men's Association, 1863, and became a Socialist, 1865. In 1867 he was elected to the N. Ger. Reichstag and to the united Ger. Reichstag in 1871, of which he remained a member until his death. He with Liebknecht opposed the war in 1870, and in 1871, as the only Socialist member, the annexation of Alsace. In 1872 he was imprisoned for high treason. With Liebknecht he organised the Social-Democratic party and joined the staff of *L'œuvre*, 1890. His oratorical powers gave him a commanding position in his party, which survived the attacks of the more violent 'young' Socialists on one hand and the 'Revisionists' on the other. He became leader of the parl. Socialists and was a confirmed adherent to Marxian principles. His chief publications are *Der deutsche Bauernkrieg*, 1876; *Unsere Ziele*, 1886; *Charles Fourier*, 1890; and his attack on bourgeois marriage, *Die Frau und der Sozialismus*, 1883, and an autobiography, *Aus meinem Leben*, 1910-14.

Bebington, urban dist. of Cheshire, on the Mersey, near Birkenhead, of which it is virtually a suburb. It is a residential dist. for Liverpool. Pop. 35,000.

Bèbre, riv. of France, which rises in the dept. of Loire, and drains the S.E. of the dept. of Allier. After a course of 47 m. it enters the R. Loire.

Beo, Abbey of, Benedictine abbey, of which only the ruins remain, near Bernay, Normandy. It was founded by Herlwin or Herlewin in 1034. Under Lanfranc as prior and Anselm, prior and abbot, it became the centre of learning in Europe.

Beccafumi, Domenico (1484-1549), It. painter, b. in Siena. Son of a peasant,

Giacomo di Pace, who was employed on the estate of Domenico's subsequent patron, Lorenzo Beccafumi. Domenico was at one time known as Il Mecherino, from the name of an artist with whom he worked; but, later, he was known by the name of his patron. He painted in distemper and in oil; better in the former style, and his small figures are superior to his larger ones. He is remembered chiefly for the work he did for the famous pavement of the Duomo of Siena. His best works are in Siena.

Beccaria, Cesare Bonesana, Marquis of (1735-93), It. writer on moral and political philosophy; a student and in a manner imitator of Montesquieu; pub. a work on the monetary abuses in Milan. He ed. a paper, *Il Caffè*, after the manner of the *Spectator*. His best-known work was *Crimes and Punishments*, a work singularly in advance of his time. In 1768 the Austrian gov. founded a chair of political philosophy for him at Milan. See CAPITAL PUNISHMENT.

Beccaria, Giovanni Battista (1716-81), It. physicist, b. at Mondovì; studied theology at Rome, and was prof. of philosophy at Palermo. In 1748 the king of Sardinia appointed him to the chair of natural philosophy at Turin. He pub. various works on electricity; elected a fellow of the Royal Society, London, 1755.

Beccles, a municipal borough and mkt. tn. in Suffolk, England. It is situated on the r. b. of the Waveney, which riv. is navigable to Yarmouth. The tn. is 110 m. from London. Printing is an industry, and there are ironworks. Pop. 7100.

Beccerra, Gaspar (1520-70), Sp. painter and sculptor. He was a native of Baeca in Andalusia. He studied, it is said, under Michelangelo in Rome. Philip II. had many of the rooms of his Madrid palace painted by him.

Bee-fn, Fr. name for various warblers of the family Turdidae. It includes such thin-billed birds as the stone-chat and hedge-sparrow.

Bèche, Sir Henry Thomas de la (1796-1855), Eng. geologist, b. in London. He attained a reputation by his geological map of England, in which he was assisted by the Gov. He became president of the Geological Society in 1847.

Bèche de Mer, often known by the Malay name *trepang*, or as sea slug or sea cucumber, species of holothurian echinoderms, about 5-12 in. long, with either smooth or warty skins. They are found chiefly off the coasts of the E. Archipelago and New Guinea and Queensland. First boiled and then dried in the sun and smoked, they are used in gelatinous soups in Chinese cookery, and are considered a great delicacy.

Becher, Johann Joachim (1635-82), Ger. chemist and physician, b. at Spire, became prof. of medicine at Mainz; his *Physica Subterranea*, 1669, contain his experiments on various substances; Stahl's *Doctrine of Phlogiston* is indebted to him (ed. 1703). He d. in London.

Bechstein, Johann Matthäus (1757-1822), Ger. naturalist, b. at Waltershausen

in Saxe-Coburg-Gotha; educated at Jena Univ. He devoted himself to the study of silviculture and was chosen director of the Academy of Forestry at Dreissigacker by the duke of Saxe-Meiningen in 1800. His *Naturgeschichte der Stubenvogel* (1840) has been trans. into Eng.

Bechstein, Karl (1826-1900), Ger. pianoforte-maker, b. at Gotha, Germany. He was the founder of the Berlin firm which still bears his name, and whose instruments are famous for depth of tone.

Bechuanaland, country of Africa, occupying part of the central plateau of S. Africa, bounded by the Orange R. on

estab.; the Bamangwato (102,000), the Chief Khama's people, occupying the main portion of the N.E. of the protectorate, chief tn. Serowe, removed from Palapye, 1903; the Bangwaketsi (24,000); the Batawana (42,000); and the Bakgatla (14,000). In 1909 the Bamalete Reserve (6000) was also fixed. A portion of Matabeleland, the Tati concession, is attached to the protectorate. In 1922 part of S.W. Africa, Caprivi-zipl, was also incorporated, but was transferred back to S.W. Africa in 1929. The W. portion of the protectorate is occupied principally by the Kalahari Desert, where

THE NATIVE HOSPITAL AT SEROWE, BECHUANALAND PROTECTORATE

E.N.A.

the S., the Zambesi R. and Rhodesia on the N., the Transvaal on the E., and S.W. Africa on the W. Politically it is divided into Brit. B., incorporated, 1895, with Cape Colony, area 51,424 sq. m.; pop. over 90,000 of which about 20 per cent are white; and the B. Protectorate, area estimated at 275,000 sq. m.; pop. (census 1946) 252,000, of which 2300 are white. The pop. of Ngamiland (1936 census) is 42,000. The protectorate is governed as a Brit. crown colony by the high commissioner represented by a resident commissioner. The chief European centres in the protectorate are Lobatse, Gaborone, Francistown, and Serowe.

Mafeking, in Brit. B., is the headquarters of the protectorate administration. Until 1915 the excess of expenditure over revenue, derived principally from a hut-tax of £1 per annum, was covered by an imperial grant, but from that year revenue has exceeded expenditure (up to 1944). In 1899 the boundaries of 4 native reserves were

big game abounds; the E. is veldt-land, affording pasture for cattle, the chief wealth of the native peoples. The country is more pastoral than agric., crops depending entirely on the rainfall. Kafir corn, mealies (the chief native food crop), beans, melons, and pumpkins are sown, and, ordinarily, suffice for the people's needs. The winter climate (May to Aug.) is good except in the marshy dists. round Lake Ngami in the Okavango basin, N.W., and in the Makarikari salt marshes, N.E.; the rainfall ranges from 10 in W. to 26 in E.; the soil is fertile but needs irrigation.

Minerals. Gold and silver are found in the Tati concession, where there is mining on a small scale. Gold and silver to the total value of £112,000 were mined in 1941.

Trade. Imports: blankets, ploughs, ironware, and groceries. Exports: cattle, hides, skins, dairy produce, and wood. Rhodesia is the best customer for sheep and goats from B. and the Union for pigs.

Cattle number over 900,000 head, mostly owned by natives. European settlers trade in dairy produce.

Education. There exist at present 10 European, 4 coloured, and 145 native schools. The European schools are financed by the Gov., the native schools mainly by the native treasuries. Under the director of education, the schools are controlled, in most of the reserves, by school committees, on which the missionary bodies, together with Africans, are represented. The Bamangwato have for many years past entirely met the cost of the Khama Memorial School.

Development and Welfare. As in other African dependencies, schemes are under way in B. for effecting improvements in agriculture, medical services, education, and communications, also for combating soil erosion, improving water supplies, irrigation dams, and tribal granaries.

Communications. The railway from Kimberley to Vryburg and Mafeking traverses the B. Protectorate *en route* to Rhodesia. A telegraph line from Cape Province runs from Mafeking through Gaberones and Francistown to Bulawayo and Salisbury in Rhodesia.

History. Exploration began at the end of eighteenth century; in 1818 the London Missionary Society settled at Kuruman. Robert Moffat's headquarters from 1821. Livingstone's systematic explorations commenced in 1841. After the Sand River convention, 1852, the Boers began to encroach from the E. The appeals from the native chiefs, notably the Christian and enlightened Khama, during the seventies, led to a temporary Brit. occupation. After the first Transvaal war, the Boers set up the republics of Stellaland (at Vryburg) and Goshen in the N., which they retained contrary to the London convention, 1884. Sir Charles Warren's expedition, 1884, finally brought B. under Brit. rule. The present administrative div. dates from 1895. In that year arrangements had been made to transfer the protectorate, with the exception of the native reserves, to the Brit. S. Africa Company, but as a result of the Jameson raid the Imperial Gov. again took over the administration. The same year portions of native ter. were made over to the Brit. S. Africa Company, Ltd., and are known as the Tuli, Gaberones, and Lobatsi farms. In 1896 the B. Railway Company constructed the railway which connects the Union of S. Africa with Rhodesia. In 1910 the protectorate, excluding the Tati dist., was vested by Order in Council in H.M. High Commissioner for S. Africa, and in 1911 the Tati Concessions, Ltd., were confirmed in their possession of the Tati dist. By an agreement concluded in 1932 with Tshokedi Khani, acting chief of the Bamangwato tribe, the Brit. S. Africa Company obtained the sole right, for 20 years, to prospect for precious stones, minerals, and metals throughout the Bamangwato country. In 1920 an advisory council, both native and European, was estab. for the benefit of the resident commissioner. The Gov. of the Union of S. Africa have

from time to time made efforts to induce the Brit. Gov. to transfer the B. Protectorate, and also the other two high commission territories to the Union, and indeed the S. Africa Act makes provision for the possibility of such incorporation. But hitherto the people of these territories have manifested no wish to change their political status, particularly in view of the fundamental difference between Brit. and S. African native policy. See G. B. Clark, *Transvaal and Bechuanaland*, 1883; J. T. Brown, *Among the Bantu Nomads*, 1926; J. Mockford, *Khama: King of the Bamangwato*, 1931.

Beck, Sir Adam (1857-1925), Canadian engineer, b. at Baden, Ontario, of Ger. parents. Educated at Galt, Ontario, and then joined his father's business at London, Ontario. He was the creator of the hydro-electric system of the power supply which led to the development of Canadian secondary industries. He was a member of the Ontario Legislative Assembly and chairman of the Hydro-Electric Power Commission.

Beck Case, a legal case of mistaken identity. In Apr. 1904 a man named Adolf Beck was identified by sev. women and an ex-policeman as a certain man named Smith, who had previously been imprisoned for fraud. He was tried and convicted of attempting to defraud these women again. While undergoing penal servitude he discovered that Smith was a Jew, and by personal marks he was at length able to prove his innocence. He was pardoned and offered a sum of money as compensation for his imprisonment. Smith was arrested, and Beck d. in poverty in 1909. This case was largely instrumental in bringing about the estab. in England of the court of criminal appeal. See J. Kempster, *Perversion of Justice as exhibited in the Beck Case*, 1905.

Beck, Josef (1894-1944), Polish soldier and politician, b. Oct. 4 in Warsaw. He served with Pilsudski's Polish Legion in 1914, and also in the Polish war with U.S.S.R., 1919-20. When Pilsudski came to power in Poland, B. became foreign minister in 1932. He was instrumental in concluding a pact of non-aggression with Hitler's Third Reich on Jan. 26, 1934, but later when Hitler threatened Danzig, he signed a military alliance with Great Britain on Aug. 25, 1939. After the fall of Poland, B. fled to Rumania, where he was interned. He continued to exert some influence on the exiled Polish gov. in London, mainly in hostility to Russia, and also made unsuccessful overtures to Hitler. He d. at Bucharest.

Becke, George Louis (1848-1913), Australian novelist, b. at Port Macquarie, New S. Wales. His chief works are: *By Reef and Palm*, 1894; *The Ebbing of the Tide*, 1896; *His Native Wife*, 1896; *Wild Life in Southern Seas*, 1897; *Rodman the Boat-steerer*, 1899; *Tom Wallis*, 1900; *Ilelen Adair*, 1903; *Notes from my South Sea Log*, 1905. He also wrote various works in collaboration with Walter Jefferey.

Beckenham, urb. dist. of Kent, England, 9 m. S.E. of London. It is chiefly a

residential area. At Monk's Orchard is the Bethlehem hospital, opened in 1930. Pop. (1931) 44,000.

Becker, Ferdinand Wilhelm (1805-34), Ger. physician, b. at Hoxter on the Weser, where his father, Karl Ferdinand B., a distinguished philologist, practised as a physician. Educated at Göttingen, and in 1820 came to Scotland, where he was appointed assistant librarian in the Advocates' Library (*q.v.*). He was appointed by the Russian Gov. to make inquiries concerning the efficacy of vaccination; he d. suddenly. His works include sev. Lat. treatises on medical subjects, and a pamphlet on *Cholera*, pub. in London.

Becker, George Ferdinand (1847-1919), Amer. geologist, b. at New York Jan. 5; graduated at Harvard and Heidelberg. United States geologist, 1879-92; afterwards on staff of U.S. Geological Survey. Reported on goldfields in S. Africa and Alaska, and on the geology of the Philippine Is.

Becker, Karl Ferdinand (1775-1849), Ger. philologist, b. near Trier, estab. a school at Offenbach, 1823. His prin. work, *Ausführliche deutsche Grammatik*, 1836, was long popular.

Becker, Wilhelm Adolf (1796-1846), Ger. archaeologist, b. at Dresden; studied under Beck and Hermann at Leipzig Univ., and became prof. of archaeology there in 1842. His greatest work is the *Handbuch der römischen Alterthümer*, 1843, finished (1868) by Marquardt and Mommsen, but his most popular books are the scenes of Rom. and Gk. life in the form of romances, *Gallus*, 1838 (new ed. 1880), and *Charicles*, 1840 (new ed. 1877); both have been trans. into Eng. See d. at Meissen.

Beckerath, Hermann von (1801-70), Prussian statesman, b. at Krefeld; gained great wealth from the bank which he founded, 1838; was a member of the Frankfurt Parliament, 1848, and made finance minister.

Becket, Thomas (1119-70), chancellor of England and archbishop of Canterbury. He was b. of Norman parents, his father, Gilbert B., being a well-to-do London merchant. He received his education at Merton Priory and in London, being also given a long course in knightly exercises and later being sent to Paris to study theology. He was attached to the court of Theobald, archbishop of Canterbury, during the years 1148-53. In 1152 the pope ordered Theobald to refuse the crown of England to Eustace, the son of King Stephen, this step having been taken at the instigation, it is said, of Thomas B. On the accession of Henry II. B.'s further promotion was expected. By the archbishop he had already been promoted and offices had been heaped upon him, and a year after the accession of Henry II (1155) he was appointed to the chancellorship. His appointment was popular and was regarded as the beginning of a new era, since he was the first Englishman to receive an appointment of this description since the Conquest. During his period of office he was far more regal in his

manner of living than was the king himself. He was the head of an embassy to the Fr. court, he suggested a means of gaining the Norman Vexin, and he took an active part in the Toulouse campaign. In 1162, when he was created archbishop of Canterbury, he changed his manner of living to that of an ascetic; he determined to support and claim full privilege for the Church; and he became the zealous champion of the Church against the king. Henry II. was anxious to break the power of the Church, and especially to reduce the benefit of the clergy. By the Constitutions of Clarendon he attempted to do this, and although B. at first refused, ultimately he gave a grudging consent. But B. and the king had shown too openly their antagonism, and from this time onwards they became open enemies. B. fled the country, his property was seized, and the revenues of his sees were impounded. A claim was made on him for moneys due from him when chancellor of the kingdom, he remained in France for 2 years, and then went to Rome, where he was reinstated by the pope in his archbishopric. In 1170 a reconciliation was patched up between himself and the king, and he returned to England. He received a magnificent reception from the people, but quarrels soon broke out again. The coronation of the young King Henry during B.'s absence led him to excommunicate the bishops who had taken part in it. The news of this aroused the Angevin fury of Henry II., and he burst forth with the words that led to the murder of B. in Canterbury Cathedral by 4 of the king's knights. The murder took place on Dec. 29, 1170. B. was canonised in 1172. See W. H. Hutton, *Thomas Becket, Archbishop of Canterbury* (Makers of National History series), 1910; S. Cunningham, *The Story of Thomas Becket*, 1914; also biographies by J. C. Robertson, 1857, and W. H. Hutton, 1926.

Beckford, William (1759-1844), Eng. author, the son of William Beckford (1709-70), lord mayor of London and supporter of Wilkes, was b. at Fonthill Abbey, Wilts. He inherited a fortune on his father's death. In 1783 he married Lady Margaret Gordon, daughter of the fourth earl of Aboyne. After his wife's death in 1786 he went to Portugal. He was M.P. for Wells 1784-90, when he resigned, and for Hindon 1806. In 1801 he sold the contents of Fonthill, and began the building of a new house at a cost of nearly £300,000. His eccentric habits of seclusion here gave rise to various stories. In 1822 he sold Fonthill to John Farquhar, who sold his collection of pictures and art treasures; 3 years later the tower (260 ft. high) collapsed and destroyed part of the house. B. built another tower near Bath, where he lived till his death. The oriental romance for which he is chiefly remembered, *The History of the Caliph Vathek*, was originally written in Fr. and (according to the *Quarterly Review*, June 1834) was pub. before B. had closed his twentieth year. Justin Hannaford (introduction to reprint of 1905) states that it was composed

in 1785 or 1786, and (as B. was wont to assert) at a single sitting of 3 days and 2 nights. Yet other accounts say that it was written in Fr., 1781 or 1782, and first pub. in Fr. in 1787. His *Letters from Portugal* were pub. in 1834, and in the same year a reissue of his satirical *Biographical Memoirs of Extraordinary Painters*, originally written in 1780. See C. Rodding's *Memoirs*, 1859; R. Garnett's ed. of *Vathek*, 1893; and L. Melville, *Life and Letters*, 1910. See also *The Travel Diaries of William Beckford*, ed. by G. Chapman, 1928.

Beckmann, Johann (1739-1811), Ger. writer, b. at Hoya in Hanover. Educated at Göttingen Univ. where, in 1766, he was made prof. of natural science. His prin. work was the *History of Inventions*. He wrote also *A History of the Earliest Voyages made in Modern Times* which he left incomplete. His eds. of the *Wonderful Histories* of Antigonus Carystius and of Marbodius's *Treatise on Stones* show a rare union of scientific knowledge with philological learning.

Beckton, dist. of Essex, England, near the l. b. of the Thames, 9 m. from London, by rail. There are enormous gasworks and the N. outfall of the metropolitan drainage system is here.

Beckum, tn. of Westphalia, Germany, 23 m. S.E. of Münster. Pop. 11,000.

Beckwith, John Charles (1789-1862), Brit. general and missionary, b. in Nova Scotia, was a nephew of General Sir Thomas B. (q.v.). He served in the Light Div. during the Peninsular war, and lost a leg at Waterloo. In 1827 the condition of the Waldensians in Piedmont turned him to missionary work. He settled at La Torre, founded 120 schools and built a church.

Beckwith, Sir Thomas Sydney (1772-1831), Eng. soldier, son of Major-General John B., who led a regiment of foot at Minden. He won a great reputation as a leader of light troops, and was practically the creator of one of the finest units, the 95th, in Moore's celebrated Light Div. It was in India under Baird that B., as a subaltern, learned military organisation, and when, on his return to England, a rifle corps or regiment of light troops was about to be formed, B. obtained a captaincy in the new unit which, later, was known as Manningham's Rifles or the 95th of the Line. B. became the lieutenant-colonel of this regiment in 1803, and the part that he and his brigade took in closing Moore's retreat from Portugal is graphically described by Napier. Subsequently he again distinguished himself in the Peninsular war, notably at Busaco and at Sabugal. In 1829 he was appointed commander-in-chief at Bombay, India, Jan. 15.

Beckx, Pierre Jean (1795-1887), general of the Jesuits, b. at Sichen, in Brabant, and d. at Rome. He became confessor to the duke of Anhalt-Köthen, and procurator for the prov. of Austria in 1847. Six years later he was made general of his order, and as such influenced Pope Pius IX. He took a prominent part in the discussions concerning the Immaculate Conception and papal infallibility.

Beoman, John Christopher (1641-1717), Ger. historian and geographer, was b. in Anhalt. He d. at Frankfurt.

Becon, Thomas (1512-67), Eng. divine, chaplain to Archbishop Crammer. He graduated as B.A. at the age of 16 at St. John's College, Cambridge. His religious opinions caused his summons to London, there to recant them and further to burn the books wherein they had been proclaimed. During the reign of Edward VI. he prospered, but was sent to the Tower on the death of the king. His release followed on Elizabeth's accession.

Becontree, dist. of Essex, part of the urban dist. of Dagenham, 11 m. from London. Here the L.C.C. has built houses to accommodate nearly 100,000 persons.

Beccue, Henri François (1837-99), Fr. dramatist, b. in Paris. Was for some time a banker. His plays, which met with varying success, include the opera *Sardanapale*, 1867; *Michel Paupe*, 1870; *L'Enlèvement*, 1871; *Les Corbeaux*, 1882; and *La Parisienne*, 1885.

Bequer, Gustavo Adolfo (1836-70), Sp. poet and man of letters, the son of an artist, Joaquín B. In 1856 he went to Madrid, and earned a scanty living on translations and miscellaneous journalistic work. He wrote 3 vols. of poems and prose legends. In the former he was imbued with the romantic spirit that influenced Byron and Heine; his prose legends are weird and morbid. See his *Works*, ed. by Correa, with a biographical introduction (Madrid, 1885).

Bequerel, Antoine César (1788-1878), Fr. physicist, b. at Châtillon-sur-Loing; served in the Fr. army as an engineer in Spain, 1810; he was appointed to the Ecole Polytechnique and served in France in 1814. He then left the army and began to study with Ampère and Biot magnetism, electro-conductivity, and more particularly electro-chemistry. In 1837 he became prof. of physics at the Musée d'Histoire Naturelle. The value of his researches in electrical science was recognised by the Royal Society with the Copley medal, 1837, and he may be regarded as one of the pioneers in the study of electro-chemistry. Of his numerous scientific publications the chief are *Traité d'électricité et du magnétisme*, 1840; *Éléments de l'électro-chimie*, 1843; *Traité complet du magnétisme*, 1845; *Éléments de physique terrestre et de météorologie*, 1847.

Bequerel Rays, invisible rays given off by uranium. The property of radioactivity of uranium was first discovered by Antoine Henri B. (1852-1908), who was a prof. at the Ecole Polytechnique in Paris, and awarded the Nobel prize in 1903. He was the grandson of Antoine César B. (q.v.).

Becse, or Becsej, tn. of Vojvodina, Yugoslavia, on the r. b. of the Theiss; has a large trade in grain. Pop. 22,900.

Bective Abbey, anct. building situated on the R. Boyne, 5 m. from Trim, Ireland. In later times a church was erected on the site of the ruined abbey, and the steeple of the church still remains.

Bed, term generally for the sleeping

place for human beings or animals; specifically a piece of furniture used for sleeping. Primitive man made his bed upon the floor of a cave or hut of skins, of leaves, of ferns, of dried grass or straw. E. nations pile sleeping-mats and rugs on the floor for night, and remove them in the day. The bed of the O.T. and N.T. can be seen to-day in the E. In India the string bed stretched on a low framework of wood, the *charpoy*, marks a transition towards the bedstead. The material of the bedding, straw, wool, or feathers, has not varied much since early times; hair was used in the Middle Ages. Pillows and bolsters were used in anct. Greece and Rome. The curved head-rest of wood or more costly material is found in anct. Egypt, and to-day in Japan, in Africa, and the Pacific. In modern times flock, wool, horsehair are used for the stuffing of bedding; feathers, still used for pillows, have ceased to be a luxury for the bed; the spring mattress has given place to the coiled wire-woven net, fixed in the framework, a development of the crossed plate of iron or webbing descended from the hide thongs of anct. times which supported the bedding. The bedstead proper in anct. Egypt was a low frame-work of wood, on which was stretched a webbing of rushwork or fibre; more lofty beds, with steps, were used for persons of rank. The early Gk. bed had a head-board, and laced thongs of hide bore its pile of skins or other coverings. Oriental influence brought carving and inlay of metal and ivory, which the Romans copied. At Pompeii have been found the carved bronze posts and head-rests of beds which once supported a narrow frame of wood; such were probably placed in an alcove and sheltered by curtains. In the early Middle Ages the bedstead, where used, appears to have been a box-like construction, but there are illustrations in MSS. of beds with carved and decorated head- and foot-boards; others are mere couches or benches placed against the wall with curtains hung from a side cornice. A feature of twelfth- and thirteenth-century beds is their slope from head to foot. In the fourteenth century is found the tester, with canopy and side curtains usually hung from a wall-projection at the head. It must be remembered that bedsteads were luxuries for the well-to-do, and that the common folk slept, as did their ancestors, on rushes, skins, or straw upon the floor. Till the end of the fifteenth and beginning of the sixteenth century most of the decoration seems to have been lavished on the bed-trappings, which a great personage carried with him, to furnish the light frameworks of the permanent bedsteads. With the sixteenth century comes the great 4-post bed, with its opportunity for the craft of the wood carver. Many fine examples of Elizabethan and Jacobean beds of this type still exist. A historic example is the great bed of Ware, once at the 'Saracen's Head,' now at Rye House. With the end of the seventeenth century a return was made to the tester, but the canopy and side curtains rest on the head-

posts of the bed, and the foot-board, carved and curved, remains or is dispensed with. France was before England in the change, and the eighteenth century in France produced ornate and beautiful examples. Chippendale and Sheraton designed fine mahogany bedsteads, and the present day has seen a revival of the taste for wooden bedsteads in preference to the iron and brass bedsteads which had come into use since the middle of the nineteenth century.

Bed, in geology, term used to indicate the layers of certain rocks, usually called strata. See GEOLOGY.

Bedale, see BEDE.

Bedale, mkt. tn. of the W. Riding of Yorkshire, England, 7 m. from Northalton by rail. The B. hunt is named after the tn.

Bedarieux, tn. in the dept. of Hérault, France. There are manufs. of wool and cloth, and also tanneries and distilleries. Pop. 8000.

Bedda, or **Beda**, Nuts, product of *Terminalia bellerica*, species of Combretaceae. These tropical seeds are used in medicines, and also in dyeing and tanning. In common with the seeds of sev. other plants they are called myrobalans.

Beddard, **Frank Evers** (1858-1925), Eng. naturalist, was educated at Harrow and Oxford. He was prospector to the Zoological Society 1884-1915; formerly lecturer on biology at Guy's Hospital, and examiner in zoology and comparative anatomy at the univ. of London, and of morphology at Oxford. He was also naturalist to the *Challenger* expedition commission, 1882-84. His works are *Animal Coloration*, 1892; *Text-book of Zoogeography*, 1895 *A Monograph of the Oligochaeta*, 1895; and *Structure and Classification of Birds*, 1898.

Beddgelert, i.e. the grave of Gelert, vill., Carnarvonshire, N. Wales, 13 m. S.E. of Carnarvon. It is close to the pass of Aberglaslyn, in which is the rock called the chair of Rhys Goch, the bard (d. 1429). From the vill. lying at the foot of Snowdon, the ascent can be made. Pop. 1100. The traditional grave of Llewellyn's hound, Gelert, is marked by a stone, recalling the legend of the hound who saved his master's child from a wolf and was killed in mistake by the father.

Beddington, dist. of Surrey, England, on the Wandie, 2 m. from Croydon. It has a public park, and an orphan asylum which was formerly the seat of the Carew family. Pop. 26,000.

Beddoe, **John** (1826-1911), Eng. anthropologist and physician, b. at Bewdley, Worcestershire. He was educated at Univ. College, London, and Edinburgh. He served during the Crimean war as a doctor on the civil staff, and from 1857 had a medical practice in Clifton, Bristol. His anthropological works include *The Races of Britain* (1885); *Stature of Man in British Isles* (1870); *The Anthropological History of Europe* (1910).

Beddoes, **Thomas** (1760-1808), Eng. physician, b. at Shifnal, in Shropshire. Entered at Pembroke College, Oxford, 1776, and studied languages, chemistry,

and geology. Came to London, 1781, and studied medicine under Sheldon. He took degree of doctor of medicine at Oxford, 1786, and visited France in the following year. At the outbreak of the Fr. Revolution, he supported the rebels, and in consequence had to leave Oxford. He returned to Shropshire, and wrote the *History of Isaac Jenkins* intended to check drunkenness. In 1794 he married Anna Edgeworth, sister of Maria Edgeworth. He was the inventor of a 'pneumatic' system of therapeutics by inhalation of medicated gases, and set up an institution, which is notable as having provided Humphry Davy with opportunities for his researches.

Beddoes, Thomas Lovell (1803-49), Eng. poet, b. at Clifton, the son of Thomas B. (q.v.). His poetic drama, *The Bride's Tragedy*, 1822, is modelled on Webster and Tournear, and his verse re-echoes that of the Jacobean dramatists. His fantastic and amorphous drama in verse, *Death's Jest-book, or The Fool's Tragedy*, was pub. posthumously, 1850, by his friend, T. F. Kelsall, who was his literary executor, and in 1850-51 pub. a memoir of B. and collected eds. of his poems. Many of B.'s lyrical poems are exquisite, as, e.g., *If thou wilt ease thy heart, and if there were dreams to sell*. From 1824 till his death B. lived a wandering life abroad, chiefly in Germany and Switzerland, but his revolutionary views prevented his remaining long in one place. He committed suicide under peculiar circumstances in 1849 at Basle. See E. Gosse, *Poetical Works of T. L. Beddoes*, 1890, 1928, with the first full account of his life, and *Letters*, 1894; R. H. Snow, *Thomas Lovell Beddoes, Eccentric and Poet*, 1928; H. W. Donner, *Thomas Lovell Beddoes: the making of a Poet*, 1935.

Bede, Bēda, or Bēda, surnamed The Venerable (c. 673-735), Eng. historian, b. in the ter. of the monastery of St. Peter at Wearmouth. When 7 years old he was admitted to this monastery, and studied under the famous abbot, Benedict Biscop, and his successor, Ceolfrid. In 682 Biscop founded the neighbouring monastery of Jarrow, and it is here that B. generally resided. In his nineteenth year he was admitted to the diaconate by St. John of Beverley, then bishop of Hexham, and 11 years later the same bishop ordained him priest. At the end of his *Ecclesiastical History* B. gives us these particulars of himself, and goes on to mention how the observance of the monastic discipline, the daily charge of singing in the church, and the delights of learning, teaching, and writing had made up his holy and tranquil life. His learning was great, covering almost all the subjects then known: Lat., Gk., astronomy, medicine, and probably some Hebrew. His *Ecclesiastical History* is a chief source of knowledge of the early hist. of England. Its facts are derived partly from the Rom. writers, but still more from native sources and traditions. King Alfred trans. it into Anglo-Saxon. B. also wrote scientific works, including a treatise on the calendar, and other historical essays, such as the *History of the*

Abbots of his own monasteries. Another large div. of his work consisted of theological treatises and biblical commentaries. A collected ed. of B.'s works was first pub. at Paris in 1544. See ed. by J. A. Giles, 1843-44; also C. Plummer, *Bedæ Opera Historica*, 1896. An Eng. trans. of the *Ecclesiastical History* is pub. in Everyman's Library.

Bedeau, Marie Alphonse (1804-63), Fr. general, b. and d. at Verton, near Nantes. He was sent to Algeria in 1836, and in 1847 became its governor-general for some time. During the revolution in 1848 he was appointed, by Marshal Bugeaud, commander of one of the 5 columns for its suppression, but proved of little service. He was arrested with Cavaignac and La Moricière in 1851 and banished, but in 1859 returned to his native land.

Bedeaux System, also known as B. point plan, a wage incentive system based on a form of job standardisation covering direct and indirect production work. The employee receives a basic hourly wage until his efficiency exceeds a standard fixed in advance by time study. Production in excess of standard is rewarded by an increasing hourly rate strictly related to production, until for high production it becomes almost a pure piece rate. Thus, if production is 150 per cent of standard, the daily wage earned is 140 per cent of the basic daily wage. The system is similar in principle to other incentive systems involving the 'sharing' of savings resulting from super-standard production between employer and employee. The application is usually accompanied by the fixing of high standards and the exercise of rigid control, but is not concerned with production methods, and has therefore led to industrial disputes and considerable controversy.

Bede, Cuthbert, see BRADLEY, EDWARD. **Bedegar, or Bedeguar** (Persian, wind-brought), name of a spongy gall, found chiefly on the wild rose, and especially on the sweetbrier. It is covered with a mossy growth which is really undeveloped leaves. The gall-insect which produces it is *Rhodites rosæ*. See GALLS.

Bedel, see BEADLE.

Bedell, William (1571-1642), Eng. prelate, b. at Black Notley in Essex. Took holy orders and was chosen fellow of his college, Emmanuel, Cambridge; was chaplain to Sir Henry Wotton at Venice. On his return to England he trans. into Lat. various works concerning the hist. of the Church. In 1627 he became provost of Trinity College, Dublin, and in 1629 was elected bishop of Kilmore and Ardagh; he fought the Catholics in a novel manner, by converting the better among their priests; he aided in the trans. of the Prayer Book and Bible into Erse, and saw that the trans. was read in his diocese. In the rebellion of 1641 he was unmolested at first, but was afterwards imprisoned; he d. in consequence of this. The trans. of the N.T. was pub. at Dublin, 1602.

Bedesman, or Beadsman, an almsman, who offered *bedes* or prayers for his benefactor's soul. Bedesmen were attached

to the churches. In Scotland the king's bedesmen were licensed mendicants, who received maintenance in kind on the king's birthday. Later the word came to mean a pensioner, or the inmate of a hospital.

Bedford: (1) Co. tn. of Bedfordshire, England, and a parl. and municipal bor. It is situated on the R. Ouse, amid fertile pasture lands and corn fields, about 50 m. from London. The riv. banks are tastefully laid out as promenades, and there are 2 large parks. There is considerable trade in mkt. garden and agric. produce. Engines and agric. machines are manufactured. Sir W. Harper (*d.* 1573), lord mayor of London in 1561, is buried in St. Paul's Church. He did much to benefit B., his native place, and endowed an Edward VI. grammar school, and the 'Harper Trust' supports a modern and other schools for boys and girls. The name of John Bunyan is associated with the tn. He was imprisoned in the jail; his chair is preserved, and the Bunyan meeting house is on the site of the chapel in which he preached. B. returns one member to Parliament. Pop. 40,500. (2) Co. seat of Lawrence co., Indiana, U.S.A., 60 m. N.W. of Louisville: shipping port of the Bedford, Indiana, oolitic limestone, the best building stone in the U.S.A., and of which many important buildings have been constructed. It has also cement works and machine shops. Pop. 12,500. (3) Co. seat of Bedford co., Pennsylvania, 35 m. S.W. of Altoona: its many mineral springs attract visitors during summer. In 1758 Fort Bedford, an important military frontier post, was constructed. Pop. 3000.

Bedford College, women's college of London Univ., founded in 1849 by Mrs. Reid to provide a liberal education for women. In 1878 the London Univ. admitted women to degrees, since which date the majority of students at B. C. read for a univ. degree in arts or science (pass or honours), although a general course of advanced study may be chosen. There are also an art school and a training dept. The original buildings were in Bedford Square; it was then moved to York Place, Baker Street, and in 1913 new buildings in Regent's Park were opened by Queen Mary.

Bedford, Dukes of, see RUSSELL FAMILY.

Bedford Level, dist. in England of about 400,000 ac., situated in the counties of Suffolk, Norfolk, Lincoln, Cambridge, Northampton, and Huntingdon. It was once fenland, and was in the first place drained by the earl of Bedford in 1634. A large portion is under cultivation, and colesed and flax are grown. Wild-fowl live in the more marshy dists. in vast numbers.

Bedford Park, London residential dist. in the bor. of Acton, laid out on garden suburb lines.

Bedfordshire, S. Midland co. in England, bounded by Northampton on the N.W., Bucks on the W., Bucks and Herts on the S., by Herts and Cambridge on the E., and Huntingdon on the N.E. Its area is 302,942 ac. The surface is

generally level; a branch of the Chiltern Hills crosses the N.E. and S. The Great Ouse flows through the centre to the E., and is navigable to King's Lynn from Bedford, the co. tn. The Ivel, a feeder of the Ouse, is also navigable. The valley of B. is fertile, and the Ouse valley is noted for its pasture-lands. Wheat is grown, barley, and vegetables. Sheep-rearing is carried on in the S. The industries are engineering and motor works at Luton, straw-plaiting at Luton and Dunstable, printing at Dunstable, and agric. machines and tools at Bedford and Luton. There are limestone quarries in the co., and the world's largest brickworks at Stewartby. Sev. relics of Rom. times and parts of Rom. roads are still to be seen in various parts. The co. is divided into 9 hundreds and 122 pars., and returns 2 members to Parliament. Pop. 221,000. See F. C. Eccles, *The Edwardian Inventories for Bedfordshire*, 1905; *Bedfordshire* (Victoria County History), 1912-14; C. G. Chambers, *Bedfordshire*, 1917; A. Mee, *Bedford and Huntingdon*, 1939.

Bedfordshire and Hertfordshire Regt., The (formerly 16th Foot), regiment of the Brit. Army, raised in 1688 and sent to Holland in 1689, serving in all campaigns down to peace of Ryswick, 1697. After a few years in Ireland it returned to Holland under Marlborough and fought at Blenheim, Ramillies, Oudenarde and Malplaquet. In 1782 it received the title The Buckinghamshire, which it exchanged in 1809 for The Bedfordshire. During the nineteenth century it served in the W. Indies, Ceylon, Bengal, and N. America. Under Sir R. Low it served in the Chitral campaign in 1895. During the First World War it raised 18 battalions for service in France, Flanders, Italy, Gallipoli, and Palestine. In 1919 the title was changed to The Bedfordshire and Hertfordshire Regiment. Units of the B. and H. R. fought on the W. front in the Second World War. Other units also fought on the It. front, and in Burma, where they were part of the Chindit force.

Bedivere, the last knight of King Arthur's Round Table. His adventures are recounted in the *Morte d'Arthur* of Malory. It was Sir B. who bore Arthur's body to the barge and hurled his sword *Excalibur* into the lake.

Bedier, Joseph (1864-1938), Fr. writer, b. in Paris; educated at the École Normale. One of the foremost authorities on Fr. medieval literature, having a gift for moulding legend and tradition into literary forms of grace and distinction. Held chair of Fr. literature at Fribourg (1889-91), at Caen (1891-93), and at the Collège de France (1893-1925), being administrator of the last-named from 1925 until his death. Publications: *Le Roman de Tristan et Yseult* (1900-20); *Les Chansons de croisade* (1909); *La Chanson de Roland* (1921-26); *La Formation des légendes épiques* (1908-17); Elected to the Académie Française in 1920 in recognition of his *Histoire de la littérature française* (1923).

Bedlam (properly **Bethlem Hospital**), London co. mental hospital, originally

founded in 1247 as a priory at Bishops-gate, under St. Mary's of Bethlehem. Later converted into a madhouse, and transferred in 1676 to Moorfields, then in 1815 to Southwark. At one time the inmates were treated in a cruel manner, being exhibited as though they were wild beasts. Hogarth's picture refers to this. 'Bedlam beggars' or 'Tom-o'-Bedlams' were names given to such patients as, being partially cured, were allowed to go at large. In 1931 the hospital was moved into the country and the grounds on which it stood were given by Lord Rothermere as a playground for S. London children.

Bedlingtonshire, urban dist. of Northumberland, England. It is situated 22 m. above the mouth of the Blyth. It has collieries and glass works. Pop. 27,000.

T. Fall

BEDLINGTON TERRIERS

Bedlington Terrier, so named after the tn. of B. in Northumberland. It was first bred there at the beginning of last century, and was for some time only known to the miners of the dist., with whom it was, as now, a favourite sporting dog. It stands about 13 in. and weighs from 18 to 20 pounds; colour blue-black, with black nose, or liver, tan, or sandy with light-coloured nose; the coat is short, crisp, and inclined to harshness; the head is narrow, the muzzle long and powerful; ears set low, and falling close to the head; tail tapering and not carried high; the legs are long and flanks cut up. The B. is a splendid ratter, and full of courage and fight, with remarkable speed.

Bedloe's Island, in New York harbour, U.S.A., lying, together with Governor's and Ellis Is., in the bay S. of Manhattan Is. On it stands the famous statue of Liberty, presented to the nation by France, which dominates New York harbour.

Bedmar, Alfonso della Cueva, Marqués de (1572-1655), Sp. diplomatist. He was appointed to Venice in 1607 to break up a league against Spain with France and the Netherlands. The plot that he was supposed to have planned, in 1618, with the viceroy of Naples, the duke of Ossuna, to capture the city during the ceremonies of the marriage with the Adriatic of the doge of Venice, is the basis of Otway's tragedy, *Venice Preserved*. He left Venice on its discovery and went to the Netherlands as president of the council. He became a cardinal in 1622, and bishop of Oviedo, where he d.

Bedminster, post-township of Somerset co., New Jersey, U.S.A., about 15 m. S.W. from Morristown. Pop. 2000.

Bed of Justice, originally the throne of the Fr. king, when he was present at the sitting of Parliament. The term signified an occasion when the king overruled parl. decisions, on the principle that his authority was paramount to that of his Parliament, since the latter was his delegate, Louis XVI. held the last B. of J. in 1788, and then he ordered the whole Parliament to be imprisoned.

Bédos de Celles, Dom François (1709-1779), Benedictine monk of St. Maur, was b. at Caux. He was a master in the knowledge of organ-building, and pub. *L'Art du facteur d'orgues* in 1766 to 1778.

Bedouins, i.e. the people of the open land or desert, Arab. *Ahl-bedur*, *Bada-win*, or, as they also call themselves, *Ahl-el-beit*, the people of the tent. According to Arab traditional ethnology, the B. are Mustarabs, naturalised Arabs, the descendants of Ishmael, as distinguished from the pure Arab descended from Shem; thus the latter are the agric. settled Arabs, the B. the nomad pastoral people. The earliest home of the B. was N. Arabia, Hejaz, and Nejd, from whence they spread in early times to Syria and Mesopotamia, and to Egypt and Tunisia. The name has lost much of its true racial significance, for it is often applied to many Hamitic nomad tribes, such as the Bisharin and Hadendos in Lower Egypt and the Sudan, while true B. have settled in vils. and become agric. Physically, the B. of N. Arabia are slight and wiry rather than strong, and below the middle height; in colour, brown, deepening in shade in the S. The features are good, with aquiline nose. Their organisation is tribal, their leader the sheikh, chosen for his qualities, whether of wealth, birth, or courage. Living in tents and moving from well to well and pasture to pasture, the organisation is loose, and intertribal feuds are common, with constant cattle raidings. They were notorious plunderers of caravans and travellers, and a regular toll was paid by the Turkish Gov. to these tribes through whose ter. passed the pilgrimages to Medina and Mecca. The building of the Hejaz railway caused much disturbance in consequence among the tribes. Regarding all travellers as trespassers, they nevertheless respected a safe conduct or passport which could be obtained by payment from a sheikh. The proverbial Arab hospitality was then

freely extended. Though professing Mohammedanism, they are by no means strict observers, except under pressure from the Wahabis, as in Nejd. Polygamy is rare, but the marriage tie is loose. The dress of the men consists of a long skirt and a black camel's-hair cloak, with a black or striped headcloth; the women wear white trousers and skirt, with a large blue cloak which they draw over the face before strangers. The chief authorities are J. L. Burckhardt, *Notes on the Bedouins and Wahabis*, 1831; C. M. Doughty, *Arabia Deserta*, 1882; W. S. Blunt, *Bedouin Tribes*, 1879; Lady Anne Blunt, *Pilgrimage to Nejd*, 1881; Hill Gray, *With the Bedouins*, 1890; S. M. Zwerner, *Arabia, the Cradle of Islam*, 1900; A. Kennett, *Bedouin Justice*, 1925. See also bibliography under ARABIA.

HEDGE BEDSTRAW

Bedsore, sore or type of ulceration which may afflict a patient who is confined to bed through illness, accident, or old age, especially if unable to move freely and often. Constant pressure on one surface causes a loss of vitality to the surrounding tissues through stoppage of the circulation, and results, if neglected, in a discoloration of the skin, then a slough, and finally a deep ulcer. The parts most liable are the base of the spine, the hips, shoulders, heels, and elbows, and the back of the head. The tendency to rapid formation of B. varies with the weight of the patient, his capacity to move, etc., but want of cleanliness, the wetting of bedclothes and bedding from perspiration and excretions, rucked or untidy sheets are the chief exciting causes. A patient should, therefore, be kept scrupulously clean, and washed with soap and water daily, all damp clothing at once changed, the sheets kept smooth and the parts liable rubbed briskly; the skin on these parts should also be rubbed with methylated spirits, eau-de-cologne, whisky, or other stimulant, and dusted with boracic acid or prepared starch powder. A water-bed or an air-cushion for the exposed parts is a good protection and of the utmost use if a B. has formed. Should a slough form, continued fomenta-

tions will bring it away, when the sore can be dressed with boracic ointment, or if persistent in not healing, friar's balsam, red lotion, or zinc ointment may be applied; an ointment containing gentian violet is now often used for bedsore and other skin troubles.

Bedstead, though applied originally to the place in which a bed was located, is a term now employed to indicate the framework of the bed. See BED.

Bedstraw, name of the genus of Rubiaceae known as *Galium*, related to wood-ruff and madder. *G. aparine* is often called goose-grass or cleavers; *G. verum* (yellow or lady's bedstraw), *G. mollugo* (great hedge bedstraw), and *G. cruciatum* (crosswort) are common in Britain.

Bedwelty, par. of W. Monmouthshire, Wales. It is situated 7 m. S.W. of Pontypool, and has a pop. of 30,000. It has coal mines and iron foundries.

Bedworth, tn. of Warwickshire, England, 5 m. from Coventry, on the Nuneaton-Coventry branch of the railway. The Coventry Canal serves it for the carriage of its coal and ironstone mined there, and there are ironworks and brickfields. Pop. 12,000.

Bee, name of a group of insects in the order Hymenoptera, which includes ants, wasps, saw-flies, Ichneumon-flies, and many other creatures with 4 membranous wings, the thorax and abdomen fused, well-developed mandibles, and an ovipositor in the female. The B's. themselves constitute the family Apidae, or Anthophila, which is sev. times subdivided, and in addition to the above characteristics, they all agree in having the head united to the thorax, females with poisonous stings, males with antennae divided into 13 segments, females into 12 segments. In character they may be social or solitary, and the functions of life are divided among undeveloped females or workers, males or drones, and a highly developed female or queen B. There are about 1500 known species of B's. exhibiting various degrees of specialisation and intelligence. The queen B. is larger in size than her fellows, and permits no rival in her home, so that in each hive there is only one queen, who may be distinguished by the yellowness of the under-part of her body, the absence of pollen-baskets and wax-pockets. Despite her short wings, she is capable of flying to a great height, and when she is pursued by her suitors, numbering probably 10,000, she rises in the air until all but one have failed to reach her. The object of the nuptial flight accomplished, the male falls dead to the earth, and the queen returns to her hive to renew her race. The eggs are laid in special cells prepared for workers, drones, and a few queens, and may be laid at the rate of about 3000 in one day. The eggs are bluish-white, about one-twelfth of an in. long, and hatch in about 3 days into worm-like larvae. The young grub is fed by the workers for about 5 days on food previously masticated for them, then all receive unmasticated food but the future queens, which are fed on a specially prepared royal jelly. The food is believed

THE HONEY-BEE

A, mouth parts; B, the sting; C, waxen cells in section; and D, in elevation; E, female (queen); F, male (drone); G, unfertile female (worker).

to affect greatly the reproductive system of the B.; the material fed to the workers lacks the reproductive vitamin E, so that the reproductive organs fail to develop. Vitamin E is present in royal jelly, stimulating the production of queens from larvae which receive it; if, indeed, the hive requires a queen, a worker-grub is often carefully fed on royal jelly until it develops into the superior creature. After a few days the grub has stored sufficient food for a fast, the workers seal up its cell,

it spins its cocoon and rests in the pupa state. After about 3 weeks from the day of egg-laying, the imago breaks from the cocoon, is assisted by the workers in detaching and cleaning itself, rests for a day or two, then takes up its work in the hive, and its cell is utilised for another egg or for the storing of honey. The queen pupa, however, is shut up and fed until her piping voice indicates that she has matured sufficiently, when she is released and immediately attempts to kill off all

rivals. In the early summer the process called swarming takes place. A number of Bs., accompanied by the old queen, rush from the hive, fly for some little distance, then settle in a thick cluster on some object near by. They then proceed to make a new hive, the workers constructing combs from wax secreted in their bodies, and the queen is then able to deposit her eggs. At this stage of their existence the Bs. carry with them a great deal of honey from the previous hive, and they are so quiet that they may be handled almost with impunity. As the new queens appear in the old home they may lead off new swarms, as many as 3 occurring in one summer, which prevents over-population. The bee-keeper aims at preventing swarming, with consequent loss of stock and honey, by destroying new queen cells or in other ways. It occasionally happens that a worker-B. produces eggs, but these invariably develop into drones, which merely increase the size of the swarm. The drones of the hive are males which make a peculiar, dull sound when flying, and thus receive their name. They are also distinguishable by their large eyes and the extra segment of their antennæ. Beyond assisting in the fertilisation of the queen they appear to be of no value to the hive, and in the autumn the workers turn them out and kill them wholesale. The workers are provided with 2 peculiar structures, a wax-pocket situated under the middle joints of the abdomen, and a pollen-basket, which is a dilatation of a joint of the hind tarsi. Pollen is brushed into the basket by means of the pollen brush on the hind leg of the opposite side, and furnishes the B.-bread necessary for the nutriment of the young. The nectar is collected by the long, hairy tongue of the worker, and is converted into honey in the honey-bag, where it is stored up until used as food or deposited in the comb. In times of scarcity, the honey-dew secreted by aphides is collected, and Bs. also gather a resinous matter known as propolis from trees to use it as cement in their hives. The poison is composed of a transparent fluid, containing formic acid and other irritants, which remains in a venom-bag, and the sting is curved in such a way that if once used it is difficult of withdrawal, and its use frequently results in the death of the B. The life of a worker-B. is short, usually lasting for 6 weeks, and into this space of time it crowds the honey and pollen gathering, the care of the larvæ, building and cleansing of the hive, and its ventilation by means of their wings when it has grown too warm. The queen B. may live for 3 summers. The intelligence of the B. has, from the time of Aristotle, Virgil, and Pliny, been recognised as surpassing that of any other insect, though experiments indicate that most of its actions are in reality governed by instinct. The return to the hive, for instance, after promiscuous wandering to considerable distances is made on a homing line which, once commenced, cannot be deviated from by a fraction. As regards its senses, the sight is highly developed, as well as

the power of smell. It has organs of taste, and is able to hear; the antennæ are the highest organs of sensation. The worker-B. can communicate indications of direction (where, for example, food may be found) to its fellows by two different movements of aerial dances. During the winter months it becomes torpid, its respiration is lessened, and it consumes little food, but in the spring the activity of its life is recommenced. The enemies from which it suffers are other insects, larvæ, and birds. The B.-louse, or *Braulta cæca*, is a parasite which attaches itself to the thorax of a B.; the death's-head moth, *Acherontia atropos*, also attacks the B.; the old-world family of birds named *Mecropidæ* consists of B.-eaters. Other creatures devour the larvæ, various lice infest the bodies of the different species, and even Bs. themselves are sometimes parasites in the hives of more industrious neighbours. The Isle of Wight disease, much feared by bee-keepers, is caused by a mite, *Tarsonemus*, which infests the breathing tubes (tracheæ) of the B.; the disease is highly infectious. The primitive B. from which others seem to be derived is the *Prosoptis*, a weak and solitary form, with few hairs, unmodified hind legs, and a short proboscis; the nest is built in crevices in walls, and on bramble-stems. Another solitary genus is *Colletes*, which digs a burrow in the ground and forms a colony in the mortar of walls. The *Sphecodes* include 4 Brit. species, and seem to be sometimes parasitic, sometimes industrial. The *Andrena* is the largest genus, having over 60 Brit. species; it burrows in sandy or gravelly soil, and appears in early spring. *Dasydota* also digs holes in the earth, while *Halictus* lines its oval underground cells with a varnish which is probably formed from saliva. The genera *Stelis* and *Nomada* are purely parasitic, the former laying its eggs in the cells of *Osmia*, the latter in those of *Andrena*. *Xylocopa*, a solitary B., is sometimes called a carpenter-B., from its habit of boring large holes for its cells in timber; in appearance it is very hairy, and it is amongst the largest species of Bs. *Chalicodoma* is a mason-B., which covers its 8 or 9 cells with a large dome. *Megachile* is the leaf-cutting B., which makes its cells of pieces of leaf joined together. *Anthidium* places its cells in empty snail-shells, and *Osmia* makes use of previously formed cavities. The chief social Bs. are well represented in Britain by *Bombus*, the humble-B., and *Apis mellifica*, the honey-B., the habits of which have been described above. *Apis dorsata* is an E. B., which builds a comb 5 or 6 ft. in length; *A. indica* is a native of S. Asia; *A. florea* inhabits the W. Indies; *A. adansonii* is found in W. Africa. See also BEE-KEEPING and HUMBLE-BEE. See Sir J. Lubbock, *Ants, Bees, and Wasps*, 1882; E. Saunders, *Hymenoptera Aculeata of the British Islands*, 1896; M. Maeterlinck, *La Vie des abeilles*, 1901; O. H. Latteus, *Bees and Wasps*, 1913; E. T. Edwards, *The Lore of the Honey Bee*, 1929. K. von Frisch on 'dance-language,' *Experientia* (Basel) 1947.

Beebe, Charles William, Amer. ornithologist, b. Brooklyn, N.Y., in 1877. Educated Columbia Univ. Appointed, 1899, curator of ornithology, New York Zoological Society. Organised the collection of birds, New York Zoological Park. Has headed many expeditions in both hemispheres. Among his numerous publications are: *Two Bird-lovers in Mexico*, 1905; *The Bird: its Form and Function*, 1907; *Tropical Wild Life in British Guiana*, 1917, etc.; *Monograph of the Pheasants*, 1918-22; *Galápagos, World's End*, 1924; *The Arcturus Adventure*, 1926; *Beneath Tropic Seas*, 1928; *Half Mile Down*, 1935.

Beech, name of sev. species of *Fagus*, the typical genus of Fagaceæ. The common B., *F. sylvatica*, forms large forests throughout Europe, and is valued

for its wood, which is used in the manuf. of small articles, e.g. sabots and household utensils, but is of little value to the joiner as it is liable to rot when exposed to air. The bark is employed in tanning, the catkins for packing, while the nuts yield a volatile oil and are frequently used for fattening pigs. Although the trees may grow to a height of 100 ft., they are often grown in a stunted form, and clipped to make hedges. The flowers appear only every few years, the male flowers forming pendulous catkins, while the females grow in pairs within a mass of scales, which later develop into a cupule enclosing 2 nuts. The copper and purple Bs. are well-known varieties of *F. sylvatica*, and are noted for their bright-coloured leaves, as is the red B. of America, *F. ferruginea*. The evergreen B., *F. betuloides*, is known as the myrtle-tree in Australia; *F. obliqua* is the oblique-leaved; *F. fusca*, the New Zealand B.; the weeping B., fern-leaved B., and crested B. are the varieties *pendula*, *asplenifolia*, and *crinata* of *F. sylvatica*. Other trees known as Bs. belong to various other genera, and among them may be noted *Carpinus betulus*, white B., or hornbeam; *Erostemma caribæum*, sea-side B.; *Populus alba*, Dutch B., or white poplar; *Platanus occidentalis*, water beech.

Beecham, Sir Thomas, second Baronet, Eng. musician and impresario, b. Apr. 29, 1879, at Liverpool; son of Sir Joseph Beecham, first Baronet, and grandson of Thos. Beecham, who founded Beecham's Pill business, St. Helen's. B. was educated at Rossall School, Fleetwood, where he was taught harmony by Edward Thomas Sweeting; and at Oxford (Wadham College), where he had lessons from J. V. Roberts. He conducted an amateur orchestra, collected by himself, at Huyton, 1899; conducted for Kelson Truman's travelling opera company in 1902; and in 1905 he became known as a conductor in London, where he founded the New Symphony Orchestra in 1903. Left it and founded the Beecham Symphony Orchestra, 1908. In 1910, became lessee of Covent Garden theatre, and entered upon production of opera. It was he who first produced Russian ballet in England, 1911; and who introduced Chaliapin to the Brit. public, 1913 (Drury Lane). He was knighted 1916, and succeeded to the baronetcy the same year. He continued to give opera throughout the war, at heavy loss to himself. Was inactive 1920-27, but since made great efforts to estab. opera permanently in England. He pub. *A Mingled Chime* in 1944. See COVENT GARDEN THEATRE.

Beechdrops, or **Cancer-root** (*Epiphegus virginiana*), parasitic herb of the order Orobanchæ; found in the roots of beech-trees in N. America.

Beecher, Charles (1815-1900), Amer. Congregational minister. The fourth son of Lyman B., and brother of Harriet Beecher Stowe. He officiated as pastor of the second Presbyterian church, Fort Wayne, Indiana, 1844-51; first Congregational church, Newark, New Jersey, 1851-54; Congregational church, Georgetown, Massachusetts, 1857. He d. at Haverhill, Massachusetts, in 1900. He ed. his father's letters and autobiography (2 vols., 1864-65). Author of *Pen Pictures of the Bible*, 1855; *Spiritual Manifestations*, 1879; *Eden Tabernacle*, 1880.

Beecher, Henry Ward (1813-87), Amer. Congregational minister, son of Lyman B. and brother of Harriet Beecher Stowe, b. at Connecticut, June 24. He graduated in 1834 at Amherst College, Massachusetts, and later read theology under his father at the Lane Theological Seminary. In 1847 he accepted the pastorate of Plymouth Congregational church, Brooklyn, New York. He was one of the founders of the *Independent*, which he ed. in 1861-63. He favoured the Republican candidates in the presidential contests of 1856 and 1860, and, on the outbreak of civil war, his church raised a volunteer corps for active service. From 1870 to 1881 he ed. the *Christian Union*. The chief of his pub. writings are: *The Star Papers*, 1855-58; *Lectures to Young Men*, 1844 (revised ed. 1850); *Aids to Prayer*, 1864; *Norwood, or Village Life in New England*, 1867; *Yale Lectures on Preaching*, 3 vols., 1872-74; *The Life of Jesus the Christ*, 2 vols., 1871 and 1891; *Evolution and Religion*, 1885. See his *Life*,

by Joseph Howard jun., 1887; and a biography by W. C. Beecher, Rev. S. Scoville, and Mrs. Beecher, 1888; also his *Autobiographical Reminiscences*, ed. by Ellinwood, 1898.

Beecher, Lyman (1775-1863), Amer. Presbyterian minister, father of the Harriet Beecher Stowe. He was among the foremost preachers of his time. In 1832 he was appointed president of Lane Theological Seminary, near Cincinnati, a position which he held till 1852. He was arraigned for heresy, but was acquitted and became the recognised leader of the new school of the Presbyterian Church. His autobiography and letters were ed. by his son, Charles Beecher (1864-65).

Beecher Stowe, Mrs. Harriet Elizabeth, see STOWE.

Beechey, Frederick William (1796-1856), Eng. admiral and geographer, was the son of Sir W. B., the painter. He was with Franklin in the N. Polar expedition of 1818, and with Parry in 1819, and co-operated with them in 1825. B. is., in Barrow Strait, is named after him. He was on the Mediterranean N. African survey, 1821; S. Amer. survey, 1835; and Irish coast survey, 1837-47; and was president of the Marine Dept. at the Board of Trade, 1850. Promoted rear-admiral, 1854.

Beechey, Sir William (1753-1839), Eng. portrait painter, b. at Burford. He attended the Royal Academy as a pupil in 1772. In 1793 he became an associate of the Academy, and in that year also he was chosen to be portrait painter to Queen Charlotte. He was rewarded with a knighthood and the title of R.A. in 1798 for his picture of a review of cavalry, in which he portrayed George III., the Prince of Wales, and the duke of York.

Beechey Island, in the Arctic Archipelago, lying off the coast of Canada in the Barrow Strait. On it have been erected various memorials to Arctic explorers, including one to Franklin, who wintered on the is. in 1845, and to Lieutenant Bellot, who d. with a Brit. expedition in 1853. Mean temperature about 3-5° F.

Beeching, Henry Charles (1859-1919), Eng. author and divine. He became canon of Westminster Abbey, 1902-11, and dean of Norwich, 1911. He was select preacher at Oxford Univ., 1896-97, and at Cambridge, 1903-09; prof. of pastoral theology, King's College, London, 1900-3; and chaplain of Lincoln's Inn, 1900-3. His numerous publications include: *Love in Idleness*, 1883, and *Love's Looking-Glass*, 1891 (in collaboration with 2 others); *In a Garden, and other Poems*, 1895; *Religio Laici*, 1902; *The Grace of Episcopacy*, 1906; *Francis Atterbury*, 1909; and *Revision of the Prayer Book*, 1910.

Beeching, James (1788-1885), Eng. inventor, b. at Bexhill, near Hastings. He went to Flushing, where he constructed the famous *Big Jane*, a smuggling craft. He won £1000 as a prize for his invention of a self-righting lifeboat.

Beechworth, tn. in the co. of Bogong, Victoria, Australia. It is the centre of the Ovens gold area. Pop. 7500.

Beeder, see BIDAR.

Bee-eater, the typical genus *Merops* of the family Meropidae, which has an extensive range over Africa, India, and Australasia. They are slender birds, with long bill and pointed wings, with a flight like a swallow, which in shape they resemble. They are brightly coloured, green predominating. They feed on bees, wasps, and other insects. The European B. is *Merops apiaster*, which migrates from Africa, where it breeds, to S. and Central Europe; it nests in colonies in holes dug out by its long bill in sandy riv. banks. It is rarely seen in Great Britain.

Beef, term applied to the flesh of an ox, bull, or cow when killed. Prepared in different ways, it serves as food in many countries. See COOKERY.

Beef-eater, see YEOMAN OF THE GUARD.

Beefsteak Clubs, certain London clubs, formed for social purposes, where the refreshment was limited to steaks, with beer or wine. The earliest of these was founded in 1709, and included the wits and chief men of the day, with Richard Estcourt, the actor, as providore. The 'Sublime Society of Steaks,' founded in 1735 by John Rich, the manager of the Covent Garden Theatre, and Lord Peterborough, is the most famous of these clubs. It numbered among its members, Garrick, Hogarth, Wilkes, John Kemble, and in 1785 the Prince of Wales joined the club. When the Covent Garden was burnt down in 1808, the club moved to the old Lyceum; afterwards it had rooms in the Bedford Coffee House, and finally in 1838 the 'Steaks' moved to the new Lyceum and there dissolved in 1867. *Consult Arnold's Life and Death of the Sublime Society of Steaks*, 1871. A B. Club was founded in 1749 by Thomas Sheridan (the actor and father of Richard Brinsley Sheridan), in connection with the Theatre Royal, Dublin, and Peg Woffington was elected president. The present B. Club in London was founded in 1875 by A. J. Stuart-Wortley with rooms in Toole's Theatre. Its premises are now at 9 Irving Street, London.

Beef-tea, extract of beef, used as a valuable stimulant and restorative in cases of illness. It has little or no nutritive value, and in certain cases, such as kidney disease or gouty or rheumatic affections, should not be taken. It is especially useful for children and for surgical cases after operation or in other conditions where alcohol cannot be given safely. It consists merely of the blood and juices of the meat, but little of the albumen and gelatinous constituents, as are contained in various commercial meat extracts.

Beef-wood, kind of wood, very hard and durable, that makes excellent timber. It is so called because it resembles raw beef in colour. The name is applied to trees of 2 different genera—the *Swartzia*, belonging to the order Leguminosae, in Guiana, and trees of the order Casuarinaceae, in Australia.

Beehive House, building, of primitive architecture, made of unewn stones and without mortar, specimens of which are

to be found in Ireland and W. Scotland. They consist of long stones laid down in a circle, and each course is overlapped by the one resting immediately above it, and with the circular roof it resembles a bee-hive in shape. From the seventh to the twelfth century churches, priests' houses, and other buildings were formed after this fashion.

Bee-keeping, practice of cultivating bees for the benefit of their honey. The origin is extremely anct., but it is only within the last 100 years that it has been proved a source of profit to the agriculturist. It is no longer necessary for bees to construct their own hives and combs, and as wax is provided for them their labour is so much lightened that the output of honey has increased to an enormous extent. In former days 40 lb. was considered to be an average amount collected, but now the average is doubled, and as much even as 400 lb. has been obtained from a single hive. In the winter the surviving bees are usually allowed about 20 lb. of honey for their use, and this may be supplemented by various syrups as they are required. In the spring they need a supply of extra food, but in the summer all that is required in this direction is that the hive should be placed in a spot surrounded by suitable flowers. In Scotland the hives are moved to localities in which heather is abundant, to obtain the rich dark heather-honey. During the spring, when the bees begin to swarm, the keeper is careful to prevent them from emigrating beyond his power. Usually when the cluster appears he covers it with a straw skep, and when the various members have settled in it they are transferred to their new hive, but artificial swarming is sometimes used when a queen is placed in a new hive situated on the position of the old one. A swarm consists of about 40,000 to 50,000 insects. Modern B. owes much to the Amer. clergyman, the Rev. L. L. Langstroth, who in 1851 produced a hive in which movable combs, built in frames, hung side by side. Later it was found that bees would use thin sheets of beeswax, called comb foundation, stamped with an outline of the cell, if it were put near their hives. It has also been found possible to remove the honey from the wax without injuring the cells, by means of a rotating machine. Honey sections are also placed in hives so that the substance may be sold in a very marketable form. In obtaining honey the person about to extract it usually covers all unprotected parts of his body as a guard against stings. He then stupefies the bees with smoke, chloroform, or by some other means. See J. C. Digges, *Practical Bee Guide*, 1904; A. M. Sturges, *Practical Bee-keeping*, 1924; A. Gilman, *Practical Bee Breeding*, 1928; J. A. Lawson, *Honeycraft*, 1931; S. B. Whitehead, *Honey Bees and their Management*, 1946.

Beelzebub (the god of flies, from Heb. *baal*, lord, *zebûb*, fly), Philistine god, whose temple was at Ekron. It is now thought that the word developed from Baal-Zebul, i.e. lord of the high house.

The Jews regarded all heathen gods as devils, and accordingly B. or Baalzebub appears in the N.T. as the prince of demons.

Beemster, polder in the Netherlands. It is situated 13 m. N. of Amsterdam, and has a pop. of 5300.

Beer, see under BREWING; BARLEY.

Beer Acts. The sale of B. in England is under magisterial control, though in the early part of the nineteenth century licences could be obtained without application to magistrates. In 1869 the Wine and Beerhouse Act was passed, regulating the sale of B. By this Act a licence was estimated at a third of the ann. value of the beerhouse premises, and a minimum value was fixed, based on the pop. of the neighbourhood. For the first hundred barrels the brewers paid a tax of £1, and on every additional fifty 12s. Since those days beer has been subject to almost continuous taxation. The granting of licences, however, remains with the magistracy sitting in what are called Brewster Sessions. See LICENCES AND LICENSING LAWS for later legislation.

Beer-Alston, vil., previous to 1832 a parl. bor. in the par. of Beer Ferrers, 8 m. from Plymouth, England. Pop. of Beer Ferrers or Bereferis, 1800.

Beerbohm, Sir Max, Eng. writer and caricaturist, b. in London, Aug. 24, 1872, youngest son of Julius K. Beerbohm and Eliza Draper, and half-brother of Sir Herbert Beerbohm Tree. Educated at the Charterhouse and at Merton College, Oxford. First became known as a writer through the *Yellow Book* quarterly, 1894-97. Dramatic critic to the *Saturday Review* for 12 years from the retirement of Bernard Shaw in 1898. His book, *Around Theatres* (1924), contains articles contributed to that journal over a period of 12 years. His first pub. vol. of drawings, *Caricatures of Twenty-five Gentlemen*, appeared in 1896, the same year in which he issued a vol. of essays entitled *The Works of Max Beerbohm*. His later caricatures are in the vols.: *The Fort's Corner* (in colour), 1904; *A Book of Caricatures*, 1907; *The Second Childhood of John Bull* (in colour), 1911; *Fifty Caricatures*, 1913; *A Survey*, 1921; *Rossetti and his Circle* (in colour), 1922; *Things New and Old*, 1923; *Observations*, 1925. His other books are: *The Happy Hypocrite*, 1897; *More*, 1899; *Zuleika Dobson* (his one novel), 1911; *A Christmas Garland* (prose and verse parodies), 1912; *Seven Men*, 1919; *And Even Now*, 1920; *Yet Again*, 1923; *The Dreadful Dragon of Hay Hill*, 1928. From 1910 until Italy entered the World War in 1940, he lived at Rapallo, from which retreat he surveyed the world with humour and detachment. He was knighted in 1939. From time to time successful exhibitions of his original drawings have been held in London. After his return to England during the war he gave 2 memorable broadcasts, and in 1943 he delivered the Rede Lecture, choosing Lytton Strachey's works as his subject. He returned to Rapallo in 1947. Both as a writer and as an artist he has a fastidious and carefully finished

style, aiming at nothing short of perfection. Wit, elegance, humour, power of satire, and yet a human sympathy are his characteristics. See Bohun Lynch, *Max Beerbohm in Perspective*, 1921.

Beer-money was an allowance of one penny a day to soldiers of the Brit. army in lieu of a supply of beer, instituted in 1800 and abolished 73 years later. It was also given to servants by householders instead of providing them with beer.

Beeroth, O.T. name for the modern Bireh, a vil. in Palestine, 9 m. N. of Jerusalem.

Beersheba (well of the oath, or possibly seven wells), tn., in anct. geography, in the extreme S. of Palestine, 50 m. from Jerusalem. The expression 'from Dan to B.' was indicative of its southerly position. The covenant of Abraham and Abimelech, king of the Philistines, was made there. Its Arabian name is Bir-es-Seba, meaning well of the lions. According to Eusebius, it was in his time a prosperous mkt. tn. and possessed a Rom. garrison. In early Christian times bishops of B. are occasionally mentioned, but by the fourteenth century the tn. had lost all importance. The wells played a prominent part in the hist. of the patriarchs: B. being the scene of Hagar's trial and Ishmael's miraculous preservation; of Abraham's covenant with Abimelech, and of Jacob's setting forth on his journey to Haran (Gen. xxi., xxvi., xxviii.). Two of the wells still have supplies of water and 5 others have been discovered. It is now a small tn. of under 3000 inhabs. There is a Brit. military cemetery. During the First World War B. was captured from the Turks on Oct. 31, 1917, by General Allenby's troops, and it was from B. that the advance was made which resulted in the capture of Gaza.

Beestings, or **Beastings**, name applied to the first milk taken from a cow or other animal after parturition. It is thicker and more yellow than ordinary milk. It has a larger percentage of albumin and salts in its composition, but not so much casein.

Beeston, par. in the co. of Nottingham, England, and situated 3 m. S.W. of that tn.; it has manuf. of lace and hosiery. Pop. 16,000.

Beeswax, substance produced by bees and used by them in the construction of the honeycomb. The wax is secreted by special glands in the abdomen of the bee, is pressed out between the segments of the body and moulded into roughly circular cells for the reception of the eggs and honey. It may be collected by draining off the honey and heating the residue in water, when it rises to the surface and solidifies on cooling. B. is used for making candles, for modelling or casting ornaments or effigies, for polishing floors and furniture, and in medicine as a basis for ointments and plasters, on account of its non-irritant quality. It is sometimes taken internally, when it acts as a protective to the gastric and intestinal surfaces.

Beeswing, term for a film as delicate as the wing of a bee, which appears some-

times as a crust on port and other wines, and indicates their age.

Beet, name applied to sev. species of *Beta* of the order Chenopodiaceæ. The roots of many species are valued as a food, and *Beta vulgaris*, the common B., is used in the manuf. of sugar. *B. maritima*, sea or wild B., is eaten as a vegetable as well as *B. rubra*, the red beetroot. *B. cicla*, white beetroot, is cultivated for its leaves, which are eaten like spinach. From *B. vulgaris* is derived the variety *rapa*, the sugar B., and also the mangel-wurzel. The production of B. sugar on a large scale has been promoted for some years in Germany, U.S.A., and in other European countries, while efforts have been made to stimulate its production in Great Britain, at some expense, it is true, to cane sugar production in the Brit. W. Indies. A gov. subsidy was granted after the First World War and has been reviewed recently. In 1937-38 the subsidy was £2,250,000, in 1938-39, £2,550,000. Half the world's supply of sugar is now derived from the beetroot. The estimated average ann. world production (all countries) of sugar B., 1940-44, is 75,000,000 tons.

Beet-fly (*Anthomyia betæ*), insect, so called because the maggots feed on beet leaves. As soon as the maggots are hatched they begin to feed on the leaf round them and continue feeding for one month, when they turn to chestnut-brown pupæ. The flies come out a fortnight later and are grey in colour with black hairs.

Beethoven, Ludwig van (1770-1827), Ger. musical composer, was of Belgian descent. His grandfather, Louis, left Antwerp in 1732 and settled in Bonn, where he became one of the archbishop-electors' musicians. His son (father of Ludwig) was a tenor singer at the court, but through drink and thriftlessness was always poor. The grandfather d. when Ludwig was only 4 years old, but the latter, to whom he had been kind, always cherished his memory. Ludwig's father taught him to play the violin and clavier; he displayed such precocity that at 9 he had to be placed under more accomplished teaching. At 12 years of age he occasionally acted as deputy for the court organist, and at 13 pub. his first composition. In 1784 he was appointed assistant organist to the court, and conducted the orchestra at the opera. Three years later, during a short visit to Vienna, he played before Mozart, who was amazed at his talent in improvisation, and gave him a few lessons. For the next few years his life at Bonn was a trying round of hard work and responsibility; his mother d., and his father's habits became so disorderly that his salary had to be paid to Ludwig, who thus, at about 19, became head of the family. In 1792 the archbishop-electors (brother of the Emperor Joseph II.) sent him to Vienna to study under Haydn, with whom, however, he did not get on well. B. was clumsy in manner and speech, a contrast to Mozart, just dead, whom Haydn had intensely admired; thus Haydn treated the

newcomer coldly, and he in return undervalued his teacher. In spite of this he worked his way by hard work and genius, and in a few years was a 'personage' in the musical world of Vienna, in spite of an ungovernable temper and rude manners. For example, at the house of Count Browne, he was playing a duet when a young nobleman in the room persisted in talking to a lady. B. stopped suddenly, saying loudly: 'I play no longer for such hogs.' Of a suspicious nature, he was insulting to those he suspected, even people of high rank. Haydn nicknamed

BEETHOVEN

him 'The Great Mogul.' Yet the aristocracy bore with it all for the sake of his genius. Princesses and countesses would forgive any rudeness, would receive his lessons wherever he pleased, and put up with his storming and tearing up their music if they were careless. He had no tact or discretion in matters of ordinary life. He was peculiar in appearance, 5 ft. 5 in. in height, broad-shouldered, large-headed, and ruddy in complexion. As a teacher he was impatient but painstaking; in piano playing he was quiet, but extravagant in conducting. He was so absent-minded that he once insisted on paying a waiter for a dinner he had not had or even ordered. It must be said in excuse for his peculiarities that his early troubles had affected his health and spirits. When he *d.*, a post-mortem examination proved that he had suffered since childhood from an incurable disease aggravated by want of home comfort and good food, and later by unskillful medical treatment. His liver had shrunk to half its proper size, and there were serious ailments of old standing in the ears and pharynx.

His family, too, tried him greatly; his father's character has already been mentioned, and his brothers, Johann and Caspar, the latter in particular, caused him endless trouble, and when the latter *d.* his son turned out worse still, in spite of all his uncle's self-denying endeavours on his behalf. In a pathetic document written by B. as far back as 1802, addressed to his brothers, he complains of the harsh judgments passed upon him by those who knew nothing of the years of suffering he had endured, and tells of the dread which he felt of his growing deafness, which would incapacitate him for the enjoyment both of society and of his beloved art. This deafness in time became so complete that although he still played and conducted he heard nothing of the music. His finest works were composed after he had lost the power of enjoying them. His life ended sadly. In the winter of 1826-27 he was staying at the house of his brother Johann, and was taken ill. His brother would neither let him have a fire in his room nor give him the food he required, and at length sent him back to Vienna, during bad weather, in an open chaise; he took a severe chill, which brought on dropsy, and he *d.* on Mar. 26. As a musician B. stands alone. In his earlier work the influence of previous masters, especially Mozart, may be traced, but gradually he built up a style of his own, more and more noble as years went on. His total production is broadly divisible into 3 periods. In the first, although influenced by his predecessors he already began to show such individuality that, for example, Haydn advised him not to publish his Trio in C minor (Op. 1, No. 3), probably as being too daring for public taste. To this first period belong his Sonata for pianoforte in E flat (Op. 7); Trio for pianoforte and strings in B flat (Op. 11); *Sonate Pathétique*; First Concerto for pianoforte and orchestra in C (Op. 15); *Adelaide* (composed 1797); also the famous Septuor (Op. 20) and the first Symphony (Op. 21) (the last two works pub. in 1800). His second period, which included his *Sinfonia Eroica*, *Fidelio* (including the *Leonora* overtures), the overtures to *Prometheus*, *Coriolanus*, and *King Stephen*, the *Egmont* music, and the *Appassionata*, with other sonatas, merged imperceptibly into that of his latter years (about 1816 onwards), which in grandeur of construction and polyphonic effect transcended anything previously achieved. To this period belong the enormous pianoforte Sonata in B flat (Op. 106), Overture in C (Op. 124), and other works of great beauty and force, including the choral Symphony (or ninth Symphony), the *Missa Solemnis*, the marvellous Quartets for strings (Opp. 127, 130, 132, 135), the 33 Variations on a Valse by Diabelli (Op. 120), and the Mass in D. The influence of B. on the form and growth of musical art has been immeasurable. There is a copious literature on B. The following are among the more recently pub. works: F. J. Crowest, *Beethoven*, 1911; J. G. Prod'homme, *La Jeunesse de Beethoven, 1770-80*, 1921;

A. W. Thayer, *The Life of Ludwig van Beethoven* (3 vols.) (New York), 1921; A. Leitzman, *Ludwig van Beethoven* (companions, letters, and personal characteristics) (2 vols.) (Leipzig), 1921; W. Nohl, *Ludwig van Beethoven als Mensch und Musiker in täglichen Leben* (Stuttgart), 1922; M. Grusemann, *Beethoven* (Munich), 1923; A. Albertini, *Beethoven*, 1924; P. Bekker, *Beethoven*, 1925; L. Schieder-mann, *Der junge Beethoven* (Leipzig), 1925; W. J. Turner, *Beethoven*, 1927; E. Newman, *The Unconscious Beethoven*, 1927; A. Hévosy, *Beethoven the Man*, 1927; R. Specht, *Beethoven as he lived* (trans.), 1933; W. J. Turner, *Beethoven: the search for reality*, 1933; Marion M. Scott, *Beethoven* (Master Musicians series), 1934; E. Closson, *The Fleming in Beethoven* (trans.), 1936; Edouard Herriot, *The Life and Times of Beethoven* (trans.) (New York), 1936; Walter Riezler, *Beethoven* (trans.), 1938; L. Schrade, *Beethoven in France*, 1942; E. Ludwig, *Beethoven: Life of a Conqueror* (trans.), 1945. See also G. Grove, *Beethoven and his Nine Symphonies*, 1903; T. Helm, *Beethovens Streichquartette* (Leipzig), 1921; C. E. Lowe, *Beethoven's Pianoforte Sonatas* (hints on rendering and form), 1921; E. Evans, *Beethoven's Nine Symphonies described and analysed* (2 vols.), 1923; Eric Blom, *Beethoven's Pianoforte Sonatas discussed*, 1938; and D. F. Tovey, *Beethoven* (musical exercises), 1944.

Beetle, Colorado, see COLORADO.

Beetle, common name for an order of insects, the scientific name of which is Coleoptera (*q.v.*), possessing hard and horny fore-wings. The word B. is also loosely applied to cockroaches (*q.v.*) of the *Blattidae* family of orthopterous insects.

Beetling, process designed for the finishing of linen and cotton goods in which a beetling machine hammers down the cloth by means of wooden stamps which rise in succession and fall by their own weight. This flattens the surface of the cloth and gives it a hard appearance.

Beets, Nicolaas (1814-1903), Dutch poet and author, b. at Haarlem. He was prof. of theology at the univ. of Utrecht, 1875-84. He is remembered chiefly for his stories of Dutch life. His *Camera Obscura* (1st ed., 1839, under the pseudonym Hildebrand) has been trans. into many European languages. The continuation, *Na Vijftig Jaar*, appeared in 1887. He also wrote critical and theological essays, of which *Stichtelijke Uren* may be mentioned. His poetry was pub. in 4 vols. (1873-81). See *Nicolas Beets et la littérature hollandaise*, by J. J. Duproix, 1907.

B.E.F., see BRITISH EXPEDITIONARY FORCE.

Befana (corruption of Epiphany), name of a legendary old woman who, being busy sweeping her house when the 3 wise men of the E. passed on their way to offer gifts to the Infant Christ, excused herself from going to the window on the ground that she would see them on their return. The wise men returned another way, and B. was punished by being obliged to wait

for them ever since. Her festival is held in Italy on Jan. 5, when her elligy is carried through the streets, amid great rejoicing. On Twelfth Night, 11. children hang up a stocking before the fire, and B. brings presents to good children, but to bad children ashes. The tradition appears to be confused, for although she is the counterpart of Santa Claus, her name is used, like that of a bogey, to frighten naughty children.

'Picture Post' Library

BEFFROI OR BREACHING TOWER

Beffroi, Belfry, or Breaching Tower, movable tower used in medieval times during military sieges. It moved on wheels, was sev. stories high, and was usually covered with raw hides to protect the besiegers in the lower story from boiling oil and fire. An upper story held a hinged drawbridge, to be let down upon the city wall for the landing of the assailants. Such a tower is mentioned by Caesar and by Froissart. See also BELFRY.

Beg, or Bey (*cf.* Persian *baig*), Moslem title given to the administrator of a dist. or tn., now used more generally as an honorific title applied to officers and men of good family, throughout Turkey and Syria. In Tunis Bey has come to be used as the hereditary title of the reigning sovereign.

Begarelli, Antonio (c. 1479-1505), It. modeller in terra-cotta, b. at Modena. He was the friend of Correggio. There are few of the works of B. left; the prin. are the 'Descent from the Cross,' and a 'Pieta' at Modena, containing many figures in the round rather larger than life.

Begas, Karl (1794-1854), Ger. painter, b. at Heinsberg; was court painter to the king of Prussia and prof. in the Academy of Arts, Berlin.

Begas, Reinhold (1831-1911), Ger. sculptor, son of Karl Begas, b. at Berlin July 15, and studied there and in Rome. In 1866 he returned to Berlin, where he spent the rest of his life. He executed statues and architectural designs for public places, as well as numerous portrait busts. Among his best-known works are statues of Schiller, 1863; Humboldt, 1882; Bismarck, 1901; the sarcophagus of Friederick III. in the mausoleum of the Friederickskirche at Potsdam; the statue of Borussia for the Hall of Glory and the national monument to the Emperor William, both in Berlin; and the Neptune bronze fountain in the Schlossplatz, Berlin.

Begg, Alexander (1840-97), Canadian writer, b. in Quebec. He took part in the N.W. rebellion against Riel. Author of *The History of the North-West*, 1891; *The History of British Columbia*, 1895; and, in collaboration with W. R. Nursey, *Ten Years in Winnipeg; a Narration of the Principal Events in the History of the City from 1870 to 1879 inclusive*, 1879.

Begg, James (1808-83), Scottish Free Church leader, b. at New Monkland, Lanarkshire; educated at Glasgow Univ. He was strongly opposed to anything savouring of liberalism in theology and church practice—particularly the projected union with the United Presbyterian Church. *See* life by T. Smith (1885-88).

Begger, word of uncertain origin, used in speaking of a person who asks alms, usually habitually, and who generally lives on the money and goods which he thus receives. *See* MENDICANCY, POOR LAWS, VAGRANTS.

Beggar-my-neighbour, game of cards, played by 2 or more persons. The players, holding their cards with backs upward, play down a card alternately, until one player turns up a court card, when his neighbour must pay him 4 cards for an ace, 3 for a king, 2 for a queen, and 1 for a knave, and in addition he wins the cards already thrown on the table and places them all under those in his hand. At last one player obtains all the cards in the pack and wins the game.

Beggars, The, *see* GUEUX, LES.

Beghards, association of men formed during the early part of the thirteenth century in the Low Countries, corresponding to and probably in imitation of the female Beguines (q.v.). Many vagabonds and mendicants adopted the title who did not belong to the brotherhood. They were denounced by the pope and councils, and suffered persecution from the Inquisition. Their communities had

almost disappeared by the end of the fourteenth century.

Begharmi, *see* BAGIRMI.

Bégin, Louis Nazaire, Cardinal (1840-1925), Canadian archbishop, b. at Point Lévis, Jan. 10. He was educated at the Little Seminary of Quebec; and at the Laval Univ., where he was awarded the Prince of Wales's gold medal in 1862, being the first to receive this prize. He was ordained in 1865 at Rome, where he remained to make a special study of eccles. hist. and oriental languages, 1866-67. He was prin. of the Laval Normal School, Quebec, 1885-88; bishop of Chicoutimi, 1888-91; coadjutor to Cardinal Taschereau, 1891-98; and archbishop of Quebec from 1898. Author of *La Primauté et l'infaillibilité des souverains pontifes*, 1873; *Le Culte catholique*, 1873; *La Sainte Écriture et la règle de foi*, 1874; *Aide-mémoire ou chronologie de l'histoire du Canada*, 1886; *Catholicisme de controverse*, 1902. He was made cardinal May 25, 1914.

Beglerbeg, or **Beylerbey**, Turkish word which signifies bey of beys; applied to the governor-general of a prov. who had under him sev. beys, and was second in rank to the grand vizier. The external distinctions were 3 ensigns consisting of staves trimmed with the tail of a horse.

Béglos, tn. in the dept. Gironde, France, on the R. Garonne, 3 m. S.E. of Bordeaux. Pop. 21,500.

Begoniaceæ, order of tropical dicotyledonous plants, comprising 4 genera, of which *Begonia* is the chief. All the species of begonia have fleshy leaves, often richly coloured with crimson, succulent stems, and pink flowers growing in panicles; the leaves are root-leaves, and have one side larger than the other—hence the name of elephant's ear sometimes given to the plant.

Beguines, order of sisters belonging to the Rom. Catholic Church, traditionally founded by St. Begga in 698, but, as now accepted, by a priest, Le Béguin, in the twelfth century. They were first known in Holland and Germany. They took no vows, and they lived in close proximity in separate houses called *beguinages*. Their houses often received large donations, which were devoted to charitable purposes. A hospital adjoined each institution, and frequently a church also. The sisters lived in purity and poverty, giving their services in nursing, and tending the aged as well as educating the children. The sisterhood is still in existence in the Rom. Catholic Church. The most famous of the institutions is at Ghent, under the name of St. Elizabeth's Beguinages.

Begum (Hindustani *begam*, fem., from Turkish *beg*, lord), name given to sultanas and to any Moslem lady of high rank.

Behaim, Behem, or Boenheim, Martin (c. 1459-1506), Ger. cosmographer, b. at Nuremberg. He studied under Regiomontanus (Johann Müller). In 1484 he accompanied the fleet of the Portuguese Diogo Cão on a journey of discovery along the Congo coast, W. Africa. In 1486 he

visited Fayal, in the Azores, returning to Nuremberg in 1490. He acquired fame for his methods of finding the lat. at sea by means of astronomical observation, for his maps, and for the globe which he bequeathed to his native city. See E. G. Ravenstein, *Behaim: his Life and his Globe*, 1909.

Behar, see BIHAR.

Behaviourism, name given to the teaching in a primarily Amer. school of psychology which originated in the early years of the twentieth century. The name arose from the study of the behaviour of animals, but it was not till the results of these studies had been applied to human psychology that the teaching was so designated. The best-known exponent of B. is Dr. J. B. Watson, and it was his 2 monographs, *Psychology as the Behaviourist Views it*, and *Image and Affection in Behaviour*, both pub. in 1913, and his book, *Behaviourism: an Introduction to Comparative Psychology* (1914), that first crystallised the doctrines of B. It was Watson who first applied to man the studies on the behaviour of infra-human mammals. The school of animal psychology was also for the most part an Amer. school, a prominent leader in it being E. L. Thorndike, but a Brit. psychologist, C. Lloyd Morgan, influenced the former's experiments. In 2 books, *Introduction to Comparative Psychology*, 1894, and *Animal Behaviour*, 1900, Lloyd Morgan abandoned the traditional way of regarding the actions of animals as if they reasoned like men, or, in other words, the anthropomorphic interpretation of animal acts. The 'trial and error' way of animal learning was emphasised by Morgan, and confirmed by Thorndike. Finally, the essential similarity of human and animal learning forced itself upon all these experimenters. Mention may also be made of the work of the Russian, Pavlov, and his students, on the 'conditioned reflex,' i.e. the automatic response made to a stimulus.

It will be seen from the foregoing remarks that these studies led to the fundamental Behaviourist view that man has no mental processes different from those of animals; and that there is no room for what is generally known as free will.

Naturally so far-reaching a repudiation of any entity like mind, or soul, has aroused criticism, especially from the subjective, or introspective, psychologists. The Behaviourist believes that if it is possible to amass observations upon human behaviour in any particular case the response to it can be predicted or, reversing the observations, we can deduce from the response what were the conditions calling it forth. See *Behaviourism*, 1925, by J. B. Watson; *Why we behave like Human Beings*, 1925, by G. A. Dorsey; and *A Theoretic Basis of Human Behaviour*, 1925, by A. P. Weiss. Bertrand Russell's *Analysis of Mind*, 1927, may be read for the case of the subjective philosopher against B.

Behbahan, see BAHABAN.

Behheading, see DECAPITATION.

Behem, Martin, see BEHAIM.

Behemoth (Heb., large beast) is a large herbivorous animal mentioned in Job xl. 15-34. It is supposed by many interpreters to mean the hippopotamus.

Behera, or Beheira, prov. of Egypt, forming part of the delta of the Nile, W. of the Rosetta branch of the riv. The chief tn. of the dist. is Damanhur (pop. 48,000), where the railway from Cairo bifurcates for Alexandria and Rosetta. Pop. 890,000.

Behistun, or Bisitun, rocky mt. side in Ardekan, Persia, 22 m. E. of Kermanshah. It rises to a height of 1700 ft., and bears an inscription, at a height of 300 ft., in cuneiform writing in 3 languages, Persian, Susian or Elamitic, and Babylonian, besides some minor records in Arabic and Gk. The main inscription, first deciphered and trans. by Sir Henry Rawlinson (1835-45), relates the exploits of Darius the Great (d. 485 B.C.), and forms the key to Assyrian antiquities.

Behm, Ernst (1830-84), Ger. geographer and statistician, b. at Gotha. He was the founder of *Geographisches Jahrbuch*, and ed. it 1866-84; also editor of *Petermanns Mitteilungen*, 1878-84. With Hermann Wagner he compiled *Bevölkerung der Erde*, 7 vols., 1872-82.

Behmen, Jakob, see ROEHME, JAKOB.

Behn, Aphra (1640-89), Eng. novelist and dramatist; b. at Wye, the daughter of John Johnson, and as a child went to Surinam, S. America. She married a Dutch merchant, B., on returning to England, and later, was employed on a diplomatic service in Flanders by the king. When left a widow she supported herself by her pen. Her works suffer from coarseness, but show considerable ability. Her best drama is *The Rovers* and her most famous novel *Oroonoko*. Her *Works* (6 vols.) appeared in 1871; also ed. by M. Summers in 1915. See V. Sackville West, *Aphra Behn*, 1927; G. Woodcock, *The Incomparable Aphra*, 1948.

Behring, Emil von (1854-1917), Ger. bacteriologist, whose name is associated with antitoxic methods of preventive medicine. He estab. the possibility of securing immunity from tetanus by the use of a serum from an infected animal and, in the same way, he used a culture of the diphtheria bacillus to secure immunity from diphtheria. But he was not successful with his remedy for tuberculosis. Works include *Theory of Blood Therapy*, 1892; *Etiology of Tetanus*, 1904.

Behring, Vitus, see BERING.

Behring Island, Behring Sea and Strait, Behring Sea Question, see BERING.

Behut, name sometimes given to the R. Jhelum (q.v.).

Beibars, Baybars, or Bibars, 2 Egyptian rulers: (1) Beibars I. (1269-77), sultan of the Mamelukes. He fought against the Christians and the Mongols. He defeated the crusaders under Louis IX. of France, captured Antioch in 1268, and ravaged the country round Mecca in 1269. In that year he murdered his master, the Egyptian sultan Kotuz, and became sultan in his place. He subdued the Armenians, and at one time almost extirpated the Syrian Assassins. The

mosque at Cairo which bears his name was erected by him. (2) Beibars (Jashengir) II. (1309-10) was a Circassian by birth. He was made ruler of Egypt by the Bahri Mamelukes, but was assassinated by a rival within a year.

Beijerland, or **Bayerland**, name of 3 coms. of Holland known as Oud, Nieuw, and Zuid respectively, situated on the is. of Hoekschevaard. Total pop. 10,000.

Beilan, tn. in the N. of Syria, not far from Alexandretta, used as a summer resort. The B. Pass is 1800 ft. high, and lies between the mt. ranges of Amanus and Rhossus. It is supposed to be the anct. Pylæ Syriæ (Syrian gates) probably used by Alexander the Great and by the crusaders. The tn. is the site of the battle fought in 1832 between the Turks and the Egyptians. Pop. 5000.

Beilby, Sir George (1854-1924), Scottish scientist. Educated privately and at Edinburgh Univ. His researches in low-temperature carbonisation of coal were of service to the nation. During the First World War, when the conservation of oil for the Navy became an anxious problem, the distillation of bituminous coal at low temperatures provided a way of obtaining fuel oil from home sources. The Fuel Research Board, of which B. became chairman, was set up in 1917. B. then set up the Fuel Research station at Greenwich for inquiring into the systematic survey and classification of Brit. coals and the treatment of coal by carbonisation and gasification so as to make the best use of its by-products. Another service B. rendered to the country was the institution of the therm system of charging for a tn.'s gas, whereby the consumer pays not for vol. irrespective of quality but for calorific power. He pub. a number of papers on the physical properties of solids and summarised these in *Aggregation and Flow of Solids*, 1921, which book won him the fellowship of the Royal Society.

Beilstein, Friedrich Konrad (1838-1907), Russian chemist, b. at St. Petersburg in 1838. In 1866 he was made prof. of chemistry at the St. Petersburg Technological Institute, from which position he retired in 1896. His publications are numerous.

Beira: (1) Portuguese prov. reaching from the Atlantic to the Sp. frontier, now consisting of the 5 dists. of Aveiro, Castelo Branco, Coimbra, Guarda, and Viseu. It is bounded by the R. Douro in the N. and by the Tagus and the Estremadura Range in the S. It has an area of 9256 sq. m. It is mountainous but well watered, and there are many mineral springs. The productions are olives and wine. There are 7 cities in the prov. and 238 other tns. Pop. 1,730,000. (2) The chief tn. of the B. dist., Portuguese E. Africa, a seaport at the mouth of the R. Pungwe. It is connected by a line 200 m. in length with the Rhodesian railway system, and is the outlet for the copper of Katanga (Belgian Congo) and the gold of Rhodesia. Transit traffic through the port to and from N. and S. Rhodesia, Nyasaland, and the Belgian Congo was valued at

£9,775,949 in 1925. Pop. 23,000, of whom 1900 are Europeans.

Beiram, see **BAIRAM**.

Beirut, **Bairout**, or **Beyrout**, tn. and prin. seaport of Syria, 55 m. W.N.W. of Damascus on a bay of the Mediterranean. Pop. 160,000. The walls are 3 m. in circumference, and the suburbs beyond the walls are greater than the enclosed tn. Forming the seaport of Damascus, B. is a progressive commercial centre. The harbour will only admit small ships, but larger ones may anchor at a distance of half a mile from the shore. In bad weather shelter being found in the bay

American Colony, Jerusalem

BEIRUT

of the riv. of B., about 3 m. distant from the tn. It is clean, plentifully supplied with springs, and contains large bazaars, an Amer. and a Fr. college, the palaces of a Gk. and a Maronite bishop, and many missions and other institutions. There is a good service of European steamers. The prin. exports are silk goods and wool, oils, oranges, and other fruits. Silk is produced in large quantities, and there are important manufs. of silk goods and gold and silver thread. A road and railway connect with Damascus, crossing the Lebanon. B. was bombarded in Feb. 1912, during the Italo-Turkish war. In the First World War it was occupied by General Allenby's victorious army on Oct. 8, 1918. In the Second World War it was bombed by Brit. planes on June 4, 1941, during the short period of hostilities between the allied forces and the Fr. troops in Syria under the orders of the Vichy Gov.

Beisan (Bethshan in the O.T., Seythopolis in the N.T., and Bessan in the crusades), tn. in Palestine in a prov. of the same name, at S.E. end of plain of Esdraelon. During the First World War B. was captured from Turks by General Allenby, Sept. 20, 1918. Was scene of Arab disturbances in Apr. 1920, and again in Aug.-Sept. 1929 during the Zionist-Arab trouble over the Walling Wall (q.v.). Recent excavations by the Museum of Pennsylvania Univ. have produced a complete hist. of the site from about the sixteenth century B.C. The earliest city level reached was that of Thothmes III., but older levels have been cleared. Among the relics unearthed were a Canaanite temple, dedicated to 'Mekal, the lord of Beth-shan,' and a basalt tablet showing a lion and a dog representing respectively Nergal, the god of death and the guardian of the temple. Other temples found point to B. as a centre of serpent cult in some form and suggest that the anc. name, Beth-shan, was derived from Shakhnan, the name of an early Mesopotamian serpent deity. Other finds of archaeological value, as representing types unknown elsewhere in Palestine, include a large Græco-Rom. temple, various stelæ of Canaanite and Egyptian kings and a circular Byzantine church. Some of these finds are now lodged in the Jerusalem museum.

Beisehir Göl, fresh-water lake in Karaman prov., Asiatic Turkey, 35 m. long N.W. to S.E., and 1 m. wide, draining into the Soghla Göl. The tn. of B. is on the E. shore of the lake.

Beiseyhir, or **Beg Shehr**, tn. of Asiatic Turkey, 40 m. W.S.W. of Konya.

Bei-Shehr, see **BEG-SHEHR**.

Beit (Heb. *beth*), Arabic word which properly signifies a tent or hut, but is also used to denote any edifice or abode of men. It is often found as a component part of proper names, e.g. Beit-al-harâm, i.e. the sacred edifice, or the edifice of the sanctuary, a designation frequently given to the temple of Mecca.

Beit, Alfred (1853-1906), S. African financier and philanthropist, b. at Hamburg. He was a close friend of Cecil Rhodes, and assisted him in the amalgamation of the Kimberley mines into the De Beer's Consolidated Mines. After 1888 he was engaged in developing the Transvaal gold mines, and in 1889 became a director of the Brit. S. Africa Co. for the administration of Rhodesia. In 1905 he founded professorships at Oxford in colonial hist., and left large sums to various charities.

Beit, Otto (1865-1930), S. African philanthropist, brother of Alfred B., b. in Hamburg. In 1898 he settled in England as a stockbroker. He was much interested in the problem of developing S. Africa by land settlement schemes and in order to remain in close touch with that country, he accepted a post as director of the Brit. S. Africa Company. He contributed large sums for public purposes, including the provision of children's sanatoria, libraries, and an institution for homœopathic research.

Beit-el-Fakih, fort. tn. in the vilayet of Hodeida (formerly Yemen), Asiatic Turkey, near the Red Sea. A trading centre for coffee. Pop. 8000.

Beit, Jibrin (Rom. Eleutheropolis and the Gibelin of crusading times), vil. of Palestine, W. of Hebron, and included in the sub-dist. of Hebron. It is of archaeological interest. The churches of Sandahanna in the vicinity furnish examples of Rom. technique applied to Christian buildings. In 1921 a fine Rom. mosaic of the third century A.D. was excavated. The Israelitish tn. of Maresah (Gk. Marissa) nearby has also recently been excavated. Among the most striking finds are painted tombs of the Heb. period, wall paintings, rock caverns, etc. A second-century tomb, that of Apollonophanes, with gabled roofs is said to be the only one of its kind found in Palestine. *Consul Linke, Handbook of Palestine, 1930.*

Beit Lahm, see **BETHLEHEM**.

Beith, John Hay (b. 1876), Eng. author; pseudonym, 'Ian Hay.' His earlier books, *The First Hundred Thousand* and *Carrying On*, on the First World War, attracted attention. They caught much of what was best in the spirit of 1914 and, conveyed a graphic and sympathetic account of life in the New Armies. He has also written comedies of a light order, such as *Tilly of Bloomsbury*, 1919, and *A Safety Match*, 1921, in which he happily reflects the gaucheries of hobbledchoy schoolchildren. He was public relations officer to the War Office (1939-41). Later books include *The Great Wall of India*, 1933; *David and Destiny*, 1934; *Housemaster*, 1936; *The King's Service*, 1938; *Stand at Ease*, 1940; *Little Ladyship*, 1941 (also dramatised); *America Comes Across*, 1942.

Boith, mrkt. tn. in N. Ayrshire, Scotland, 11 m. S.W. of Paisley, with 2 railway stations. Coal and fireclay are found in the neighbourhood. There are manufs. of linen, thread, rope-making, cabinet-making, and upholstery. Pop. 5000.

Beja, the cap. of the dist. B., Portugal, about 90 m. from Lisbon. There are remains of Rom. walls and a gateway. Its manufs. are leather and pottery, and it trades in olive oil. It has a noted cathedral and castle. Pop. 12,000.

Beja, or **Boja** (Bisharin), African people N. of Abyssinia, between the Nile and the Red Sea, widely spread in Nubia. They are probably Hamitic, and include the Ahabda, Hadendoa, Bisharin, and other tribes. They are Muslims. They represent the Blemmyes of Strabo.

Bejan, or **Bajan** (medieval Lat. *bejanus*, Fr. *bec jaune*, yellow beak, i.e. fledgling), name applied to freshmen in the univs. of the Middle Ages, still surviving in St. Andrews and Aberdeen. Bejanian, or payment for students entering the univ., was part of an opening ceremony which led to horse-play and rowdiness.

Bejapoor, see **BIJAPUR**.

Béjar, a fort. tn. in the prov. of Salamanca, Spain, on the R. Cuerpo de Hombro, 3165 ft. above the sea-level. It is surrounded by old walls; within it the

ducal family of the same name has its ancestral palace, and there are many interesting churches, notably Santa Maria, San Juan, and El Salvador. There are sulphur springs, 108° F., in the neighbourhood. Pop. 10,000.

Bek, Antony (d. 1310), Eng. prelate, created bishop of Durham in 1283 by Edward I. He was renowned for his magnificent retinue. He was one of the royal commissioners to negotiate a marriage between the king's son, Edward, and Margaret, infant queen of Scotland, 1290. In 1294 he was sent on an embassy to arrange an alliance with Germany against France. In 1296 he took part in Edward I.'s expedition against Scotland, and received Baliol's submission in the castle of Brechin. After his return from the battle of Falkirk he appears to have lost Edward's favour. In 1302 B. set out to Rome to place an appeal against Prior Richard without asking the king's leave; in consequence the temporalities of his see were confiscated, but he afterwards regained them. Clement V. made him patriarch of Jerusalem in 1305, and 2 years later Edward II. granted him the sovereignty of the Isle of Man. He d. at Eltham, and was buried in Durham Cathedral. See Robert de Graystones, *De Statu Ecclesiæ Dunelmensis*, ed. by Raine, 1839; J. L. Low, *Diocesan History of Durham*, 1880.

Bek, Thomas (d. 1293), Eng. prelate, brother of Antony B. (q.v.). In 1269 he became chancellor of Oxford Univ.; keeper of the wardrobe to Edward I., 1274; keeper of the great seal during Edward's absence in France, 1279; bishop of St. Davids, 1280. He founded the collegiate church of Llangadoc and Llandewi-Breth, and a hospital at Llawhaden. In 1290 he took a vow to take the cross, and set out for Palestine, but it is uncertain whether he actually left England.

Beka'a, El, or Elbika, see CÆLE-SYRIA.

Beke, Charles Tiltone (1800-74), Eng. explorer, b. at Steyne. He joined an expedition to Abyssinia in 1840, and pub. the result of his travels in *Abyssinia: a Statement of Facts* (2nd ed., 1846), and *On the Sources of the Nile*, 1849. In 1861 he visited Harar, and 4 years later he set out to Abyssinia to urge the release of certain Brit. captives, but was unsuccessful.

Békes, tn. of Hungary, at the junction of the White and Black Koros, noted for its agriculture, and specially the cultivation of flax. It trades in cattle and honey. Pop. 30,000.

Bekker, August Immanuel (1785-1871), Ger. classical scholar and philologist, b. at Berlin, where he held the chair of philology, 1811-71. He revised the texts of many of the classics from the MSS. in the large libraries of Europe, independently of other printed eds. He ed. 25 vols. of the *Corpus Scriptorum Historiæ Byzantinæ*, and *Anecdota Græca*, 3 vols., 1814-21.

Bekker, Balthazar (1634-98), Dutch Protestant theologian, b. in Friesland; educated at Groningen and Franeker; pastor at Franeker, and after 1679 at Amsterdam. His *De Philosophia cartesi-*

siana aëmonitio sincera, 1665, was written to demonstrate a relationship between Descartes' philosophy and theology. His most famous work, *Die Belooferde Wereld, or The World Bewitched*, 1691, expresses a disbelief in sorcery, magic, and even the existence of the devil. The book is an early critical study of comparative theology. On its publication B. was removed from the ministry.

Bekker, Elisabeth (1738-1804), Dutch poetess and novelist, was the wife of Adrian Wolff. She resided in France for some time with Agatha Beken, and it was in conjunction with this friend that she wrote her novels, sentimental works in the style of Richardson. Perhaps her most popular works were: *Historie van den Heer Willem Leerd, 1785; Historie van Mejnrouwe Sara Burgerhart, 1782; Abraham Blankaart, 1787; Cornelia Wildschut, 1793-96.*

Bektashi, a name applied to a class of dervishes (q.v.), estab. in 1357 by Hadji Beyktash or Bektasch. When called upon by Amurath I. to bless his soldiers he gave them the name of *yentishery*, i.e. new soldiers, which is the origin of the word janizary.

Bel, or Belus, deity of the Babylonians and Assyrians, known to the Heb. as Baal, the name signifying lords in both languages. B. corresponds to the Gk. Zeus and the Rom. Jupiter.

Bel, Joseph Achille Le, see LE BEL.

Béla, name of 4 kings of Hungary in the Arpad dynasty. B. I., 1061-63, who succeeded his brother Andrew, improved the commerce of Hungary by standardising weights, measures, and coinage, pacified the country, estab. Christianity, and introduced the representative system into the diet. B. II., known as the Blind, 1131-41, succeeded his second cousin, Stephen II., and was the son of the pretender Almus. The kingdom was administered by his wife, Helena of Siberia, at whose instigation the ministers of the preceding king were massacred at the diet of Arad. B. III., 1173-96, was grandson of B. II., and succeeded Stephen III. He had been educated at Constantinople, and introduced Byzantine customs into Hungary. B. IV., 1235-70, grandson of B. III., deposed and succeeded his father Andrew II. He was a supporter of the freemen against the nobles, whose power he attempted to break. In 1241 Hungary was overrun by Mongols, and, asking aid of Frederick of Austria, B. was compelled to yield some of his ter. to him. Later he vanquished both the Mongols and Frederick.

Belacazar, tn. of Andalusia, Spain, 50 m. N.W. of Cordova. Manufs. woollens. Pop. 7500.

Bel and the Dragon, The Story of, apocryphal addition to the book of Daniel in the Bible, forming 2 distinct and separate stories. The original text is considered to be either Gk. or Aramaic. The stories are variously received; by the Rom. Catholic Church as true, forming the fourteenth chapter of Daniel in the Vulgate; but they are generally accepted as

fables, written to impress the instability of idol worship.

Coming to us from different sources the writings vary greatly in detail, but the stories may be given in brief, as:

Bel. Daniel declines to worship an image of Bel (Baal), and when the king of Babylon points out how great a quantity of food the image consumes each day, Daniel has all the entrances to the temple closed, first sprinkling the floor with fine ashes. In the morning footprints show that the food has been removed by the priests through a secret door. Whereupon the king has the image destroyed and the priests put to death.

Dragon. Daniel refuses to worship a dragon, which he kills by throwing a ball of pitch down its throat. Yielding to the angry people, the king has Daniel cast into a den of lions, where for 6 or 7 days Daniel lives unharmed. On discovering this the king has Daniel's accusers thrown in and devoured, while Daniel is released.

Bela Kun, see KUN.

Belasco, David (1853-1931), Amer. dramatist, b. in San Francisco, eldest child of Humphrey Abraham B., an Eng. Jew. He appeared at the Metropolitan Theatre, San Francisco, in 1874 as the young duke of York in *Richard the Third*. Later he was stage manager of the Madison Square Theatre in New York, but he is best known for his original plays. These include *Hearts of Oak*, 1880; *La Belle Russe*, 1882; *May Blossom*, 1884; *Valerie*, 1886. After these came 4 plays in collaboration with H. D. de Mille, including *The Wife*, 1887; *Lord Chumley*, 1888. Then, among others: *Madame Butterfly*, of which the plot was taken from John Luther Long's novel, 1900; *Du Barry*, 1901; *The Darling of the Gods* (with J. Luther Long), 1902; *The Girl of the Golden West*, 1905; He opened the Belasco Theatre, formerly the Republic, in Sept. 1902; but in 1917 it had its old name restored, and the name Belasco was given to the Stuyvesant Theatre on 44th Street.

Belcher, Sir Edward (1799-1877), Eng. admiral. He was present at the bombardment of Algiers in 1816, and took part in the 1825 expedition to explore the Bering Strait. He took part in the war in China, 1840-41, and in 1852 was given command of the unsuccessful expedition to search for Sir John Franklin.

Belcher, George Frederick Arthur (1875-1947), Eng. artist, son of a doctor of medicine. Educated at King Edward VI. school; went to Gloucester school of art. Made a reputation as a painter of still life and *genre* and as a humorous draughtsman. It is for his studies of London life that he will be chiefly remembered, his humorous drawings being a familiar feature of *Punch*, the *Tatler*, and other periodicals. His favourite characters, generally drawn with an element of caricature, were charwomen, public-house loafers, and the like, whose sharp Cockneyisms supplied the aptest captions while really reflecting these strata of London life. But apart from low-life *genre* subjects B. also produced serious

figure drawings such as his etchings of James de Rothschild and Sir Frederick Ponsonby with backgrounds illustrative of their activities. In oils B.'s interests were also chiefly in low-life character portraiture. A.R.A., 1931; R.A., 1945.

Belcher, James (1781-1811), Eng. prize-fighter, b. in Bristol. He was put to the trade of a butcher, but his local success as a pugilist soon induced him to follow that career in London. In 1803 he lost an eye while playing racquets. He was defeated by H. Pearce in 1805 and in 1807 by Tom Cribb. Soon after this he became a publican in Soho, where he d.

Belcher, Jonathan (1681-1757), Amer. administrator, b. at Cambridge, Massachusetts, and graduated at Harvard, 1699. In 1730 he was appointed governor of Massachusetts and New Hampshire: his freedom of thought made him many enemies, who went so far as to forge letters to encompass his ruin: the influential people of New Hampshire, who wanted a separate gov., were opposed to him, and he was superseded in 1741. In 1747 he was appointed governor of New Jersey, an office he held till his death.

Belcher, John (1841-1913), Eng. architect, b. and d. in London. Son of an architect. His work, which was influenced by that of Scott and Street, began during the last stages of the Gothic revival, but most of the buildings designed by him show small traces of that revival. Earlier examples are the Curriers' Hall, London Wall, and the Catholic Apostolic church, Camberwell; later are the Colchester tn. hall, the premises of the Institute of Chartered Accountants in Moorgate Street; Whiteley's premises in Bayswater, and the offices of the Royal Insurance Company, St. James Street. He was one of the first notable modern architects to call in the aid of sculptors for the decoration of public buildings. With M. Macartney he produced an excellent folio work on the Eng. Renaissance. President of the Institute of Brit. Architects, 1904-6; gold medallist, 1907; R.A. 1909.

Beled, or Balad, Arabic word, signifying a tn., prov., or country, occurring in many E. geographical names, e.g. Beledulgerid—Baladal-Jarid, or the country of palm-trees.

Beledugu, or Beledougou, region of Fr. W. Africa, lying to the N. of the R. Niger, between 7½° and 8½° W. long.

Belem (shortened from Bethlehem), tn. in Portugal, situated near the entrance to the R. Tagus. It is a suburb of Lisbon. Its Gothic monastery and church, the finest structure in Lisbon, was built to commemorate Vasco da Gama's discovery of the sea route to India. In the church of B. are the tombs of both da Gama and Camoens. Pop. 10,000.

Belem, or Pará, cap. of the prov. of Pará (q.v.), Brazil. Situated with a good harbour in the estuary of the Tocantins on Para R. It was founded in 1616 to secure the Amazon against the Eng., Dutch, and Fr. The modern city contains many fine buildings, including a

cathedral, bishop's palace, and gov. house. Pop. 309,000.

Belemnites, genus of fossil dibranchiate molluscs representing the family Belemnitidae, allied to the Sepiidae, or cuttle-fish family. These fossils, which occur abundantly from the Lias to the Cretaceous, are the internal shell of the animal's body. From a few well-preserved specimens it has been seen that they had 10 arms provided with hooks, and in some cases an ink-bag has been discovered. The size of the B. seems to have varied from a few inches to sev. feet.

Belfast, city, co., and parl. bor., cap. of N. Ireland. Pop. 440,000. It is 112 m.

and the Presbyterians. The surrounding country is well wooded and picturesque, many country seats and villas lying in the neighbourhood. B. Lough is very pretty, and round its shores have sprung up many residences, forming the vills. of Whitehouse, White Abbey, Holywood, and Bangor. Early remains are found in the chalk beds at Cave Hill, the scene of a battle between the Irish and savages of the Ards, 1408. The harbour of B. is under the management of a board of harbour commissioners, elected by the ratepayers and shipowners. The ship-building trade was begun in 1791; in 1860 it gave employment to some 100 men;

British Railways

CITY HALL, BELFAST

N. of Dublin by rail, and is a railway centre, three railways running through the city, via the Great N. of Ireland, the N. Cos., and the B. and Co. Down, B. being the terminus of each. Situated at the entrance of the R. Lagan into Belfast Lough, B. is a seaport of the first rank; regular passenger communication is maintained with Liverpool, Heysham, Glasgow, and Ardrossan. B. was at one time subject to epidemics, being built on alluvial deposit, but has been made more salubrious by careful drainage. Many fine buildings are to be seen in the city, including the public library, the city hall, built in 1906, and the post office. The old Queen's College was replaced by Queen's Univ. under Irish Univs. Act of 1909; there are also Presbyterian and Methodist colleges, Royal Academical Institute, and a municipal technical institute. There are sev. fine public parks. The older churches of the city are classical in design, the modern, Gothic. The 3 main religious bodies are the Protestant Episcopalians, the Rom. Catholics,

to-day some 25,000 men are employed. Aeroplane engines and wings are also made. An airport was estab. in 1937. The Alexandra Dock, which was opened in 1889, is now, with all its modern improvements, one of the most commodious harbours in the United Kingdom. One of the largest graving docks in the world was opened here in 1911. B. is also an important distributing port; it is the centre of the Irish linen industry, and the business headquarters of the flax spinning and weaving industry. In recent years nearly a million pounds worth of linen has been exported by the United Kingdom, most of it coming from B. Over 100,000 persons find employment in this industry. It has distilleries, and tobacco and rope works. The chief exports are linen, whisky, iron ore, aerated waters, and cattle. It was created a city in 1888, and in 1897 the title of lord mayor was conferred upon the mayor of the city. Before the Franchise Act of 1918, it sent 4 members to Parliament, the number was then increased to 9. Under the Gov. of

Ireland Act, 1920, it returns 16 members to the N. Irish Parliament, and 4 members to the House of Commons at Westminster.

The origin of the tn. and of its name are alike lost in obscurity. A castle is said to have been built by John de Courcy in 1177, and destroyed in 1316 by Edward Bruce. At the beginning of the sixteenth century B. was no more than a vil., owned by the O'Neill family, who were in opposition to the reigning monarch. In 1552 Hugh O'Neill swore allegiance to his king, and received the tn. and fortress of B. and the surrounding lands, but lost them in 1571 to Sir Thomas Smith, after whom Sir Arthur Chichester had them. B. received a charter in 1613, and under Wentworth's wise policy started on a career of prosperity and progress. The cotton manuf. was begun in 1777. There have been various riots in the city owing to the intensity of the religious opposition of the different sects, notably in 1880, 1884, and 1907. B. became the centre of resistance to Irish Home Rule. In 1912 there were many demonstrations and religious and political disturbances. The Ulster Volunteer Force was founded, and an Ulster provisional gov. set up in 1913. During July 1920, in the course of the Sinn Féin campaign, serious rioting occurred in B. When in the same year Ulster elected to remain within the United Kingdom, B. became the seat of gov. of N. Ireland. On July 18, 1945, the city was visited by the king and queen with Princess Elizabeth, and the king addressed the N. Ireland Parliament. During the Second World War B. suffered damage from air attack, having been bombed in Sept. 1940. See D. J. Owen, *History of Belfast*, 1921.

Belfast, city and seaport of Waldo co., Maine, U.S.A., on the W. side of Penobscot Bay, industries, shipbuilding and manufacturing. Pop. 5500.

Belfast Lough, inlet on the E. coast of N. Ireland, situated between the tns. of Antrim and Down. It is an estuary of the Lagan, and is 7 m. wide at its mouth. It extends 15 m. inland, and has the tns. of Belfast, Carrickfergus, Holywood, and Bangor on its shores.

Belfort, cap. of the ter. of the same name, in the dept. of Haut-Rhin, France. It stands on the R. Savoureuse, in the depression called the Trouée de B., between the Vosges and the Jura, 117 m. N.E. of Dijon. It was ceded to France by Austria at the peace of Westphalia in 1648, and fortified by Vauban. In the Franco-Ger. war of 1870-71 it withstood a siege of 3 months, capitulating with military honours on Feb. 16, 1871, and was restored to France at the peace of Frankfurt. The fortifications were then enormously strengthened.

During the early days of the First World War the Fr. garrison in B. attacked the Gers., who, by the middle of Aug. 1914 were compelled to withdraw beyond Mulhouse. The Fr. had to withdraw again to B. to conform to the general line further N. In Sept., 1914, the Fr. made another advance from B., and this time estab. themselves in Alsace. Throughout

the whole of the war the place remained the right-hand pivot of the allied line. It was again a centre of fighting in the Second World War, during the advance across Europe of the Amer. Seventh Army and the Fr. First Army in 1944. B. itself was liberated on Nov. 25, 1944. Pop. of tn., 42,500; of ter., 86,000.

Belfry, term originally applied to a tower used for purposes of defence, later a watch-tower, or one from which an

THE BELL-TOWER AT EVESHAM, WORCS.

alarm bell was rung, and finally a bell-tower, usually confined to eccles. buildings. It generally is part of the church, but is sometimes a separate building, as with the lt. campaniles. Such Bs. are found in England at Evesham, Berkeley, Beccles, and sev. places in Cornwall and Scotland, where the church stands in a glen, the B. then being placed on the hillside above it. Municipal Bs., attached to the tn. hall, are common on the Continent, as at St. Quentin, Douai, Brussels, etc., and are also found at Glasgow and Aberdeen. The famous B. at Bruges, with a carillon of 48 bells, is part of 'Les Halles.' The framework of a B. is made to rest either upon stone corbels or upon recesses in the wall, in order to mitigate the effect of the vibration upon the masonry. The higher the bells are hung the more this is felt. See also BEFRON.

Belga, the currency unit of Belgium, introduced in 1926 after the franc had been stabilised. It is equivalent to 5 paper francs, and at par 35 Bs. equal £1.

Belgæ, name given by Cæsar to the different tribes who inhabited the N. of Gaul, between the sea on the W., the rivs. Matrona (Marne) and Sequenna (Seine) on the S., and the Rhenus (Rhine) on the E. But it is not well determined how far this name may be extended to the E.; perhaps the Treviri, on the banks of the Moselle, were included. Cæsar also (*Bell. Gall.* v. 24) uses the term Belgium to express a part of Gallia Belgica, on both sides of the Somme, including the Bellovaci, Atrebatæ, and Ambiani. The B. were, according to Cæsar, of Ger. origin. The Bellovaci (Beauvais) were the most warlike and numerous Belgic tribe in the time of Cæsar (*Bell. Gall.* ii. 4). The rest of the tribes are mentioned by Cæsar (ii. 4); among them we find one name, the Atrebatæ, the same as that of a Belgic tribe in Britain. The B. may be described generally as occupying, in the time of Cæsar, the Fr. depts. of Nord, Pas-de-Calais, Somme, Seine-Inférieure, Oise, and Aisne, with a part of modern Belgium. When Cæsar invaded S. Britain he found that part of the is. occupied by B., that is, by tribes of Ger. origin (*Bell. Gall.* v. 12). The whole S. coast from Suffolk to Devonshire was probably occupied by Belgic tribes.

Belgard, tn. in the prov. of Pomerania, Germany, situated 16 m. S.W. of Köslin, on the Persante. There is an old castle, and horse and cattle m'rks. are held. Pop. 12,500.

Belgaum, or **Belgam**, dist. of Bombay, India. The tn. and cap. of the same name is situate 2500 ft. above sea level, and contains an old fort. The dist. is generally productive and cotton cloth is manufactured. Pop. tn., 44,000.

Belgian Congo, see CONGO, BELGIAN.

Belgiojoso, tn. of N. Italy, 8 m. E. of Pavia. Pop. 4500.

Belgiojoso Christina, Princess of (1808-1871), It. patriot and authoress. B. at Milan, she was the daughter of the Marquis Trivulzio, marrying the prince of Belgiojoso. In 1848 she supported the It. revolution, and at her own expense raised a troop of volunteer patriots. On the defeat of her party in the following year her property was confiscated and, an exile, she returned to Paris, where she continued her literary work. She d. at Milan.

Belgium, country of N.W. Europe. Since 1830 constituted as an independent kingdom, it was anciently a part of Gallia Belgica, so called from the tribe the Belgæ (q.v.). It is bounded on the N. by the Netherlands, on the S. and S.W. by France, on the E. by Luxemburg and Germany, and on the N.W. by the North Sea. It lies between lat. 49° 30' and 51° 30' N. and long. 2° 33' and 6° 25' E. It has an area of about 11,780 sq. m., about one-eighth of the area of Great Britain. Its greatest length is a line drawn from Ostend to Arlon, about 174 m. It is divided into 9 provs., Antwerp, Brabant,

E. Flanders, W. Flanders, Hainault, Liège, Limbourg, Luxembourg, and Namur. Its cap. is Brussels. In general B. is a flat country, the greatest height to which any elevation rises is about 2270 ft. In the S. and E. it takes the general aspect physically of N. France, while in the N. and N.W. it resembles the Netherlands. A continuation of the Ardenne uplands separates the riv. valleys of the Meuse and the Moselle, and extends in a N.E. direction into the Rhineland. The provs. of Liège, Luxembourg, and Namur are divided by numerous ravines and streams, by valleys and ridges of hills. The vegetation is poor and the country in this part is covered with forests, which become less extensive as approach is made to the coast. The N. and W. provs. consist of well-watered and extensive plains, which are easily cultivated. In the provs. bordering the sea and the lower Scheldt the inundations of the sea are only kept back by the dikes which have been built. Nearly 200 sq. m. of land are thus artificially protected from the inroads of either the sea or rivs. Those lands under sea level are locally called polders.

The shallowness of the North Sea and the entire absence of coastal indentations are incompatible with the existence of good seaports, though the port of Antwerp to some extent compensates for the disadvantages of the coast. The length of the coast-line is 42 m. The sand dunes are a feature of the coast of W. Flanders, and among the well-known watering-places are Ostend, Blankenberghe, Knocke, and Nieuport Bains.

Rivers and Canals. The waterways of B. fall into 2 great divs., the navigable rivs., such as the Scheldt and the Meuse, and the system of canals. The 2 great rivs. of B., the Scheldt and the Meuse, enter that country from France, where they have their source, and enter the sea in the Netherlands. They are navigable throughout the whole of their course in B. and are supplemented by a number of tribs. which enter them during their course through B., and some of which are themselves navigable. The course of the Scheldt through B. is about 110 m., its prin tribs. being the Lys, the Dender, the Durme, and the Ruppel. The Meuse has about 115 m. of navigable water in B. and receives in its course the waters of the Sambre and the Ourthe. Another riv. of B. is the Yser, which enters the sea at Nieuport, and which is navigable for about 30 m. In addition to these systems of natural waterways, the country is also supplied with an excellent canal system. These canals number 26, and have an entire length of over 550 m. The chief canals are from Bruges to Ostend, from Brussels to Charleroi, from Brussels to Willebroeck, and from Ghent to Bruges. The most important is the Albert Canal, 81 m. in length; it runs from Antwerp to Liège, and was constructed for the traffic of 2000-tonners.

Climate. The climate of B. is similar to that of England; it is, however, a little colder in winter and hotter in summer.

The S.E. part is to be preferred to the damp and hazy atmosphere of the N. and N.W. Frost is usually not encountered until the middle of Oct., nor after the middle of Apr. The mean ann. temp. is about 50° F., while the mean ann. rainfall of Brussels is about 28 in., or about 3 in. less than that of London. The rainfall, however, varies from an average of 27 in. in the W. to a little over 40 in. in the E. of the country.

Agriculture and Forestry employ well over one-fifth of the available Belgian man power, estimated at 4 million people. At least 4.5 million ac. are cultivated, and there are about 1.3 million ac. of forests, half of which is scientifically exploited under gov. superintendence. About 60 per cent of the cultivated area is covered by little farms of from 2.5 to 12.5 ac. There are also some 840,000 small holders, who cultivate less than 2.5 ac., and only a relatively small number of really big farms. Cultivation in B. is, however, so intensive that B. produces about 80 per cent of its own agric. needs. The chief products are (1946-47):

	Area acres	Estimate metric tons
Wheat	395,000	328,000
Rye	265,000	206,000
Oats	475,000	445,000
Barley	155,000	137,000
Potatoes	200,000	1,553,000
Sugar beet	110,000	1,470,000
Ordinary beet	215,000	5,160,000
Flax	80,000	180,000
Chicory	10,000	14,000
Tobacco	12,000	10,000

Hay-lands and meadows occupied 2,125,000 ac., fruit an area of 170,000 ac., and leguminous plants 80,000 ac. There is an important floriculture in the Ghent region. To improve the breeds and to introduce modern farming methods national, provincial, and local exhibitions of horses, cattle, agric. implements, and produce are regularly held, at which prizes are given. Breeding of live stock is also an important industry. In 1946 (end Dec.) there were 309,000 horses and 1,652,000 cattle, besides 775,000 swine, 143,000 sheep, and 73,000 goats.

Minerals. The mineral wealth of B. is also of great importance. Mining employs 175,000 workers. The prin. minerals are coal and stone. The iron deposits are nearly exhausted. The output of ore was 39,000 metric tons in 1946 (177,000 in 1939 and 113,000 in 1942). The lead and zinc mines, too, are more or less entirely exhausted. Coal is found principally in two basins: (i) the S., which may be divided into an E. basin of 100,000 ac., and a W. basin of more than double that area. The chief centres of the W. basin are Mons, Charleroi, and Namur, while the centre of the E. is Liège. (ii) The N. basin, which covers 250,000 ac. of the Limbourg prov. This rich reserve of coal deposits has only

been exploited since 1917. The chief centres are Beringen, Genk, and Elsden. The coal found in B. varies from anthracite to the richest of gas coal. The output was 22.8 million metric tons in 1946 (29.5 in 1938 and 15.7 in 1945). It is the intention of the Gov. to nominate a national council for the coal mines to co-ordinate all problems. The production of freestone, porphyry, granite, marble, gravel, limestone, and sand for glass is also of great importance. About 15,000 men are employed in 575 stone-pits, and their output is valued at well over 500 million francs (1943).

Industry. The metallurgic industry is the most important of B., and employs about 230,000 people. The manuf. of iron is centred in the Sambre and Meuse valleys which cross the S. coal basin. In 1946 2.20 million metric tons of iron were produced, and nearly 2.25 million metric tons of steel. There are, in addition, numerous lead, zinc, copper, silver, and other non-ferro metal works throughout the country. An important amount of the raw material goes to the Belgian factories producing power installations, locomotives, wagons, ships, weapons, bicycles, motor cars, cables, and tools of all shapes and sizes. Next to this industry comes the manuf. of textiles, employing about 165,000 persons, half of whom are women. The chief centre of the cotton industry is Ghent. Woollen manuf. is carried on in the region of Verviers. Linen is the chief industrial product of the Lys valley. Lace is made at Brussels, Malines, and Bruges. At least 1000 silk-weaving looms are working in various tns. throughout the country. Other important industries include food, chemicals, leather, glass, furniture, paper, tobacco, pottery, clothing, building, and transport.

Trade. B. being a manufacturing country the import of raw materials and the export of manufactured articles are necessarily complementary. B.'s situation at the cross roads between other manufacturing countries, its easy communications with the sea, as well as inland, make B. also a transit country. Commercial branch houses employ well over 500,000 people. In 1946 Belgian seaports loaded 13 million metric tons and unloaded 5.2 million. Provided with a good canal system and railways covering 6000 m., quick transport is assured. Seven thousand barges are in use for the riv. and canal transport. The Belgian merchant navy, however, was never of great importance. Imports and exports for 1946 and 1947 (partly) were as below:

IMPORTS (1946)

Metric tons: 19,740,000
Value: 52,560 million frs.
(From United Kingdom 9000 million frs.; 3300 in 1945.)

First half-year 1947:

Metric tons: 12,080,000
Value: 36,330 million frs.

EXPORTS (1946)

Metric tons: 7,440,000
 Value: 29,650 million frs.
 (To United Kingdom 2000 million frs.;
 67 in 1945.)

First half-year 1947:

Metric tons: 5,670,000
 Value: 28,340 million frs.

With Luxembourg B. has had a customs union since 1922. In June 1947 an agreement was signed with the Netherlands to join this union.

Government and Constitution. The gov. is based upon the strictest liberal principles; all power emanates from the people. Justice is free to all, the press is free, the people are surrounded on every side by safeguards designed to ensure to them the proper gov. of their country and their own personal liberty and freedom of conscience. The gov. is a constitutional representative and hereditary monarchy (Constitution of 1831). Those sections of the Belgian Constitution which regulate the legislative power were revised in 1921. The legislative power is vested in the king, the Chamber of Representatives, and the Senate. Judicial power is exercised freely without dependence upon any authoritative influence by provincial councils. The royal succession is in the direct male line in order of primogeniture. The right of successors is forfeited by marriage without the king's consent, but may be restored by the king with the consent of both Houses of Parliament. The king can do no wrong, his person is sacred, and the ministers are responsible for all his acts. He cannot suspend or dispense with the laws. He has power to nominate to all civil and military offices, and he commands both army and navy. He can declare war, make peace, and conclude offensive and defensive alliances and commercial treaties which he must communicate to the Chambers. He has power in default of male heirs of nominating his successor with the consent of the Chambers. He can only appoint one regent, and under a regency the constitution cannot be altered. The legislature (Chamber and Senate) meets annually in Nov., and must sit for at least 40 days. The king has the power of dissolution, and on dissolution a fresh election must take place within 40 days. The Chamber of Representatives is chosen by the people, and consists of 1 member for every 40,000 inhab. To be a general elector it is necessary to be a Belgian by birth, or to have received the 'grand nationalisation,' to be not less than 21 years of age, to be a male (very few women have the vote, and those mainly war widows), and to have resided in the constituency for a minimum period of six months. In order to be eligible as a deputy it is necessary to be a Belgian, to live on Belgian soil, to be in full possession of civil and electoral rights, and to be at least 25 years old. For the Senate the minimum age limit is 40 years, and candidates must fulfil one out of twenty special conditions. Each deputy has an

ann. allowance of 60,000 francs and a free pass all the year over Gov. and companies' railways. Senators receive 42,000 francs per annum. The number of members elected directly to the Senate is equal to half the number of members of the Chamber of Representatives. Each provincial council nominates, for every 200,000 inhab. of the prov., 1 provincial senator. Each provincial council elects at least 3 senators. There are at present 44 provincial senators. Senators are elected (or co-opted) by the Senate itself in the proportion of half of the preceding category. The king has the right of appointing his own ministers. They have the right of access to the Chambers, must appear on request of the Chambers, and may take part in debates. They may vote when they are members. They can be dismissed at pleasure, and may be charged by the House of Representatives before the court of cassation. For judicial purposes B. is divided into 26 arrons, and 230 cantons. For administrative purposes into 41 arrons, 211 cantons, and 2670 coms. The provs. and coms. enjoy a considerable measure of local gov. Proportional representation applies to the provincial and communal elections. Each prov. has its prov. council elected at the same time as the members of the legislature. The governor is appointed by the king. Each com. has a council re-elected every 6 years. The council nominates its aldermen. The burgomaster is appointed by the king.

Language. The languages spoken in B. are Fr. or Walloon, a dialect of anct. France, and Flemish or Dutch. The Fr. dialect prevails in the S. and the E., the Flemish or Dutch in the provs. of Antwerp, Brabant (N. half), Flanders, and Limbourg. Officially the two languages are equally used. While the educated in Flanders have mostly a good knowledge of the Fr. language—which, to some extent, they prefer to Flemish—the Walloons are not so likely to learn the other national tongue. Ger. is spoken in the E. part of Liège prov. and in the Eupen and Malmédy dists., where Fr. too is generally understood throughout. In 1944, conjointly with the Dutch Gov., it was decided to simplify the written language. Since May 1947 the use of the new rules for the writing of the Dutch language is obligatory in all gov. services. In most schools the new system was being taught a year earlier.

Education. The educational institutions may be classified as primary, middle, superior, and special. In addition normal schools have been estab. by the Gov., by some provs. and tns., and by school committees to train teachers for elementary and middle schools (*athénées, lycées, and collèges*). Since 1914 all children from 6 to 14 are bound to go to school, and it is a duty of the State to give this primary education free of charge. Those schools which are subsidised by the Gov. are under frequent inspection and the programmes must be in accordance with a model State programme. The superior institutions are the 4 univs. The 2 State univs. at Ghent and Liège were

erected under the Dutch Gov. (1816-17). In 1930 the Ghent univ. became a Flemish univ. The Catholic univ. of Louvain dates from 1426. The free univ. of Brussels dates from 1834. The special schools are chiefly technical, engineering, agric., mining, commercial, normal, military, and navigating schools. In 1923 the Colonial School at Antwerp (estab. in 1920) and the School of Tropical Medicine were constituted a colonial univ.

the time of the 1830 revolution, but its hist. as part of the Netherlands goes back to the time of the Romans. The ter. covered by B. to-day was already inhabited in the early Stone Age (Palaeolithic). Hist. starts with the conquest by Caesar. In the Rom. period it formed part of Gaul, and was distinguished by the name of Gallia Belgica. It was inhabited chiefly by Celtic tribes, although there were many traces of tribes of Germanic origin.

THE RIVER MEUSE AT BOUVIGNE, PROVINCE OF NAMUR

E.N.A.

There are the various royal academies and conservatoires devoted to the fine arts; besides well-endowed museums and libraries, and numerous scientific and literary societies.

Population and Religion. The pop. of B., including Eupen and Malmédy, was estimated to be 8,388,000 at the end of 1946, which total may be roughly divided into 4½ millions of Flemings and 3½ millions of Walloons, while there are about 70,000 Ger.-speaking Belgians and some 300,000 foreigners. The pop. of Brussels with 13 adjacent coms. is 870,000, of Antwerp with 8 adjacent coms. 530,000. The next tns. of importance are Liège and Ghent. The religion of the country generally is Rom. Catholic, although full liberty of conscience is granted to all, and all ministers, no matter of what denomination, are paid by the State. In 1945 there were 6407 Rom. Catholic ministers, 27 Protestant, 77 Jewish, and 9 Anglican. No inquiry about profession of faith is made by the census authorities. The kingdom is divided into 6 Rom. Catholic dioceses, an archbishop having his see in Malines. There are also a number of conventual houses.

History. The hist. of B. as an independent kingdom can be said to date only from

By the influx of the Franks into this part of the country the Ger. tribes were increased, and it is the hist. of the Franks in Europe that forms the early hist. of the Netherlands. The Salic Franks settled in the region between the lower Rhine and the North Sea. At the end of the fifth century, under Clovis, they had conquered the whole of Gaul (France). In the beginning of the ninth century the whole country formed part of the empire of Charlemagne. After his reign his empire was gradually divided. Flanders and the W. provs. went to France, the E. provs., including Brabant, to Germany. During the feudal Middle Ages different hereditary counties, duchies, bishoprics, and lordships were estab. In the meantime the tns. rose to power. Flanders with its cities became one of the most important counties, and had to struggle constantly against France to maintain her independence. Towards the end of the fourteenth century the line of Flemish counts became extinct, and their ter. passed into the hands of the dukes of Burgundy, and at the beginning of the fifteenth century, through various marriages and by inheritance or purchase, all the provs. became united, and the industry of the Netherlands flourished

...tly. In 1477 the daughter of Charles the Bold, Mary, married the Archduke Maximilian. In this way began the connection of the Netherlands with the house of Austria. The Netherlands were passed on by the emperor to his son Philip, who married the daughter of Ferdinand and Isabella of Spain, and was the father of the Emperor Charles V. Dying considerably before his father Philip left the Netherlands to his son, by whom it was incorporated with the Sp. crown, and who began the connection of the Netherlands with Spain which lasted up to the treaty of Utrecht, 1713. With the beginning of the rule of Charles V. we get also the beginning of the spread of Protestantism. During the reign which followed we get the bloody religious wars of Philip II. The N. provs. broke away, but B. remained under Sp. rule. For a short time after 1598 an independent gov. was set up there, but it failed owing to the death of the Archduke Albert, and the country reverted to the crown of Spain. In the century which followed, dist. after dist. was ceded to France during the wars with Spain and following the war of Devolution. By the treaty of Ryswick (1697) a great amount that had been lost at Nimègue (1678) was restored. By the treaty of Utrecht, which concluded the war of the Sp. Succession, B. was ceded to Austria. During the century which followed, the fortunes of the Austrian Netherlands underwent many vicissitudes. In the war of the Austrian Succession B. was overrun by France, but all conquests were restored by the treaty of Aix-la-Chapelle of 1748. The Seven Years' war left B. unmolesied, and under Maria Theresa it prospered. But Joseph II., the enlightened despot, roused anger by his reforms and danger by his attempt to open the R. Scheldt, and before his death B. had declared itself an independent nation—'United B.' Leopold II. promised an amnesty in return for surrender, but the Belgians held out and were subdued by an Austrian army. Then came the days of the Revolution and Napoléon. The battles of Jemappes and Fleurus placed B. in the hands of the Fr., the treaty of Campo Formio (1797) confirmed that possession, and for the rest of the Napoleonic period B. became to all intents and purposes an integral part of France, ruled by the Code Napoléon. After the abdication, 1814, B. again passed to Austria, and was administered by an Austrian governor-general, but in 1815, by the Congress of Vienna, it was united to Holland, and William Frederick of Nassau became king of the Netherlands, taking the oath in Sept. 1815. It was an unfortunate alliance, and a feeling of discontent spread throughout the whole country. Nevertheless the prosperity of the country increased. The revolution of Paris of 1830 was successful: the revolutionary spirit seized the Belgians, and the cry 'Imitons les Parisiens' roused them to successful imitation of the citizens of Paris.

The Belgians again declared in favour of independence and were successful in

keeping at bay the forces of the Dutch. At the congress of the 5 great powers held in London, it was agreed that the country of B. should be independent, that it should be a constitutional monarchy, not a republic, and that the Orange Nassau family should be permanently excluded. The election of Leopold of Saxe-Coburg was the signal for a fresh Dutch invasion. The crisis was terminated in 1839 by the action of the great powers, who forced a settlement which was in effect the Treaty of XXIV. Articles, drawn up 8 years before. By its terms B.'s share in the national debt of the Netherlands was reduced and the ters. in dispute were partitioned, but to compensate for territorial losses the neutrality of B. was guaranteed. It was this treaty which became known as 'the scrap of paper.' From 1839 to 1914 B. maintained its independent neutrality. After 1850, however, the constitutional party began that series of reforms which gained for B. the position of one of the freest countries in Europe. The question of Luxemburg threatened in 1867 the peace of Europe, and B. took part in the congress which prevented war breaking out. In 1870, on the outbreak of hostilities between France and Germany, B., fearing invasion, mobilised her troops, but her neutrality was recognised. In 1885 the Congo Free State was acknowledged to be under the presidency of the king of B., Leopold II., who had succeeded his father in 1865. Leopold II. d. in 1909, and was succeeded by his nephew Albert.

At the beginning of his reign King Albert was credited with socialist sympathies, and in 1913 a general strike was called with the object of obtaining equal manhood suffrage and the abolition of the system of plural votes. A strike with similar intentions had taken place in 1893, soon after the creation of a new political force, the Labour party, in 1885. In 1899 proportional representation had come into being, but it was not until 1918 that plural voting was abolished. In the strike of 1913 Albert stood by the gov. of the Catholic party, but later, in advising the withdrawal of an Education Bill, to which the Socialists objected, the king showed his strict impartiality. At this juncture Albert paid a state visit to Berlin, and on his return he initiated a Bill introducing compulsory military service. Although the majority of the people relied on the 1839 treaty, especially as it has been respected during the Franco-Prussian war in 1870, it had been the policy of Leopold II. to make B. secure from invasion, and this policy was also adopted by Albert. Leopold had encountered parl. opposition in obtaining the credits necessary for the fortification of Liège, Namur, and Antwerp, and although under Albert compulsory service was estab., it had not had time to take effect before B. was invaded by Germany on Aug. 3, 1914. Under Gen. von Emmich the Gers. attacked Liège with a recklessness which caused them great losses in the face of the heroic resistance of the Belgians. (See LIÈGE.) The

reduction of Liège took 12 days, and the Belgian army was driven back to Louvain, whence it was further driven back to Antwerp. Louvain was looted. (See LOUVAIN.) On Aug. 20 a Ger. army under Gen. von Kluck entered Brussels, while another army under Gen. von Bülow subdued the fortress of Namur. The way to France now lay open, but the Ger. army was harassed by the Belgians, who were entrenched at Malines and Antwerp. On Oct. 10 Antwerp surrendered after a successful withdrawal of the army to the W., and the whole of B. was occupied by the Gers., save for the small S.W. corner from Nieuport to Ypres. B. was now under a Ger. military occupation, and Gen. von Bissing was made governor. After a period of terrorism, attempts were made to set industry going again. Men who would not work for the benefit of the enemy were deported, and from 1916 to 1917 nearly 150,000 men were sent to work in Germany. When it was found in 1917 that the passive resistance of the workers could not be broken, Belgian industry was dismantled and many of the machines were transported to Germany. One aim of Von Bissing's policy was to divide B. against itself by supporting the Flemish movement and to corrupt the loyalty of the Flemings by setting them against the Walloons. The assumption was that B. was an artificially created state without any real national unity.

Meanwhile the remains of the Belgian army were stationed on the extreme left of the allied front, and withstood severe fighting in the valley of the Yser. (See FRANCE AND FLANDERS, CAMPAIGN IN.) After the fall of Antwerp the coast tns. of Zeebrugge and Ostend had fallen into Ger. hands, but in 1917 they were rendered ineffective as submarine bases by some ships being sunk by a Brit. squadron at the entrance of the harbours, thus partially closing them. (See VINDICTIVE; ZEEBRUGGE.)

The treaty of Versailles, which ended the war, gave B. the status of a sovereign state, free to make what alliances she wished, but the 1839 treaty guaranteeing Belgian neutrality was abrogated. The logical outcome of this was that B. contracted a defensive alliance with France and England. B. also gained the dists. of Eupen and Malmédy, and the com. Morosnet, ceded by Germany, thus adding 380 sq. m., which in 1925 were made part of the prov. of Liège.

At the end of the Ger. occupation B. was faced with the task of reconstruction. Belgian industry, which had always been a formidable competitor with Germany, had been designedly disabled. The iron and steel works had suffered the most, with consequent unemployment. Ghent was industrially a dead and deserted city. The identification and return of industrial equipment which had been transported to Germany were a slow process, although required by the terms of the Armistice; but in the 10 years that followed reconstruction was rapid. To enable the Belgian Gov. to carry through

the work of reconstruction commercial credits were arranged with the United Kingdom, Canada, the U.S.A., and France in favour of B. to the extent of £31 millions. B. also claimed 6500 million gold marks from Germany to compensate for the valueless paper marks circulated during the occupation. This claim was not considered by the Young reparations experts, but a private settlement was reached in July 1929, whereby Germany agreed to pay 16,200,000 rentenmarks by Mar. 1930, with subsequent annuities during the next 36 years. In 1925 B. was faced with a financial crisis, and the franc was set upon a downward course. As a drastic measure the Gov. obtained plenary powers, and rehabilitation was brought about by the 'industrialisation' of the State railways and the telephone and telegraph services. On Oct. 25, 1926, the franc was stabilised by royal decree at 175 to the £, while a new monetary unit, the belga (*g.v.*) was estab. for foreign trade on a gold basis.

A conspicuous feature of Belgian politics after the 1914-18 war was the rise of the *Parti Ouvrier Belge* (Belgian Workman's party), under which name were grouped the Socialists, with Emile Vandervelde as their famous leader. The *Parti Ouvrier Belge* became a political organisation, having over 600,000 subscribing members. They held to Marxian principles, but the present realisation of practical ideals was their policy. Shorter terms of military service, vocational education, and insurance were 3 of their objectives. The *Parti Ouvrier Belge* rejected Communism, but as a working-class party it has polled a considerable number of votes. Proportional representation, which gainsays any one party a large majority, made coalition govs. inevitable in B. The 1919 elections for the Senate and Chamber were held on a one man, one vote basis, and the parliament which had thus unconstitutionally come into being revised the constitution in 1921 in order to legalise the simple manhood suffrage by which it had been elected. The motion to extend the suffrage to women, which was put forward in 1925, was defeated, although in 1919 some women conspicuous for patriotic war service had been allowed to vote. The Socialists forced a general election, and gained such success that in July 1925 Viscount Pouillet formed a Socialist-Catholic coalition Gov., in which Vandervelde, the Socialist leader, was foreign minister. In this capacity he signed on behalf of B. the ill-fated Locarno treaty, the aims of which he had done much to further. In May 1926, Pouillet's ministry gave way to one formed by Henri Jaspar, also of the Catholic party. Vandervelde still kept his office, but the Socialist demands for a shorter military service of only 6 months, together with other military reforms, precipitated a crisis. M. Jaspar dissolved his ministry, but formed it again with the exclusion of Vandervelde and the Socialists. In 1929 there was a crisis over the language problem. This problem is a very real one, and the Flemish movement

gained much prominence after the war. In 1930 the univ. of Ghent was made Flemish, and provision was made for the teaching in schools to be given in the language prevalent in the dist. In 1932 the language problem was ameliorated by a law dividing B. for administrative purposes into 3 sections: Wallonia, where only Fr. was to be used officially; Flanders, Flemish; and the Brussels dist., which was to be strictly bilingual. The law does not apply to the Ger.-speaking dists., Eupen and Malmédy. A Gov. Bill for a credit of £6,000,000 to provide defence works on the E. frontier and other military works was passed in 1933. War memories remained bitter, as was shown by the refusal of the Cabinet to restore to their offices state servants who had been dismissed because of 'unpatriotic conduct' during the Ger. occupation. Most of these were Flemings, some of whom had taken steps to organize a separate Flemish state. On Feb. 17, 1934, King Albert was killed while mountaineering alone in the Meuse Valley and was succeeded by his son, Leopold III. (b. Nov. 3, 1901). The latter's wife, Queen Astrid, was killed in a motor accident at Lake Lucerne, Aug. 29, 1935.

Since 1925 B. had placed its faith in the Locarno treaty, and supported the policy of collective security. In 1936, however, Germany's repudiation of Locarno increased Belgian fears of another European conflagration, and the failure of the League of Nations successfully to impose sanctions against Italy in the same year produced in B. a tendency away from collective security towards isolation, self-dependence, and rigid neutrality. Consequently at the end of 1936 King Leopold gave a new direction to Belgian policy. With the concurrence of Great Britain and France, B. was released from its Locarno obligations, and at the same time received from the 2 W. powers a unilateral promise of support in the event of aggression. Some months later, on Oct. 13, 1937, Germany also confirmed the inviolability of B., and undertook to respect Belgian ter. except in the event of Belgian participation in military action directed against Germany. It followed from the policy of neutrality and rejection of military alliances that B. should increase its dependence on its own armaments, and expenditure between 1936 and 1940 was the highest in Belgian hist. A system of defensive fortifications was developed on the E. border opposite the Ger. frontier, and the period of military service considerably lengthened. Belgian strategy, however, was conditioned by Fr. preparations for prolonged siege warfare, and defence in depth was impossible to organize in a country so narrow that a retreat of 60 miles would take its army back to the coast. Had the Maginot line been continued northwards from Sedan, that combined with the fortifications of the interior might have provided an adequate defence, but the efforts of the Belgian Gov. to induce the Fr. Gov. to extend the line always met with refusal.

On Aug. 26, 1939, 5 days before the Ger. invasion of Poland, the Ger. ambas. to B. repeated his country's assurances of respect for the integrity of B., and on the outbreak of war on Sept. 3 B. reaffirmed its strict neutrality. Two months later, on Nov. 7, in the hope of stemming the tide of events, King Leopold conjointly with the queen of the Netherlands made an offer of mediation, but the hope expressed of an equitable peace proved fruitless. The first warning came in Jan. 1940, when 2 Ger. officers made a forced landing in Belgian ter., and plans were discovered in their possession, showing that the land behind the Belgian frontier had been carefully surveyed for landing-grounds for planes and parachutists. On May 10, 1940, before dawn, the Ger. air force launched an attack on selected airfields and centres of communication. In the afternoon M. Pierlot, the premier, declared that B. would resist the invader. Meanwhile King Leopold III. had taken immediate command of the army, and therefore delivered no message to Parliament. The Belgian Gov. now ordered general mobilisation and declared martial law. A 'black-out' was ordered throughout the country, and a rationing system put into force. On the afternoon of the next day news came to Brussels of fighting on the Albert Canal, a development which was unexpected. Yet, despite this great disillusionment, there was still no panic. But the situation changed when the pop. of E. B. began to flow back towards Brussels, bringing stories of Ger. methods of warfare similar to those employed against Poland the previous year. Small tns. of no strategic importance, like Tongres, Tirlemont, and St. Trond, had been bombed, civilian trains attacked and their passengers machine-gunned in the ditches. The public squares of Nivelles and Tournai were razed to the ground, and this set in motion a migration of 2,000,000 Belgians, first towards the W. and S. of B., and then into France. As the Gers. advanced they entered vils. and tns. whose economic activity had come to a standstill; for all the industries engaged on national defence had been transferred, their engineers and technicians, and skilled workmen, with their tools and machinery, having gone first to Paris, then to Toulouse, and finally to Bordeaux. Similarly, much railway material had been evacuated. When the Gers. reached Brussels on May 17 they found a half-deserted city. The tram service had ceased, for the Allies had demolished the bridges, and for sev. days there was no water, gas, or coal in the cap., while the canals were blocked by barges sunk by Belgian troops. On May 28 came the shock of the capitulation of the Belgian Army, followed by violent attacks on the king by the Fr. premier, M. Reynaud. M. Pierlot gave solemn assurances that B. would continue the fight. Meanwhile, however, the wave of Belgian refugees continued to pour into the centre and S. of France, and so great was the concentration of fugitives in Toulouse, to take but one example, that the number of

its inhab. had risen from 150,000 in Sept. 1939 to 700,000 by May 31, 1940. This influx was augmented by Fr. refugees from N. France and the Paris region. Conditions of living for the refugees were appalling. After the capitulation the Belgian Gov. was transferred to Poitiers, and the Chamber and Senate to Limoges. One of the clauses of the Franco-Ger. armistice of June 17 provided that the Fr. authorities should allow no former allies, who could bear arms, to leave the country, and this clause was soon applied, under Ger. pressure, to the Belgians. In Oct. there were still nearly 100,000 Belgian refugees in France, but a year later only 10,000 still remained, for political reasons, in the unoccupied zone, most of them living in the worst material conditions. On May 28 M. Pierlot, broadcasting from Paris, had declared that Leopold's capitulation had no legal validity, and that his decision had been taken against the will of his ministers, that Belgian officials were thenceforth absolved from their oath of allegiance to the king, and that B. would continue the struggle at the side of the Allies. On Oct. 22 M. Pierlot and M. Spaak, Belgian foreign minister, arrived in London from Spain, and here they joined their colleagues, the finance and colonial ministers. The Belgian Gov. thus set up in London was unquestionably a legal one under Article 82 of the Constitution which provides, *inter alia*, that, if the king becomes a prisoner of war, the council of ministers should exercise his powers on their responsibility. The Belgian Gov. in London was regarded as the legal gov. of B., not only by all the Allies, but also by neutral states.

The Ger. attitude in B., far from being reminiscent of the brutal outbursts of the 1914 Ger. soldiery, was correct, and even polite. The Ger. officers reiterated that the war between B. and Germany was over, and that the Belgians must look to a new era of collaboration. They did all they could to stir up the Belgian people against those Belgian authorities who had left the country. These refugee politicians were attacked by the Rexist and Flemish Nationalist parties. The reaction of the Belgian masses, who had remained in B. throughout, was one of resignation. Their disaster had been too appalling for them to entertain any hope of salvation. Slowly the factories started work, and train services were resumed; for the manufacturers realised that if they refused industrial production for Germany they would get no foodstuffs. But about this time Great Britain's determination to continue the struggle was awakening the first hopes of the Belgian people, and acts of sabotage became more frequent. Since May 28, 1940, King Leopold had been a prisoner in the castle of Laeken. A legal pronouncement by eminent Belgian lawyers stated that in his capacity as head of the army the king was within his rights in signing the capitulation, and in allowing himself to be taken prisoner with his fellow soldiers; but that this fact in no way changed the nature and

authority of the Gov., which remained still the country's sole legal gov. Leopold allowed the archbishop of Malines to state in a pastoral letter, in his name, that he had committed no act of a political nature, and that he had signed no pact even of a military nature with the enemy. The king's determination to adhere to this course helped in large measure to cripple Ger. machinations designed to divide Belgian public opinion.

Ger. 'fifth columnists' and their sympathisers in B. made strenuous efforts to undermine Belgian hopes of eventual liberation. Léon Degrelle, the Rexist agitator, and other dangerous Fascist party leaders, were transported to France when the war broke out. They had now returned to menace the patriots through the connivance of Gen. Baron von Falkenhausen, the Ger. military governor of B. and N. France. The Gers. had posed as admirers of Flemish culture, holding centenaries of famous Flemish artists. In this they were assisted by insignificant exiles of the von Bissing regime of the previous war, who had taken up posts in Germany. To complete their div. of B. from the artistic standpoint, the Gers. also encouraged an autonomist movement among Walloon intellectuals, even to the extent of organising Walloon exhibitions at Düsseldorf. Léon Degrelle republished his paper, *Le Pays Réel*, and extolled Germany's New Order. Another traitor, Henri de Man, under the Union of Manual and Intellectual Workers, also propounded the thesis of resignation to the Ger. conquest and collaboration with the occupation authorities. But the true situation was shown by the fact that at the end of 1941 the total strength of the Rexist was only 2000 or less, and that of the Flemish Nationalist party only 5000, including women and children. Germany now ordered all the Flemish extremist organisations to amalgamate into one group, with a para-military organisation, the political activities of which were to be directed by the fifth-columnist Staf de Clercq. But the agitators were by no means of one mind, for Degrelle advocated a new state composed of B. and N. France, which would involve the revival of the Burgundian empire. The Belgian people, however, did not take these incongruities seriously and, unable to arouse any enthusiasm, the extremist leaders decided to form a Walloon Legion for service under the Gers. in Russia.

The Ger. economic exploitation of B. involved the inflation of the currency, and a rapid increase in the State's short-term debt. Within eighteen months a total of no less than 14,600 million francs in loans had been issued. Besides the State, the big cities ran into debt no less rapidly. The contributions towards the Ger. occupation expenses were estimated for the financial year of 1941 at a minimum of 15,000 million francs. The total sum of the State's debts rose in that year from 59,000 million francs to 85,000 million francs, exclusive of 13,000 million francs

due as war damage. The gradual requisitioning of supplies was ruthlessly carried out. Side by side with requisitioning, the Ger. policy aimed at gaining control over all industrial and business concerns. Ger. infiltration into Belgian commercial affairs was engineered by pressure brought to bear through the central clearing house in Berlin. Totalitarian principles were introduced into the economic structure even to the appointment in industry of *Führers* and assistant *Führers*. Some concerns refused to work

disturbances nor sabotage. Belgian patriots replied to executions by intensifying their activity. On Jan. 20, 1943, during the day, the Gestapo headquarters in Brussels were shelled by a Belgian R.A.F. pilot, who killed sev. Gers.

Naturally the Gers. tried to change the currents of education in B. by controlling appointments to chairs in the univs. In their attempt to gain control over the intellectual life of Flanders they concentrated on the univ. of Ghent because it is a stato institution, and its profs. are appointed by the Ministry of Education. In the effort to poison Belgian culture, hundreds of books opposed either to the National Socialist ideology or to the pan-Ger. policy of the Reich, were removed from public libraries, and all bookshops forbidden to sell them. All textbooks were revised by the 'protectors,' and wherever passages were to be found in hist. books dealing with Ger. atrocities in B., the passages were torn out. But despite these trials, miseries, and humiliations the spirit of the people remained indomitable. On Nov. 11, 1940, enormous crowds gathered round the tomb of the unknown soldier in Brussels, overcame the police, and laid a wreath on the Brit. monument. On May 10, 1941 and July 21, 1941, violent disturbances broke out following impressive ceremonies in most of the leading cities. The entire clergy, in accordance with the traditions by which it was inspired in the time of Cardinal Mercier, stood behind its leaders, particularly in offering unshakable resistance to extremist agitators, and in the encouragement of judicious patriotic conduct. Belgian morale was sustained by the underground press. According to *La Libre Belgique*, which began in 1915, more than thirty illegal newspapers were pub. in 1941-42 under various titles. Their chief aim was to expose the pillage and extortion practised by the Ger. occupation authorities, who executed a number of persons for editing, contributing to, or circulating these papers. In Apr. 1941 a decree signed by Gen. Raeder, who was at that time the head of the Ger. administration in B., ordered the dissolution of the municipal councils—which in B. had always enjoyed the highest prestige, popularity, and influence. Thenceforward the safeguarding of municipal interests was entrusted to individual burgomasters and aldermen who had to confine their activities to enforcing the decrees of the Gers. All through the occupation the Belgians were sustained by confidence in their ultimate liberation. To this the battle of Britain was the first great contributory factor. In that great battle 14 Belgian pilots in the fighter command won distinction by bringing down 27 Ger. planes for the loss of 6 of theirs, and after that the number of Belgian airmen in Great Britain was considerably increased. After the Franco-Ger. armistice of 1940 the Belgian ministers, as stated above, went to London. M. Albert de Vleeschauwer, minister of colonies, arrived in July 1940, and

BRUSSELS LACE

for the Ger. authorities, and their directors were replaced by Ger. superintendents. As a result of passive resistance on the part of the miners the coal output was reduced, but 75 per cent of the output was sent to Germany for the manuf. of ersatz petrol, with the result that the Belgians suffered bitterly in the winter cold. Under the conditions of cold and hunger the surreptitious food traffic became a normal procedure, with numerous resulting prosecutions by the Gestapo. The Belgian working classes, after the Free Trade Union Movement was banned, were in sorry plight. Numbers of workmen were compelled to labour in Germany, where for the most part they were sent to dists. most liable to aerial bombardment. One consequence of this exploitation was that acts of sabotage against the property and installations of the Ger. army were more frequent than during any period of the previous war. But Ger. terrorism put a halt to neither

to him was entrusted the administration of the Belgian Congo. The collaboration of the Congo in the struggle was strengthened, and its considerable wealth put at the disposal of the Allies. Belgian troops, some from the Congo, took part in the Abyssinian victories of the Allies. M. Gutt, minister of finance, who also reached London, supervised the important gold credits B. possessed abroad. Measures were taken to recover the equivalent of the Belgian gold handed over to Germany by the complacency of the Vichy Gov. A Fr. ship sailed from Lorient having aboard the £65,000,000 sterling of Belgian gold which the Belgian Gov. had insisted should be conveyed under the care of the Brit. Admiralty to Britain. Later the ship reached Dakar (q.v.), and the gold was handed over to Germany. It was therefore decided to seize the gold, totalling 260,000,000 dollars, belonging to the Banque de France, and deposited at the Federal Reserve Bank of New York. By a resolution of Feb. 5, 1941, the New York Tribunal authorised the attachment of this amount which was duly carried out. Of all the Belgian forces put at the service of the Allies, the merchant navy suffered the greatest losses. Of a total tonnage of 420,000 tons carried by Belgian ships on May 10, 1940, only 220,000 tons were left by Dec. 1941. But more than 200 trawlers and fishing boats found refuge in Brit. waters, and carried out valuable work in spite of the danger from mines, torpedoes, and planes. The 23,000 Belgian civilians living in Britain in 1941 constituted then the largest allied colony in the United Kingdom. Most of them had reached England in May-June 1940, and most of them found employment under the Ministry of Labour. For information on the fighting in B. during the Second World War, see FLANDERS, BATTLE OF; WESTERN FRONT IN THE SECOND WORLD WAR.

On Jan. 1, 1944, M. Pierlot, the Belgian premier, broadcasting to B., promised liberation to his countrymen during that year. This promise was fulfilled by the successful invasion of the Continent by the allied armies. On Sept. 2, 1944, Brit. armoured columns reached Tournai, the first Belgian tn. to be liberated, and Brussels was freed on the following day, Sept. 3. Belgian forces co-operated with the Brit. and Amer. armies, and by Nov. 3 the whole of B. was liberated, following the end of the final Ger. resistance at Zeebrugge and S. of the Scheldt.

With the overthrow of the enemy Europe faced a long process of readjustment, and progress was slow. Of the countries in W. Europe the one to show the greatest progress was perhaps B., where a relatively high degree of political and economic stability was attained. But the issue of the return of King Leopold III. threatened to divide the country. In the later stages of the war the Gers. had removed the king and his family away from B., doubtless intending to use him as a hostage. On his liberation by the Allies, he wished to resume

his functions. The resistance movement, which naturally was a strong influence in the country, had become associated with the Left, and was opposed to the return of the king, who, in the opinion of many, was associated with undue submissiveness to the Gers. In view of this hostility, therefore, the Belgian Gov. refused to take responsibility for the return of the king. Hence the country remained under the regency of Prince Charles, count of Flanders, the king's brother. Leopold remained abroad, but did not renounce his right to the throne.

Literature. As there is no Belgian language it is impossible to speak about a Belgian literature. Nevertheless Fr., as well as Flemish works were being produced in the Middle Ages. (See also FLANDERS.—*Flemish Language and Literature.*) The Fr.-writing authors, Jean Bodel (thirteenth century), *Chanson des Saxons*; Jean Froissart (1337-1410), *Chronique de France, d'Angleterre, d'Ecosse, d'Espagne, de Bretagne*; Philippe de Commines (c. 1447-1511), *Mémoires, 1464-98*; and Jean Lemaire de Belges (1473-1525), *Illustration des Gaules et singularités de Troie*, took an important part in the formation of Fr. prose in B. After the Middle Ages, with the sustained oppression of other countries, all literary activity ceased for centuries. Only in the nineteenth century did Belgian literature assume a national character, distinct from the Fr. Charles de Coster (1827-1879), with his *Légende d'Uylenspiegel*, the story of a kind of Flemish Robin Hood, was one of the most important precursors of the revival. The combination of the Walloon and Flemish temperament—the one sensitive and delicate, the other meditative, simple, and close to nature—found its expression in the literature that sprang up, mainly under Fr. influence, in the second half of the century—in the personal and spiritual poetry of Émile Verhaeren (1855-1916) or the peasant novels of Camille Lemonnier (1844-1913). The latter, although he may have derived much from Zola, may be said to be the first distinctive force in Belgian literature. His *Contes flamands et wallons* was pub. in 1879, and his best novel, *Un Mâle*, in 1881. Maurice Maeterlinck (q.v.) was b. in 1862, and achieved a European reputation with his mystical and allegorical plays. Later in life he turned to writing essays in which he expressed his thought in more direct fashion. More narrowly Flemish in his outlook, though writing in Fr., is Georges Eekhoud (1854-1927), whose novels and stories were realistic and emotional portrayals of the life of his time. Besides Verhaeren, the other major Belgian poet of the nineteenth century was Georges Rodenbach (1855-98), whose poetry is also Flemish in character rather than Fr., and Charles van Lerberghe (q.v.) (1861-1907). Among other poets whose work continued into the twentieth century must be named Albert Giraud, Fernand Séverin, Max Elskamp, Paul Spaak, Henry Carton de Wiart, and Albert Mockel, whilst among the younger writers

Émile Cammaerts (q.v.) is pre-eminent. Belgian drama flourished during the twentieth century under the combined influence of Verhaeren and Maeterlinck. Crommelynck and Vanzype may be mentioned in this connection. The First World War gave an added impetus to the Fr. literature of B., and the Académie Royale de Langue et de Littérature Française de Belgique was founded in 1920. During the thirties, however, the tendency was more towards literature becoming independent of Fr. influence, while at the same time Fr. critics came to value the individual merits of Belgian writers, among whom Charles Plisnier, Pierre Bourgeois, Marie Gevers, Henri Michaux, André Baillon, Franz Hellens may be named from a generation of distinguished poets and novelists whose reputations date from the years before the Second World War.

Belgorod, or Bielgorod (white town),

tn. of the R.S.F.S.R. on the R. Donetz, 73 m. S. of Kursk. It takes its name from a neighbouring chalk-hill. B. was an episcopal seat, and had 2 monasteries and 13 churches. Before the Second World War there were manufs. of leather, soap, woollens, wax, bristles, and hemp. The surrounding country produces fruit. B. was involved in the battles for the Donetz Basin and Klarkov in the Second World War, being occupied by the Gers. in the invasion of 1941; but it was recaptured by the Russians on Mar. 21, 1943. Pop. 30,000.

Belgrade (*Beograd*, white fortress), cap. city of Yugoslavia, and of the People's Republic of Serbia, situated at the confluence of the R. Save with the Danube, with its once-white citadel standing on a promontory, over 100 ft. high, jutting into the Danube. Pop. 388,200. The city had at one time a considerable Turkish quarter, but, with the exception of a single Mohammedan mosque and a few houses in Turkish style, this disappeared with the westernisation of the city, a process which began at the end of the last century. Since that time the city has grown, especially after the First World War, when it expanded to the E. and to the S., becoming a handsome, well-built city, with broad streets, public gardens, modern water-supply, electric tramways, wireless installations, numerous churches and public buildings, including a univ., museums, national library, and national theatre. B. possesses a Rom. Catholic cathedral, and is a patriarchal see. The port of B. is the second largest on the Danube, both that riv. and the Save being broad and navigable at this point. For this reason B. became the commercial exchange between the Balkans and central Europe. Its manufs. include arms, cutlery, saddlery, silks, carpets, cottons, and leather. The chief exports are wool, skins and hides, wax, honey, tan-bark, silk, cattle, pigs, and timber; while hardware, salt, pottery, and agric. produce are imported. The National Bank of the Serbs, Croats, and Slovenes is in B., and issued bank-notes secured on the state domains. An air-liner for passengers between B. and Zagreb was started in 1928, and before the Second World War a Fr. company operated a passenger and mail air service between B. and Paris via Bucharest and Vienna. The main Yugoslav railway runs through B., north to Subotica (Szabadka), there to Budapest, and S. through Nish to Salonika.

B. has had an eventful hist., being besieged in 1456 by the Turks, who were defeated by John Hunyadi; taken by them in 1522, and by the imperialists in 1688. It was recaptured by the Turks in 1690, and in 1717 surrendered to Prince Eugene. The Turks regained it in 1739, but lost it to Austria in 1789. It was restored to Turkey in 1791, and the Turkish garrison withdrew in 1867. During the First World War the situation of B. exposed it to Austrian attack, and the city was bombarded soon after Austria declared war on Serbia in 1914. Serbia was invaded, but it was not until Nov.

29, 1914, that the Serbian garrison evacuated the city. On Dec. 2 it was occupied by the Austrians, who, however, were driven out a fortnight later. In the autumn of 1915 General Mackensen took command of the Ger.-Austrian army on this front, and Serbia was again invaded. B. fell on Oct. 7, 1915, and remained in enemy hands until the end of the war. On the outbreak of war in 1939 Yugoslavia was not immediately involved, but B. suffered severely as a result of the *coup d'état* of Mar. 27, 1941, which set up a new gov. determined upon resistance to

Belapatam, tn. in Malabar dist. of Madras presidency, India, standing on the riv. of the same name, 4 m. from Cannanore.

Belief, term used ordinarily to denote assent to a statement, suggestion, or fact. Psychologists give various definitions of the term, and it would appear that while the acceptance of a certain association of ideas or reputed circumstances is required, it is not necessary that they be true. B. must not be confounded with knowledge, as predisposition and suggestion have undoubtedly a strong bearing

BELGRADE

E.N.A.

Ger. demands. On Apr. 6 Yugoslavia was invaded, and B., although declared an open tn., was for 3 days subjected to a rolling air bombardment of merciless severity. The heavy damage was widespread, and the city was occupied by the Gers. on Apr. 13, not again to be freed until Oct. 20, 1944.

Belgravia, residential dist. in the W. end of London, England, lying to the S. of Belgrave Square, and adjoining Hyde Park.

Belial, compound Heb. word, meaning that which is without profit or worth. It is often treated by the translators of the Bible as if it were a proper name, and has acquired personification by usage in such phrases as 'a son of B.' and in the passage, 'What concord hath Christ with Belial?' In the N.T. it is used in the changed form of Beliar, due to Syrian pronunciation. In Apocalyptic literature=Satan.

on the judgment of a connection of ideas; while lack of intellectual ability or use or the interposition of another B. as a truth, are means by which a true logical conclusion may be missed. In the Christian religion faith and B. are used as acceptance of and reliance in the teachings of the Bible, and more especially in Christ. See D. Hume, *A Treatise of Human Nature* (book 1. *Of the Understanding*), 1739; James Mill, *Analysis of the Phenomena of the Human Mind*, 1829; A. Bain, *The Emotions and the Will*, 1859; W. James, *The Will to Believe*, 1931.

Beligrad, see BERAT.

Belinsky, Visarion Grigorievitch (1811-1848), Russian writer and literary critic, b. at Chembar. His work, *Survey of Russian Literature since the Eighteenth Century*, appeared in 1834. A complete ed. of his works was pub. in 12 vols. in 1850-62.

Belisarius, Byzantine soldier in the

reign of the Emperor Justinian, probably b. in Germania, in Illyria, c. A.D. 505. He is first mentioned about 525, during the war between the Byzantine empire and Persia. About this time Procopius, from whose histories the events of the life of B. are gathered, became his secretary. In 530 B. was commander of the E. imperial army, and defeated a large Persian force at Dara, in N. Mesopotamia. In the next year the Persians invaded Syria, and B. was defeated at Callinicum on the Euphrates. He was recalled to Constantinople, where he married Antonia, a wealthy but profligate woman. Here he supported Justinian against the conspiracy of the 'green' party, who were attempting to make Hypatius emperor. In 533 he was sent into Africa to recover the imperial provs. held there by Gelimer, king of the Vandals. He landed in Sept. at Caput Vada, and advanced to Decimum, where he gained a victory. He then entered Carthage. The king was finally captured at Mt. Pappua, and B. returned to Constantinople, where he was honoured with a triumph. In 535 he was made sole consul. Later in that year he set out to recover Italy from the Goths. In 536 he took Naples and occupied Lower Italy, and at the end of the year entered Rome by amicable arrangement with the Gothic garrison. During 537 he was besieged there by Vitiges, the Gothic king, the siege being abandoned early in 538, when Vitiges retired to Ravenna. Narses was now sent from Constantinople with a reinforcement, but owing to a misunderstanding with B., resulting in the devastation of Milan by Braias, nephew of Vitiges, Narses was recalled, and B., now commanding both armies, refused to carry out a treaty, leaving Vitiges with the title of king and the provs. N. of the Po. In 540 he captured Ravenna, and took Vitiges prisoner, but was recalled by Justinian before completing his conquests. During 541-42 he was engaged in a campaign against the Persians, who had captured Antioch, but was recalled, degraded, and fined, on account of misrepresentations of his conduct. In 544 the Ostrogoths, under Totila, again invaded Italy, and B. commanded the expedition against them. He regained possession of Rome, but no reinforcements being sent him, he resigned his position, which was filled by Narses, and returned to Constantinople, where he stayed in retirement till 559. In that year he defeated the Bulgarians, who were threatening Constantinople. In 563 he was imprisoned on a charge of conspiracy against Justinian, but his innocence was soon established, and he was released after 6 months. He d. in 565, leaving 1 daughter, Joannina.

Belize, cap. of Brit. Honduras, on the bay of Honduras, at the mouth of the R. B. or Rio Viejo, which is navigable for 120 m. by canoe. The harbour is shallow and impaired by sand-bars, so that large vessels must load and unload by means of lighters; small vessels can enter by a channel through the reefs. Logwood, mahogany, tortoise-shell and bananas are exported. The tn. has swamps round it,

but is by no means the unhealthy place it was before the proper measures of control of yellow fever were put into force. Half the tn. was destroyed by a hurricane on Sept. 10, 1931, a great many houses collapsing through being submerged by the sea and over 200 persons being killed. It has been gradually rebuilt. B. is connected with other tns. in Honduras by means of telephone and telegraph lines. Air services are scheduled daily to and from Havana, Miami, Guatemala, El Salvador, Nicaragua, and Costa Rica from Stanley airfield. There is also a bi-weekly service to Jamaica. Pop. 17,000.

Belknap, Sir Robert, Eng. jurist, chief justice of the court of common pleas from 1374 to 1388, when he was removed for having, unwillingly, signed an affirmative to the question of Edward III., 'Whether he might by his regal power revoke that was acted in parliament.' In the succeeding parliament all the judges were arrested in Westminster Hall on a charge of high treason, but B. escaped with his life through the intercession of the bishops. (Fuller's *Worthies of England*.)

Bell, hollow, metallic instrument, in shape resembling a reversed cup, suspended by its apex or neck, and having in its interior a swinging clapper, hammer, or loose ball.

Bell-founding. Bs. are made of a kind of bronze, known as B.-metal (*q.v.*). In early times, Bs. were not cast, but were made of thin plates of hammered iron, riveted together. The B. called *Clog-an-cadhacha Phatraic* (the bell of Patrick's will) at Belfast, mentioned in the *Annals of Ulster* as early as A.D. 552, is quadrangular in shape and of this primitive type, as are also some of the Scottish Bs. The small Bs. discovered by Layard in the palace of Nimrod, on the site of the anct. city of Nineveh, are made of copper and tin, in the proportion of 10-1. During the Middle Ages the quantity of copper used was much reduced. In modern times the approximate ratio is 4-1 (*see* **BELL-METAL**). It was formerly thought that a mixture of silver with B.-metal sweetened the tone, but it has been proved that silver in any quantity is injurious to the tone of a B., great or small. Bs. have also been made of antimony, brass, steel, gold, and thick glass. Bs. cast of steel have a beautiful tone but a less sustained vibration. The casting of Bs. in England was originally practised in monasteries. It was then adopted as a trade by itinerant artificers. The art of casting in England has made little advance in modern times, and no Bs. of modern manuf. are better than those cast 400 years ago. The B. is first designed on paper; a core is then constructed of brickwork, covered with soft clay, which is moulded to the exact form of the interior of the B. to be cast. Over the core is fitted a soft model of the future B. Then a third heavy shell, moulded to the required shape, is placed over the model; the model is removed, and molten B.-metal is run into its place and left to cool until it has set. The following are recognised to be fair proportions for a B.; the

thickness of the edge to be one-tenth of the diameter, and the height 12 times its thickness.

History of Bells. Hand-Bs. or cymbals were employed by the Egyptians at the festival of Isis. Aaron and the Hebrew high priests wore golden Bs., alternating with pomegranate knobs on the blue robe of the ephod. The Gks. used Bs. in their camps; and the Romans employed them to announce the hour of bathing, and as a signal to begin selling in the market-place. The introduction of B.-ringing into the Christian church has been ascribed to Paulinus, Bishop of Nola in Campania (A.D. 353-431), probably because *nola* and *campana* are late Lat. words for B.; but the date of their introduction is a century later. They were introduced into Gaul about A.D. 500. In the seventh century, Bede mentions a B. brought by Benedict from Italy for his abbey at Wearmouth, and says Bs. were used at Whitby Abbey at the time of the death of St. Hilda, 680. Pope Sabinius ordained the ringing of Bs. to announce canonical hours in 604. It appears that Bs. were not used in Switzerland and Germany for religious purposes till the eleventh century. For a long time Bs. were comparatively small, and were often only hand-Bs. The *Clog-an-eadhachta Phatraic*, already mentioned, is 6 in. high, 4 in. deep, and 5 in. broad. Larger Bs. began to be cast in the thirteenth century. The largest B. in the world is the *Tsar Kolokol* of Moscow, which was cast in 1733. It is 21 ft. high, 21 ft. in diameter, and weighs 432,000 lb. In 1737, owing to a fire, it fell and sank into the ground; in 1837 a chapel was excavated below it, of which it forms the dome. Among other large Bs. are the *Amarapoora*, in Burma, 260,000 lb.; those at Rouen and Vienna, each about 40,000 lb.; Montreal Cathedral, 28,560 lb.; 'Big Ben' of the Houses of Parliament, 30,000 lb.; and the Great B. of St. Paul's, 11,470 lb.

The Uses of Bells. Bs. have been chiefly associated with ceremonies of a sacred character. In the Anglican and Rom. churches they are consecrated, have sponsors, are sprinkled with water, anointed, and receive names. Inscriptions on old Bs. are of interest, and show that superstitious ideas prevailed as to the power of Bs. over evil spirits, in dispelling storms, and putting an end to famine, pestilence, etc. The *Passing B.* was rung in order to terrify evil spirits from the dying body, as well as to admonish the living. By the eighteenth century tolling took place after death. The *Sanctus* or *Sacring B.* was rung during the celebration of mass. The *Pardon B.*, of pre-Reformation date, was tolled before or after service to call men to pray for the forgiveness of their personal sins. Other Bs., connected with religious services, are the *Gabriel* or *Ave B.*, the *Vesper B.*, and the *Bridal* or *Marriage B.* Bs. were also employed for secular purposes. They were used as a call to arms, as a warning of danger, particularly of flood and fire, and by watchmen at night. The *Curfew B.*,

supposed to have been introduced by William the Conqueror, was rung at 8 o'clock as a warning to men that it was time to extinguish their lights and go to rest. It was abolished by Henry I. in 1100. Bs. were, and still are, attached to cows and sheep (usually only to the leader of the herd or flock), as a signal to the shepherd. These Bs. or crotals are also attached to the front horse of a sleighing team in N. Europe, Russia, and N. America. The hanging of Bs., with wire connections, in houses was adopted during the eighteenth century, but has been replaced by the electric B.

Campanology, or the art of B.-ringing. Bs. may be chimed (*see* CHIMES), or rung in changes. Four Bs. give 24 changes, 8 give 40,320, while 12 give 479,001,600 changes. The ringing of Bs. so as to admit changes was at one time a fashionable art, for the *School of Recreations* or *Gentleman's Tutor* (1684) has a chapter on 'Advice to a Ringer.' The first known work on the subject is *Tintinnologia*, pub. by Fabian Stedman in 1668. The muffled peal is effected by covering half the clapper with a cap of leather. The art of pealing Bs. has been carried to great perfection in England. Consult: T. North, *English Bells and Bell Lorc*, 1888; A. S. Pease, *Notes on the Uses of Bells among the Greeks and Romans*, 1904; J. J. Raven, *Bells of England*, 1906; E. Morris, *The History and Art of Change Ringing*, 1931; F. P. Price, *The Carillon*, 1933; H. B. Walters, *Church Bells*, 1937. See also CARILLON MUSIC.

Bell, Alexander Graham (1847-1922), Scottish-Amer., inventor, b. Mar. 3, in Edinburgh, Scotland; educated at the Edinburgh High School and the Edinburgh and London univs. Removing with his father, Alexander Melville B., to Canada in 1870, he became prof. of vocal physiology in Boston Univ. in 1872, where his experiments resulted in the patenting of the telephone in 1876. He also invented the photophone and graphophone, and wrote many papers on electrical matters and on research work in connection with deaf-mutes.

Bell, Alexander Melville (1819-1905), Scottish-Amer. educationist, b. in Edinburgh, Scotland, on Mar. 1. Lectured on elocution in Edinburgh Univ. 1843-65, and from 1865 to 1870 at the univ. of London. In 1870 he removed to Canada, becoming instructor of elocution at Kingston, Queen's College, and in 1881 he moved to Washington, D.C. He devised the system of 'visible speech,' by which deaf-mutes are taught to speak.

Bell, Andrew (1753-1832), Scottish educationist, b. at St. Andrews, Scotland, on Mar. 27, and educated at the univ. there. In 1789 he was appointed chaplain of Fort Saint George in Madras, and superintendent of an institution for the education of the orphan children of the military. Being unable to obtain properly qualified assistants, he at last introduced a system of teaching the pupils through themselves, which proved highly successful. Returning to England, he pub. a pamphlet in 1797, *An Experiment*

in *Education made at the Male Asylum of Madras*. Joseph Lancaster (q.v.) founded a school on the principles which he developed, and the movement grew rapidly. He was buried in Westminster Abbey.

Bell, Sir Charles (1774-1842), Scottish surgeon and neurologist, b. in Edinburgh; educated at the High School, Edinburgh; in 1804 he came to London. Appointed surgeon to Middlesex Hospital, 1814, and raised that institution to the highest repute. Was interested in military surgery, when wounded troops came home from Spain, and visited Waterloo immediately after the battle, where he did the wounded great service. His *Anatomy and Philosophy of Expression*, written in 1804, describes the arrangements by which the influence of the mind is communicated to the muscular system. The investigations on which the work was based led to his great discoveries in the physiology of the nervous system. Thus in 1807, on the anatomy of the brain, he made the discovery of the various nervous functions corresponding to their relations to different parts of the brain. Again, it was B. who discovered that in the nervous trunks there are special sensory filaments, designed to transmit impressions from the periphery of the body to the sensorium and special motor filaments which convey motor impressions from the brain or other nervous centre to the muscles. In 1816-1818 he pub. a series of *Quarterly Reports of Cases in Surgery treated in the Middlesex Hospital*; in 1821 a vol. of plates, etc., entitled *Illustrations of the Great Operations of Surgery*, etc.; in 1824 appeared *An Exposition of the Natural System of Nerves of the Human Body*. In 1824 he accepted the chair of anatomy at the London College of Surgeons. Other works include *The Anatomy of the Brain* (1802); *An Essay on the Forces which circulate the Blood* (1819); *The Hand* (1833); *A Familiar Treatise on the Five Senses* (1841). His discoveries in physiology as a whole were the greatest since those concerning the circulation of the blood by Harvey.

Bell, Charles Frederic Moberly (1847-1911), Eng. journalist, b. in Alexandria; educated in England; returned to Egypt and entered business there in 1865. In 1875 he left commercial life and devoted himself to journalism, having already estab. a connection with *The Times*. In 1880 he was one of the founders of the *Egyptian Gazette*. He became famous as a *Times* correspondent during the Arabi revolt of 1882. In 1890 he returned to England as manager of *The Times*, in succession to J. C. McDonald. His enterprises included *The Times Atlas*, 1895; the *History of the South African War*, 1900-9; and *The Times Book Club*, 1905. In 1908 he became managing director of the reconstructed *Times Publishing Company*. See F. H. Kitchin, *Moberly Bell and his Times*, 1925; E. C. H. Moberly Bell, *The Life and Letters of C. F. Moberly Bell*, 1927.

Bell, Clive (b. 1881), Eng. art and literary critic; educated at Marlborough

and Cambridge. His *Since Cézanne*, 1922, and *Landmarks in Nineteenth-century Painting* are contributions to the comparative study of Fr. and other schools of painting. Other works: *Art*, 1914; *Poems*, 1921; *Civilisation*, 1928; *Proust*, 1929; *An Account of French Painting*, 1931; *Enjoying Pictures*, 1934. He became chevalier of the Legion of Honour in 1936.

Bell, Currer, Ellis, and Acton, see BRONTË.

Bell, George Joseph (1770-1843), Scottish jurist, b. near Edinburgh; became member of the Faculty of Advocates, 1791. Pub. works on Scots law; appointed in 1821 prof. of Scots law at Edinburgh, and in 1831 a prin. clerk of session.

Bell, Gertrude Margaret Lowthian (1868-1926), Eng. traveller and archaeologist, b. at Washington Hall, Durham, daughter of Sir Hugh B., ironmaster and colliery owner. Educated at Queen's College, London, and Lady Margaret Hall, Oxford. She learnt Persian with the view of joining her relative, Sir Frank Lascelles, ambas. in Persia, in Teheran, whither she went in 1892. At Teheran she acquired a knowledge of the E. by taking a desert journey in 1900 to Jerusalem and Syria. Later, she took lessons in Arabic and Persian from 2 sheikhs at Haifa. A polyglot by nature, she learned enough Hindustani to find her way about India without an interpreter. In 1905 she continued her Persian studies under Reznach in Paris, and afterwards made her name with *The Desert and the Sown*, pub. in 1907, and *The Thousand and One Churches*, a description of ruins and inscriptions of churches in Lycæonia written in collaboration with Sir William Ramsay. A few years later saw her once more in the E., first in Damascus and then in Bagdad, where she was destined to take a leading part in the administrative development of the new Arab state, Iraq, during its most critical years under the high commissionership of Sir Percy Cox. The knowledge she had acquired of the Arab tribes proved of value during the First World War, and from 1915 she was interpreter of all reports received from central Arabia. Later, in Cairo, she assisted Colonel Lawrence (Lawrence of Arabia) by doing propaganda work for dealing with the revolt in the desert. At Basra she prepared political memoranda and performed staff work under Sir Percy Cox, being appointed assistant political officer at Bagdad. She received the C.B.E. in 1917, and attended the Peace Conference in Paris in 1919. Later in that year she returned to Bagdad, where she was thenceforth known as the Mother of the Faithful, the last woman who bore the name being Ayesha, the wife of the Prophet. In 1926 she completed the arrangement of the Bagdad museum of which she was hon. director of antiquities and was preparing to return home to England, when she d. peacefully in her sleep. She was buried with military honours in the cemetery outside Bagdad. Other publications: *Safar Nameh* or

Persian Pictures, 1894; *Poems from the Divan of Hafiz*, 1897; *Amurath to Amurath*, 1907; *Palace and Mosque at Ukhaidir*, 1914; *Review of the Civil Administration of Mesopotamia*, 1921. *The Letters of Gertrude Bell*, 1927, were ed. by her stepmother, Lady Bell.

Bell, Henry (1767-1830), Scottish marine engineer, one of the originators of steam navigation, *b.* at Torphichen Mill, Linlithgow. Served in a shipbuilding yard at Bo'ness with an engineering firm in London, and in 1790 he settled in Glasgow, but removed in 1807 to Helensburgh, where he studied mechanics. In 1812 the *Comet*, a small vessel 40 ft. long, built under his direction and with an engine constructed by himself, was launched on the Clyde, being the first steam vessel in Europe.

Bell, John (1691-1780), Scottish traveler, commonly called Bell of Antermomy, followed the medical profession. In 1714 he went to St. Petersburg, where he joined an embassy to Persia. Returned to St. Petersburg, where he was appointed to another embassy, this time to Pekin; returned to Moscow, 1722. Of these travels he wrote a most entertaining account. Returned to Scotland c. 1725. Undertook in 1737 another mission for Russia to Constantinople, where he settled as a merchant; married, 1746, and retired to Antermomy. His travels were printed and pub. at Glasgow, 1763.

Bell, John (1763-1820), Scottish anatomist, educated at High School, Edinburgh. Opened, 1790, a private school of anatomy; 1793, pub. the first vol. of his *Anatomy*; next *Discourse on the Nature and Cure of Wounds*; *Principles of Surgery*, 1801-8. *D.* of dropsy at Rome.

Bell, John (1811-95), Eng. sculptor, *b.* at Hopton, Suffolk. Statues by him of Lord Falkland and Sir Robert Walpole were commissioned for the Houses of Parliament. The memorial to the guards who fell in the Crimea is also by B.

Bell, John (1745-1831), Eng. publisher. Defying the combination of London publishers who brought out Johnson's ed. of the poets, B. pub. the *British Poets* in Bell's Edition, giving the chief poets from Chaucer to Churchill with the exception of a few that were copyrighted. B. was the first publisher to discontinue the use of the long *f* (s). He was one of the founders of the *Morning Post*, and proprietor of *Bell's Weekly Messenger*, and of the sporting paper *Bell's Life in London* (see EGAN, PIERCE).

Bell, Sir Joseph (1837-1911), Scottish surgeon. He was appointed consulting surgeon to the Royal infirmary and Royal Hospital for Sick Children, Edinburgh, and editor of the *Edinburgh Medical Journal*, 1873-96. His publications are: *Manual of Surgical Operations and Notes on Surgery for Nurses*. He was the prototype of Sir A. Conan Doyle's celebrated detective, Sherlock Holmes.

Bell, Robert (1800-67), Irish journalist, *b.* at Cork on Jan. 16; educated at Trinity College, Dublin, where with others he founded the Dublin Historical Society. In 1828 he became editor of the *Atlas* in

London. The best known of his works are a *History of Russia*, 3 vols., 1836-38; *Lives of the English Poets*, 2 vols., 1839; and a *Life of George Canning*, 1846.

Bell, Robert (1841-1917), Canadian geologist, *b.* at Toronto. He made topographical and geological surveys in nearly all parts of Canada; was medical officer, naturalist, and geologist to the *Neptune*, *Albert*, and *Diana* expeditions, 1884-97, and surveyed many rivers and lakes of the dominion. He pub. upwards of 200 reports and papers—mostly on geological, biological, and geographical subjects—together with folklore.

Bell, Robert Anning (1863-1933), Eng. artist and designer, *b.* in London; educated at Univ. College School. His illustrations for books are notable, as also his stained-glass designs. Designed the mosaic panels in the Houses of Parliament and in Westminster Cathedral. A.R.A., 1914; R.A., 1922.

Bell, Robert Charles (1806-72), Scottish engraver, *b.* at Edinburgh. His largest work was an engraving of 'The Battle of Prestonpans,' after Sir William Allan. Between the years 1850 and 1872 a number of his best plates appeared in the *Art Journal*.

Bell, Thomas (1792-1880), Eng. zoologist, *b.* at Poole in Dorsetshire. He was appointed prof. of zoology at King's College in 1836. In 1828 B. was elected F.R.S., and from 1853 to 1861 was president of the Linnean Society. Among his works are *A History of British Stalk-eyed Crustacea*, 1853; *A History of British Quadrupeds, including the Cetacea*, 1837; and *A History of British Reptiles*, 1839.

Bell, Book, and Candle. Form of excommunication in the Church of Rome, in which an ecclesiastic, after pronouncing his malediction, closes his book, throws a lighted candle to the ground, and tells the bell as for the dead. The symbolic significance of the first 2 actions is that the anathematised person is removed from the book of life, and his soul is cast from the sight of God as the candle from the sight of men.

Bella, tn. in the prov. of Potenza, Italy, 16 m. S.S.W. of Meli. Pop. 4000.

Bella, Stefano della (1610-64), It. etcher, *b.* at Florence. His etchings, which reached a high standard, probably number about 15,000.

Bellac, cap. of an arron. in the dept. of Haute-Vienne, France. Pop. commune, 4000.

Belladonna (*Atropa B.*), dwale or deadly nightshade, perennial plant of the order Solanaceae. See NIGHTSHADE. For the B. Lily, see AMARYLLIS.

Belladonna Lily (*Amaryllis B.*), plant of the order Amaryllidaceae, the single species of its genus; native of Cape Prov. It is devoid of a corona, and is zygomorphic, in which it differs from its allies, the daffodil and snowdrop.

Bellagio, vil. of Italy, beautifully situated on the promontory dividing the 2 arms of Lake Como. Pop. of com. about 4000.

Bellahouston, eccles. par. of Lanarkshire, Scotland, 2 m. S.W. of Glasgow, of which it forms a suburb. Pop. 12,000.

Bellaire, city in Belmont co., Ohio, U.S.A., on the Ohio R., and a shipping centre for the Belmont co. coalfield. Its manufs. are glass, agric. machinery, pig-iron. Beds of coal, limestone, and fire-clay are in the neighbourhood. Pop. 14,000.

Bellamy, Edward (1850-98), Amer. social reformer and author, *b.* at Chicopee Falls, Massachusetts, U.S.A. He studied at New York and Germany. He attracted attention by *Looking Backward, 2000-1887*, in which book he pictured life under socialistic conditions. In 1897 *Equality*, sequel to *Looking Backward*, was pub.

Bellamy, George Anne (c. 1727-88), Eng. actress, the illegitimate daughter of Lord Tyrnawley; educated at a Fr. convent. She lived with her mother in London, and associated with Mrs. Woffington and Garrick. She became a famous actress, and, till 1770, played in London, Edinburgh, and Dublin. Her extravagance and licence, which were as renowned as her career was brilliant, caused her sorrow and poverty in her later years. Released from the debtors' prison in 1785, she pub. her *Apology*.

Bellamy, Jacobus (1757-86), Dutch poet, *b.* at Flushing of poor parents. His first verses expressed his love for his native country. Aided by wealthy admirers, he went to Utrecht, with the intention of studying divinity. These studies, however, he soon left for the pursuits of poetry and general literature. He ranks among the first poets of his nation and the restorers of Dutch poetry.

Bellarmino, Robert (Roberto Francesco Romolo Bellarmino) (1542-1621), It. prelate, *b.* in Tuscany. He entered the order of Jesuits in 1560; was ordained priest at Ghent by Jasenius in 1569, and elected prof. of theology at the univ. of Louvain in the year after; having filled this chair for 7 years he went to Rome in 1576; created cardinal, 1599; archbishop of Capua, 1561-65. He then became chief theological adviser to the pope. A model of Christian asceticism, and one of the greatest theologians, especially in polemics, that the Romish Church ever had. Among his most important works are his *Disputationes de Controversiis Christianae Fidei*, 3 vols., 1581, 1582, 1583; *De Potestate Summi Pontificis*, and *De Scripturis Ecclesiasticis*. See J. Brodrick, *The Life and Work of Blessed Robert Bellarmine*, 2 vols., 1928.

Bellary, dist. and tn. in the Madras presidency, India. The tn. is 300 m. from Madras by rail, and was formerly a military station. The fort, built on a bare granite rock, rises abruptly from the plain to the height of 450 ft. A high point opposite it is called the Copper Mountain; Hyder Ali is said to have worked it, but found the expense exceeded the profit. Much iron ore is found. Cotton and woollen goods are manufactured and cotton largely exported. Pop. dist. 863,000; tn. 43,000.

Bellasis, Edward (1800-73), Eng. serjeant-at-law. He was educated at Christ's Hospital, and was called to the Bar in 1824. He became serjeant-at-law in

1844. From 1833 to 1845 he was interested in the Oxford Movement, and became acquainted intimately with Newman, Pusey, Ward, and Manning. He left an interesting autobiography and a number of theological treatises, besides taking a prominent part in the controversy aroused by the bull of Pius IX. in 1850.

Bellatrix (Orionis). White star of the second magnitude in the left shoulder of Orion.

Bellay, Joachim du, *see* DU BELLAY.

Bell-bird, the name given to sev. birds on account of their notes, but applied in particular to the Brazilian campanero, a species of Cotingidae. It is a white, frugivorous bird, and is noted for a long black fleshy appendage dotted with feathers which hangs from its forehead. When the bird utters its cry this caruncle becomes elongated.

Bell-Casting, *see* under BELL.

Belle Alliance, name of a farm, was the centre of the position of Napoleon's army at the battle of Waterloo. It lies 13 m. S. of Brussels. Wellington and Blücher met here. The battle of Waterloo, and subsequent victory, has been spoken of as the B. A. by the Prussians.

Belleau, Remi (c. 1528-77), Fr. poet, member of the Pléiade (*q.v.* and *see also* RONSARD). *B.* at Nogent-le-Rotrou. Tutor to Charles, marquis d'Elbeuf, who, under B.'s tuition, became a noted patron of the muses. Produced the first Fr. translation of Anacreon, but first achieved celebrity by his commentaries to Ronsard's *Amours*. His chief work, however, is *La Bergerie*, a prose and verse pastoral in imitation of Sannazaro. His *Airil* is a stock item in Fr. anthologies. *See* Gouverneur's ed. of Remi Belleau, pub. by Janner (3 vols.), 1867.

Belleau Wood, forest to the N.W. of Château-Thierry in France. The battle in this sector is now famous in the Amer. annals of the First World War. At Château-Thierry Amer. troops took a large share in preventing the Gers. from advancing across the Marne towards Paris in May-June 1918. As a continuation and part of that battle came the intense fighting in Belleau Wood, where the offensive was undertaken by the 2nd Div. of the Amer. Expeditionary Force. This was largely made up of the U.S.A. Marines and of regiments from the regular U.S.A. Army. After nearly 3 weeks of intensive fighting, the Amers. cleared the Gers. and their machine-gun nests out of the forest, and not only held it, but also the little tn. of Vaux. The severity of the contest is marked by the fact that the Amers. lost in killed alone 285 officers and nearly 8000 men.

Belleek, par. and vil. with railway station, co. Fermanagh, N. Ireland, on the R. Erne. It has given its name to Belleek china which is made there. Pop. par. 1300, vil. 200.

Bellefontaine, tn. of Logan co., Ohio, U.S.A., 49 m. N.W. of Columbus. Pop. 9800.

Bellegarde: (1) Fortress, situated on a peak, 1380 ft. above the sea, in the dept. of Pyrénées-Orientales, France, on the

Sp. border, 17 m. S. of Perpignan. Philip III. of France was defeated in the neighbourhood by Peter III. of Aragon (1285). The fortress was captured by the Spaniards in 1793, but was retaken, 1794. (2) Tn. in the dept. of Ain, France, on the Swiss border. Pop. 5000.

Belle-Ile-en-Mer, is. of France, dept. of Morbihan, in the Atlantic Ocean, 8 m. S. of Quiberon Point. Its length is nearly 12 m. and its greatest breadth about 7 m. The chief industry is pilchard and sardine fishing; fine draught-horses are reared; and the soil is fertile and well cultivated. Admiral Hawke defeated the Fr. fleet under Conflans off the coast in 1759; the is. was captured by the Eng. in 1761, but restored to France 2 years later. The chief tn. is Le Palais. Pop. 6000.

Belle Isle: (1) Is. in the Atlantic, lying between Newfoundland and Labrador, about 15 m. from either coast. Area, about 15 sq. m. There is a lighthouse, 470 ft. high, visible at a distance of 28 m. The true breed of Newfoundland dogs originated in this is. (2) Is. in Conception Bay, near the S.E. extremity of Newfoundland. It is about 6 m. long by 3 m. broad. The soil is fertile, and there are rich deposits of hematite iron ore. The cliffs are rocky and imposing, some standing 400 ft. high. Pop. 1500.

Belle Isle, Strait of, channel between Newfoundland and Labrador, forming an entrance to the gulf of St. Lawrence from the Atlantic Ocean; it is the main route from Great Britain to the St. Lawrence R., but during the winter months it is blocked with ice. It is about 80 m. in length, the breadth varying from 10 to 18 m.

Belle-Isle, Charles Louis Auguste Fouquet (1684-1761), Fr. marshal, a grandson of the intendant Fouquet, b. at Villefranche. After distinguishing himself in the wars of the Sp. Succession, he was made governor of Metz and a marshal of France. He, with Broglie, had command of the forces in the war of the Austrian Succession, and stormed Prague in 1741. In the year following he led the brilliant retreat to Eger. He became minister of war in 1758.

Belleme, or **Bellesme**, tn. in the dept. of Orne, France. It was besieged in 1228 by the army of Louis IX. of France. To the N. is the small forest of B., where there are some mineral springs. Pop. 2000.

Belleme, Robert, Earl of Shrewsbury, Anglo-Norman noble, knighted by William the Conqueror in 1073. During Rufus's reign he became the most powerful lord in the realm. In 1102 he lost his Eng. estates and returned to Normandy. He d. in prison, where he had been incarcerated by Henry II.

Bellenden, John (fl. 1533-87), Scottish poet; became canon of Ross and archdeacon of Moray. Trans. Livy, and also Boece's *Historia Scotorum* into Scottish vernacular.

Bellenden, Sir John (d. 1577), Scottish courtier, eldest son of Sir Thomas Bellenden of Auchinvoile. In 1547 he was made a lord of session by the queen regent.

In 1551 Mary Queen of Scots appointed him one of her privy council, and he was supposed to be implicated in the murder of the queen's favourite, Rizzio; he fled from Edinburgh, but was soon restored to favour, and supported the queen's marriage with Bothwell.

Bellenden, William, Scottish classical scholar, and writer on Cicero, who fl. in the early part of the seventeenth century. He held a chair at the univ. of Paris, and was favoured by James I. of England.

Bellerophon, genus of fossil gasteropod mollusca, which is the typical genus of the family Bellerophonitidae. The species occurs in the Paleozoic formations.

Bellerophon, son of Glaucus, king of Corinth, and Eurymede (Homer, *Iliad*, vi.). His name was changed to B. from Hipponous, after having killed Bellerus by accident. He was sent to Proetus, king of Argos, and unwittingly won the love of Antea, wife of Proetus. He spurned her advances, whereupon she sought to turn her husband against him. Proetus sent him to Iobates, king of Lycia, with sealed instructions to put B. to death. Iobates was unwilling to kill him directly, so imposed upon him the almost impossible task of killing the monster Chimæra. But by the aid of Pallas, who gave him the winged horse Pegasus, he succeeded in slaying the monster. He defeated the Amazons, and cut down the Lycian ambuscade, which Iobates had set to kill him. Thereupon the king ceased to attempt his death and gave him his daughter Philonoe in marriage. His story is re-told by Wm. Morris in *The Earthly Paradise*.

Belles Lettres, term borrowed by the Eng. and other languages from the Fr., signifying any writing of a refined or elegant character, but more particularly applied to essays, poetry, and criticism.

Bellet Strait, sea channel between N. Somerset Is. and Boothia Felix, N. Canada; discovered by Joseph B.

Belleville: (1) Formerly a suburb, now the E. quarter, of Paris. (2) Tn. of Essex co., New Jersey, U.S.A., 3½ m. N.E. of Newark. Pop. 28,160. (3) Co. seat of St. Clare, Illinois, U.S.A., 15 m. S.E. of St. Louis. There are large flour mills, and manufs. of heavy iron goods. Coal is found in the dist. Pop. 28,400. (4) Tn. in Ontario, Canada, on the bay of Quinte and the Moira R. The Albert Univ. was founded here in 1857. Pop. 15,000.

Bellevue, tn. in Campbell co., Kentucky, U.S.A., near Newport. Pop. 10,000.

Bellw, Harold Kyrie (1857-1911), Eng. actor, b. at Prescott, Lancashire; entered the navy, and later went to Australia, where he first appeared on the stage in 1874. In 1878 he joined Henry Irving's company at the Lyceum, and in 1879 Maria Litton's at the Imperial. Later, he formed a touring company with Mrs. Brown-Potter. The partnership broke up in 1898, when he appeared successively at the Criterion and Lyceum.

Bellewaarde Lake, lake in the W. of Flanders, Belgium, the scene of much fighting in the successive battles of Ypres in the First World War.

Belley, tn. in the dept. of Ain, France, 44 m. E. of Lyons. It is the seat of a bishopric, and has a cathedral dating from A.D. 889, and the ruins of an anct. Rom. temple. Lithographic stone is quarried in the neighbourhood. Pop. 5000.

Bell-flower, name applied to different species of Campanula (*q.v.*).

Belli, Giuseppe Gioachino (1791-1863), It. poet, b. at Rome. Most of his poetry is written in the Rom. dialect. See *1 sonnetti romaneschi* (1886-89), ed. by Morandi.

Belligerents, Rights and Duties of. The conduct of war involves the relations first between the 2 parties engaged in the war, the B., and secondly between either or both those parties and neutrals. (*See NEUTRALITY and CONTRABAND.*) By the articles of The Hague Convention, 1907, the armed forces of the B. must alone carry on the war, and to them alone do the rights, duties, and laws of war apply; besides the regular army, militia or volunteer forces may be regarded as B. troops, and not as mere marauders, only if they are commanded by someone responsible for his men's acts, carry emblems distinctive and recognisable at a distance, carry arms openly, and conduct war in accordance with accepted laws and customs. The last 2 conditions will suffice when the population of an invaded country take up arms and have not time to organise under the other conditions. Enemy's property on land, where it belongs to the state, can be seized by an army of occupation; also all appliances for transmission of news, persons, or goods, and munitions of war belonging to private persons can be seized, but must be returned with compensation after peace. Requisitions in kind or services on private persons can only be made for the necessities of the army, and paid for or receipts given, to be paid afterwards. Private property on land is not immune in war. On sea, enemy's private property is still liable to capture and confiscation. It is forbidden to use poison or poisoned arms; to kill or wound persons belonging to the enemy's nation or forces treacherously, or those who have surrendered at discretion; to declare 'no quarter' shall be given; to use arms or projectiles, etc., which will cause superfluous injury; improper use of flags of truce, enemy's flags or uniforms, or red-cross badges; bombardment of undefended places or dwellings, except on a refusal after formal summons to furnish supplies requisitioned; destruction and seizure of property except when urgently necessary for purposes of war; pillage of a tn. or place, even if taken by assault. Prisoners of war must be treated humanely; they are in the power of the enemy's gov., not of those that took them; they may be confined, but only as a measure of necessity; they may be authorised to work, but not for any purpose of the war; they are treated on the same footing as the soldiers of their captors in respect of food, etc. Escaped prisoners are subject to punishment if caught before rejoining their own army or

before leaving the country occupied by their captors; if captured a second time after escaping successfully, they are not liable to punishment for first escape. A prisoner released on parole and recaptured bearing arms forfeits his rights as a prisoner of war. For treatment of sick and wounded in war *see* GENEVA CONVENTION; it may be noted that The Hague Convention, 1907, drew up rules on the lines of the Geneva Convention for the treatment and conduct of hospital ships and of sick and wounded in naval warfare. Although the great powers had been formulating international law for the half century before the First World War no opportunity had occurred for testing the various agreements reached, and finding out by actual experience their working value. One feature of the First World War was the invention and use of new weapons (*e.g.* tanks), yet no international agreement was reached adapting the use of them to the general principles of international law already estab. The blockade of Germany caused Great Britain to declare by proclamation that she attached enemy character to companies wherever incorporated, carrying on business in enemy country. Direct trading with the enemy was forbidden, but this did not prevent indirect trading via neutrals, and in order to stop this the 'Trading with the Enemy (Extension of Powers) Act, 1915' prohibited persons resident in United Kingdom from trading with persons in neutral countries likely to have association with the enemy. Internment of enemy subjects was dealt with variously in practice. Great Britain, France, Italy, and U.S.A. gave enemy subjects a certain time to leave their ter., but Germany and Austria detained all enemy subjects at the outset, but later released those not of military age. Enemy subjects allowed to remain in B. states were also treated variously; in Great Britain, France, and Germany they were interned; in the U.S.A. they had a fair measure of freedom, and in Japan no restrictions were imposed. The Hague Conference in 1907 agreed that merchant ships in enemy ports should be given some days' grace to clear from those ports, but Article 6 provided that the convention should only be applicable to a war in which all the belligerents were parties to it. Neither Italy, Serbia, nor U.S.A. came within this category. Germany offered days of grace to Great Britain, who replied with a counter-offer, to which no reply was received. The term 'merchant ships' in the convention was also debated. Great Britain held that it did not apply to tugs and lighters used in a port nor to pleasure yachts, but Germany adopted the opposite view. The distinction between armed forces and the civil pop. is now disappearing owing to (a) the organised employment of a nation's manpower, (b) the employment of aircraft for bombing civilians as well as troops, (c) the inability of democratic govts. to conduct war without the active support of the electorate they represent, (d) the importance of conducting an economic war

against the enemy. The use of poisonous gas was forbidden by The Hague rules, but Germany first used it, to which the Entente was compelled to retaliate in kind. Under the Washington Treaty, 1922, Great Britain, France, Italy, Japan, and U.S.A. agreed not to use any kind of gas, but this treaty is no longer operative. It was hoped, through the League of Nations, to postpone recourse to war in disputes between nations by the procedure under the Covenant of the League. Under the Covenant (*q.v.*) the members of the League agreed 'that if there should arise between them any dispute likely to lead to a rupture, they will submit the matter either to arbitration or to inquiry by the Council, and . . . in no case resort to arms until 3 months after an award has been made by the arbitrators or a report has been made by the Council.' This procedure was intended to delay the opening of hostilities, and permit of the dispute being considered by a third party. But the arbitrary action of the 'totalitarian' powers as illustrated by the Jap. invasion of China, the It. invasion of Abyssinia, and the Ger. seizure of Austria and Czechoslovakia went far to destroy this hope even before the outbreak of the World War in 1939. The events of the war weakened the validity of much international law in so far as it concerned the rights of belligerents. Nevertheless, the Hague Conventions retained an authority on which could be based much of the prosecution of the war criminals at the trials conducted at Nuremberg in 1946. Even the defence had recourse to them. For instance, according to the evidence of Keitel (former chief of staff of the Ger. army), Hitler gave Himmler plenary powers as Reichsführer of the S.S. so as to enable him to become a factor in the direction of the war against Russia by the side of the *Wehrmacht* on the 'legal thesis' that the Soviet Gov. had not ratified either the Hague rule of land warfare or the Geneva Convention (*q.v.*), and had thus knowingly and willingly exempted themselves from the rules of international law.

Bellincioni, Gemma, It. soprano singer, b. at Monza, Aug. 17, 1861. She is remembered particularly for her interpretations of Santuzza in *Cavalleria Rusticana*, of Violetta in *La Traviata*, and of Salome in Strauss's opera. She began by playing light and comic parts. Tambrlik, the tenor, noticing her ability, engaged her to tour with him abroad. Also estab. herself as an actress in stage plays, the *Dame aux Camélias* being one of her most marked successes. Pub. *Io e il Palcoscenico* (Myself and the Stage). Milan, 1920.

Bellingham: (1) Vil. of Northumberland, England, on the l. b. of the R. Tyne. The church dates from the thirteenth century, and has a finely groined roof. Cairns and Druidical stones are found in the neighbourhood. Beds of coal and ironstone are worked. Pop. 1500. (2) City of Whatcom co., Washington, U.S.A., on B. Bay, 96 m. N. of Seattle; an important shipping centre. Prin. industries: saw-milling, salmon canning;

manufs., tin cans and machinery. Pop. 29,300. (3) Dist. in the bor. of Lewisham, London, England, 9 m. from the City by railway. The L.C.C. has a housing estate there.

Bellingshausen, Fabian Gottlieb von (1778-1852), Russian naval officer and explorer, b. in Oesel Is., Livonia. Entered Russian navy in 1797. In 1803 he circumnavigated the world, and, later, led a Russian expedition to the Antarctic, reaching as far S. as 70° S. lat. He was present at the battle of Varna, 1828.

Anderson

GIOVANNI BELLINI

Self-portrait in the Uffizi Gallery, Florence.

Bellingshausen Sea, portion of the Antarctic Ocean, S.W. of Drake Strait and W. of Graham Land. It is named after the Russian explorer (*q.v.*).

Bellini, Gentile (1421-1501), It. painter, eldest son of Jacopo B., was b. at Venice. Two of his prin. works are the 'Histories of the Holy Cross' at San Giovanni, and the 'Preaching of St. Mark' at the college of that saint. Some of B.'s pictures were taken to Constantinople, and Mohammed II., sent an invitation to the artist to his court. This proposal was accepted by B. He was courteously received by the sultan, who sat to him for his portrait, and commissioned him to paint various historical works. Among them was the subject of the 'Decollation of St. John'; this picture was admired by Mohammed, who pointed out, nevertheless, some inaccuracy in the marking of the discoloured neck; and, in order to prove the justice of his criticism, he ordered the head of a slave to be struck off in the presence of the artist. From this moment B. never enjoyed an hour's tranquillity until he had obtained leave to return to Venice. Mohammed dismissed him with marks of favour, placing

a gold chain round his neck and giving him letters to the Venetian senate expressive of his satisfaction. He was engaged in various public works after his return to Venice, for which he was requited by the republic with an honourable pension for life and the order of St. Mark.

Bellini, Giovanni (1422-1512), It. painter, the son of Jacopo and the brother of Gentile B., b. at Venice. He contributed perhaps more than any painter of his time to emancipate art from the dry Gothic manner of his predecessors. Giovanni ornamented the public edifices and churches of Venice and other cities of Italy with a prodigious number of paintings, and continued his labours to a very advanced age. Some of his small pictures are in England; but it is only by his large works in Italy that an adequate idea of his power can be formed. See Roger Fry, *Giovanni Bellini*, 1899.

Bellini, Jacopo, It. painter, b. in Venice, was one of the earliest artists in oil painting, and his works have considerable merit, considering the age in which they were executed. He painted portraits and frescoes. A few of his works survive, but his manner is best judged from the book of his sketches, which is in the Brit. Museum. He is better known as the father of Gentile and Giovanni B. He d. in 1470.

Bellini, Laurentio (1643-1704), It. physician, b. at Florence. After receiving in his native place the elements of a classical education, he proceeded to Pisa, where he made such progress in his studies that, when only 20 years of age, he was appointed prof. of philosophy. He continued to teach anatomy and to practise medicine at Pisa, with great success, for 30 years, when he was invited to Florence and made chief physician to the Grand Duke Cosimo III. His best work is the treatise *Gustus Organum novissime deprehensum* (Bologna, 1665), in which he pointed out the papillae of the tongue to be the essential organ of taste. His works were collected and pub. in 2 vols. (Venice, 1708, reprinted 1732).

Bellini, Vincenzo (1801-35), It. operatic composer, b. at Catania, Sicily, and descended from a family of musicians. Entered the Neapolitan conservatoire, studying under Zingarelli. Wrote a cantata and some masses. His first succeeded by *La Straniera*, at the same opera, *Adelson e Salvini*, was performed in 1824 at an obscure theatre in Naples, but his second, *Bianca e Fernando*, produced in 1826 at the San Carlo, Naples, made his name. The following year he wrote *Il Pirata* for the Scala at Milan; and this was theatre. To lovers of modern It. music the most familiar of B.'s operas are *I Montecchi e Capuleti* (1829), in which the part of Romeo had been a favourite of the great contraltos of the previous six or more decades; *La Sonnambula* (1831); *Norma*, his best and most popular work (1832); and *I Puritani*, written for the It. opera in Paris and influenced to some extent by Fr. music. Received a commission to write an opera for the national grand opera, Paris, but while studying

verse and cadence for this work he was seized with a sudden and fatal illness. He wrote flowing melody, and gave the voice every opportunity to reveal its natural charm and its acquired technique. His popularity in Paris and elsewhere was enormous.

Bellinzona, cap. of the canton of Ticino or Tessin, Switzerland, 8 m. E.N.E. of the head of Lago Maggiore, situated at an elevation of 775 ft., commanding the St. Gotthard route. It has 3 old castles and railway repair shops. Pop. 10,000.

Bellis, a genus of herbaceous plants of the order Composite. See DAISY.

Bellman, Karl Mikael (1740-95), Swedish poet, b. at Stockholm. He studied at the univ. of Upsala. He was in the civil service, 1758-c. 1764, in commerce, 1764-1772. Later he was enabled to devote himself entirely to poetry and literature by the liberality of Gustavus III., who appointed him to a nominal office, with the title of secretary of the court. As early as 1757 he pub. a book of verse, a trans. of *Evangelical Thoughts of Death* by Schweidnitz, and in the next few years many poems in the style of Dalin. *The Moon*, a satirical poem, appeared in 1760. His chief work consists of the dithyrambic collection of odes entitled *Fredman's Epistles and Fredman's Songs*, written between 1765 and 1780, and pub. in 1790.

Bell-metal, an alloy, composed of a mixture of copper and tin, used for making bells. There is from 18 per cent to 30 per cent tin, with 80 per cent to 70 per cent copper, the proportion of tin being larger in the case of small bells. See also ALLOY.

Bello, Francesco (c. 1450-1505), It. epic poet, known as Ciccio da Ferrara on account of his blindness. Lived in great poverty at Mantua and Ferrara. His *Manbrino* (45 cantos), dealing with the romantic and chivalrous adventures of an oriental potentate, had a considerable influence on Ariosto's *Orlando Furioso*.

Bello, Horizonte, cap. of the state of Minas Geraes, Brazil; formerly (before 1897) called Curral del Rey. The neighbourhood produces gold, manganese, and iron, coffee, grapes, maize, etc. It was the scene of fighting in the Civil war of 1930. Pop. 168,000.

Belloc, Joseph Hilaire Pierre, Eng. poet, essayist, and historian, b. at La Celle, Saint-Cloud, July 27, 1870; son of Louis Swanton Belloc, advocate. He was, as a Rom. Catholic, educated at the Oratory School, Edgbaston. After a brilliant career at Oxford, where he took first-class honours in hist., he served for some years in a Fr. artillery regiment. He became a naturalised Brit. subject in 1902. In 1906 he was elected M.P. for S. Salford as a Liberal. Becoming disillusioned with Eng. politics, he retired from Parliament, 1910; and, in conjunction with Cecil Chesterton, estab. (1911) the *Eye-Witness*—afterwards the *New Witness*. His numerous writings range from political pamphleteering to works of serious historical study, and although his reputation may be said to be mainly that of a historian, his name is also estab. as a poet.

and essayist. In addition, he has written some 16 novels, nearly all of which were illustrated by G. K. Chesterton. As an essayist he has an engaging style, and the easy variety of his choice of subject is shown in *Hills and the Sea* (1906) *On Nothing* (1908), *On Everything* (1909), *On Something* (1911), *This and That and the Other* (1913). Sev. other vols. of essays followed, among which may be mentioned *Essays of a Catholic Layman in England* (1931). His historical and biographical works are written from the point of view of a Catholic controversialist, and he looks at Eng. hist. in particular with the eye of a continental writer. His major historical works are as follows: *History of England, 1688-1910* (vol. xi. of Lingard's *History*) (1914); *The Last Days of the French Monarchy* (1916); *Europe and the Faith* (1920); *The Campaign of 1812 and the Retreat from Moscow* (1924); *A History of England, 4 vols.* (1925-31); *Six British Battles* (1931); *The Tactics and Strategy of the Great Duke of Marlborough* (1933); *A Shorter History of England* (1934); *Monarchy: A Study of Louis XIV.* (1938). B.'s biographical writings include studies and lives of Danton (1899), Robespierre (1901), Marie Antoinette (1903), James II. (1928), Joan of Arc (1929), Richelieu (1929), Wolsey (1930), Cromwell (1931), Napoleon (1932), Charles I. (1933), William the Conqueror (1933), Cromwell (1934), and Milton (1935). He also wrote a number of books which sprang from his enthusiasm for travel and his love of places. They include *The Historic Thames* (1907), *The Stane Street* (1913), and *The Cruise of the 'Nona'* (1925); and the same spirit animates many of his essays, while the best known of his books, *The Path to Rome* (1902), is the story of a journey by road from the N. of France through Switzerland to Rome. Among his writings on contemporary politics, *The Party System* (1911) with Cecil Chesterton and *The Serrile State* (1912) should be mentioned, and in a lighter vein *But Soft—we are observed!* (1928). His first financial success was in the different field of books for children with *The Bad Child's Book of Beasts* (1896), followed by *More Beasts for Worse Children* (1897), *Cautionary Tales for Children* (1908), and *New Cautionary Tales* (1930). B. also ranks high as a poet of both serious and light verse, and vols. of his poetry were pub. in 1896, 1910, 1911, 1923, also *The Chanty of Nona* (1928), and *Ladies and Gentlemen* (1932); *The Last Lady* (1940).

Belloc Lowndes, Marie Adelaide, Mrs. (c. 1868-1947), Eng. novelist; only daughter of Louis Belloc and sister of Hilaire B. Educated at Mayfield convent, Sussex; married, 1896, Frederick Savrey Lowndes. Her novel, *The Heart of Penelope*, was pub. in 1904, and after that she wrote a considerable number of novels, which estab. her reputation as a teller of stories with exciting incident combined with psychological interest. Among the best known are *Barbara Rebell* (1905) and *The Lodger* (1913), the latter being trans. into a number of

foreign languages. Her play, *With All John's Love*, was produced in 1932, and was followed by 2 other plays. She is also the author of 3 vols. of memoirs, *I too have lived in Arcadia* (1941), *Where Love and Friendship dwell* (1943), and *The Merry Wives of Westminster* (1946).

Bellona, the goddess of war among the Romans, the sister or wife of Mars. During the Samnite war (296 B.C.) Appius Claudius vowed to dedicate a temple to her, and it was afterwards erected (293 B.C.) in the Campus Martius.

Bellot, Joseph René (1826-53), Fr. naval officer and Arctic explorer, b. in Paris. He won the cross of the Legion of Honour in the Fr. expedition against Tanatavo in 1845. In 1851 he joined the party in search of Sir John Franklin. In Mar. 1853 he was killed while on the expedition under Captain Inglefield. An obelisk at Greenwich commemorates him.

Bellows, see BLOWING-MACHINES.

Bellows, Albert F. (1829-83), Amer. landscape painter, b. at Milford, Massachusetts, studied and painted in France, Belgium, and England. His early work was in oils, but later he turned to water-colour. Among his works are 'Afternoon in Surrey', 1868; 'Sunday in Devonshire', 1876.

Bellows-fish, see under CENTRISCUS.

Belloy, Dormont de (real name Pierre Laurent Buiette) (1727-75), Fr. dramatist and actor, b. at Saint-Flour in Auvergne. He was intended for the legal profession, but he preferred the stage. He played principally at St. Petersburg. His tragedy, *Tibris*, which was introduced in France in 1758, was a failure, and thus disappointed B. returned to Russia. His next play, *Zelmire*, in 1762, and *Le Siège de Calais*, in 1765, were successful when produced in Paris. He was mainly responsible for the innovation of having Frenchmen as heroes of plays, rather than figures from classical hist. and legend.

Bell Pepper, see GUINEA PEPPER.

Bell Rock, or Inchcape Rock, reef off the E. coast of Scotland, at the opening of the bay formed by the Red Head in Forfarshire and Fifeshire, nearly opposite the mouth of the Tay. It is nearly 12 m. S.E. of Arbroath, and is about 2000 ft. long. A lighthouse, 120 ft. high, designed by Robert Stevenson and Rennie, was erected in 1807-11; a new light-room was built in 1902. The old tradition of the bell hung on a tree by the abbot of Aberbrothock (Arbroath), is celebrated in Southey's ballad, *The Inchcape Rock*. Consult Campbell, *Notes on the Bell Rock*, 1904.

Bells, nautical term, used in describing the time. A day on board ship is divided into watches of 4 hours each. Every watch is marked off into half-hours by the ringing of a bell, the strokes of which depend on the number of half-hours that have elapsed during the watch. Thus, 'two bells', marked by a double stroke, shows that one hour of the watch has expired.

Bellshill, tn. of Lanarkshire, Scotland, 3 m. N. of Hamilton, in the mining dist. Pop. 17,000.

Belluno, prov. in Venetia, Italy; area 1293 sq. m. The country is mountainous, and there are extensive forests. The chief riv. is the Piave, which rises in the Alps and flows into the gulf of Venice. The vine and fruit-trees grow on the lower hills and in the valleys, and there is good pasturage. Pop. 233,580. The cap. is B., an episcopal city, standing on the r. b. of the Piave 51 m. N. of Venice. The cathedral belongs to the Renaissance period, and is in the Palladian style. The prin. manufs. are silk and wax, and there is also considerable trade in timber and fruit. The tn. is the Rom. Bellunum. Marshal Victor-Perrin took from it his title of duke of B. Pop., com., 27,000.

Belluno, Duke of, *see* VICTOR-PERRIN.

Bell-wort, Lindley's Eng. name for the order of plants called Campanulaceae (q.v.).

Belmez, tn. with large coal mines in the prov. of Cordova, Spain, 35 m. N.W. of Cordova. Pop. 10,000.

Beloit, city of Rock co., Wisconsin, U.S.A., on the Rock R., 75 m. S.W. of Milwaukee. B. College was founded in 1846; it is a Presbyterian institution, and accommodates 500 students. Manufs. agric. tools, flour, and paper. Pop. 24,000.

Belon, Pierre, Fr. botanist, *b.* at a hamlet in a par. of the Fr. prov. of Maine about the year 1517. Nothing seems to be known concerning his family. Medicine and botany were his studies at a very early period of his life. He visited Germany, Bohemia, Italy, Greece, Egypt, Palestine, and Asia Minor, and appeared in Paris, after 3 years of absence, in 1550, with an extensive collection, which he arranged, and from which he proceeded to pub. various works. In 1557 he traversed Italy, Savoy, Dauphiné, and Auvergne. In 1564 he was assassinated in the Bois de Boulogne as he was returning to Paris.

Below, Fritz von (1853-1918), Ger. general. He first saw service in the Franco-Ger. war of 1870-71. In 1912 he was appointed to the command of the 21st Army Corps, and at the beginning of the First World War his corps formed part of the Ger. Sixth Army on the W. front. In 1915, however, his corps was transferred to the E. front, where it played a distinguished part against the Russians. He was appointed to the command of the First Army in 1916 and was opposed to the Brit. on the Somme in Nov. of that year. He *d.* in a field hospital on the W. front on Nov. 23.

Below, Otto von (1857-1944), Ger. general. On outbreak of First World War was commanding an infantry div. in E. Prussia. At the battle of Narva he commanded the 1st Reserve Corps against the Russians. In the Masurian winter battle of Feb. 1915 he commanded the Eighth Army, which played a distinguished part in the capture of Lyck. In the summer of 1915 he became commander of the Army of the Niemen. In Oct. 1916 he was sent to the Macedonian front to take command of the operations in that theatre. In 1917 he commanded

a mixed Ger.-Austrian force in Italy, which defeated the Its. at the battle of Caporetto, a defeat which would have had more serious results for the Entente had B. not advanced too far from his transport. In the Ger. offensive of Mar. 1918 B. was in command of the Seventeenth Army during the battle of the Somme. After the armistice B. commanded a force in E. Prussia and retired in 1919.

Belpasso, tn. and prov. of Sicily, 7½ m. N.W. of Catania. It lies on the slope of Etna. Since its destruction by a lava stream in 1669 it has twice been rebuilt. Pop. 10,700.

Belper, mrkt. tn. on the Derwent, 7½ m. from Derby, England. It is noted for its cotton mills, silk and hosiery factories. Seams of coal are worked in the neighbourhood, and there are engineering works and nail factories. Pop. 13,000.

Belphebe (Fr. *belle*, beautiful, and Gk. *Phoebe*, Diana), character in Spenser's *Faerie Queene*. She is sister of Amoret, and in her all the virtues of Queen Elizabeth are set forth.

Belsen, the site of a Ger. concentration camp, 10 m. N.W. of Celle, Hanover. Allied troops stormed their way into it in mid-Apr., 1945. In it all the horrors of Buchenwald (q.v.) were found repeated. There were at one time 10,000 persons in the camp. These included some political prisoners. Some 1500 persons were found to be suffering from typhus and over 1000 from typhoid fever. Sev. Brit. Red Cross relief teams went to the camp on Apr. 22 to tend the sick and starving prisoners. The R.A.M.C. set up hospital wards in charge of army sisters. Horrible sights met the eye. Innumerable emaciated figures were covered with the ulcers of filth and disease. One patient was so emaciated that she appeared to be an aged woman; but her age was only 37. Another woman who looked 'almost human,' yet totally expressionless and with the usual yellow waxen pallor of starvation, also looked incredibly old. Her age was 24. Lying close up against a girl typhus patient were the dead body of a woman and on her other side 8 more huddled corpses. There was no attempt at physical decency in the camp, for there was no sanitation whatever, and the internees were too weak to move out of the over-crowded huts. A medical officer went through another hut which had been nearly cleared. In one corner was a pile of filthy rags and old shoes. He marked with a cross in paint on the forehead those who he thought might live if taken out at once. It was ascertained that 17,000 people were cremated by the Gers. in Mar., before the increasing number of deaths began to 'get out of hand.' Some internees and corpses bore the obvious marks of torture. Josef Kramer, aged 38, the camp commandant, and 29 others were tried by a military court held at Lüneburg, and of these 11, including Kramer, and a young woman of 22, Irma Greso, were, on Nov. 17, 1945, sentenced to death for the torture, whipping, and

shooting of prisoners, and for selecting victims for death by the gas-chamber. The sentences were carried out in the following month.

Belshazzar, the last king of Babylon of the Chaldean dynasty, was the son of Queen Nitocris. He perished 539 or 538 B.C., in the seventeenth year of his reign, in the night when Babylon was stormed by Cyrus whilst the attention of the court was engaged by a splendid festival. It was at this feast that B.'s downfall was foretold by the writing on the wall (Dan. v.). His hist. has been a favourite subject of poets and artists; e.g. the painting of B.'s Feast by Martin and the dramas of Milman and Hannah More, and a poem by Byron.

Beltane, or **Beltein** (Gaelic *bealltainn*, *bealltuinn*), name applied to a Celtic festival, formerly celebrated in Ireland, Scotland, and Cornwall, traces of which still remain in different parts of the Brit. Isles. It was originally a May Day festival, when bonfires were lighted on the hill-tops, sheep were driven through the fire, and, possibly, human sacrifices were made. The name is still used in the Gaelic parts of Scotland for May Day. The popular etymology of the word from Celtic *tiene*, fire, and *Bel*, the Phœnician god of the O.T. is no longer accepted.

Belt Case, *The*, a libel suit brought by Richard Claude Belt, a sculptor, against a former pupil, Sir Charles Bennet Lawes (afterwards Lawes-Wittewronge). Lawes had accused Belt, in *Vanity Fair* and elsewhere, of acknowledging as his own certain pieces of sculpture, which had been executed or finished by other persons. The case, *Belt v. Lawes*, was heard at Westminster before Baron Huddleston, and lasted 43 days, from June 21 till Dec. 28, 1882. The jury decided in Belt's favour, with £5000 damages.

Beltrami, **Eugenio** (1835-1900), It. mathematician, *b.* at Cremona. B. lectured on mathematical physics at the univ. of Rome, and was elected president of the Lincei. His chief contribution to mathematical science resulted from his researches on the so-called non-Euclidian geometry. The formula known as Beltrami's theorem is: 'The centre of a circle circumscribing a triangle is the centre of gravity of the centres of its inscribed and escribed circles.' His most important essay is *Saggio di interpretazione della geometria non-euclidia*.

Beltrami, **Giulio Cesare** (1779-1855), It. traveller, *b.* at Bergamo. He was connected with the Carbonari societies, and in consequence was obliged to leave Italy for America in 1821. He accompanied Major Long on an expedition in 1823, and in the following year he discovered the sources of the R. Mississippi. He pub. a hist. of his journey at New Orleans, *La Découverte des sources du Mississippi*, 1824.

Belts, *The*, straits in Den. which connect the Baltic with the Cattegat. The Great B. separates Zealand and Fünen, and is nearly 40 m. long, from 10 to 15 m. broad, with a depth of from 5 to 20 fathoms. The Little B. divides Fünen

and Slesvig. It is half as wide as the former. At Fredericia it is less than a mile wide. Navigation of the B. is difficult, because of the sandbanks and small low is.

Belts and **Belting**, strips of flexible material passing round from one pulley or drum to another to transmit the motion of a driving shaft to a machine some distance away. They are used chiefly in mills where an engine is used to rotate a shaft running from end to end of the building, pulleys being fixed on the shaft at intervals so that the power may be transmitted to separate machines on one or more floors. The advantages of the system over toothed-wheel gearing are economy of material in spanning a large space, decreased noise and jarring, less damage to machinery through defects in the driving mechanism, and greater immunity from accidents generally. An endless belt is stretched from one pulley to another; if it is an open belt the 2 pulleys rotate in the same direction; if the belt is crossed between the pulleys, the shafts are made to rotate in opposite directions. If there is no slipping of the belt on the pulleys, the velocities of the belt and of the surfaces of the 2 pulleys must all be equal, hence the number of revolutions will be inversely proportional to the diameters of the pulleys. If the driving shaft runs at a constant speed, and it is required to increase or diminish the speed of the driven shaft, speed cones are used. These consist of pulleys of different diameters placed side by side on each shaft, so arranged that a smaller pulley on one shaft is directly opposite a larger pulley on the other, so that the length of belting passing round the pair remains constant. The ratio of numbers of revolutions can thus be altered without tightening or loosening the belt. Suppose the belt be stretched over the pulleys at rest with a tension sufficient to keep the pulley surfaces and the belt well in contact. This tension will initially be uniform throughout the belt. On rotating the driving pulley, friction causes the belt to be carried along with it and the tension increases on the driving side between the 2 pulleys and decreases in that portion of the belt opposite to the driving side. Therefore there is always a slack side and a tight side to a belt, although the average tension remains the same, supposing the belt to be perfectly elastic. As the load on the belt increases the difference in the tensions increases, and also the liability of the belt to slip on the pulley. It has been found that as the slip increases so does the coefficient of friction, so that the belt accommodates itself to heavier working. The best evidence shows, therefore, that there is no fixed coefficient of friction for leather belting, so that the load may be increased without the belt ceasing to drive, though in practice there is a limit when the velocity of slip becomes inconvenient. This may be remedied by tightening the belt, but for safety the greatest tension should never be greater than one-fourth of the strength of the belt at the joint,

and considerations of economy and durability demand that the tension should be usually much less, and the effect of excessive tensions in disturbing the bearings of the shafts should also be taken into account. In considering the speed of belting, it should be noted that part of the tension in the belt is used up in bending the belt over the curve of the pulley. The actual resistance of the belt to curving may be neglected in the case of thin flexible leather or woven belting, but at high speeds centrifugal force tends to reduce the pressure of the belt on the pulley, and it is probable that at about 10,000 ft. per minute for leather belts, the belt tension would be so much reduced that the belt would cease to drive. Belts may be used to drive pulleys which are at right angles to the driving shaft, in which case the belt takes a quarter twist. When 2 pulley shafts are not parallel, whether their directions intersect or not, the belt may be passed round and kept in place by guide-pulleys. The only condition to be observed is that the point at which the belt leaves each pulley must be in the same plane as the next pulley.

Materials. Belts are usually made of leather tanned by oak-bark; the thickness varies from $\frac{3}{8}$ to $\frac{1}{2}$ in. in single belting and twice that amount in double belting. The strength of single belting is from 750 to 1500 lb. per sq. in. of width. Rawhide is sometimes used, and is of considerable strength. The strips of leather are joined by paring down the ends, cementing them together with glue, and lacing or riveting them to make them more secure. It is usual to leave one joint uncemented, so that the belt may be tightened when required. Leather belts are usually run with the flesh side next to the pulley, but in America experiments appear to show that the driving power is greater with the grain or smooth side in contact. Cotton belting has the advantage of being cheaper and stronger than leather, 8-ply cotton belting being found by the manufacturers to be twice as strong as double leather belting. Indiarubber is sometimes used in wet places, where leather is unsuitable, but is easily damaged by contact with oil. Chain belting consists of links of leather strung together on wire pins which are not bent as the belt passes over the pulley.

Pulleys. A belt passing round a conical pulley in motion has a tendency to creep up to the larger end. Pulleys are therefore made with the rims slightly convex, so that the belt remains in the middle of the rim. The arms may be elliptical or segmented in section, and the latter form is usually preferred. They may be straight or curved; the former are stronger and lighter, but are more liable to fracture on cooling. Pulleys are sometimes cast in 2 halves, so that they may be fixed on a shaft without interfering with the shaft bearing. Wrought-iron pulleys are often made with split rims, which are closed up by a screwed-on piece after the pulley is on the shaft. When a belt is thrown off the pulley for repairs or tightening, it

rests mainly on the upper shaft. If this is the driving shaft there is a danger that the belt will be doubled round on itself by the rotation of the shaft and slung round with risk of damage to life or property. This may be obviated by the provision of a light perch above the shaft on which the pulley may hang when unshipped. Allied to systems of belting is the use of rope for gearing. The pulleys are then provided with grooves so shaped that the ropes do not reach the bottom, but are wedged in by the sides, and so give a very effective drive. Cotton ropes are very strong, but hemp and wire are also used. The rope may meet the pulley at an angle, so that the shafts need not be exactly parallel. Another advantage of rope gearing is that many ropes may be run from a driving drum to sev. machines. See W. H. Atherton, *Conveying Machinery*, 1937; *Mechanical Handbook, Yearbook, and Manual* (ann.).

Belts, Jupiter's, see JUPITER.

Belurbet, tn. in co. Cavan, N. Ireland, 8 m. N.W. of Cavan, on the R. Earn. Pop. 1300.

Beluchistan, see BALUCHISTAN.

Beluga, or the white whale, belongs to the family of Dolphins. It is found chiefly round Greenland, but occurs in many parts of the Arctic seas, and occasionally has been seen off Scotland. Its body measures 12 to 16 ft. in length, and is a creamy white colour. Its head is arched, its snout short and rounded, its teeth are few, small, and conical, and it has short flippers. Young whales are at first a bluish-grey. Bs. associate in herds.

Belur, vil. of the Hassan dist. of Mysore, India, which contains a famous temple. Pop. 4000.

Belur-Tagh, see BOLOR-TAGH.

Belus: (1) Name of the chief deity of the Babylonians and Assyrians. (2) In Gk. mythology, the son of Poseidon, and father of Ægyptus and Danaus. He was fabled to have been the founder of Babylon. The patronymic Belides is given to Ægyptus and Danaus; to Lynceus, son of Ægyptus; to Palamedes; and to the Danaides, daughter of Danaus.

Belvedere, architectural term for a small building constructed at the top of a house or palace, and open to the air, at least on one side, and often on all. The term is an It. compound, signifying a fine view, and in Italy Bs. are constructed for that purpose. The chief example is in the Vatican. In France the term is applied rather to a summer-house in a park or garden than to the constructions on the tops of houses.

Belvedere (*Kochia scoparia*), species of Chenopodiaceæ which is native to E. and Central Asia. It is cultivated in Britain as an ornamental plant on account of its leaves, which resemble those of a cypress; hence it is called the summer cypress.

Belvidere, co. seat of Boone co., Illinois, U.S.A. Fine public buildings and factories. Pop. 8000.

Belvisia (*Napoleona imperialis*), species of Lecythidaceæ which grows in tropical W. Africa. It grows to a height of 7 or 8 ft. and is loaded with large, broad,

bright blue, red, or white flowers. The fruit resembles a pomegranate.

Belvoir Castle, situated 4 m. S. of Bottesford in Leicestershire, England. Since the time of Henry VII. it has been in the hands of the Manners family, and is now the seat of the duke of Rutland. The castle itself is a fine castellated, pseudo-Gothic building. During the Civil war it was a royal stronghold, whilst its hist. goes back to the days when William the Conqueror granted its site to Robert de Todenei, who founded a priory at the foot of the isolated mound from which the castle commands so wide a prospect. Its picture gallery contains paintings by Vandyck, Murillo, Reynolds, Holbein, etc.

Bely, Andrei (pseudonym of Boris N. Bugaev) (1880-1934), Russian poet and novelist. His *Petersburg*, pub. in 1913, was highly rated by contemporary Russian critics. It is the story of a revolutionary student whom the police try to provoke to murder his father, a senator. Basically the work is the story of Petersburg itself, seen as a dream rather than as a real city. B. followed this up with 2 vols. of a vast piece of fiction which was known as *Moscow*. Here he gives an immense fresco of the scientific, literary, political, and popular personages of the city; but he *d.* before much of the work was completed. He has been called a blend of James Joyce and Marcel Proust.

Belyta, genus of hymenopterous insects of the family Proctotrypidæ. They are cosmopolitan, and their larvæ live in the bodies of insects and spiders or in their eggs. These parasites are minute, have 4 wings, and frequent sandy places.

Belz, small tn. of W. Ukraine, formerly of Poland, 39 m. N. of Lwów.

Belzoni, Giovanni Battista (1778-1823), lt. traveller and antiquarian, *b.* at Padua, but lived during his youth at Rome, where he intended to enter the monastic life, but in 1800 he left Italy and visited most countries in Europe. In 1803 he came to England and married; he lived by exhibitions of feats of strength. He was interested in hydraulics, and went to Egypt with a plan for irrigating that country; the jealousy of the natives frustrated his intentions. He shipped many monuments of Egyptian ant. civilisation to England, and discovered many unknown tombs along the course of the Nile. In England he pub. an account of his travels and excavations.

Bem, Joseph (1795-1850), Polish general, *b.* at Tarnow, Galicia. He was educated at the univ. of Cracow, and admitted as a cadet in the corps founded by Napoleon at Warsaw. After 13 years' military service, he took part in the Polish rebellion, 1830-31. He then left for Paris, where he lived for 16 years. In 1848 he joined the Hungarians, and received command of 10,000 men. In 1849 he defeated the Austrians, driving them and the Russian allies into Wallachia. He also expelled Puchner from the Banat and returned to Transylvania. Here he was forced to retreat before superior forces of the Russians, and escaped to Hungary, where he fought in the battle

of Segesvár. He escaped to Turkey, and there embraced the Muslim faith. He was appointed to the sultan's army as Amurat Pasha.

Bemba, *see* BANGWELO.

Bembatoka Bay, *see* BOMBETOKA.

Bembex, typical genus of the hymenopterous family of insects known as Bembecinae. They are peculiar to hot climates and resemble wasps in size and colour.

Bembo, Pietro (1470-1547), lt. historian, *b.* at Venice, the son of a Venetian patrician; studied at Padua and Ferrara, learning Gk. from Lascaris of Messina. He pub. imitations of Petrarch. At Urbino he became acquainted with Giuliano de' Medici, brother to Leo X., whose secretary, by Giuliano's influence, B. became. He had many benefices, and in 1530 was commissioned by the Council of Ten to write the hist. of the Venetian republic; he wrote this in Lat., completing it up to the year 1513. In 1539 he became a cardinal.

Bembridge Beds, geological name for a fossiliferous div. of the Upper Eocene strata, principally developed in the Isle of Wight. The beds rest on a compact cream-coloured limestone, known as B. limestones. The shells of *Limnæa* and *Planorbis* are found in large quantities, but the distinguishing feature of the beds is the mammalian remains of *Palæotherium* and *Anapalæotherium*. The vil. of Bembridge in Hampshire gives its name to this geological formation. Its pop. is about 1500.

Bemselberg, Konrad, *see* BOYNEBURG.

Ben, the first syllable in many Heb. names, and means son, lit. or metaphorically, *e.g.* Ben-hadad is the son, or the worshipper, of Hadad, or Adod, the chief idol of the Syrians. Ben-jamin is son of the right (hand), *i.e.* son of happiness.

Ben, Beinn, or Bhein, word in the Scottish dialect of the Gaelic language which has been adopted to indicate most elevated summits of mt. ranges. A corresponding term is *pen* which occurs in the names of many places in Cornwall and Wales.

Ben, Oil of, extracted from the seeds, called Ben-nuts, of a tree found in the E. Indies and Arabia, and known as the horse-radish tree (*Moringa pterygosperma*). When first exposed to intense cold the oil deposits a whitish, flaky substance, and this being removed, is unaffected by cold, on which account it is of value to watch-makers. Oil of B. is also used by painters, and by perfumers to extract the scent from flowers. When pure it retains its sweetness.

Benadir, coastal dist. in the S. of It. Somaliland, containing Brava, Marka, Warscik, and Yub, the ports of the protectorate. *See also* under SOMALILAND, ITALIAN.

Benalla, township of the Delalite co. of Victoria, Australia, 43 m. S.W. by W. of Beechworth. Pop. 3000.

Benares: 1. Tn. in the native state of B. in the United Provs., India; one of the most ant. cities of the world, and the holy city of the Hindus. Ruins, situated

3½ m. to the N. of the city, indicate that here was the original site. In the sixth century Sakya Muni, the Buddha, estab. his religion there, a fact which testifies to the status of the city even at that time. Its modern temples number about 1500. Its appearance from the R. Ganges is one of great beauty. Numbers of bathers are observed daily washing away their sins in the waters of the riv. But the city itself is narrow, crooked, crowded, and dirty. It is surrounded by a road called the Panch-kos road, from the limit of its distance, 5 kos (7½ m.), from the city. Sacred rites are observed in connection with it, and thousands of pilgrims traverse it in the belief that they are ensuring entrance to the heaven of Siva. The European quarter is situated

he wrote his first notable play, *Gente Conocido*. In 1922 he was awarded the Nobel prize. His plays are elegant and polished comedies; among the best known are *Lo Cursi*, 1901; *El Hombrecito*, 1903; *Rosas de Oloño*, 1905; and *La Malquerida*, 1913. Many of the plays have been trans. into Eng., by J. G. Underhill, 4 series, 1919-24.

Benbecula, is. of the Hebrides, lying between N. and S. Uist, and about 20 m. W. of Skye. It belongs to Inverness-shire. Its area is about 36 sq. m. Three-quarters of the land is taken up by farming. Pop. 1200.

Benbow, John (1650-1702), Eng. vice-admiral, spent his whole life in active service at sea. Near Jamaica he attacked a Fr. squadron far superior in numbers

Canadian Pacific

BATHING GHATS ALONG THE GANGES AT BENARES

to the W., and contains the B. College and the Hindu Univ., constituted in 1916. In 1929 the foundation stone of an agric. college was laid. Its chief manufs. are silks, gold, and silver thread, filigree work, and embossed brass-ware ('Benares ware'). Pop. 264,000. The state of B. has an area of 875 sq. m., and is a level tract watered by the Ganges, Karamnasa, Gumti, and Burna. It yields barley, rice, wheat, sugar, and opium. Its climate is cool in winter, but hot to an extreme degree in the summer. Famines occur occasionally. 2. Formerly a dist. of Brit. India, B., the family domain of the Maharaja of B., was constituted a native state in 1911. In 1919 the tn. of Ramnagar was also handed over to the Maharaja, to be used as his cap. Pop. c. 450,000.

Benavente, tn. standing on the R. Isla in the Zamora prov., Spain. Silk spinning is the industry. Sir John Moore began his retreat to Corunna here in 1808. Pop. 5000.

Benavente y Martínez, Jacinto (b. 1866), Sp. playwright, b. in Madrid. He entered the univ. there and studied law, but left it for literature. He travelled over Europe and for a time was manager of a Russian circus and an actor. In 1896

to his own; his leg was broken by a shot, but he sat on deck to take charge of the attack; he was defeated owing to the want of support from other officers; he returned to Jamaica, the officers were punished, and he d. of his wounds.

Bench, see INNS OF COURT.

Bench-warrant, order issued by the court to enforce obedience, as in the case of delinquent jrymen, for contempt of court. These warrants are used extensively in the U.S.A.

Benckendorf, Alexander, Count (1849-1917), Russian diplomat, b. at Berlin, Aug. 1; son of Constantine, Count B., and Louise, princess of Croy-Dülmen. A Rom. Catholic, educated in France and Germany. He was in the diplomatic service, 1869-76, as attaché at Rome and Vienna, and again in 1886 as first secretary at Vienna. Was Russian minister at Copenhagen, 1897-1903. Amb. to England from 1903. He was believed to have prevented, when on a visit to Copenhagen in 1905, the completion of an understanding between the Ger. Emperor and the emperor of Russia, at Björkö (Sweden). Under his auspices the Anglo-Russian Agreement was signed 1907, completing the Triple Entente.

Bencoolen, cap. of the residency of B. Sumatra; situated on the S.W. coast. The Eng. settled there in 1865, and estab. an extensive trade. It was ceded to the Dutch in 1825. Its pop. is 10,000. The residency covers an area of 9690 sq. m., and has a pop. of 257,000.

Ben Cruachan, mt. 3689 ft. high, in Argyllshire, Scotland, just N. of Loch Awe.

Bencezur, Julius (1844-1920), Hungarian painter, b. at Nyiregyháza. Studied under Karl Piloty in Munich, and in 1883 became director of the Academy of Budapest. His most noteworthy paintings are: 'Arrest of Rákóczy in 1701,' 1869; 'Family of Louis XVI. during the Assault on Versailles,' 1872; 'Bacchanti,' 1881; and various portraits.

Bend, Bando, or Balteum, heraldic term for one of the group of figures called ordinaries, which are the earliest devices of medieval heraldry, being 9 in number, and simple in character. See HERALDRY.

Bend (dyke), see BAND.

Benda, Georg (1722-95), Czech composer, b. at Staré-Benátky, Bohemia. He was one of a noted musical family. He was also a pianist, violinist, and a musical director at Berlin in 1742, Gotha in 1748, and Hamburg in 1778. He composed operas and cantatas. He d. at Köstritz, Thuringia.

Benda, Julien (b. 1868), Fr. critic, philosopher, and novelist, b. in Paris. Almost wilfully opposed to the spirit of the age in all things, he regards dissent as a sign of degeneracy. This is revealed in his *L'Ordination* (1913) (a story of winter in Paris); in *Marie Claire* (1911); and also in the *Dialogues d'Eleuthère* and in his pamphlet *Le Bergsonisme*. He is an anti-Bergsonian, and hostile to the neo-vitalists for their effusiveness and mobility. His reputation rests mainly on his *Trahison des cleres* (1927), in which he inveighs against the prostitution of literary or artistic powers to political ends. In *Belphegor* he is a stern critic of democracy. He has been well described as a 'die-hard' intellectualist. This attitude is exemplified in his novel *Les Amourants* (1927). His later writings include *Un Régulier dans le siècle* (1938), *La grande épreuve des démocraties* (1940), and a book on Kant (1940). See Herbert Read, *Julien Benda and the New Humanism*, 1930.

Bendall, Cecil (1856-96), Eng. orientalist. He issued a *Catalogue of Buddhist Sanscrit MSS. in the University Library, Cambridge*, 1883. He also wrote *A Journey of Literary and Archaeological Research in Nepal and Northern India*, 1886. In 1885 he was appointed to the chair of Sanskrit in London Univ.

Bendamir, Bendemeer, Bendamur, or Bundameer, riv. of Persia, which flows into Lake Tashk or Nargis, to the E. of Shiraz.

Bendemann, Eduard (1811-89), Ger. painter, b. at Berlin. His master was Friedrich Wilhelm Schadow, whose daughter he married later. In 1832 he produced his picture of the 'Captive Jews' at Berlin. His fame spread, and in 1837 he was awarded the gold medal at

Paris. In 1838 he was appointed to the professorship at the Academy of Art in Dresden. His paintings were correct and elegant, but lacking in passion and force. In 1858 he succeeded his former master, Schadow, in the directorship of the Düsseldorf Academy.

Bender (Bendery), or Tighina, tn. in the Moldavian republic, U.S.S.R., formerly of Rumania, situated on the r. b. of the Dniester. Tobacco, candles, and bricks are produced, while it exports corn, wine, and cattle. Timber is floated down the Dniester. The tn. dates back to the twelfth century. Pop. 38,000.

Bendl, Karel (1838-97), Czech composer, b. in Prague. Was successively conductor of theatres in Brussels and Amsterdam; of the choir *Ilhahol*, Prague; and of private noblemen's orchestra in Nice and in Milan. Then devoted himself entirely to composition, with especial inclination to choruses, duets, and songs with orchestra. Shows the influence of Smetana. His works are tuneful and cheerful, but are almost forgotten. They include *Starý zenich* (The Old Bridegroom), 1871; *Indická princezna* (Indian Princess), 1877; *Dítě Tábora* (The Child of Tabor), 1888; *Carovný květ* (A Magic Flower), 1891; *Česká svatba* (Czech Wedding Day), 1892; a ballet, and folk-songs.

Bendigo, formerly Sandhurst, tn. and co. in Victoria, Australia. The co. has for its W. boundary the R. Loddon, and the Campaspe on the E. Its area is about 1949 sq. m. The tn. is noted for its gold and quartz mining. Rich deposits of gold were found in 1851. It is also noted for its agric. produce and wines. It is on the main line of railway between Melbourne and Echuca, 100 m. N.N.W. from Melbourne. Pop. 31,000.

Bends, Karl Knutssen, see CHARLES VII. (of Sweden).

Bendzin, tn. in the prov. of Lodz, Poland. It is one of the chief coal-mining centres of S.W. Poland. Pop. 27,000.

Benedek, Ludwig von (1804-81), Austrian general, b. at Odenburg, Hungary. He was a doctor's son. He started his career in the army in 1822. In 1846 he took part in the suppression of the Polish peasants in Galicia. In 1847 he commanded a regiment in Italy, and again received command during the Hungarian campaign of 1849. Then he returned to Italy. He repelled the Piedmontese at Solferino. In 1860 he became governor of Hungary. Six years later, 1866, he had command of the A. Austrian army in the war with Prussia. He was defeated at Sadowa, and was suspended, a court-martial being ordered. This latter was dropped by the emperor's command. B. retired to Graz, where he d.

Beneden, Pierre Joseph van (1809-94), Belgian zoologist and naturalist, was appointed head of the Louvain Natural History Museum in 1831. In 1881 he was appointed president of the Academy of Sciences. Among his most notable works are *Zoologie médicale* (in collaboration with Gervais); *Osteographie des cétacés vivants et fossiles*, 1868; and *La Vie animale et ses mystères*, 1863.

Benedetti, Vincent, Count (1817-1900), Fr. statesman, *b.* at Bastia in Corsica. At 23 years of age he entered the Foreign Office. Five years later, in 1845, he was appointed consul in Egypt, and in 1848 consul at Palermo. In 1864 he was ambas. at Berlin. He drafted a secret treaty between France and Prussia, which was made public when war broke out in 1870. For this he was criticised, and retired to Corsica. He was exonerated before he *d.* in Paris.

Benedicite, the canticle or hymn, beginning in Lat. 'Benedicite omnia opera Domine,' and in Eng., 'O all ye works of the Lord, bless ye the Lord.' It is probably an enlargement of the 148th psalm. It occurs in the Gk. and Lat. Bible in the third chapter of Daniel, under the title of the Song of the Three Children. It is said to have been sung by the 3 young Jews, Shadrach, Meshach, and Abednego in the burning fiery furnace. This hymn formed part of the Christian service from the time of St. Chrysostom, and is still used in the Anglican Church.

Benedict, name assumed by 15 popes and 1 anti-pope. Of the earlier occupants of the papal chair who bore this name, the following list gives the date of their accession and death. B. I., 573-78; B. II., 684-85; B. III., 855-58; B. IV., 900-03; B. V., 964-65; B. VI., 972-74; B. VII., 974-83.

Benedict VIII. (1012-24). In the early days of his pontificate he was opposed by an anti-pope, Gregory, but was reinstated by the Emperor Henry II. In his days, the Saracens began their attacks upon the S. coast of Europe, and the same age also witnessed the beginning of the It. settlements of the Normans. The pope was noted for his disciplinary policy, and opposed and forbade the marriage of priests.

Benedict IX. (1033-c. 1056). Nephew of the preceding pope, who obtained succession of the papal chair at the age of 12. The unexampled licentiousness which corrupted his court, although tolerated by the emperor, caused the Romans to revolt and drive him out. He was replaced by a pope, Silvester, and later still another pope was elected in the person of one Gregory. Henry III., the emperor, caused all 3 to be deposed, and replaced them by a pope Gregory II., who *d.* 2 years later (1037). B. IX., again seized the papal chair, but was again driven forth by the Romans.

Benedict X. (1058-59). Elevated by the Rom. barons, he was opposed by the great Hildebrand, who caused another pope to be elected, and who finally deposed and degraded Benedict.

Benedict XI. (1303-4). Was unanimously elected, but was faced by great difficulties, the legacy of his predecessor, Boniface VIII. He *d.* in the year after his election, probably poisoned by Nogaret, whom he had excommunicated.

Benedict XII. (1334-42). Nephew of John XXII., whom he succeeded in 1334. Although elected by the influence of nepotism, he opposed nepotism during his tenure of office. He reformed the monastic orders.

Benedict XIII. (1724-30). Title held by Francesco Orsini, who became pope in 1724. A great theologian and philosopher, who wrote a number of works which were pub. after his death. He meddled but little in political matters, and failed in his attempts at reforms.

Benedict XIII. Pedro de Luna, member of a noble Sp. family, elected anti-pope by the Fr. cardinals at Avignon in 1394. It was expected that after his election he would end the schism by voluntary abdication, but by his firmness and his belief in his own cause he prolonged it for 30 years. Abandoned by the cardinals who had elected him, recognised nowhere save in Spain and Scotland, at times in fear of his life, he remained anti-pope until his death in 1423.

Benedict XIV. (1740-58), archbishop of Bologna, where he was *b.* in 1675, and elected to the papal chair in 1740. He did something to reform the papal states, but his reforms were not sweeping enough. He attempted also to reform the missionary methods of the Jesuits in S. America, India, and China. During the whole of his pontificate he continued his studies, and also had a number of scholars at his court. He was learned, enlightened, and tolerant. He *d.* in May 1758.

Benedict XV. (Giacomo della Chiesa) (1914-1922). A learned occupant of the papal chair, whose diplomatic training stood him in good stead during the First World War. B. 1854. Trained at first for the law at the Ateneo, he abandoned a legal career and was ordained in 1878, becoming secretary to the papal embassy in Madrid in 1882. Five years later he was a member of the household of Cardinal Rampolla; then secretary of state to Leo XIII. In 1907 he was archbishop of Bologna and in 1914 was elected pope. His sev. attempts to bring about peace were rendered nugatory by his extreme neutrality, which delayed his protests against Ger. infractions of international law and usage until too late to be effective. But he interceded with success with the Fr. and Ger. Govs. for the exchange of prisoners of war, and, again, was instrumental in stopping the pro-Ger. propaganda of the Carlist Rom. Catholics in Spain. It was during his régime that the Brit. Gov., for the first time for centuries, accredited a diplomatic representative to the Vatican and that the Fr. Gov. resumed diplomatic relations after a lapse of nearly 20 years.

Benedict, Saint (480-543), founder of the order of Benedictine monks, *b.* at Nursia in Italy, was educated at Rome, but at the age of 14 removed to Subiaco, a desert place 40 m. distant, and concealed himself in a cavern. The monks of a neighbouring monastery chose him for their abbot, but he retired to solitude again; many followed him and put themselves under his direction; in a short time he founded 12 monasteries. He converted (in 528), the people at Monte Cassino from idolatry; here he founded other monasteries, and composed his *Regula Monachorum*, or *Rules for Monks*,

which did not receive papal sanction until 52 years after his death. See I. Hinwogen, *St. Benedict*, Eng. trans., 1924.

Benedict, Sir Julius (1804-85), Ger. composer and musician, *b.* at Stuttgart. His father was a Jewish banker. His studies, under Hummel, took place at Weimar, and under Weber at Dresden. In 1825 he was appointed director of the Ger. opera at Vienna. In 1836 he came to spend the rest of his life in London. He was conductor of the Eng. opera at Drury Lane at the time of Balfe's popularity. In 1838 he composed *The Gipsy's Warning*, *The Bride of Venice* in 1843, and *The Crusaders* in 1846. In 1850 he went to America in company with Jenny Lind on her oratorio tour. One of his most successful operas was *The Lily of Killarney*. He was created a knight in 1871, and *d.* in London.

Benedict Biscep (628?-690), Eng. monk and ecclesiastic, *b.* of a noble Northumbrian family, his surname probably being Baducing. During his early life he was a courtier at the court of King Oswin. After 2 journeys to Rome (he later made sev. more) he became a monk at Lerins. In 669 he escorted Theodore of Tarsus to Canterbury, and was made abbot of St. Peter's Monastery at that place. Some years later he made his third journey to Rome and returned with a vast store of books and manuscripts. He built and endowed with these a monastery at Wearmouth, on land given him by King Egfrith of Northumbria. In 682 he erected a dependent house at Jarrow. He was a pioneer of Saxon architecture, and gave impetus and opportunity to literature and culture in England.

Benedictine, see LIQUEURS.

Benedictine Order, the order of monks, known also as Black Monks, who follow the rule of St. Benedict. The year when the order was first estab. is unknown, but it is known that 14 monasteries were founded by St. Benedict (*q.v.*) before his death in 543. There were nuns of this order as well as monks. The aim of the order is the personal sanctification of its members compatible with living in community and the performance of divine office in choir. The influence of its members is much to be seen in the Teutonic races in N.W. Europe, in their art, literature, and education, in which subjects the Benedictine monks largely engaged. The first monastery of the order was founded at Sublaco but later the abbey of Monte Cassino became the centre of the order. The conventual buildings were destroyed in the sixteenth century by the Lombards, and again by the Saracens, and other invaders. Unhappily the abbey again suffered severe damage during the Second World War, when the cenotaph of the saint was destroyed and the tower in which he was believed to have lived was razed to the ground. (See CASSINO, BATTLE OF.) The B. order was first introduced into England by St. Augustine, and by the time of the Dissolution there were some 300 flourishing establishments. All the cathedral priories and most of the richest abbeys in England were of this

order, and 5 colleges of Oxford and Cambridge owe their origin to the monastic foundations of the Benedictines. Likewise a number of the univs. of Europe developed from the schools of the B. monasteries. At the present day the Eng. prov. of the order includes 5 monasteries, the abbeys at Ampleforth, Downside, Woolhampton, Hereford, and Fort Augustus, and 4 nunneries. See H. N. Birt (ed.), *Cardinal Newman on the Benedictine Order*, 1914; C. Butler, *Benedictine Monachism*, 1919; D. Knowles, *The Benedictine Order*, 1929.

Benediction (from Lat. *benedico*, to bless), the conferring of a blessing, or an earnest wish for the welfare of a person or project. In the Catholic Church there is the sacerdotal B., which is performed only by the priest. In this acceptance of the function, only the power of the priests to resist evil forces is included, while in the wider interpretation of it by Christian denominations any hope strengthened by prayer is understood to deserve the name. Originally the B. was particularly resorted to in exorcism of evil spirits. The Rom. Catholic rite is performed generally by the priest barefooted and with uncovered head, and during the prayer holy water is sprinkled. Of these functions the B. of the Blessed Sacrament is the most popular. Among reformed churches the term is applied to the words used by the preacher in dismissing his congregation.

Benedictus (Lat. *bene*, well, and *dico*, to say), song of thanksgiving composed by Zacharias, at the circumcision of his son John the Baptist. It commences in Lat. with 'B. qui venit in nomine Domini,' and in Eng. 'Blessed is He that cometh in the name of the Lord.' It has occurred since the ninth century in the service of the Christian Church, the usual version being 'Blessed be the Lord God of Israel.'

Benedix, Julius Roderick (1811-73), Ger. author and dramatist, *b.* at Leipzig. He was in succession a tenor, a journalist, a lecturer, and a stage manager. He was gifted with a vivid imagination which was evident in his dramatic works, and a fund of humour that was displayed in his comedies, which abound in witty dialogue and humorous intricate plot, with a continual variety of scene and incident. His dramatic works are numerous. Twenty-seven vols. have been collected at Leipzig. His literary works, apart from comedy and drama, are: *Popular German Stories*, pub. in 1839-40; *1813, 1814, 1815*, a book which presents scenes from the wars against Napoleon I., and *Scenes from Lives of Comedians*, pub. in 1847.

Benefice (*Beneficium*), term first used in reference to life interests in land. The name was employed by the Lombards and in the laws of Charlemagne's constitutions. These lands were generally won by distinction in war, and were given as incentives to martial prowess. Later the lands became grants of a hereditary feudal nature. To-day the word implies any variety of church dignity, and in particular those of rectories and vicarages which are B.s. with the cure of souls (hence curacy), these differing

from bishoprics and cathedral dignities. Exempt, or as they are sometimes called, peculiar Bs., are those not under the jurisdiction of a bishop, though regarding residence they are under episcopal administration. The holding of a B. is dependent upon 4 conditions. Of these the first is Holy Orders; the second is Presentation, i.e. the formal donation of the B. by the patron; the third is Institution, at which ceremony responsibility for the cure of souls is formally committed to the clergyman by the bishop; fourthly, there is Induction, the ceremony of giving the clergyman possession of the temporalities. The work involved in the holding of a B. entails public worship, baptism, marriage, burial, the ceremony of the Lord's Supper, and the duties of visits and communion with the parishioners. The properties connected with a rectory are the freehold of the house, the glebe, and tithes. A vicar, as distinct from a rector, does not enjoy all of these emoluments, being entitled generally only to a portion of the ecclesiastical dues of a particular par. But a vicar is entitled to reside in the rectory house. In Scotland Bs. are divided into temporalities and spiritualities, i.e. lauds and teinds. The Patronage Act of 1874 regulates the election of its ministers. The Scottish minister has not the same rights in the church and churchyard as those held by ministers in England. His emoluments consist of the glebe and manse.

Beneficiary, in the law of both England and Scotland, term used to denote any person who is in the enjoyment of, or is entitled to, any interest or estate held in trust by other persons. It is often doubtful in the case of charitable bequests who the Bs. really are, and the courts or commissioners occasionally, as a result of their inquiries, reform the charity, and so change the class of Bs. (See CY-PRES.) The trustees are liable to give an account of their actions to the Bs., and an interdict or injunction may be issued against them by the latter if they make a wrongful use of their funds.

Benefit of Clergy, term used in connection with a previous condition of Eng. law. It demonstrates the power of the clergy and the ignorance of the people. Briefly, the benefit meant an exemption of clergy from the authority of secular magistrates respecting crimes and misdemeanours. The entire control over a priest was vested in the bishop. Later this was modified, though a priest could still resume holy orders after conviction. Still later the privilege was extended to all persons who were able to read. This law was abolished, after many purposeless modifications, in the reign of George IV. In Scotland the benefit was never recognised.

Benefit Societies, see FRIENDLY SOCIETIES.

Beneke, Friedrich Eduard, Ger. psychologist, b. at Berlin, 1798. He pub. many books on metaphysics and ethics, also large treatises upon philosophy. His 2 books, *Theory of Knowledge and Foundation of All Knowledge*, are well known. In

1854 he suddenly disappeared; 2 years later his body was discovered in the canal at Charlottenburg.

Benelux, the customs union of Belgium, the Netherlands, and Luxembourg, an agreement for which was signed in London by the three govts. in exile on Sept. 5, 1944. It came into force on Jan. 1, 1948, with the form of a tariff union; the same duties are imposed by all three countries on imports from abroad, but no import duties are levied on goods exchanged between the three countries. Further stages in the B. union will be progressive abolition of quotas, licences, excise and consumption taxes, culminating in final economic union when goods will move within the three countries as easily as they do in the United Kingdom or U.S.A. See also BRUSSELS CONFERENCE.

Karsh, Ottawa

EDUARD BENĚŠ

Beněš, Eduard (1884 - 1948), Czech statesman. Early in life he was a tutor at the Czech Univ. at Prague, but at the beginning of the First World War he fled from Bohemia to join Masaryk (q.v.) and General Stefanik. The Czechoslovak National Council was founded by these 3 men, and a Czech national army brought into being. At the end of the war B. was chosen with Dr. Kramarz to be one of the two Czechoslovak delegates to the Inter-Allied Peace Conference at Paris in 1919, and he became the first foreign secretary of the newly created Czechoslovak Republic, of which Masaryk was the first president. He succeeded Masaryk as president in December 1935. It was B. who fashioned the Little Entente, an anti-Hungarian pact in alliance with Yugoslavia and Rumania, and an alliance with Russia was concluded during his presidency. When

Germany seized Austria in 1938 it became obvious that the independence of Czechoslovakia was threatened, and after the Munich pact on Oct. 5, 1938, B. resigned the presidency. He left Czechoslovakia on Oct. 22, took first a lectureship at Chicago Univ., and later came to England. After the outbreak of the Second World War B. took the lead in the movement for the restitution of Czech freedom in co-operation with the W. Allies. When, in 1940, the Czech National Committee was recognised as a provisional gov. B. again assumed the functions of president. After the defeat of Germany, B. returned to Czechoslovakia in May 1945 at the head of the Second Czechoslovak Republic. Under his continued presidency, the country settled down under a gov. of advanced views to a programme of reconstruction, which included the nationalisation of some thousand large industrial concerns. The first elections in the liberated republic were held on May 20, 1946, the Communists emerging as the leading party, and on July 3, 1946, Klement Gottwald, the Communist leader, formed a new gov., whose programme was, at first, a continuation of his predecessor's (Fierlinger). Subsequently Gottwald, instigated by Russia, turned Czechoslovakia into a one-party police state, and B. was compelled to accept Gottwald as head of this new Communist gov. He resigned his office of president in May 1948, and was succeeded as president by Gottwald. See Pierre Crabitès, *Beněš: Statesman of Central Europe*, 1935.

Beneschau, tn. of Czechoslovakia, 18 m. S.S.E. of Budejovice. Pop. 7800.

Benét, Stephen Vincent (1898-1943), Amer. poet and novelist, b. at Bethlehem, Pa., U.S.A.; graduated at Yale. During his college days he wrote *Five Men and Pompey*, 1915, and *Young Advocate*, 1918, both in verse. His first novel, *The Beginning of Wisdom* (1921), exploits his college experiences. The poems in *Heavens and Earth* (1920), *King David* (1923), *A Ballad of William Sycamore* (1923), and *Tiger Joy* (1925), are decorative in style, but matured. His best work is the long narrative poem of the Civil war, entitled *John Brown's Body*, which was pub. in 1928, and was awarded the Pulitzer prize. His novels include *Young People's Pride* (1922), *Jean Huguenot* (1923), and *Spanish Bayonet* (1926). His short stories are in *Tales before Midnight* (1939).

Benevento, tn. of Campania, Italy. It is the cap. of B. prov., and is situated on a hill of 400 ft., at the confluence of the Calore and Sabatto. Its pop. is 20,000, while that of the commune is 27,000. Originally the old tn. of Beneventum stood on its site, a tn. which is reputed to owe its foundation to Diomedes. The Romans defeated the Samnites in 314 B.C., who found shelter at Beneventum. During their final campaign of 275 B.C. the tn. was used by the Romans as a centre of their military activities. In 268 B.C. a Lat. colony was founded there. Hitherto the tn. had borne the name of Maicentum, but now it assumed the above name, which was given it on account of

its meaning. Antique remains testify to its importance, of which the most imposing is a triumphal arch erected to Trajan by the senate. The tn. became the residence of a powerful Lombard duchy and remained in a state of independence till 1053, when the emperor Henry III., who had made himself master of the city, exchanged it with Leo IX. for the bishopric of Bamberg. From that time it continued in papal possession till 1806, when the emperor Napoleon I. bestowed it, with the title of prince, on Talleyrand. It was united to Italy in 1860. The tn. is subject to earthquake visitations, and considerable damage has been done. The prov. is 834 sq. m. in extent. The prin. industries are the manuf. of leather, parchment, and plated ware. In the Second World War B. felt the full shock of war as the battle surged on northwards from blasted and liberated Naples. B., its cathedral, and the entire lower city between the cathedral and the Vanvitelli Bridge, a mass of ruins, fell on Oct. 2, 1943. This bridge, however, has since been well restored. The famous Rom. bridge also sustained some damage.

Benevolence, a type of compulsory loan exacted by kings who dispensed with legal justification. It originated in 1473 with Edward IV., though like contributions had been levied in previous reigns. They were not officially called Bs., however. They were voted unlawful in the reign of Richard III. in 1484, yet Richard often employed this illicit mode of enriching himself as did Henry VII. James I. attempted its adoption, though without material success. Bs. were rendered illegal both by the Petition of Right, 1628, and by the Bill of Rights, 1689.

Benfeld, tn. of the dept. of Bas-Rhin, France, situated on the R. Ill, in a dist. of great fertility. Its chief productions are tobacco, hops, and hemp. It was besieged by Count Ulrich of Württemberg, 1331, and by the Armagnacs, 1444. It was ceded to Sweden in 1632, but it came into the hands of the Gers. by the treaty of Frankfurt. It again became a Fr. tn. with the return of Alsace-Lorraine after the First World War. Pop. 3000.

Benfey, Theodor (1809-81), Ger. philologist of Jewish parentage, b. at Nörten, near Göttingen. He pub. many manuals and trans., and in 1866 he sent forth his great work, the Sanskrit-Eng. dictionary. All his works were produced under stress of great poverty. As a result of his unflagging labours for a period of over half a century, Sanskrit philology owes more to him than to almost any other scholar. His death occurred at Göttingen.

Benfleet, urb. dist. of Essex, England, recently formed from the vils. S. Benfleet, which is 7 m. W. of Southend (pop. 12,000), Thundersleigh, and Hadleigh. N. Benfleet is 10 m. N.W. of Southend, and has a pop. of 600.

Bengal, prov. of India until the partition of India in 1947, bounded on the S. by the bay of Bengal, on the W. by Nepal and Bihar and Orissa, on the N. by Sikkim and Bhutan, and on the E. by Assam and Burma, and comprising the 5

divs. of Bardwan, Rajshahi, Presidency, Dacca, and Chittagong. In 1947 the prov. was divided into two, W. B. (chiefly Bardwan div.) falling to India, with an area of 26,912 sq. m. and pop. of 19,341,000. E. B. prov. (Pakistan), including the Sylhet div. of Assam, has an area of 56,008 sq. m. and pop. (estimated) of 44,081,000. The pop. of the former B. prov. is divided between Muslims 55 per cent, Hindus 43 per cent, the remainder being Indian Christians and Europeans. Bengali is the chief language. Calcutta (pop., with suburbs, 2,110,000), on the Hugli, is the cap. of W. B., and the chief tn. and port; Dacca (pop. 213,000), on the Brahmaputra, and Howrah (pop. 379,000), opposite Calcutta, are 2 other important cities. Chittagong (pop. 140,000) is in Pakistan and, after Calcutta, the most important port of the region.

Geography. Since the greater part of B. consists of the alluvial plains of the Ganges and Brahmaputra Rs., it is low-lying, though in the N. near the Himalayas, the Singalila Range attains an altitude of 12,000 ft. The Chittagong Hill Tracts, 4300 ft., and Hill Tippera, 3000 ft., are the only other heights. B. is remarkable for its network of waterways, the prov. owing its existence to the 2 great rvs., mentioned, the combined delta of which covers an area nearly as great as that of England and Wales. The lower part of this delta, the Sundarbans, is a half-submerged region of dense forest and mangrove swamps, changing in outline and aspect as a result of the silting of the riv. channels and the formation of is., which ultimately become joined to the mainland. The ports of B. are all situated many miles up-stream on the 2 main channels, the Hugli in the W. and the Padma in the E. Large areas that were once covered by dense jungle are now cultivated fields, but forests still occupy about 12,000 sq. m. of B. These forests under the control of the B. Forest Dept., have since 1854 been under scientific management and yield revenue. Elephants, wild buffaloes, tigers, leopards, rhinoceroses, bears, wolves, and other wild creatures are still to be found in the more remote tracts.

Climate. Though much of B. is outside the tropics, the climate is tropical, but is not, on the whole, unhealthy for Europeans, most of whom, however, spend the hot, wet season in the hills of the N., around Darjeeling, the hot-weather cap. The rainfall is heavy, but varies in the different dists., and in different seasons. So irregular is it that it may sometimes cause disastrous floods, while at other times the land suffers from droughts. Earthquakes occur occasionally and damage is sometimes done by cyclones, especially in the E. A cyclone in 1919 resulted in much loss of life and destruction of property in the neighbourhood of Dacca.

Production. The alluvial plain of B. is one of the most productive, and therefore populous, dists. in the world. Three-quarters of the pop. are dependent upon

the land for their living. Rice is the chief crop, and more than four-fifths of the cultivated area is devoted to it. There are 3 harvests in the year. Jute, tobacco, sugar, oil-seeds, and cotton are also grown, and there are extensive tea gardens in the N. and E. The jute industry, which is by far the largest industry in B., is centred in Howrah. Cotton materials are woven at Dacca, once famous for its muslin, and silk is made at Dinajpur. Coal is the chief mineral, the largest mine being at Raniganj, near the Bihar border; iron, copper, and salt are also obtained. Natural productions are extraordinarily abundant, and comprise, besides those mentioned, indigo, turmeric, opium poppy, pepper, ginger, spices, mulberry, timber, all in profusion. Almost every conceivable material necessary for human subsistence is to be found. The fishing industry, in the rvs. and off the coast, is of considerable importance.

Administration. Each prov. is administered by a governor with a council of ministers, forming the provincial gov., a legislative council, and a legislative assembly. The larger body, the legislative assembly, consists of 250 members elected by the constituencies. The legislative council has a maximum of 65 members, of whom 30 are elected by the constituencies, 27 by the assembly, and 6 to 8 nominated by the governor.

Communications. B. is well served by railways, the E. Indian being the main artery of traffic up the Ganges Valley; the E. Bengal railway serves the N. dists., and the Bengal-Nagpur line runs to the S. The many rvs. and canals are invaluable means of communication, and the roads are, on the whole, excellent. There are passenger services along the rvs. and round the coast, and ocean-going steamers connect Calcutta with near and distant ports.

History. The Moslem conquest of B. took place early in the thirteenth century. It was first administered by governors appointed by the Moslem emperors; then, for 2 centuries the governors ruled precariously as independent sovereigns. In 1576 it became a portion of the great Mogul empire and for a further 200 years was ruled by Mogul governors. In 1765 it passed under the administration of the E. India Co., which had here made its first settlements in 1633. In 1858, administration was transferred to the Crown. The rights of proprietors and cultivators were assured and protected by the Permanent Settlement of the Land Revenue Act and the Tenancy Act respectively, 1793 and 1859. The former presidency of B. included most of N. and Central India, the prov. later consisted of B. proper, Bihar, Orissa and Chota Nagpur; in 1905 the Sambalpur dist. was transferred to it from the Central Provinces, and the dists. of Rajshahi, Dacca, and Chittagong were detached and added to Assam. This partition was revoked in 1911, and in 1912 B. was reconstituted, Bihar, Orissa, and Chota Nagpur being formed into a separate prov. (See BIHAR.) In the same year the lieutenant-governorship of B. was changed to a

governorship. From that year until 1921 the prov. was administered by the governor with an executive council of 3 members. Under the Government of India Act, 1919, a further change in the administration was made. From 1921 to 1937 the governor acted through an executive council of 4 members in connection with certain 'reserved' subjects. Two members of this council were Indian. Other 'transferred' subjects were administered by the governor with the aid of 3 Indian ministers. On Apr. 1, 1937, the prov. was declared autonomous, and a legislative council and a legislative

gov. of B. was severely criticised for its maladministration, which was a contributory factor to the prevalence of famine. A gov. inquiry into the administration was set up in 1944 under the chairmanship of Sir Archibald Rowlands, and the report of this committee was pub. in Oct. 1945. The prov. was found to be under-administered, its communications had been allowed to decline, and in particular the public health and medical services were inefficiently run. In Mar. 1945 the provincial gov. was defeated in the Assembly over the budget proposals, and resigned. As a result the normal administrative machinery broke down, and consequently both legislative bodies were suspended by proclamation on Mar. 30, 1945. The governor, Mr. R. G. Casey, then took over the direct administration of the prov. under Section 93 of the Government of India Act. For the partition of B. between India and Pakistan, 1947, see beginning of article.

See C. Stewart, *The History of Bengal from the first Mohammedan Invasion to 1757*, 1910; F. A. B. Birt, *Men of Bengal*, 1911; L. B. Day, *Folk-tales of Bengal*, 1912; R. Guha-Thakurta, *The Bengali Drama*, 1930.

Bengal, Bay of, part of the Indian Ocean. It stretches between India and further India, washing the whole of the E. side of the country. It is visited by the monsoons, which prevail over the whole area of the ocean. Many large rvs. empty themselves into the bay—the Ganges, and Brahmaputra from the N., while from the E. it receives the Irawadi, and from the W. the Mahanadi and Godavary. There are good ports on the E., but few on the W. The Andaman and Nicobar are the chief groups of is., which are numerous.

Bengal Hemp, name given to a species of Indian hemp (*Cannabis indica*), from which bhang (*q.v.*) and hashish (*q.v.*) are derived. See also **HEMP**.

Bengali Language, one of the forms of speech comprising the E. group of the Indo-Aryan tongues. It resembles Oriya and Assamese, since all 3 are derived from the same source. They are immediately descended from the Māgādhī Prakrit, and the centre of that language was Bihar. Bengali has 2 main dialects, of which the W. is the more pure. The oldest writer of Bengali is the poet Candī Dās, a Vaishnava. A school of poets was founded by him, who wrote hymns to Krishna. See A. S. and L. Roy, *Bengali Literature* (India), 1943.

Bengal Light, or blue light, as it is

NATIVE OF BENGAL
A Pujara Brahman.

E.N.A.

assembly were set up. The same year was notable for a crisis in the jute trade, B.'s staple industry, which required gov. intervention, but subsequently the mtrks. improved. A far graver situation arose in 1943 as a result of the decline in rice production, combined with an increase in pop. of over 1,000,000 since 1930. Famine conditions threatened as early as Apr. of 1943, and from Aug. until the end of the year they were acute. Over 15,000 persons died of starvation during that period, while another 10,000 were treated in hospitals as a result of malnutrition. Cholera and other epidemic diseases followed in the wake of famine, and between June 27 and Nov. 13 77,938 deaths from cholera were recorded. Altogether the total of deaths from all causes due to famine and disease caused by famine was estimated at 690,000 during the year. Relief centres were set up, and nearly 6000 kitchens estab. for the free distribution of food. At the same time the price of rice was controlled. The provincial

called, is a vivid signal light used at sea. It is a composition of nitre, sulphur, and black sulphide of antimony, ground to a powder, dried, and mixed, by weight, in the proportion: nitre 6, sulphur 2, and black sulphide of antimony 1. When this is lighted, a brilliant blue light which illuminates the sea for miles around is the result. The B. light is used in cases of shipwreck. Owing to the poisonous fumes from it the light cannot be used safely in enclosed spaces.

Bengel, Johann Albrecht (1687-1752), Ger. scholar and theological writer, b. at Winnenden, near Stuttgart. He pub. an ed. of the Gk. Testament, and his theological works were esteemed by John Wesley.

Benghazi, seaport, situated on the N. coast of Africa, in a prov. of the same name, cap. of Cyrenaica. It lies on a tongue of land separated from the mainland by a lagoon-like salt lake and a salt marshy tract. The harbour is only accessible to vessels of light draught. There are 2 narrow-gauge railways and, before the Second World War, it was in regular steamship communication with Naples, Syracuse, Tripoli, and other It. tns. Since the It. occupation many noteworthy buildings were erected and broad streets constructed. The prov. and tn. of B. were incorporated in the national ter. of Italy by a decree of Jan. 9, 1939. B. was captured by the Australians on Feb. 7, 1941, in spite of hard fighting by the It. under General Bergonzoli. The destruction by the R.A.F. of 75 planes on the air-field of Bernina was a contributory factor to the surprise attack on B. On Apr. 3, however, the Brit. and Imperial forces evacuated the tn., and it was twice bombarded by the Royal Navy during May. It was again occupied by Brit. and Imperial troops on Dec. 24 in an advance by General Auchinleck, but was recaptured by the Ger. and It. forces under Rommel on Jan. 29, 1942. After the battle of El Alamein, B. once more, and finally, fell to the Brit. forces under General Montgomery on Nov. 20, 1942. By this time, owing to repeated bombardment from the air, the tn. presented a scene of utter desolation. Scarcely a building remained intact, while areas remote from the docks were damaged by sabotage, ruined by neglect, or wrecked by looters. Pop. (1938) 65,000 (Its., 19,500; Jews, 3000; the remainder, Arabs).

Benguela, cap. of the dist. of that name in Angola and an important trading centre on the B. railway. This line was completed in 1929 and extended by agreement between the Portuguese and Belgian Govs. through the mining region of Katanga (q.v.) in the Belgian Congo, the connection with the Bas-Congo-Katanga line being completed 1931. The total cost, including the Lobito Bay port, was about £13,000,000, the greater part being provided by Brit. capital. Pop. 7000 (whites 1000). See also LOBITO BAY.

Benguet, prov. of the Philippine Is. Rice is grown and tropical fruits. The United States have also introduced

grapes, figs, blackberries, and strawberries into the prov. with success.

Benhadad, name of 2 (or, according to some, 3) kings of Damascus. B. I., son of Tabrimmon, was an energetic fighter. He besieged Ahab of Israel in Samaria (2 Kings vi.) and long opposed Shalmaneser, the Assyrian king. His death took place between 846 and 842 B.C. (see 2 Kings xvii. 7-15). B. II., son of Hazael, and probably the grandson of B. I. He was thrice defeated by Joash, king of Israel (2 Kings xiii. 25). More probably Mari, and not B., is the correct name of this king, as Rammannirari III. mentions a king of Damascus called Mari whom he besieged at Damascus. B., like his father, grievously oppressed Israel.

Benham, William (1831-1910), Eng. theologian, was tutor at St. Mark's College, Chelsea, 1857-64; prof. of hist. at Queen's College, London, 1864-73; and rector of St. Edmund's, London, in 1882. He trans. Thomas à Kempis's *Imitation of Christ*, 1874, and brought out an ed. of Cowper's letters in 1883. His best-known works are: *A Short History of the Episcopal Church in America*, 1884; *A Dictionary of Religion*, 1887; and (in collaboration with another) *Life of Archbishop Tait*, 1891. He was chief editor of the Anct. and Modern Library of Theological Literature.

Beni, the plural of the Arabic word *bn* or *ibn*, a son. It occurs in E. geography as a component part of many names of families or tribes, as Beni Temim, the sons of Temim, or the Temimides.

Beni, riv. in Bolivia. It rises in the Andes, and has a course of about 1000 m. Its current is very strong, and it is navigable only for some 200 m.

Beni, dept. of Bolivia, with a good climate and fertile soil, yet thinly populated. Trinidad is the chief tn. Pop. 36,000.

Benicario, seaport in Castellón, Spain. It manufs. a red wine, and also brandy. The wine is exported chiefly to Bordeaux, where it is mixed with lighter wine for table use. Pop. 8000.

Benicia, seaport and city in Solano co., California, U.S.A., on the strait of Carquinez, about 25 m. by water N.E. of San Francisco, with which it is connected by the S. Pacific railway. It has extensive wharves, shipyards, an arsenal and barracks. Pop. 2800.

Beni-Hassan-el-Qadym, or Old Beni-Hassan, vil. of Middle Egypt, situated near the E. bank of the Nile. In the neighbourhood are catacombs.

Beni-Israel (Sons of Israel), colony of Jewish descent settled on the Malabar coast, Bombay presidency, India. Although they acknowledge the Mosaic laws and have traditions which suggest an anct. Judaic invasion of India, they repudiate the name of Jews. According to some authorities, the B.-I. settlement in India dates no farther back than the fifteenth century, while it is supposed by others to be a remnant of the 10 tribes. The colony numbers about 5000.

Benin, country of Brit. W. Africa and

part of S. Nigeria, lying between the Niger and Dahomey. Its area was at one time very extensive, but the gradual securing of independence by small tribes occupying some of its states, has lessened it. The characteristics of B., climatic, botanic, and zoologic, resemble those of S. Nigeria. The name B. also embraces a city and riv. in the same locality. Its inhab. are pure negroes. The tn. is situated on Gwato Creek, and exports palm oil via Gwato, 30 m. distant. Coral exists in abundance. B. was taken by the Brit. in 1897, who found in the tn. human remains everywhere, pits encumbered with bodies in all degrees of decomposition, and altars reeking with human blood. Brit. possession was finally consolidated by a second expedition which entered the tn. in 1899. See A. M. Boisragon, *The Benin Massacre*, 1897.

Benin, Bight of, in the gulf of Guinea, between Capes Formosa and St. Paul. It consists of a continuous line of low, marshy, sandy shore, intersected by numerous rivs. and estuaries more especially towards Cape Formosa, where they form alluvial ls., which are part of the delta of the Niger.

Benin River, riv. of W. Africa, which flows into the Atlantic after a course of 70 m. It forms the W. boundary of the Oils R. Protectorate.

Beni Saf, seaport, with harbour of 26·2 ft. depth, in Algeria, 30 m. N. of Tlemcen, in the prov. of Oran. It exports iron ore found in the dist.

Beni-Suef, tn. and prov. in Central Egypt. The tn. is on the W. bank of the Nile, 63 m. S.S.W. of Cairo, and is the centre for the produce of the prov. of Fayum. It has a cotton factory and alabaster quarries. Pop. (census 1937), dist. 561,000; tn. 45,000.

Benjamin, youngest son of Jacob and Rachel. His mother, who *d.* at his birth, gave him the name of 'Son of my sorrow' (Ben-oni), but Jacob altered it to its present meaning, 'Son of my right hand' (or prosperity).

Benjamin, tribe of Israel, named from the youngest son of Jacob and Rachel. When the tribe entered Palestine it was given an area bounded by Ephraim, Dan, and Judah. The numbers of the tribe declined during the control of the Judges, but increased again by means of an addition of 400 virgins who were captured from Shiloh. In spite of the circumstance that its ter. lay to the W. and E., it was physically united with Judah, and it owed its increasing importance to its position between Judah and Ephraim. It is called 'the least of the tribes,' but it has a conspicuous place in the hist. of the O.T., for it gave the first king to the Jews, Saul being a Benjamite; Jerusalem belonged to the dist. of B., and when Israel came Bethel, the sanctuary, was allotted to B.

Benjamin, Judah Philip (1811-84), Amer. lawyer and politician, *b.* at St. Croix, W. Indies. From 1853 to 1861 he represented Louisiana in the Senate of the U.S.A. In the latter year he withdrew

from the Senate to become attorney-general in Jefferson Davis's provisional gov. of the S. Confederacy, being subsequently appointed secretary of war, 1861-62, and chief secretary of state, 1862-65. Nicknamed 'the Soul of the Southern Confederation.' After the surrender of the Confederates, B. escaped to England, and, entering Lincoln's Inn, was called to the Bar in June 1866. He practised on the N. circuit, and in 1872 was made queen's counsel. He enjoyed a wide practice in appeal cases to the Judicial Committee of the Privy Council. His book *Benjamin on Sale* is a legal classic. Owing to ill health he retired to live in Paris in 1882, where he *d.*

Benjamin of Tudela, Jewish rabbi, and author of the *Itinerary*, the son of Jonas of Tudela, was *b.* in the kingdom of Navarre in the twelfth century. He travelled from Constantinople through Alexandria in Egypt and Persia to the frontiers of China. He wrote an account of his journey, which reveals the position of the Jews in the countries he visited, and this has been trans. from the Hebrew in Fr., Eng., and Lat.

Benjamin Tree (*Styrax benzoin*), tree of the order Styracaceae, native of Sumatra and Java. It yields the fragrant resin called gum benzoin or gum Benjamin, which is used in the manuf. of incense and in perfumery.

Benkovac, tn. in Dalmatia, Yugoslavia, about 20 m. S.E. of Zara. Pop. 17,000.

Ben Lawers, mt. in Perthshire, Scotland, about 32 m. W.N.W. of Perth, on the N.W. side of Loch Tay. Commands a fine view. Height 3984 ft.

Ben Ledi (Gaelic, the hill of God), mt. in Perthshire, Scotland, 5 m. N.W. of Callender. Height 2873 ft.

Ben Lomond, mt. in Stirlingshire, Scotland, E. of Loch Lomond, and about 26 m. N.W. of Glasgow. An extensive view is obtained from the summit. Terminated on the N. side by a precipice of 2000 ft. Height 3192 ft.

Ben Macdhuil, or **Muichdhuil** (Gaelic, mt. of the black pig), mt. in Aberdeenshire, on the border of Banffshire, Scotland. The second highest mt. in Great Britain, its elevation being 4296 ft. Its summit is flat and bare.

Ben More, mt. name recurring frequently in Scotland. Best known are (1) 3843 ft. in Perthshire; (2) 3273 ft. (B. M. Assynt) in Sutherland; and (3) 3169 ft. on the is. of Mull.

Benmore, see FAIRHEAD.

Benn, Sir John Williams (1850-1922), Eng. printer and publisher of trade journals, *b.* at Hyde. His work as a councillor on the London County Council earned for him the sobriquet of father of the L.C.C. To the work of the L.C.C. he brought an almost passionate enthusiasm. At first the whip, and afterwards the leader of the 'Progressives,' he became chairman of the General Purposes and the Highways Committees and, in 1904-05, chairman of the council.

Benne Oil, also called gingill or teel oil, is expressed from the seeds of *Sesamum indicum*, and is used in cookery, also for

lighting, lubrication, medicine, and cosmetics. A favourite Indian cake is made with a mixture of this oil, honey, citron.

Bennet, Henry, see ARLINGTON, EARL OF.

Bennett, Enoch Arnold (1867-1931), Eng. novelist and playwright, *b.* at Shelton, Hanley-in-the-Potteries, N. Staffordshire, May 27, and educated at the Endowed Middle School, Newcastle-under-Lyme. Graduated at London Univ. Went into the office of his father, a solicitor in Hanley. In 1889 went into a solicitor's office in London, stayed there till 1893, when he became assistant-editor of *Woman*, of which paper he became editor, 1896; resigned, 1900. His first story was *A Man from the North*, 1898. In the same year appeared *Journalism for Women*; and the next, *Polite Farcies*—his first plays. His prose fiction, from the first, he divided into novels and fantasias: by the latter (some in collaboration with Eden Phillpotts) he obtained fame and money; by the former, estab. himself as a literary artist. He first attracted the attention of the critical world with a description of life and conditions in the Five Towns of the Potteries, making his name with *Anna of the Five Towns* (1902); and he was at his best when he returned to that theme—for, with all his acquired culture, B. was essentially a provincial. He was understood not to admire Dickens; yet it is in the delineation of the nineteenth-century Eng. eccentric that he, like Dickens, excels. Perhaps his best novel is *The Old Wives' Tale*, 1908. Other later works of fiction are: *Clayhanger*, 1910; *The Card*, 1911; *Hilda Lessways* (sequel to *Clayhanger*), 1911; *The Regent* (sequel to *The Card*), 1913; *The Price of Love*, 1914; *These Twain* (sequel to *Hilda Lessways*), 1916; *The Pretty Lady*, 1918; *Mr. Prohack*, 1922; *Lilian*, 1923; *Riceman Steps*, 1923; *Lord Raingo*, 1926; *The Strange Vanguard*, 1928; *Accident*, 1929. Among his plays are: *Cupid and Common-sense*, 1908; *What the Public Wants*, 1909; *The Honeymoon*, 1911; *Milestones* (with E. Knoblock), 1912; *The Great Adventure*, 1913; *The Title*, 1918; *Judith*, 1919; *The Love Match*, 1922; *Body and Soul*, 1922; *London Life* (with E. Knoblock), 1924; *Mr. Prohack*, 1927. B. resided much in France, and, as touching his personal experiences, wrote *The Truth About an Author*, 1903; *The Reasonable Life*, 1907; *The Human Machine*, 1908; *How to Live on Twenty-Four Hours a Day*, 1912; *From the Log of the Velsa*, 1920; *Things That Have Interested Me* (3 series), 1921, 1923, and 1925; *Journal*, 1930-33. See Georges Lafourcade, *Arnold Bennett, a Study*, 1938; W. Allen, *Arnold Bennett*, 1948.

Bennett, James Gordon (1795-1872), Amer. journalist, founder and editor of the *New York Herald*, *b.* at New Mill, Banffshire, in Scotland. Was educated for the Rom. Catholic priesthood, but emigrated to America in 1819. He founded the *New York Herald* in 1835.

Bennett, James Gordon (1841-1918), son of the above. He succeeded to the management of the *New York Herald* on his father's death, dispatched H. M.

Stanley to Central Africa to find Livingstone, bore half the expense of Stanley's Congo expedition of 1874, arranged the *Jeannette* polar expedition, and promoted, with J. W. Mackay, the Commercial Cable Company in 1883. He *d.* at Nice, May 14; and left money to found a home for journalists in New York.

Bennett, John Hughes (1812-75), Eng. pathologist, *b.* in London. He was educated at Exeter and Edinburgh, and studied for 4 years in Paris and Germany. In 1841 he began to lecture on histology in Edinburgh, and in 1843 was appointed prof. of the institutes of medicine at Edinburgh. This post he resigned in 1874. He pub. numerous treatises on medicine.

Bennett, Richard Bedford, Viscount (*b.* 1870), Canadian statesman. Descended from United Loyalist stock settled in Fundy Bay, his forebears beginning colonial life with a shipyard in N. Brunswick and building ships for riv. and coastwise trade. After taking his law degree at Dalhousie Univ., B. practised in N. Brunswick. Later he went into partnership in Calgary, and entered the Legislature of the N.W. Ter. First became prominent in politics as an opponent of the provisions for separate Catholic schools in the proposed provincial constitutions of Alberta and Saskatchewan. This gave him the leadership of the small band of Conservatives in Alberta's first legislature in 1905. At the 'reciprocity' elections of 1911 he was returned as a Conservative by Calgary by a large majority. He enhanced his reputation by his opposition to the railway policy of the Borden Gov. Being opposed also to the ministerial policy during the First World War, he withdrew from politics in 1917 and resumed the practice of law. Returned again for Calgary in 1925. In 1926 he was minister of finance. Soon in opposition again, he estab. himself as the best parliamentarian on the Conservative side, and was selected in 1927 to take the place of Mr. Meighen as leader, and, thereafter, was chiefly responsible for getting the Conservatives back to power in 1930. Is an ardent champion of protective tariffs. Came to London in 1930 as the head of the Canadian delegation to the Imperial Conference. Presided over the Ottawa (Imperial Economic) Conference, 1932. In the election of Oct. 1935 he sustained the most crushing defeat in the hist. of Canadian politics, the chief issue being the tariff, which was too high for the primary producers, and for United Kingdom manufacturers alike. He was succeeded by Mr. Mackenzie King as premier, and, later, by Manier as Conservative leader. In 1938 he took up permanent residence in England. Created viscount in 1941.

Bennett, Sir William Sterndale (1816-1875), Eng. composer and pianist, *b.* at Sheffield. For 10 years he studied in the Royal Academy of Music and then visited Germany, where, at Düsseldorf and Leipzig, he made the acquaintance of Mendelssohn and Schumann. On his return to England he received a warm reception, and in 1838 was elected member of the

Royal Society of Musicians. In 1849 he founded the Bach Society. In 1856 he became prof. of music at Cambridge, and was engaged as conductor to the Philharmonic Society the same year. This latter post he resigned on being appointed prin. of the Royal Academy of Music in 1866. He received the honorary degree of D.C.L. from Oxford Univ. in 1870, and the following year was knighted. With the exception of opera, B. attempted almost every form of vocal and instrumental composition. *The Naiads* and

Bennigsen, Levin August Theophil, Count (1745-1826), Russian general, *b.* at Brunswick. After a period in the Hanoverian service he entered the Russian army and gained distinction in the Turkish and Polish wars. Aided in the assassination of Tsar Paul V. Commanded the Russian armies against Napoleon at Pultusk (1806) and Eylau (1807) and was present at Borodino (1812) and Leipzig (1813).

Bennigsen, Rudolf von (1824-1902), Ger. Liberal statesman, *b.* at Lüneburg.

BEN NEVIS

A. D. S. Macpherson

The Carn Mhor Dearg *arête* is in the middle ground; beyond is the Allt a'Mhuillin gleu.

The Wood Nymphs (overtures) and *The May Queen* (a cantata) are among his best-known works.

Ben Nevis, highest mt. in the Brit. Isles, situated in the co. of Inverness, Scotland, 4½ m. E.S.E. of Fort William. Its elevation is 4406 ft. The N.E. side is bounded by a precipice of about 1500 ft. in depth. On its summit, which consists of a large plateau, snow lies in some gorges all the year round. An extensive view is obtained therefrom, every mountain of any size in Scotland being visible. From 1881 to 1904 meteorological observations were taken at the summit, and until the erection in 1883 of an observatory and the construction of a bridle road leading up the side of the mt., daily ascents were made for that purpose. The base of the mt., which, in circumference, measures about 30 m., is composed principally of granite and gneiss, while the upper part is formed chiefly of porphyry.

son of a Hanoverian general. Educated at Göttingen. Entered the Hanoverian Second Chamber in 1855. Founded the National Verein to promote Ger. unity and constitutional liberty. The Austro-Fr. war gave impetus to this movement, but B. was unable to preserve neutrality in the later Austro-Prussian war, though, after it was over, he was invited by Bismarck to co-operate in the reform of the Confederation and, the National Verein being dissolved as having fulfilled its function, B. became a member of the Prussian Diet. Declined the post of vice-chancellor, and later became president of Hanover prov. Retired 1897.

Bennington, township of the co. of B., Vermont, U.S.A. It has woollen mills, and manufs. stereoscopes, boxes, and linen. Pop. 7600.

Benoît, Pierre Léonard Léopold (1834-1901), Flemish composer, *b.* at Harlebeke, Flanders. In 1851 B. entered the Brussels

Conservatoire, where he studied till 1855. There he composed an opera, *Le Village dans les montagnes*, for the Park Theatre. His sacred tetralogy consisted of his *Cantate de Noël*, a *Messe solennelle*, a *Te Deum*, and a *Requiem*.

Benoît, Pierre (b. 1886), Fr. novelist, b. at Albi, Tarn. Won an international reputation with his *Count Philip*, a novel which is concerned with the story of the fates of Count Philip Königsmarck, Ernst August, father of George I., and Countess Platen. Among his other more notable works are *L'Atlantide* (1922), and *La Chaussée des géants* (1922) on the Dublin riots of 1916.

Benoît de Sainte-More, Fr. *trouvère* of the twelfth century. He wrote a long poem in octosyllabic verse entitled *Chronique des Ducs de Normandie* at the suggestion of Henry II. of England. His *Romanse of Troy* is based on the *Historia de excidio Trojæ* of Dares Phrygius, and the *Ephemerides belli Trojani* of Dictys Cretensis. The story, told as though it were a medieval romance, commences with Jason's theft of the Golden Fleece and ends with the return of the Gr. heroes after the sack of Troy. B. is also supposed to be the author of *Enéas* and the *Roman de Thèbes* (based on Statius).

Ben-Rhydding, hydropathic establishment in the W. Riding of Yorkshire, on the bank of the R. Wharfe, 16 m. N.W. of Leeds.

Bensberg, vil. of the Rhineland, in the dist. of Cologne, Germany, about 10 m. E. of Cologne. B. has rich lead, iron, and zinc mines. Pop. 4,500.

Bensheim, tn. of Hesse, 14 m. S. of Darmstadt, Germany. Pop. 10,000.

Bensley, Thomas (d. 1833), Eng. printer and producer of some of the finest and most magnificent books of his period. His chief production was Macklin's folio Bible, and his octavo Shakespeare is also well known.

Benson, Arthur Christopher (1862-1925), Eng. author and essayist, the eldest son of Archbishop B. Educated at Eton and King's College, Cambridge, he became a master at Eton in 1885, continuing there until 1903; when he was elected a fellow of Magdalene College, of which he became master, 1914. In 1886 he produced his first work of fiction (*The Memoirs of Arthur Hamilton*) under the pseudonym of Christopher Carr. Two vols. *Poems and Lyrics*, pub. in 1893 and 1895 respectively, gave him a reputation as a writer of verse. Further literary productions of his were: *A Study of Archbishop Laud*, 1887; *Lord Vylat and other Poems*, 1897; *The Life of Archbishop Benson*, 1899; *Fasti Etonenses*, 1899; *The Schoolmaster*, 1902; *The House of Quiet*, 1904. Monographs in the English Men of Letters series on *D. G. Rossetti*, 1904; *Edward Fitzgerald*, 1905; *Walter Pater*, 1906. *Peace and other Poems*, 1905; *The Upton Letters*, 1905; *From a College Window*, 1906; *The Thread of Gold*, 1906; *Beside Still Waters*, 1907; *Joyous Gard*, 1913; *The Orchard Pavilion*, 1914; *Hugh* (memoir of his brother), 1915; *Meanwhile*,

1916; *Cambridge Essays on Education*, 1917; *Magdalene College*, 1923; *Memories and Friends*, 1924; *Chris Gascoyne*, 1924; *The Canon*, 1926; *Basil Netherby*, 1926; *Crassage*, 1927. The last 4 are novels. He also ed. with Lord Esher *The Correspondence of Queen Victoria*, 1907; and he wrote the words of *Land of Hope and Glory*, for which Elgar composed the music. See E. H. Ryle, *A. C. Benson as seen by some Friends*, 1925.

Benson, Edward Frederic (1867-1940), Eng. author, b. at Wellington College, July 24, the son of Edward White B. (q.v.). He was educated at Marlborough and King's College, Cambridge. From 1892 to 1895 he was engaged in investigations at Athens on behalf of the Brit. Archaeological Society. In 1893 he pub. his first novel *Dodo*, a story of society life. Other novels: *Vintage*, 1898; *The Capsina*, 1899; *The Challoners*, 1904; *The Image in the Sand*, 1905; *The House of Defence*, 1907; *The Osbornes*, 1910; *Dodo the Second*, 1914; *The Countess of Lowndes Square*, 1920; *Dodo Wonders*, 1921; *David of King's*, 1924; *Mezzanine*, 1926; *Paying Guests*, 1929; and *Travails of Gold*, 1933. He was also the author of 2 plays, *Aunt Jeannie* (1902) and *Dinner for Eight* (1915). His study of the life of Charlotte Brontë was pub. in 1932, and *King Edward VII.* in 1933. He dealt with the hist. of his own times in 2 vols. of memoirs, *As We Are* (1932) and *As We Were* (1934).

Benson, Edward White (1829-96), Eng. archbishop, b. at Birmingham. Entering Trinity College, Cambridge, in 1848, he was elected fellow in 1853. From this date until 1859 he was a master at Rugby, being appointed in the latter year head master of the newly opened Wellington College. In 1868 he was made prebendary, and 3 years later, chancellor of Lincoln. In 1877 he was transferred to Cornwall to become the first bishop of Truro, and on the death of Dr. Tait in 1883, succeeded him as archbishop of Canterbury. As primate he cultivated cordial relations with the E. churches. He imparted new vigour to church life in England and reorganised the internal administration of the Church. Many of his numerous writings possess considerable scholastic and antiquarian value.

Benson, Sir Francis Robert (1858-1939), Eng. actor manager; educated at Winchester and Oxford. While at Oxford he played the part of Clytemnestra in the *Agamemnon* of Æschylus, and one result of this was that he was invited to join Sir Henry Irving's company at the Lyceum. In 1883 he founded a Shakespeare repertory company, which continued until 1916, giving performances not only in London and the provs., but also in U.S.A. and Canada. In 1920, after the war, a new company was started, and toured S. Africa. B. himself played about 100 parts, the majority from Shakespeare, and estab. a school of acting, which had a marked influence on the Eng. stage. He was also responsible for many of the Shakespearean festivals at Stratford upon Avon. He was knighted in 1916, and in 1934 awarded a civil list pension of

£100 in recognition of his services to drama. In 1886 he married Gertrude Samwell, who was a member of his company under the name of Constance Featherstonhaugh.

Benson, Robert Hugh (1871-1914), author and priest of the Rom. Church, the son of Edward White B. (*q.v.*). He was educated at Eton and Cambridge, and held curacies for some years as a priest of the Established Church. He wrote both novels and religious works. Some of his novels are historic romances and most of his later works of fiction are vehicles for Catholic propaganda. The best known are: *The Light Invisible* (1903), *By What Authority?* (1904), *The King's Achievement* (1905), *The Sentimentalists* (1906), *The Queen's Tragedy* (1906), *Lord of the World* (1907), *The Conventionalists* (1908), and *The Dawn of All* (1911). His poems were pub. shortly after his death. See *Hugh* (1915) by Father C. C. Martindale and life (1916) by his brother, A. C. Benson.

Benson, R. M. (1824-1915), Eng. missionary and founder of the Cowley Brotherhood, which restored the community life of the Church in England. Author of *Spiritual Readings* (1879) and *War Songs of the Prince of Peace* (1901), both mystical in conception.

Benson, Stella (1892-1933), Eng. novelist, b. at Much Wenlock, Shropshire, a niece of Mary Cholmondeley (*q.v.*); educated privately. During the First World War she worked in London on social services, for the women's vote movement, and on the land. Later for reasons of health travelled in the U.S.A. In 1921 she married J. C. O'Gorman Anderson of the Chinese Customs Service, and lived in China where she d. on Dec. 7. Her novel *Tobit Transplanted* won the Femina Vie Heureuse prize in 1931. She left a journal of 20 vols. to Cambridge Univ. for publication in 50 years' time. Other novels: *I Pose*, 1915; *This is the End*, 1917; *Living Alone*, 1919; *Good-bye, Stranger*, 1926. Her short stories have been pub. in a collected ed. See R. Ellis Roberts, *A Portrait of Stella Benson*, 1939.

Bent, James Theodore (1852-97), Eng. traveller and archaeologist, b. near Leeds. He was educated at Repton and Oxford (Wadham College). He visited Italy and Greece, and in 1885 began investigations in Asia Minor. In 1891 he visited S. Africa, exploring the great Zimbabwe ruins in Mashonaland. In 1893 he explored parts of Arabia and Abyssinia. Chief works: *The Cyclades, or Life among the Insular Greeks*, 1885; *The Ruined Cities of Mashonaland*, 1892; *The Sacred City of the Ethiopians*, 1893.

Bent Grass, name applied to many varieties of Gramineæ under the generic name of *Agrostis* which grow in a N. temp. *A. alba*, the white B. G., marsh B. G., or florin grass, is valuable as food for cattle; it creeps along the ground and roots at the nodes of its bent and wiry stems. *A. (or Apera) spica-venti* is the silky B. G., or windward-spiked grass, which is found commonly in Britain. *A. vulgaris* and *A. stolonifera* are varieties

of *A. alba*; *A. canina* is the brown B. G. which grows on peaty soil.

Bentham, George (1800-84), Eng. botanist, b. at Stoke, near Portsmouth. A nephew of Jeremy B., he was attracted to the study of botany through the applicability thereto of the analytical methods learnt from his uncle. For some years he lived in France managing his father's estate, eventually coming to England to study law and to assist his uncle. On his uncle's death in 1832 he was able to follow up more fully his scientific inclinations, and finally in 1842 he removed to Herefordshire to devote himself entirely to science. The cost of maintaining his herbarium proved too expensive, however, and in 1854 he presented his collection to Kew Gardens, and himself resided and worked there until the year of his death. He produced sev. important treatises on botany, the chief being *Genera Plantarum*.

Bentham, James (d. 1794), Eng. writer on architecture. Educated at Trinity College, Cambridge, he became prebendary of Ely Cathedral in 1779. B. directed his attention to the study of church architecture, and his *History of the Church of Ely* was pub. in 1771.

Bentham, Jeremy (1748-1832), Eng. writer on law and political economy; the son of Jeremiah B., a solicitor of London. Educated at Westminster and Oxford. Studied law and was called to the Bar about 1772, but did not practise to any great extent. He had attended, at Oxford, Blackstone's lectures on Eng. law, but was not satisfied with him. His first publication, *Fragment on Government*, 1776, was an attack on Blackstone, and was attributed by Johnson to Dunning. In 1780 he wrote his *Principles of Morals and Legislation*; it was printed but not pub. until 1789. In 1785 he went abroad and travelled over the greater part of Europe, and on his return in 1791 pub. his *Panopticon, or The Inspection House*, a valuable work on prison discipline. This was his proposed circular prison with cells round the warders' well in the centre, and it was taken up by the Gov., experimented upon at great expense, and dropped. At this time B.'s fame abroad was greater than here, and every embryo republic looked to him. Borrow met an *alcaide* near Finisterre who spoke of the 'great Baintham.' From about 1817 on he was a bencher of Lincoln's Inn; he d. at Westminster. He left his body to be dissected, and the skeleton may be seen at the Univ. College, London. Among his other works are *Discourse on Civil and Penal Legislation*, 1802; *Punishments and Rewards*, 1811; *Parliamentary Reform Catechism*, 1817; *A Rationale of Judicial Evidence*. The prophet of utilitarianism and the herald of all manner of social and legal reforms, the greatness of B. grows with time and with the realisation of his amazing grasp of so many and diverse subjects, his power of unerring prophecy, and his universal tolerance in an age which, judged by modern standards, was harsh in the extreme. The older Benthamites had misjudged him. Even

thinkers like James Mill regarded him as a visionary, an obscure jurist among greater jurists, a kind of catfish among the lawyers, a philosopher whose hedonistic calculus was devoid of practical value, and the defender of moneylenders. This misconception was due to his works not being read or not closely read by those who criticised him. The human and sensitive B., too, was forgotten in this hasty appraisal. The reforms for which B. was directly or indirectly responsible in the process of time, eloquently proclaim alike the catholicity of his learning and the liberality of his opinions. These reforms include the reform of the representative system of Parliament; the mitigation of the terrible criminal law, the abolition of transportation, and the improvement of

JEREMY BENTHAM

prisons; the abolition of imprisonment for debt; the overhauling of the jury system; reforms in merchant shipping; the introduction of uniform and scientific methods of drafting Acts of Parliament; the reform of the Poor Laws; the abolition of religious tests; the development of savings banks, friendly societies, cheap postage, census returns, registration of births and deaths, real property registration, national education, protection of inventors, and public health legislation. It is also to be remembered that B., in his proposals for perpetual peace in the shape of a congress or diet working towards disarmament and the abolition of secret diplomacy, gave what was practically an outline of the modern Covenant of the League of Nations. (On this last point see C. John Colombas, *Outline of League of Nations Constitution*—Grotrius Society Publications.) B. also played no inconsiderable part in the building up of the Brit. Empire, in which connection the colonisation of Australia and the Indian penal code both owed much to his inspiration. It is small

wonder that Talleyrand could say of him, 'Pillé par tout le monde, il est toujours riche.' B.'s numerous works have never been adequately or completely pub., a number of MSS. and much correspondence never yet having been printed. His total output would probably fill some 50 vols. of the size of the *Traité*. His works, in 11 vols. (closely printed), including a biography and selected letters, were ed. by Sir John Bowring (q.v.), 1838-43. Bowring also ed. the *Deontology*, 1834. B.'s MSS. are preserved and catalogued in Univ. College, London Univ. (consult T. Whittaker's *Report*, 1892). There are translations of his works in most languages, in which connection it may be recalled that B., early in his career, was almost a Frenchman. The work of Prof. Élie Halévy, of the Ecole Libre des Sciences Politiques, Paris, has done much to make B. and his work better known to the scholars of his native land. Other works on B. are A. C. Doyle, *Jeremy Bentham*, 1899; Atkinson, *Study of the Life and Work of Bentham*, 1903; W. R. Sorley, *Bentham and the Early Utilitarians*, 1914; Graham Wallas, *Jeremy Bentham*, 1922; C. Philipson, *Three Criminal Law Reformers*, 1923; *Jeremy Bentham: a Commentary on the Commentaries; A Commentary on William Blackstone's Commentaries*—printed for the first time from the Author's MSS., with an introduction and notes, by C. W. Everett, 1928; and *Theory of Legislation*, ed. by C. K. Ogden, 1931.

Bentham, Sir Samuel (1757-1831), Eng. naval architect and author of sev. works on naval administration, was the brother of Jeremy B. He travelled for some years in Russia, and became an officer in the Russian service. On his return to England he became inspector-general of naval works.

Benthamia, genus of plants of the natural order Cornaceae. *B. frugifera*, a native of India, is found to thrive in the open air in the S. of England. It possesses a mulberry-like fruit and a fragrant bloom.

Bentheim, dist. of Lower Saxony, Germany, including the forest of B., where is situated the old castle of the counts of B. Pop. 60,000. The chief tn. of the dist., B., is celebrated for its sulphurous mineral springs, and before 1939 had manufs. of bricks, and cotton-weaving. Pop. 4200.

Bentinck, William, first Earl of Portland (c. 1649-1709), the son of Henry B. of Diepenheim, Overijssel. In his youth he was attached to the Orange household and grew to be William III.'s friend and confidential adviser. He negotiated William's marriage with Mary, daughter of James II., and was entrusted with the preparations for William's landing in England in 1688, the success of which placed William and Mary on the Eng. throne. B. was rewarded for his services by being created Earl of Portland and receiving other honours.

Bentinck, William Henry Cavendish, third Duke of Portland (1738-1809), Eng. statesman. Entered Parliament as a Whig in 1761, and held office under

Rockingham in 1765 and 1782. Was put forward as nominal leader of the coalition ministry by Lord North and Fox in Apr., 1783; but growing weary of Whig dissensions, he withdrew into private life soon after its defeat in the following Dec. With the events of the Fr. Revolution his interest in politics reawakened, and for 7 years he was home secretary in Pitt's Tory administration. As leader of the 'Ministry of All the Talents' in 1807 he was second time Prime Minister, but being unequal to the task, resigned in Oct. 1809.

Bentinck, Lord William Henry Cavendish (1774-1839), Eng. general and administrator, second son of the third duke of Portland. Entered the army in 1791, and in 1803 was nominated governor of Madras. He introduced reforms which provoked a Sepoy mutiny, and was recalled in 1807. In 1808 he was sent to Portugal and served under Sir J. Moore at Corunna. Subsequently he commanded the Brit. forces in Sicily until 1814. He succeeded Lord Amherst as governor-general of India in 1827. During a successful administration lasting 8 years he introduced many reforms. On his return to England he sat as M.P. for Glasgow.

Bentinck, Lord William George Frederick Cavendish (1802-48), Eng. politician and sportsman, the third son of the fourth duke of Portland. Entering the army in 1819, he retired in 1822 to become private secretary to his uncle, George Canning, whom, in 1828, he succeeded as M.P. for Lyme Regis. At first professing no party, he afterwards attached himself to the Conservatives and voted with them until 1846, when he became leader of the Protectionist party, created in consequence of Sir R. Peel's conversion to Free Trade principles. Lord George became a vigorous speaker in Parliament, displaying an intense bitterness towards Peel.

Bentivi, or Bienteveo, *Tyrannus sulphureus*, a species of Tyrannidae. The former is the Portuguese and the latter the Sp. name of the bird. It is related to butcher-birds and shrikes, and feeds on carrion and reptiles. W. H. Hudson gives its scientific name as *Pitangus boliviensis*. He states that it has a wide range in S. America down to Buenos Aires, and that it is named from its trisyllabic cry in which some people fancy there is a resemblance to the words *Bien te veo* (I see you well).

Bentivoglio, Ercole (1506-73), It. poet, b. at Bologna, grandson of Giovanni B. (q.v.). He was employed by the house of Este in sev. important missions. He wrote some satires, which were considered next in merit to those of Ariosto, and also sev. comedies.

Bentivoglio, Giovanni, son of Annibale B., who, after being for some years at the head of the commonwealth of Bologna, was murdered by a rival faction in 1445. Giovanni was then a boy of 6 years of age, but in 1462 he made himself master of Bologna. Though stern and vindictive in his gov., B. was a patron of the arts

and of learning; he adorned Bologna with fine buildings and made collections of statues and paintings, and of MSS. Pope Julius II. expelled him from Bologna in 1506, and after 44 years' dominion he was obliged to escape with his family into the Milanese ter., where he d. 2 years afterwards at the age of 70. His 2 sons were replaced by the Fr. in 1511 at the head of the gov. of Bologna, but in the next year, the Fr. being obliged to leave Italy, Bologna surrendered again to the pope in June 1512, and the Bs. emigrated to Ferrara, where they settled under the protection of the duke d'Este.

Bentivoglio, Guido (1579-1644), It. statesman, b. at Ferrara, was a descendant of the Bs. who had been rulers of Bologna in the preceding century. He studied at Padua, and returned to Ferrara in 1597. When Guido in 1601 proceeded to Rome he was made a prelate of the papal court. After the death of Clement in 1605 his successor, Paul V., sent him as nuncio to Flanders, where he wrote his historical work on the insurrection of that country against the Spaniards in 1566 (*Della Guerra di Fiandra*, in 3 parts, 3 vols., Cologne, 1632-39). In 1616 B. was sent as nuncio to France, where he won the favour of Louis XIII. and his court by the courteousness of his manners and his prudence in diplomatic affairs. The other works of B. are: *Relazioni fatte in Tempo delle Nunziature di Fiandra e di Francia*, Cologne, 1630. It was trans. into Eng. by Henry, earl of Monmouth, 1652. *Memorie con le quali describe la sua Vita*, 8vo, Amsterdam, 1648: this is a sort of diary of his life, pub. after his death. *Lettere*, 8vo, Rome, 1654.

Bentley, coal-mining tn. (Bentley-with-Arksey) of the W. Riding of Yorkshire, England, near Doncaster. Pop. 16,000.

Bentley, Richard (1662-1742), Eng. divine, scholar, and critic; b. at Oulton, Yorkshire, of humble parents; educated at Wakefield and St. John's College, Cambridge. He became a schoolmaster at Spalding, 1682, but left this to be private tutor to the son of Dr. Stillingfleet (afterwards bishop of Worcester). He accompanied his charge to Oxford, and was soon admitted to the degree of M.A. Here he had access to the Bodleian library, and made the friendship of Mill, the editor of the Gk. Testament, and Bernard, then Savilian prof. He laid the foundation of his reputation in a dissertation on an obscure chronicler, John Malelas or John the Rhetor (real name John of Antioch), which was pub. with an appendix to Dr. Mill's ed. of the author in 1691. In 1692 he was appointed keeper of the King's Library, and in 1694 Boyle Lecturer; his degree of D.D. he took at Cambridge in 1696. To the ed. of Callimachus by Grævius in 1697, he contributed a collection of fragments of that poet. Now it was that his famous quarrel with the Hon. C. Boyle began; the latter was to edit the *Epistles of Phalaris*; and noticing (rightly or not) some want of courtesy on the part of B. regarding the loan of a certain manuscript in the king's library, animadverted upon it with some potulence in

his preface. B., who had decided before (as was right) that these epistles were spurious, said so in Wotton's *Reflections on Ancient and Modern Learning*, and criticised Boyle's performance with some asperity. Whereupon all the wits of Christ Church, chief among whom was Atterbury, set their heads together and wrote an answer, to the delight of the tn., with whom the arrogant B. was in little favour. Theirs was the wit, but B. had the learning. In 1700 he became master of Trinity College, Cambridge, and next year he married. He helped Küster with an ed. of Suidas, and pub. an ed. of Horace, 1711; he wrote 2 critical letters on Aristophanes, and in 1708 sent to Hemsterhuis a valuable letter containing emendations of the fragments of comic writers in Julius Pollux's *Onomasticon*, an ed. of which Hemsterhuis had just pub. If his learning was great, his manners were harsh and overbearing, and he quarrelled with the seniors. He was deprived by the visitor, Bishop Greene, but B., by a number of expedients, resisted the deprivation for 4 years, and the matter was dropped. In 1717 he was, by his bold and unscrupulous manoeuvres, elected regius prof. of divinity; litigation followed as usual, and as usual B. won. He effected the publication of Cote's ed. of Newton in 1709. His valuable ed. of Terence appeared in 1726. He undertook an ed. of *Paradise Lost* in 1731, supposing that Milton's amanuensis was likely to have committed blunders in taking down the poet's words; if his criticisms and emendations are prosaic, they are ingenious, and though he was unable to appreciate the effect on Milton of It. poetry and romantic study, yet Pope, who was no genius at editing himself and in the matter of verbal criticism was not worthy to comb B.'s wig, had no business to put him into the *Dunciad*. Of B. we can only say that what he lacked in manners and modesty (and he lacked a good deal) he made up in learning. His style was strong and flexible. Swift's *Battle of the Books* is an account of B.'s quarrel with Boyle. See J. H. Monk, *Life of Richard Bentley*, 1830; Sir R. C. Jebb, *Bentley*, 1882; H. C. Beeching, *Francis Atterbury*, 1909; J. W. Mackail, *Bentley's Milton*, 1924.

Bentley, or **Bently**, vil. of Hampshire, England, 4 m. S.W. of Farnham in the Petersfield div. Pop. 800. A considerable amount of Rom. pottery, belonging to the third century, was unearthed in 1945 in a part of Alice Holt Forest near B.

Benton, Thomas Hart (1782-1858), Amer. statesman, b. at Hillsborough in N. Carolina. He represented Missouri in the U.S.A. Senate 1821-51, being eventually rejected on account of his opposition to slavery. His attitude on this question, his opposition to the proposed establishment of a U.S.A. bank, and his advocacy of Amer. expansion in the W., made him prominent in Amer. politics. He d. at Washington.

Benton Harbor, tn. and health resort of Michigan, U.S.A., in Berrien co., 50 m.

E.N.E. of Chicago, with mineral springs and various manufs. Pop. 15,400.

Benué (also Binué and Benuwé), largest and most important affluent of the R. Niger, W. Africa, which it joins at Lokoja, 230 m. above its mouth. It rises in Adamawa, and flows through fertile country, navigable for 700 m., thus affording a highway into the centre of Sudan. Explored by Baikie in 1854 and 1862, and Flegel, 1879-83.

Ben Venue, mt., 2393 ft. high, on Loch Katrine, Perthshire, Scotland, 9 m. W. of Callendar.

Benvenuto, or **Tisio da Garofalo** (1481-1559), It. painter, last representative of the Ferrara school, and follower of Raphael. In the church of San Nicolo at Ferrara he painted in 1520 the 'Virgin Mary and Infant Jesus,' in the church of Santa Maria de' Servi the 'Nativity,' and in San Lorenzo the 'Adoration of the Magi.' His best work is a 'St. Sebastian, St. Roch, and St. Demetrius' in the National Gallery, London.

Benvenuto Cellini, see CELLINI, BEN-VENTUTO.

Ben Vorlich, Scottish mts.: 1. 3224 ft. high, in Perthshire, 7 m. N. of Callendar; 2. 3092 ft., in Dumbartonshire, 13 m. E. by N. of Inveraray.

Ben Wyvis, mt., 3429 ft. high, in Ross, Scotland, 8 m. N.W. of Dingwall.

Benyowsky, Mauritus Augustus, Count de (1741-86), magnate of Poland and Hungary; Austrian soldier and adventurer; b. in Nitria in Hungary; 1756 fought in the Seven Years war. In 1767 he went to Poland to help to resist the encroachments of the Russian Empress Catherine; he was captured and imprisoned at Kazan, but succeeded in joining a Russian conspiracy against Catherine; it failed, and he escaped with one conspirator. At St. Petersburg he was captured again and banished to Kamchatka; escaped once more with 85 other exiles, took ship and went to France. On his arrival there he had permission from the Gov. to form an establishment in Madagascar, where he ultimately lost his life. See his *Travels*, trans. into Eng., 1790.

Benzaldehyde (C_6H_5CHO), colourless liquid with an odour of bitter almonds. It is produced naturally in bitter almonds, cherries, and peaches in the form of amygdalin (q.v.). It is also prepared from toluene which is converted into benzal chloride and then heated with milk of lime. Alternatively, toluene is oxidised by means of chromyl chloride, or a mixture of manganese dioxide and sulphuric acid with copper sulphate as catalyst. See ALMONDS, OIL OF.

Benz, Karl (1844-1929), Ger. engineer, who, as long ago as 1885 built a motor-car driven by benzine at a speed of 15 m. p.h. His work was a valuable basis for subsequent developments of the internal combustion engine.

Benzamide ($C_6H_5CONH_2$), organic compound formed by acting upon ammonia with benzoyl chloride. It crystallises in leaflets which melt at 130° C. and boil at 288° C.

Benzedrine, α -benzyl-ethylamine ($C_9H_{11}CH_3, CH(CH_3)NH_2$). It may be inhaled under medical advice to relieve hay fever, etc. Administered internally, it is a powerful nerve stimulant, and produces a temporary sensation of well-being.

Benzene (C_6H_6), compound of carbon and hydrogen produced in the distillation of coal-tar. It occurs naturally in Borneo petroleum. It was discovered by Faraday in 1825 as produced in the distillation of certain oils and fats, and Hoffman in 1845 showed that it was a constituent of coal-tar. To separate the various hydrocarbons in coal-tar, the substance is distilled in a tar-still, the products being drawn off at different temps. The first fraction is taken up to $210^\circ C.$, and contains a large percentage of B. The distillate, known as 'light oil,' is again fractionated, producing separate distillates of 'first runnings,' 'heavy benzols,' and 'carbolic oil.' A further distillation of the benzols in a steam-still produces pure or nearly pure B. B. is a light, colourless liquid with a pleasant odour. It crystallises in rhombic form at $0^\circ C.$, melts at $5.4^\circ C.$, and boils at 80.4° . It is insoluble in water, but dissolves in alcohol, ether, acetic acid, and carbon disulphide. It readily dissolves gums and fatty substances, as well as phosphorus, sulphur, and iodine. B. is interesting chemically as being the parent of the aromatic compounds. The atoms of carbon are represented in a graphic formula as being arranged in a closed ring, each atom being connected with an atom of hydrogen. The replacing of these atoms by other atoms or groups gives rise to a large number of derivatives, which have in general more strongly marked characteristics and are more stable than the aliphatic or fatty compounds. B. is used commercially as a solvent, and as a starting-point in the production of many valuable dyes. The name is often applied to *benzol*, which consists of B. and toluene. This mixture is largely employed as a fuel for internal combustion engines. *Benzine* (q.v.) is a distillate from American petroleum, and is much used as a solvent. *Benzoline* is a name applied to a form of benzene; it is used as a solvent and as a fuel.

Benzil ($C_6H_5CO \cdot CO \cdot C_6H_5$), organic solid, crystallising in trapezohedra, m.p. 95° . It is produced by treating benzoin with chlorine and nitric acid, or by fusing it with an alkali.

Benzine, volatile liquid obtained from petroleum. The name has been applied, however, to different organic compounds. The hydrocarbon now known as benzene (C_6H_6) was originally known as B., and the name was afterwards and is still applied to the partially purified coal-tar which contains benzene as its prin. constituent. The term B. is, however, most commonly applied to the lower boiling-point fractions in the distillation of petroleum, and has thus a kinship with petrol, petroleum spirit, motor spirit, benzoline, etc. It is valuable as a solvent, and is used for cleaning wearing apparel, etc.

Benzoic Acid ($C_6H_5 \cdot COOH$), aromatic acid, occurring naturally in some resins, especially gum benzoin and in Peru and Tolu balsams. It may be obtained from gum benzoin by sublimation, from toluene by oxidation and from hippuric acid by hydrolysis. It crystallises in light feathery plates, which melt at $121.4^\circ C.$ and boil at $250^\circ C.$ It is readily soluble in hot water, alcohol, etc. When heated with lime, benzene is produced, and salts called benzoates are formed by combination with the oxides of many metals. In medicine it is used as an antiseptic, expectorant, and diuretic. Moderate doses remain unchanged in the blood, but unite with glycocholl in the kidneys to form hippuric acid. It is useful in mild chronic cystitis and in urethral affections.

Benzoin (from Arabic *luban java* (*lubān-jawī*), incense of Java), balsamic resin obtained from *Styrax* B. It is produced by cutting the bark of trees, and is apparently the result of the wound, and is not secreted by the plant under ordinary conditions. There are different varieties containing varying proportions of the active ingredient, benzoic acid, while in some samples this is partly or wholly replaced by cinnamic acid. B. has a fragrant odour, and is much used for incense, perfumery, and pastilles. It became a favourite medicament on account of its antiseptic property and its soothing influence in affections of the respiratory organs. The most popular form of the medicine is the compound tincture, or friar's balsam, which is used externally for sores, ulcers, etc., and internally for throat troubles. Inhaling the vapour produced by adding a small quantity of friar's balsam to hot water may give relief for catarrh and influenza.

Benzoline, mixture of hydrocarbons (also known as benzene, petroleum spirit, or petrol). It is not a definite chemical compound, and consists of the lighter fractions in the distillation of petroleum or paraffins. It is used as a solvent in industry, and in medicine for heating cauteries and for cleansing the skin in acne. It is also used in oil engines to provide the inflammable vapour which, mixed with air, produces the explosion or expansion of gases which actuates the piston. It must be distinguished from benzol or benzene, which are products of coal-tar distillation, though, like them, it has valuable solvent powers.

Benzoyl, hypothetical organic radicle represented by the formula $C_6H_5 \cdot CO$. In 1832 Baron Liebig, in association with F. Wöhler, pub. a paper showing that throughout a series of compounds formed from benzaldehyde, or oil of bitter almonds, a group which he called B. behaved as a unit. A new era in chemical theory was thus inaugurated which led to far-reaching results.

Benzoyl-glycocholl, see HIPPURIC ACID. **Benzyl Alcohol** ($C_6H_5 \cdot CH_2OH$), or **Phenyl Carbinol**, organic compound found in Peru and Tolu balsams and in storax. It may be prepared by reducing benzoyl chloride or by shaking up caustic potash with benzaldehyde, when the product

is partly sodium benzoate and partly benzyl alcohol. It is a colourless liquid with a pleasant odour, and boils at 206° C.

Benzyl Chloride ($C_6H_5CH_2Cl$), organic substance produced by the action of chlorine on boiling toluene. By the addition of potassium carbonate, benzyl alcohol is produced, and heating with lead nitrate produces benzaldehyde, or oil of bitter almonds.

Beowulf, an epic poem, and considered the most valuable example of O.E. and early Germanic literature. It consists of a MS. written about A.D. 1000, and contains the O.E. poem *Judith*. It is now in the Brit. Museum, where it is bound with other MSS. in the Cottonian collections. The poem relates the deeds of B., nephew of the king of the 'Geatas' (the people). Briefly, the story describes how B. sails to Den., accompanied by 14 companions, to help his brother Hrothgar, the Danish king, whose domains are ravaged by a monster of human shape called Grendel. In the encounter between B. and Grendel, the voracious monster's arm is torn from the shoulder, but though mortally wounded, the creature escapes, leaving bloody tracks which lead to a distant lake. The deserted hall, called Heorot, is once more inhabited, but Grendel's mother appears and carries off a Danish noble. B. undauntedly follows her, and plunging into the water of the lake, kills her in a vault under the waves. He finds Grendel's corpse here, and securing the head, returns to Heorot, where he is welcomed with acclamation. The king of his native land rewards him with lands, and on his death B. is proclaimed king. Fifty years pass, and now B. himself is suffering from the incursions of a monster in the shape of a fiery dragon. B. is just able to kill the fire-breathing dragon, by the aid of a young man named Wiglaf. But he is mortally injured, and with his dying breath ordains Wiglaf his successor. See ed. by F. Klaeber (1922); also trans. into modern Eng. by William Morris (1892) and Gavin Bone (1946).

Bequeath, Bequest, 2 words strictly applicable in Eng. law to the disposition of personal property by will, 'devise' being the technical term applicable to dispositions of real property. See **WILLS AND TESTAMENTS**.

Berabra, Nubian people of Egypt, of negro stock, chiefly found in the neighbourhood of the Nile from Assuan to Wadi Halfa. They are also found in Kordofan and Dar-Fur. They are intelligent, and quick to acquire new methods of agriculture, which is their chief employment. In religion they are Muslims.

Berseans, see **BEREANS**.

Béranger, Pierre Jean de (1780-1857), Fr. poet, b. in Paris. His father left his mother only 6 months after the marriage, and B. was cared for by his grandfather, Champy, a tailor. At the age of 9 he was transferred to the protection of an aunt, who kept an inn at Péronne. Her vigorous republican ideas were passed on

to her nephew. He became a printer's apprentice for 3 years at the age of 14, subsequently acting as a clerk in the service of his father, who had acquired a fortune, and who soon afterwards lost it. B. took up his abode at Paris after this, and devoted himself to literature. At this time he lived in a garret, which forms the subject of one of his songs. Adversity shattered some of his dreams, and he was forced to solicit help from Lucien Bonaparte. Three years later he was given a position as clerk in the Imperial Univ., through the influence of the poet Arnault. In 1815 he pub. his first collection of songs, and was immediately hailed as the foremost of his country's song-writers. His popularity increased, and also his courage in airing revolutionary ideas, for which in 1821 he was imprisoned in St. Pélagie. By his influence with the people, especially with the younger generation and those immersed in militant politics, no less than by the irresistible effect of his songs, he contributed largely to the downfall of the Bourbons. Many of his best-known verses were printed satires against the gov. which succeeded the fall of Napoleon. The mocking irony of his famous *Roi d'Yvetot*, saluting the awakening of more truly liberal ideas, had a pronounced effect at a time when it seemed that no other voice might be heard than the emperor's. Moreover, legal process seemed to have no terrors for him. He met prosecution with good-humoured wit, and his second trial, that of 1828, receded on his antagonists. He was condemned to 9 months' imprisonment and to pay a fine of 10,000 francs, but, in thus striking at him, the gov. enhanced his political significance and sharpened the sting of his *recueils*, which caused them so much perturbation. The song, *Vieux Drapeau*, with its vigorous refrain,

Quand secoutrai-je la poussière
Qui ternit ses nobles couleurs,

was reprobated by the prosecution as a 'kind of *Marseillaise* for the use of the brigands of the Loire.' B.'s fine was paid by public subscription, and his popularity increased as a result of his conviction. In 1830 *Chansons nouvelles* were pub., and 10 years later his life story. In 1848 he was elected to enter the Constituent Assembly, but he resigned shortly afterwards, seeking a retirement in which he lived until his death. The versatility of theme and delicacy of his humour and pathos easily explain his hold upon a public so warm as the working class of France, while his technique and literary quality endeared him no less to the literary scholars of his day. The friend of his life, whom he did not long survive, was Mlle Judith Frère. He commemorated her in *La Bonne Vieille*, but she is not the 'Lisette' of many of his poems. Lisette was an imaginary character, or, at least, no more than a personification of the *folles amours* of youth in the manner of Ronsard, and there is no hint of any such relationship between B. and the highly respectable Mlle Frère. An excellent monograph on B. will be found in

Larousse's *Grand Dictionnaire universel du XIX^e siècle*.

Berar, prov. of India, lying to the N. of the state of Hyderabad. Up to the beginning of the nineteenth century, it was under the rule of an independent rajah with cap. at Nagpur, and later passed to the control of the nizam of Hyderabad, who assigned the ter. to the Brit. in 1853. In 1902 it was leased in perpetuity by the nizam, and incorporated with the Central Provinces on Oct. 1 of that year. It is mainly an agric. dist., yielding cotton and millet. The chief city is Nagpur. Area of the dist., 17,800 sq. m., and the pop., mainly Hindu, is over 3,600,000.

Berat, or **Beligrad**, tn. of Albania, on the Semeri R. in a fertile valley, the cultivation of which is mainly tobacco, vines, and olives. The tn. was occupied by the Austrians and later the Its. during the First World War, and was again the scene of fighting between the It. invaders and the Albanians in Jan. 1941. Pop. 10,000.

Béraud, **Henri** (b. 1885), Fr. dramatic critic and author, b. at Lyons, son of a baker. Was a silk-pattern designer and then a lawyer's clerk. His *Twenty Portraits of the French Revolution* contains vivid descriptions of Mirabeau, Saint-Just, Marat, Vergniaud, Danton, Muc Roland, Charlotte Corday, and Théroigne de Méricourt, but is marred by a blurred historical background. In 1922 he won the Goncourt award for 2 books: *Le Vitriol de Lune*, a political novel on the death of Louis XV., and *Le Martyre de L'obèse*, a humorous story.

Beraun, or **Beroun**, tn. of Czechoslovakia, pop. 11,000 (1938). It has lincolns, textile manufs., sugar refineries, and breweries.

Berber, tn. and prov. in the Sudan, near the junction of the Atbara and the Nile. The tn. was the starting-point of the old caravan route across the Nubian Desert to the Red Sea, at Suakin. Pop. 5000.

Berbera, or **Berberah**, prin. seaport and tn. in Brit. Somaliland, N.E. Africa, on a bay of the gulf of Aden. It has a good harbour and is a mkt.-place for inland tribes, being known for its large ann. fair. B. was taken by the Its. under Graziani in 1940, but was recaptured on Mar. 17, 1941. Pop. 15,000, which is nearly doubled during the cooler months from Oct. to May, when the fair is held.

Berberidææ, name applied to a group of dicotyledonous plants of the cohort Ranales, which includes the Berberidaceæ and Lardizabalaceæ. The juice usually stains yellow, and the bark or stem is bitter and used medicinally.

Berberis, genus of Berberidaceæ containing 100 species found in S. America and mountainous dists. of the tropics. The most common species occurs as a shrub in Britain, and is known as barberry (*q.v.*).

Berbers, term applied to the different branches of the indigenous inhab. of N. Africa, who have inhabited the region between the Mediterranean and the

Sahara since the earliest times. The derivation of the name is yet undiscovered, though it may have come from the Gk. *βαρβαροι*, barbarians. Egyptian inscriptions of the seventeenth and thirteenth centuries B.C. speak of the Barabara and Beraberata tribes. They were called Lebu, Mashuasha, Tamahu, Tehennu, and Kahaka by the Egyptians. There are a host of tribes called by this term to-day, the main sections being Zouaoua and Jebalia (in Tripoli and Tunisia), the Chauwia, Kabyles, and Beni-Mzab (in Algeria); the Shlûh, Amazigh, and B. (in Morocco); and the Tuareg, Amôshagh, Sorgu (in the Sahara). The word Africa has been traced by some scholars from a tribe called Avrigha, whose descendants, the

A BERBER (KABYLE) OF ALGERIA

Aouraghens, form one of the innumerable lesser groups. The actual origin of the race is still obscure, and it is to be noticed that, notwithstanding the alterations in feature, usually brought about in the process of time by foreign conquest at the hands of successive invaders, the type is still surprisingly like that of the Stone Age. The usual facial characteristics are dark hair and hazel eyes, while the complexion marks them as a 'white' race. The Arabs have been the prin. invaders, and yet the races are almost as distinct as if some barrier had existed between them. In character the B. is independent, sturdy, and self-reliant, honest, intelligent, and scrupulous. The gov. of the Bs. extends over each state, which in most cases is the vill., and there is no attempt at centralisation. Yet the poorest of them has as large a share in the gov. as the richest. They are warlike, and have never yet been thoroughly subdued. Their religion is Mohammedanism, though not strict. B. women occupy an inferior position, and are procurable by purchase, and easily disposed of at will, yet they are protected by laws, and have a voice in making them. See G. Marçais, *Les Arabes berbères du XI^e au XIV^e siècle*, 1913; P. Hacquand-Campredon, *Studies in the Evolution of Kabyle Customs*, 1921; R. Millet, *Les Almohades*:

histoire d'une dynastie berbère, 1923; also works on dialect: S. Bearnay (Rif dialects), 1917; Destaing, 1920; and Laoust, 1920.

Berbice, E. portion of Brit. Guiana. It is bounded on the E. by Dutch Guiana and R. Corentyn. Its area is 21,000 sq. m. In 1831 it was joined to Essequibo and Demerara under one gov., while formerly it formed a distinct prov. Its chief product is sugar, while rum, molasses, timber, cocoa, and tropical fruits are also features of its productions. Magnificent timber forests contain the mora and bullet trees. The R. Berbice is fed by the Canje and is navigable for 175 m. New Amsterdam is the prin. tn. of the div.

Berceo, Gonzalo de (*fl.* 1230). Sp. poet, considered the father of modern Sp. poetry, was one of the earliest poets in the vernacular. He followed the troubadour school of Langue d'Oc. His poems, which were numerous, are chiefly sacred in theme and are composed in single-rhymed Alexandrine quatrains. His most noteworthy poems are *Milagros de Nuestra Señora*, *Vida de Santa Pria*, *Vida de Santo Domingo de Silos*, and *La Estoria de Santo Millan*.

Berceuse (Fr. *berceau*), literally a cradle song; a soft lulling melody with an accompaniment to imitate rocking.

Berchem, suburb of Antwerp, Belgium. It has many fine buildings. Pop. 36,000.

Berchem (or **Bergheim**), Nicolaas (1620-1683), Dutch landscape painter, b. at Haarlem. His work, particularly in his landscapes and etchings, is held in esteem. Some of his best pictures are in the museum at Amsterdam. He d. at Haarlem.

Berchta (the original of the Eng. Bertha), fairy in S. Ger. legend. She corresponds to Hulda (gracious, bonign) in N. Ger. mythology.

Berchtesgaden, tn. of Upper Bavaria, Germany, situated at a height of 1700 ft. on the Untersberg, 12 m. S.W. of Salzburg. Its royal castle was formerly a Franciscan hospice. It has mines of rock-salt, which were worked as far back as 1174, and, in normal times, it is frequented as a health resort on account of its climate and saline springs. Pop. (1939), 3800. B. will go down to hist. as the name of Hitler's mt. home or homes. Strictly there were 2 homes: one was a large chalet in the middle of a compound containing military barracks for some 20,000 troops; the other is the much more famous 'Eagle's Nest' or Berghof. The whole place was, in effect, one huge air-raid shelter and fortress, which looked as if it could have withstood the longest siege; but it was captured without a fight by troops of General Loclerc's Div. on May 5, 1945, during the closing days of the war. Hitler's chalet and those of Goebbels and Goering near by, were destroyed, together with the whole of the camp, in allied air bombardments shortly preceding the allied occupation of B. All that remained were the underground shelters packed with munitions, food, books, and champagne. It was here that Hitler received the majority of his guests;

but only intimate friends or heads of states whom he wished to impress were invited to this fantastic fortress on the mt. peak. Whole families lived in the barracks, which consisted of a series of apartments, and children's toys and school books were found among the debris. The famous 'Eagle's Nest,' however, survived the war undamaged. It is a mushroom-shaped solid stone house built squarely atop the 6000-ft. mt. dominating B., and was generally reached by an armoured-plated electric lift or, alternatively, along 5 miles of winding mt. roads. It is a fairy castle, matching the unreality of its owner's ideas, and belonging rather to the household stories of the brothers Grimm. It contains no bedrooms, but has a series of enormous salons all fitted with vast windows offering magnificent views over the valley below, with glimpses of the blue-green waters of the Königssee and the foaming Salzach R. Its site and solidity are in harmony with the majestic scenery of snow-capped mts. surrounding it. It consists of 13 floors, 12 of which are underground, built into the core of the mt. The top storey, built of blocks of mt. rock, looks from the valley like part of the mt. In fact it consists of a huge octagonal reception room, 30 yds. in diameter, with 5 huge windows. Its fireplace is large enough to take whole tree-trunks. The stone floor was carpeted with a superb Chinese carpet in chocolate and dusty pink, in the centre of which was a huge octagonal table, on which, after the Ger. debacle, troops of an Amer. airborne div. ate their rations. Over 36 arm-chairs, covered with flowers and moquettes in different patterns, were scattered about the room, together with a number of oval dark-oak coffee tables. The only other furniture found was a magnificent wireless set and electric gramophone. Leading from this salon is a rectangular banqueting hall, with a long narrow table and about 40 light-oak chairs covered with leather to match the tan and cream Persian carpet. A huge sideboard, nearly 20 ft. long, contained a white service of Limoges china, with orange dragon pattern. All the cutlery disappeared as souvenirs. The kitchen, too, is on a gigantic scale, with its huge electric stove of 4 ovens. Next to the kitchen is the servants' dining-room in turquoise blue enamel. Below this storey were the food cellars, guard room and servants' bedrooms, and underneath those, wine cellars. Outside the top storey ran a lofty porch 30 yds. long and 40 ft. high, looking sheer down the mt. side for thousands of feet. The 12 underground storeys were served only by lift.

Other buildings in this elaborate Nazi kingdom in miniature, Goering's residence, the office of the army staff, the ballroom, the restaurant and café, the children's nursery, the sun house, the stables and garages were all wrecked. They stood roofless with blackened walls in the midst of an area thickly sown with bomb craters. The Plattenhof, an up-to-date hotel, suffered little damage, and

was soon in use as a rest-house for Amer. parachute troops. The whole mt. was honeycombed with passages and defence rooms, and the 'Eagle's Nest' was protected by 5 rings of fortifications, built into the mt. itself, and camouflaged by green and brown paint and streamers. Entrance to the forts was only by tunnels 30 yds. long. Oil drums were placed on the roads so that a smoke screen could have been thrown round the whole mt. Slave labour was used for all this immense construction. The sordid wooden barracks in which the victims of Hitler's press-gangs lived and toiled for many months stood amid the pine-trees on the hillside in sharp contrast to the luxury of the surroundings created by their labour for the Nazi tyrants.

Berchtold, Leopold, Count (1758-1809), Ger. medical writer, travelled through Europe, Asia, and Africa with a view to mitigating human suffering; pub. works against hasty internment and concerning sicknesses incident to seamen. He pub. at Vienna, 1797, directions for the cure and prevention of the plague, and was active in making known the advantages of vaccination.

Berchtold, Leopold Antonius J. S., Count von (1867-1942), Austro-Hungarian minister and diplomatist, b. in Vienna of a family which ranked among the most anct. and wealthy of the Magyar nobility. Succeeded Count von Aehrenthal as ambas. to St. Petersburg, his sangfroid and powers of deception enabling him to weather the storm with Russia over Aehrenthal's annexation of Bosnia-Herzegovina in 1908. In 1912 he succeeded Aehrenthal as foreign minister, a post he accepted with reluctance and mainly out of loyalty to the emperor. At first he thought the dual monarchy's Balkan problems could be settled without war, but after the Balkan wars (1912-13) he became a convert to the belligerent solution long advocated by the chief of staff, Count von Hoetzendorf. The assassination of the Archduke Francis Ferdinand at Sarajevo gave his party in Vienna the opportunity they sought. There is no doubt from documentary evidence, especially that of Count von Lerchenfeld, that B. was a party to the conspiracy to hasten the ultimatum to Serbia in such circumstances that Serbia might not have time to offer satisfaction. He did everything in his power to induce Germany to threaten Russia, but when he appreciated that the Russian Gov. would not yield to threats, he instructed the Austrian minister in St. Petersburg to reopen negotiations. After Italy joined the Allies and Rumanian forces overran Bukovina his influence waned, and in Jan. 1915 he resigned his office. Was subsequently Oberstkämmerer to King Karl.

Berck, Theodor (1812-81), Ger. philologist, b. at Leipzig. Appointed prof. of classical literature at Marburg, 1842; later, at Freiburg. Lived many years in Bonn, where he devoted himself to Gk. literature, his chief works being *Poetæ Lyrici Græci*, pub. 1843 (latest ed. pub.

1900); *Griechische Literaturgeschichte*, 1872-87, both these works being completed by later Ger. writers. Also produced eds. of the *Fragments of Aristophanes*, 1840, and of Anacreon, 1834. His work is still recognised, and a lyric anthology by him was re-ed. by E. Diehl in 1923.

Berck-sur-Mer, seaport and bathing resort in the dept. of Pas-de-Calais, France, 22 m. S. of Boulogne. Pop. 16,000.

Bercy, former Fr. com. situated on the r. b. of the Seine; it has been joined to Paris since 1860, and is the chief depot for the wines, oil, vinegar, and wood for Paris; boat-building is carried on.

Berdiansk, seaport on the N. shore of the sea of Azov, Russia. There is a good harbour; grain, wool, and hides are exported, and agric. machinery is manufactured. Pop. (1939) 52,000.

Berdichev, tn. of the Ukraine, 116 m. S.W. of Kiev by rail. Pop. (1939) 66,000 (mainly Jewish). An important trade centre. Famous for its 4 ann. fairs for the sale of leather, corn, wine, etc. The Ger. invading forces broke through B. on July 2, 1941, and the Russians recaptured the tn. in 1944.

Berdoe, Edward (1836-1916), Eng. doctor and author, b. in London; educated at Regent's Park College and London Hospital Medical College; practised in Hackney from 1876. In 1880 he joined the National Anti-Vivisection Society; and he ed. its organ, the *Zoophilist*, 1898-1915. He wrote many medical works. His hobby was the study of Browning, and he wrote a number of studies and works of reference on the poet.

Berdyaev, Nicolai (1874-1948), Russian philosopher, b. at Kiev. Early a revolutionary agitator and student of Marx, he became a priest in 1900 and attacked the anti-religious attitude of the Russian intelligentsia. After the revolution of 1917 he was appointed by Lenin himself to the chair of philosophy, Moscow Univ., but was expelled in 1922 and settled in Berlin, where he founded the Russian Academy of Philosophy and Religion. Later he removed to Clamart, near Paris, where he remained till his death. Appointed to a lectureship at the Sorbonne, 1939. His first book, *Subjectivism and Individualism in Social Philosophy*, was pub. in 1901. He was at this time in strong sympathy with the revolutionary movement in Russia, and in 1907 he wrote an article in which he forecast the victory of the Bolsheviks in the revolutionary struggle. He was at issue with them, however, over the rights of human creativeness, and the freedom of the spirit to which he believed orthodox Marxism to be inimical. Therefore, although the revolution of Nov. 1917 was, in his view, 'inevitable and just,' the conflict between his social and his spiritual ideals drove him into exile, and he left Russia in 1922. He remained an idealist thinker, and his philosophy of personalism had considerable influence on European thought. In a book written just before the Second

World War, *Slavery and Freedom* (Eng. trans., 1944), he sought the way whereby man could free his creative personality from spiritual, economic, and political forms of bondage. He wrote as a Christian philosopher, and in *The Meaning of History* stated the Christian philosophy of hist. As a Christian apologist he sought to free religion from the objectivity and materialism into which it has fallen as a social force. Other works which have been trans. into Eng. include *Freedom and the Spirit* (1935); *The Destiny of Man* (1937); *Solitude and Society* (1938); *Spirit and Reality* (1939); *Slavery and Freedom* (1944); *The Russian Idea* (an interpretation of Russian thought as a whole) (1947); and *Towards a New Epoch* (1948). He also wrote a scholarly and judicial account of the development of Communism under the title *The Origin of Russian Communism* (1937).

Bere, see BARLEY.

Berea: (1) Suburb and park of Durban (Port Natal), Natal. The suburb is picturesquely situated and commands the harbour. (2) Magisterial dist. in Basutoland, E. of Maseru, and containing the mission station of Berea.

Berea College, non-sectarian co-educational institution, situated in Madison co., Kentucky, U.S.A. The college was founded in 1855 to promote the welfare of the 'mountain region of the South,' and it stands on a ridge of the S. Appalachians, 1075 ft. above sea level.

Bereans, almost extinct sect of Christians founded in Scotland in the eighteenth century by the Rev. John Barclay (1734-98), a native of Perthshire. They are so called after the people of Berea, of whom it is said in Acts xvii. 11 that 'they received the word with all readiness of mind.' The B. hold that the knowledge of the existence and character of God can be obtained from the Bible alone, not from nature or reason; that the Psalms of David refer to Christ alone; that assurance is of the essence of faith, and that lack of faith is an unpardonable sin. The rest of their doctrine is practically identical with that of the Calvinists.

Berengar I. (or **Berenger** or **Berengarius**), king of Italy, 888-924, son of Eberhard, duke of Friuli, and grandson of the Emperor Louis le Debonnaire. Elected to the throne in preference to Guido, duke of Spoleto, he maintained his position against all rivals until 923, when he was overthrown by Rudolf, king of Burgundy. The following year he was assassinated.

Berengar II., king of Italy, 950-961, grandson of Berengar I. In 952 the Emperor Otto I. compelled B. to become a feudal dependant of Germany. In 961 B. was dethroned by the emperor, and eventually d. in 966, in a Bavarian prison.

Berengaria, daughter of Sanchez VI., king of Navarre, and Blanche of Castile, and queen of Richard I., Cœur de Lion. She was married to Richard in Cyprus in 1191, when he was proceeding on a crusade. Accompanying him to Palestine, she remained at Acre until Sept. 1192, when she left in advance of the king,

and safely reached Sicily, and eventually Poitou in France. The king, less fortunate, was taken prisoner by the archduke of Austria. B. was reduced to dire straits after Richard's death in 1199, but received assistance from the Templars. She d. childless in 1230. She was famed for her beauty and wisdom.

'Berengaria', The liner, originally built for the Hamburg-America line and launched in 1912 as the *Imperator*. After the First World War it passed to the ownership of the Cunard SS. Co. It was at that time one of the fastest steamships afloat, and also one of the largest vessels to be fitted for liquid fuel. It was a turbine steamer with quadruple screws; gross tonnage, 52,226; 883 ft. long, 98 ft. broad, 57 ft. deep; speed, 26½ knots. The B. was a favourite with the transatlantic traveller by reason of its speed, comfort, and luxurious equipment. One of its fastest transatlantic journeys was from Cherbourg to Ambrose Light in 5 days, 13½ hours. The ship was retired from service in 1936 after the inclusion of the new Cunard-White Star liner, *Queen Mary*, in the company's service.

Berenger de la Tour (d. c. 1559), Fr. poet, b. at Aubenas. Studied law with the view of filling some post in the magistracy, but devoted himself mainly to poetry. His verse is characteristic for elegance and verve, if at times it shows a want of good taste. Pub. works include *Le Siècle d'or*, 1551; *Choréide ou Louange du bal aux dames*, 1556; *L'Amie des amies*—an imitation of Ariosto, 1558; *L'Amie rustique*, with other poems and epistles, 1558—this last a very rare and curious work.

Berenger (called **Berenger of Tours**) (998-1088), Fr. divine, b. in Tours, of a rich and distinguished family. After studying at Chartres under Fulbert, he returned to Tours in 1031, and was made teacher in the monastery of St. Martin. He continued to reside at Tours, though he was made archdeacon of Angers in 1040. B. agreed with the doctrine expressed by Scotus Erigena in the preceding century, and openly taught it. He denied transubstantiation, and saw nothing but a symbol in the sacrament of communion. He developed these views in a letter to Lanfranc, prior of Bec, and was condemned for them by the Councils of Vercelli in 1050, Tours in 1054, and Rome in 1059. He recanted, and burnt his documents expressing them, but later again went back to his heretical opinions. On being condemned by Rome, however, he repented, and finished his life as a rigorous ascetic.

Berenice, seaport of anct. Egypt, situated on the E. coast of the Red Sea. It stands at the head of a gulf, and its harbour has been almost blocked by a sand-bar. Among its important ruins is a temple. It was founded in 285 B.C. by Ptolemy II.

Berenice, a Macedonic form of *Phere-nice*, meaning Bringer of Victory. (1) One of the 4 wives of Ptolemæus I., the founder of the dynasty of the Lagidæ in Egypt, and the mother of Ptolemæus II.,

called Philadelphus. B. had a son, Magas, by a former husband, who was afterwards king of Cyrene. (2) Daughter of Ptolemæus Philadelphus by Arsinoë, the daughter of Lysimachus. She was the sister of Ptolemæus III., Euergetes, and was given in marriage, 252 B.C., by her father to Antiochus II., king of Syria, called Theus, God, who divorced his wife Laodice on the occasion. After the death of Philadelphus, Antiochus divorced B. and took back Laodice, who poisoned her husband and put B. to death, together with a son whom she had by Antiochus. To avenge his sister's death Ptolemæus III., Euergetes, invaded Syria, put to death Laodice, and overran the empire of the Seleucids. (3) Wife (c. 248 B.C.) of Ptolemæus III., Euergetes; but her parentage is doubtful, though some authorities say she was the daughter of Magas, king of Cyrene. This B. is said to have made a vow of her hair during her husband's wars in Asia. The hair was placed in the temple of Venus, from which it was stolen, but Conon of Samos declared that it had been taken up to the skies and placed among the 7 stars in the Lion's tail. Callimachus wrote a poem on the occasion, which is now only known from the beautiful trans. by Catullus, *De Coma Berenices*. B. was put to death by her son Ptolemæus IV., Philopator, and his infamous minister Sosibius. (4) Otherwise called Cleopatra, the only legitimate child of Ptolemæus VIII. (Soter II.); reigned 6 months, the last 19 days in them in concert with her husband, Alexander II., who, according to Appian and Porphyry, murdered her 19 days after the marriage, 81 B.C. The portraits of Alexander II. and B. appear sev. times on the great wall of sandstone which encloses the temple of Edfu, and the portrait of B. is always the same. (5) Daughter of Ptolemæus IX., Auletes, who began to reign in Egypt, 81 B.C., sister of Cleopatra. During the absence of her father in Rome, B. was made regent, which office she held from c. 58 to 55 B.C. Gabinius, about the close of 55 B.C., came to Egypt with an army and restored Auletes, who put his daughter to death. (6) Daughter of Herodes Agrippa I., grandson of Herod the Great. After the capture of Jerusalem she was taken to Rome, and was to have married Titus, son of the Emperor Vespasian, but on his father's death Titus unwillingly sent her away, as the match was not pleasing to the Rom. people. (Suetonius, *Titus*.)

Berenice's Hair, see COMA BERENICES.
Berenson, Bernhard, Amer. historian and art critic, b. June 26, 1865; educated Boston Lat. School and Harvard Univ. He became a foremost authority of It. painting and painters of the Renaissance, and in this connection his work on the Venetian painters was pub. in 1894, on the Florentine in 1896 and 1903, on the Central It. in 1897, and on the N. It. in 1907. Other works include: *Lorenzo Lotto, an Essay in Constructive Art Criticism*, 1895; *The Study and Criticism of Italian Art* (3 series), 1901, 1902, 1916; *Essays on the Study of Sienee Painting*,

1918; *Three Essays in Method*, 1927; *Studies in Mediæval Painting*, 1930; *The Italian Painters of the Renaissance*, 1932; *Italian Pictures of the Renaissance*, 1932.

Beresford, Lord Charles William de la Poer (1846-1919), Baron B. of Metemneh and Curraghmore, Brit. naval officer, son of the fourth Marquess of Waterford, b. in co. Waterford, Ireland. He was educated in private schools, and entered the navy as a cadet of the *Britannia* in 1859. He became lieutenant in 1868, captain in 1882, and rear-admiral in 1897. He was naval A.D.C. to the Prince of Wales (King Edward VII.) on his visit to India (1875-6), and to Queen Victoria (1896-97). He was in command of the *Condor* at the bombardment of Alexandria in 1882, when he distinguished himself for bravery; he served in the Nile Expedition under Lord Wolseley, 1884-1885; he was in command of the naval brigade at the battles of Abu Klea, Abu Kru, and Metemneh, and commanded an expedition up the Nile to rescue Sir Charles Wilson's column. He was elected M.P. for Waterford, 1874-80; Marylebone, 1885-89; York, 1897-1900; Woolwich, 1902. He was appointed a lord commissioner of the Admiralty, but resigned in 2 years on a question of the increase of the fleet. In 1898 he visited China as a representative of the Associated Brit. Chambers of Commerce. He was in command of the Mediterranean Fleet, 1905-07, and of the Channel Fleet, 1907-09. He retired in 1911, in which year he was created G.C.B. Represented Portsmouth in Parliament until raised to peerage in 1916. Died in Caithness, 1919, and buried in St. Paul's, the peerage becoming extinct. His entertaining autobiography, *Memories*, was pub. in 1914.

Beresford, James (1764-1840), Eng. author, b. at Upham, Hants; educated at Charterhouse and Oxford. In 1812 he became rector of Knebworth Beauchamp, Leicestershire. His chief work, *The Miseries of Human Life; or the Last Groans of Timothy Testy* (1806-7), was praised by Scott, and he also pub. translations and religious books.

Beresford, John (1738-1805), Irish statesman, b. in Dublin and graduated at Trinity College in 1757. He sat in Parliament, representing Waterford, from 1760 till his death. He was made privy councillor, 1768; first commissioner of revenue, 1780; privy councillor of England, 1786. B. was Pitt's chief adviser in his Irish policy. B. suggested the clauses in Orde's Bill, regarding the removal of the commercial restrictions of Ireland, but was successfully opposed by Grattan. Lord Fitzwilliam dismissed B. from office in 1795, on the ground that his influence in Ireland was displeasing to the Grattan party, and therefore a hindrance to the gov. Fitzwilliam was recalled on this account, and B. reinstated. B. was instrumental in bringing about the union of Ireland with England, and superintended the fiscal arrangements between the 2 countries. His second wife was Barbara Montgomery, one of the 'Graces'

of Sir Joshua Reynolds's picture in the Royal Academy.

Beresford, John Davys (1873-1947), Eng. novelist, b. Mar. 7, at Castor, near Peterborough, son of the Rev. J. J. Beresford, rector of Castor; educated at Oundle School. He went to London at the age of 18, and was articled to a firm of architects. He pub. his first novel in 1911—the earliest vol. of a trilogy—*The Early History of Jacob Stahl*, by which novel, indeed, he will be best remembered—and after that wrote some 40 novels, among which should be mentioned *A Candidate for Truth* (1912), and *The Invisible Event* (1915), the remaining two novels of his trilogy. Although his themes are varied, he estab. a reputation as a writer of the realist school deriving from Gissing. He also owed much to the influence of Samuel Butler. *Jacob Stahl* was warmly received by the more acute critics, though it was not the kind of novel to woo popular taste. In the same year came the short novel, *The Hampdenshire Wonder*, a study of a small boy endowed with the most precocious intellectual gifts, and a highly original story. But in his preoccupation with abnormal psychology, he tended to lose much of imaginative power and, except for *These Lynnekers* (1916), the story of an apostate from the religious conventions of his family, and *The Prisoners of Hartling* (1922), his novels began to decline noticeably in artistic interest. Among his later books were his second trilogy: *The Old People* (1931), *The Middle Generation* (1932), and *The Young People* (1933). Besides novels he pub. sev. vols. of short stories, also a study of H. G. Wells (1915), *The Case for Faith Healing* (1934), and *What I Believe* (1938). He collaborated in 2 plays and wrote a third, *The Complicated Angler*.

Beresford, Lord John George de la Poer (1773-1862), primate of all Ireland; bishop of Cork and Ross, 1805; archbishop of Dublin, 1820; archbishop of Armagh and primate of all Ireland, 1822. In 1851 he was elected chancellor of the Dublin Univ., having been vice-chancellor since 1829. The cathedral of Armagh was restored through his liberality.

Beresford, William Carr, Viscount (1768-1854), Brit. general, the illegitimate son of the first marquess of Waterford. He entered the army in 1785 and served with distinction at Toulon, in Egypt, the Cape, and Buenos Aires. In Feb. 1809 he undertook the reorganisation of the Portuguese army and achieved great success. He was rewarded by being created a K.B. and a peer of Portugal. At Albuera he was in command, and he was also present at Badajoz, Salamanca, and other Peninsular battles. In 1814 he was made Baron, and in 1823 Viscount, B. He left Portugal in 1819, entered into Eng. politics, and became master-general of ordnance in Wellington's administration, 1828-30.

Beresina, or Berezina, riv. in Byelorussia, trib. of the Dnieper, which it joins after a course of 350 m. It waters the region of Minsk. Severe floods mar its navigable value, but it is serviceable as a

water conveyance for large rafts of timber to the open sea. It is memorable historically for the disastrous passage of Napoleon's troops in their retreat from Moscow in 1812. In the First World War Ludendorff and Hoffmann planned to drive the Russian armies against the Pripiet and Beresina marshes, and roll up the whole Russian front from the rear, but never had sufficient troops to carry out such enormous operations. In the Second World War the Gers. were successful in defeating large Russian forces on the B., following the Russian defeat at Bialystock (1941).

Beresna, or Berezna, tn. of Ukraine, situated 30 m. E. of Tchernigov, on a trib. of the Desna. Pop. 11,000.

Beretini, see CORTONA, P. DA.
Berezniki, tn. in the Ural Mts., Sverdlovsk region of the R.S.F.S.R. It was founded during the first and second Soviet 5-year plans, and has the largest chemical combine in the U.S.S.R. Pop. 63,500.

Berezov, tn. of W. Siberia, situated on the Ob in the Ostyak-Vogul natural region. From time to time fires have destroyed the tn. Its trade is in furs, mammoth bones, and fish. Pop. 1000.

Berg, Duchy of, former duchy of Germany, situated on the r. b. of the Rhine, and having for its boundaries Cleves on the N., La Marck on the E., Westphalia on the S., and Cologne on the W. It became a duchy in 1380, when it was in the hands of the Jülich family. The Thirty Years war was partly brought about by the question of its successor on the death of John William in 1609. In 1815 the Congress of Vienna made it over to Prussia, though formerly it had been in the possession of Louis, son of the king of Naples.

Berg, suburb of Stuttgart, cap. of Württemberg, Germany, on the Neckar. Before the Second World War had iron and woollen manufs. Has mineral springs.

Berg, Alban (1885-1935), Austrian composer; b. in Vienna. Won recognition with his opera *Wozzeck*, which vindicates the new atonal methods of composition of his teacher, Schönberg, to a greater degree than any of the latter's own compositions. B.'s first pub. work was the piano sonata in B minor (1908). He developed his atonal style in *Four Songs* (1908), a string quartet (1910), and *Three Orchestral Pieces*, Op. 6 (1914). *Wozzeck* was written during 1914-20 and first produced at the Berlin State Opera in 1925. His later works include a psychological opera, *Lulu*. Other works include the *Lyric Suite* for string quartet, played in London in 1932, and *Chamber Concerto* for violin, piano, and thirteen wind instruments, 1927.

Berga, tn. of Catalonia, Spain, 52 m. N.N.W. of Barcelona. Pop. 6000.

Bergaigne, Abel (1838-88), Fr. philologist, b. at Vimy, Pas-de-Calais. He became prof. of Sanskrit at the Sorbonne. The following of his works may be mentioned: *La Religion védique*, 3 vols., Paris, 1878-83; *Chronologie de l'ancien royaume Khmér*, 1884; and *Études sur le*

lexique du Rig-Veda, 1885. See V. Henry, *L'Œuvre d'Abel Bergaigne*.

Bergama (anct. Pergamus), city of Asia Minor about 40 m. N. of Smyrna. Beautifully situated in a fertile valley. Pop. 15,000.

Bergamo, city and episcopal see of Lombardy, Italy. It is the cap. of the prov. of the same name, and is situated at the base of the Alps at the junction of the Brembo and Serio. There are 2 distinct parts to the tn., the old, Città Alta, on a hill, and Città Bassa below.

rainfall (mean 74 in. annually). The appearance of the tn. is picturesque, amid the beauty of the surrounding scenery. The chief street of the tn. is named Strandgaden. Its prin. buildings are the cathedral, hospital, diocesan college, observatory, and biological station. Mariakirken, an old stone-built church, dates from the late twelfth century. The Norwegian School of Economics and Social Sciences is situated in B., and in 1946 Norway's second univ. was formally opened here. From the Middle Ages B.

Norwegian State Railways

BERGEN

There are silk and cotton factories and a cattle market. Pop. (prov.), 585,000; (tn.), 85,000.

Bergamot (*Citrus bergamia*), variety of *C. aurantium*, the orange (q.v.). Essence of B. is an essential oil obtained both by pressure and distillation from the rind of the ripe fruit of the B. The essence smells of oranges, and is used as a perfume.

Bergara, or **Vergara**, tn. in the prov. of Guipúzcoa, Spain. It is noted for cotton and linen stuffs. Pop. 9000.

Bergedorf, tn. in the ter. of Hamburg, on the R. Bille, 10 m. from Hamburg. The dist., known as *die Vierlände*, is fertile, and became a centre of market gardens for Hamburg and export. Pop. (dist.) 34,000, (tn.) 19,000.

Bergen, city and seaport of Norway, and the second largest tn. of that country, situated on the W. coast, in lat. 60° 23' N. It lies between Vaagen Harbour and the Fuddefjord. The vegetation is unusually prolific for that particular lat., though it is accounted for by the equally unusual

has been an important centre of culture, and as far back as 1600 painting and sculpture were of a high standard, as were also various crafts, especially that of the goldsmiths. There are sev. well endowed museums, such as the Bergen Museum, the Museum of Arts and Crafts, and the Hanseatic Museum. B. is the second largest shipping centre of Norway, and its trade ranks next to that of Oslo. The prin. export is fish and fish products, while the others include butter, copper ore, and hides. Its manufs. include paper, pottery, and ropes. 'Bryggens', the Quay, which is a small tn. in itself, dating from the early Middle Ages, is in a very good state of preservation. At Nordnes and Sandviken can be obtained glimpses of the tn. of the rococo and empire periods, which are in striking contrast with the modern centre of the tn. with its wide streets and fine parks. Floien, 1050 ft. above sea level, may be reached from B. by the funicular railway. About 9 centuries ago King Olav Kyrre gave municipal privileges to B., and for the

next 200 years B. was not only a leading commercial tn., but also a political centre and a royal bor. From the mid fourteenth century the Hanseatic merchants estab. themselves in the tn. and played an important part in the development of its commerce. Fire damaged it at different times, and the broad spaces (Almenninge) now met so frequently are arranged to meet any possible outbreak. B. was one of the first places to be occupied by the Gers. after their invasion of Norway in Apr. 1940, and the tn. and harbour were raided during the same month by the R.A.F. Haakonshalle, the twelfth-century guildhall, and Rosenkrantz Tower, built in the sixteenth century, were both severely damaged in the war. Pop. (including the adjoining dists.) about 130,000.

Bergen (Belgium), *see* MONS.

Bergen-op-Zoom, tn. of the Netherlands, in the prov. of N. Brabant, at the junction of the E. Scheldt and the Zoom. It has large tile and pottery works, and the oyster and anchovy fishery is important. Sugar beet is a new industry. In the fifteenth century its cloth trade and fisheries made it an important tn. Fortified in 1576, it was unsuccessfully besieged by the Spaniards in 1588, 1605, and 1622. It was more strongly fortified by Coehorn, and was captured by the Fr. in 1745, and again in 1795. Sir Thomas Graham (Lord Lynedoch) failed in the assault on the tn., 1814. The fortifications were destroyed in the nineteenth century. Pop. 24,000.

Bergerac, tn. on the Dordogne, France, in the dept. of that name, trades in wine, truffles, brandy; there are spinning mills, flour and paper mills. It was one of the strong places of Protestantism in France, was taken by Louis XIII. in 1621, and the revocation of the Edict of Nantes did much to check its prosperity. Pop. 17,000.

Bergerac, Savinien Cyrano de (1619-55), Fr. author of romances and dramas, son of the Seigneur de Mauvières et de B., served as an officer in the Guards during 1639 and 1640; his enormous nose, his adventures, including a fight with a hundred opponents, and the duels which persisted throughout his life, are recorded by his friend Lebreton; he then turned to writing, producing (1654) *Le Pédant joué*, a comedy which influenced Molière, and the tragedy, *Mort d'Agrippine*, which the orthodox suspected of atheism. His satirical scientific romances, *Histoires comiques des états de la lune* (1654) et du soleil (pub. posthumously) have been regarded as the forerunners of Swift's *Gulliver's Travels*, or as an echo of Rabelais's *Pantagruel*. He d. from an accident while in the service of the duc d'Apurjon. Edmond Rostand founded his play, *Cyrano de Bergerac*, 1897, on the adventures of the real Cyrano. The collected works were pub. by P. L. Jacob, 1858, with Lebreton's memoirs.

Bergh, Johan Edvard (1828-80), Swedish painter, b. in Stockholm. His paintings are chiefly landscape, and are idealistic in character. He preferred

vivid, lively colouring. In 1861 he was appointed prof. in the Academy of Stockholm. His best picture is perhaps his 'View of Uri,' which went to the Berlin Academy.

Berghaus, Heinrich Carl Wilhelm (1797-1884), Ger. geographer, b. at Cleves. In addition to many valuable geographical works, e.g. *Grundriss der Geographie*, 1842, his chief work is the great *Physikalischer Atlas*, 1838-48, new ed. 1886, by his nephew Hermann (1828-90).

Berghem, Nicholas, *see* BERCHEM.

Bergisch-Gladbach, *see* GLADBACH.

Bergk, Wilhelm Theodor (1812-81), Ger. classical scholar, b. at Leipzig; prof. of classical literature at Marburg, Freiburg, and Halle from 1842 to 1868, when he retired to Bonn. His chief works are his ed. of the Gk. lyric poets (*Poetæ Lyrici Græci*, 1843), of Anacreon, 1834, and a lyrical anthology. His *History of Greek Literature*, begun in 1872, was completed by G. Heinrichs and E. Peppmüller. *See* Peppmüller's memoir in ed. of his minor writings, 1884.

Bergler, Joseph (1753-1829), Ger. painter, b. at Salzburg; sent to Italy, 1776, and studied in oil and fresco with Knoller, Mengs, Canova; obtained the prize at the Academy of Parma, 1784, with a picture of Samson delivered to the Philistines by Dallah. Returned to Germany, 1786, and painted many altar-pieces for churches in the neighbourhood of Passau.

Bergman, Torbern Olof (1735-84), Swedish chemist, b. at Katrineberg, in W. Gothland. In 1767 he was appointed prof. of chemistry at Upsala. Notable for researches in dyes and on tungsten. His writings have been collected in 6 octavo vols. *Opuscula Torberni Bergmani Physica et Chemica*.

Bergmann, Ernst von (1836-1907), Ger. surgeon, b. at Rügen, Livonia, Russia. In 1866 he was attached to Prussian troops in the hospital service through the Bohemian campaign and the Franco-Prussian war, and was appointed prof. of surgery at Dorpat, 1871-78. From 1878 to 1882 he was prof. at Würzburg, and then occupied the chair of surgery in the univ. of Berlin. In 1887 he attended the crown prince of Germany, afterwards Emperor Frederick III., who was attacked with cancer of the throat; this case gave rise to a controversy due to the different diagnosis of his colleague in attendance, the Eng. specialist, Sir Morell Mackenzie. B. wrote numerous treatises, including *Die Lehre von der Fettleibigkeit*, 1863; *Die Lehre von den Kopfverletzungen*, 1880; and *Die chirurgische Behandlung von Hirnkrankheiten*, 1898.

Bergmehl, or Mountain Flour, geological deposit in the form of very fine greyish-white powder, also called kieselguhr, fossil farina, and diatomaceous or infusorial earth. It is largely composed of the indestructible siliceous frustules or cell-walls of diatoms. Beds of earth of considerable thickness that have accumulated in past geological ages are now being found on the bottom of some freshwater lakes and on the sea

floor. B. has valuable abrasive properties. It is employed in manufacturing dynamite as an absorbent; and is used as insulating material for boilers and steam-pipe coverings.

Bergner, Elisabeth (b. 1898), Ger. actress who made her reputation, in England, on her first appearance. This was in Margaret Kennedy's *Escape Me Never* at the Apollo Theatre, 1933-34. Previously she had won early fame in Germany in the leading role in *La Dame aux camélias*, and also in a Ger. rendering of Margaret Kennedy's *The Constant Nymph* and Shaw's *St. Joan*. Played Rosalind at Stratford-on-Avon Shakespeare performances. Also known for film work, notably in *Die Träumenden Münde*, *Catherine the Great*, and *Escape Me Never*. In 1935-36 Sir J. M. Barrie wrote the play *David* especially for E. B.

Bergschrund, mountaineering term for a crevasse at the base of a snow or ice slope. Bs. are usually too wide to be strided, and resort must be had to a snow bridge.

Bergson, Henri Louis (1859-1941), Fr. philosopher, b. in Paris, Oct. 18. His father was a musician of Jewish birth; his mother was Brit. Although he spoke Eng. fluently, his education was entirely Fr. at the Lycée Condorcet and the École Normale. He held the post of prof. of philosophy at the Lycée d'Angers, 1881-1883, and after a number of similar appointments in the provs., he became prof. at the École Normale Supérieure, 1897-1900. In 1900 he was elected to a professorship at the Collège de France, holding the chair of philosophy there until 1921. In 1914 he was elected to the Académie Française, and in 1927 was awarded the Nobel prize for literature. His thesis, *Essai sur les données immédiates de la conscience*, was delivered to the univ. of Paris in 1889, and won him immediate recognition. He was perhaps the first philosopher to recognise sufficiently the importance of change. His view was that much of the confusion in early metaphysics arose from the attempt to state reality in terms of *space* and to eliminate *time*. This attempted elimination of time is, he asserted, characteristic only of knowledge dominated entirely by conceptions of utility; and if the relation between knowledge and its objects is stated in terms of time instead of space, many antinomies, e.g. those of Idealism and Realism, will be resolved. Throughout his work and particularly in *Creative Evolution*, B. insisted on the distinction between the nature of experience of time and that of experience of space: that time, properly understood, and freed from certain spatialising notions that have become entangled with it through the infirmities of thought, is a process of change in which none of the parts is external to another, but all are interpenetrating; where the past is carried on into the present; where therefore there is no repetition, but a continual creation of what is new—whereas space is that whose parts are external to one another and can be simultaneously apprehended, and in which recurrence of the same thing in the same position is

possible. Like Heraclitus, B. regards everything as in a state of flux; ceaseless change in which there is, strictly speaking, no repetition or recurrence. There being no recurrence, there cannot well be any guiding rules of conduct to meet each new and unique contingency. His original aim, like that of many other philosophers, was to relieve himself of the oppressive chain of cause and effect, to assert free will as against mechanistic determinism. This he was able to do as a result of his meditations on time—reaching the conclusion that, despite the apparent progress of successfully predictive science, the future remains, not only unpredicted, but essentially unpredictable, because essentially uncertain. For B. there is a continual drama, of Life or Consciousness struggling against Matter and not conforming to its laws. At first, B. was purely dualistic on this question; but it was noticed that in *Creative Evolution* he conceded something to the monistic tendency, and regarded matter as 'a vital impulse arrested.' This principle of the *élan vital* in evolution, the urge to create, was put forward by B. as an alternative to the Darwinian theory of natural selection, which, in his view, did not sufficiently explain the evolution of intellect. His theories had a profound influence on biological studies, and were corroborated by later developments in the study of psychology. His chief publications are *Essai sur les données immédiates de la conscience*, 1889 (Eng. translation, *Time and Free Will*, 1910); *Matière et mémoire*, 1896 (Eng. translation, 1911); *Le Rire*, 1900 (Eng. translation, 1911); *L'Évolution créatrice*, 1907 (Eng. translation, 1911); *L'Énergie spirituelle*, 1919; *Durée et simultanéité*, 1923; *Les Deux Sources de la Morale et de la religion*, 1932 (Eng. translation, 1935). See W. James, *A Pluralistic Universe*, 1909; A. D. Lindsay, *The Philosophy of Bergson*, 1911; H. Wildon Carr, *Henri Bergson: the Philosophy of Change*, 1912; E. Hermann, *Eucken and Bergson*, 1912; Hugh S. Elliot, *Modern Science and the Illusions of Professor Bergson*, 1912; an article by A. J. Balfour in *Hibbert Journal*, 1911; and a critical exposition by J. Chevalier, 1928.

Bergues, tn. of N. France, in the Nord dept., 5 m. S.S.E. of Dunkirk. Pop. 3800.

Berg Wind, name applied in the S. coast of Cape prov. to a rough, hot, dry northerly wind. This wind is frequent during the months of May and Aug. Its duration is normally one day, but occasionally it blows steadily for 2 days.

Bergylt, or **Berguylt** (Norwegian *berg-gylla*), European name for the rose-fish, or *Sebastes marinus*, a fish of the family Scorpenidae (with 15 dorsal spines and 31 vertebrae). It is found on both shores of the N. Atlantic, and is known by many names, amongst them being Norwegian haddock, red-fish, hemdurgan, red-perch, red-snapper. The grown fish is of a nearly uniform orange-red colour. The same name is used in Scotland for the black goby.

Berhampur: (1) Tn., Murshidabad dist.,

Bengal, India, near Murshidabad on the Bhagirathi. The Indian mutiny broke out here. The old and abandoned tn. of Cossimbazar is within the boundaries. Pop. 32,000. (2) Tn., Ganjam dist., Madras, India. The chief industries are silk-weaving and sugar-manuf. Pop. 25,000.

Beri-beri, tropical disease, of which the main symptoms are those of peripheral neuritis, beginning with numbness and stiffness in the legs, swellings and puffing of the ankles and face, and paralysis of muscles; in 'wet B.' the puffiness becomes general and dropsical, in 'dry B.' the muscles atrophy, acute breathlessness and heart palpitations follow, with heart failure, collapse, and death, or the dropsical condition affects the lungs with fatal effects. The symptoms vary in intensity according to the particular nerves involved in the inflammation. Mortality varies greatly. The disease was found mainly among the rice-eating peoples of the E. It has also occurred in Europe, the U.S.A., and other parts of the world, not therefore being confined to the tropics. The relationship between the prevalence of the disease and a diet consisting mainly of white flour or milled rice or tapioca came gradually to be realised towards the end of the last century. Eijkman, a medical officer of a prison in Java, was the first to make scientific observations of the effect of a diet of white rice, first on birds, and later on the inmates of the prison. The result of these experiments were confirmed by the work of Fraser and Stanton in the Malay States who proved that the cause of the disease was the absence from the diet of a chemical substance found in the whole rice grain and the whole wheat germ. It was not until 1927 that efforts to isolate this anti-beri-beri substance were successful, and the substance thus obtained was analysed by Jansen and Donath working in the Netherlands E. Indies. This substance was later identified with the vitamin B, the discovery of which was made independently by scientists working in the United Kingdom following the lead given by the work of Sir Gowland Hopkins (q.v.). See VITAMINS.

See H. V. Dangerfield, *Beri-Beri*, 1905; W. Hunter and W. V. M. Koch, *Etiology of Beri-Beri*, 1906; E. Ward, *Beri-Beri, its Etiology*, 1915; H. Fraser and Sir A. T. Stanton, *Collected Papers on Beri-Beri*, 1924.

Bering, Vitus (d. 1741), Dan. explorer; entered the navy of Peter the Great, and made sev. attempts to settle the question of the junction of Asia and America; discovered the is. and strait that now bear his name.

Bering Island is situated in the S.W. of B. Sea. It is the most westerly is. of the Aleutian group, desolate and uninhabited. Bering was wrecked here, and, without food or shelter, *d. miserably* in 1741.

Bering Sea and Strait, the latter divides the continents of America and Asia, and also joins the N. Pacific with the Arctic Ocean. It is about 38 m. wide at its

narrowest part, but is wider at the N. and S. extremities. There are numerous bays on either side of the strait, of which the waters are frozen over for sev. months in the year. B. Sea, which is sometimes called the sea of Kamchatka, is a part of the N. Pacific Ocean, and is situated between B. Strait and the Aleutian Is. It is the haunt of the whale, walrus, and fur seal.

Bering Sea Question, international dispute, between the govs. of the U.S.A., Great Britain, and Canada, connected with the unlicensed fishing of Canadian sealers in the Bering Sea. In 1886 certain Canadian sealers started on a business basis the hunting and killing of seals beyond the 3-mile limit in the Bering Sea, in which Great Britain has commercial privileges, granted by Russia in 1825. The Gov. of the U.S.A. took steps to prevent Canadian fishing, and in 1892, by the Blaine-Pauncetote treaty, it was agreed that a court of arbitration should be held in Paris to settle the question at issue. This court decided *inter alia* that the U.S.A. Gov. had no right of protection of property in seals beyond the 3-mile limit, and no exclusive rights of jurisdiction in the Bering Sea. The U.S.A. also paid a sum of \$92,700 to the Canadian Gov. as a compensation for the ships she had unlawfully seized or damaged. Consult Stanton, *The Bering Sea Controversy*, 1892; Report of the *Bering Sea Commission*, 1893.

Bériot, Charles Auguste de (1802-70), Belgian violinist and composer, *b. at Louvain*; he married Malibran, the famous singer, in 1836; prof. in the conservatory of music of Paris, 1843; and of Brussels, 1843-52. He wrote a manual for the violin, composed 7 concertos and numerous other pieces. He had 2 noted pupils, Vieuxtemps and Léonard.

Beris, genus of dipterous insects of the family Xylophagidae. The species are small, metallic-coloured flies which frequent the leaves of plants, and the larvae feed on putrescent wood. *B. clavipes* lays its eggs in the form of a little chain of single oval eggs glued together.

Berislav, or Borislav, tn. in the region of Kherson, Ukraine, 40 m. E.N.E. of Kherson city. It manufs. candles, and exports corn and timber, and there are oil deposits in the B. dist.

Berja, tn., Almería, Spain, near Adra. Lead is mined near; agric. products include wine, oil, and esparto grass, and there are paper and small cotton mills. Pop. 13,500.

Berkeley, tn., Gloucestershire, England; situated in the Vale of B., a rich dairy and pasture country, celebrated for its 'double Gloucester' cheese. The B. Ship Canal admits small vessels to Gloucester from the docks at Sharpness. The church is Early Eng. and Decorated. B. Castle, where Edward II. was murdered, to the S.E., the residence of Lord Fitzhardinge (see BERKELEY, family), is one of the finest in England. Dr. Edward Jenner, the discoverer of vaccination, was *b.* and buried here. Cloth was once manufactured. It was a bor. in the thirteenth

century, but the corporation was dissolved in 1885. Pop. 800.

Berkeley, tn., Alameda co., California, U.S.A. It is a popular residential dist. for San Francisco, 7 m. distant across San Francisco Bay. It is the site of the univ. of California, estab. 1873, and of numerous denominational theological colleges and seminaries. Pop. 85,500.

Berkeley, name of an Eng. noble family, whose hist. centres round the tenure of the great castle at Berkeley, Gloucestershire. A clear descent can be traced to Robert Fitz-Harding, who *d.* in 1170, and was a wealthy citizen of Bristol. Tradition traces his descent from a son of a king of Denmark who came over with the Conqueror. In 1155 he obtained a grant from the king of the manor of B., and a marriage took place between his son Maurice and the older family, descended from the Domesday tenant. Various lords of B., usually named Thomas or Maurice, played a distinguished part in the military and political annals of the kingdom. On the death of the ninth earl of B. in 1810, an important and interesting lawsuit took place. In 1796 he had married Mary Cole, by whom he had already sev. children; to legitimise these children he made a declaration of an earlier marriage; this entry of marriage in a par. register was declared by the House of Lords to have been a forgery. The eldest son, thus declared illegitimate, had been left the castle and estates by will, and now claimed a writ of summons as a baron, 'by tenure of the castle of B.,' a claim which was defeated, as it had been declared in 1669 that such baronies by tenure were not to be revived. He was, however, raised to the peerage as Earl Fitz-Harding; his brother succeeding him revived the claim and was made a baron with the title of Fitzhardinge, which still remains, together with the ownership of the castle and B. estates. The earldom of B. remains in the legitimate branch of the family. There have been many branches of the family, such as the Lords B. of Stratton (1658-1773), with which the philosopher George B. (q.v.) was connected.

Berkeley, George (1685-1753), Irish philosopher and bishop, *b.* near Dysert, near Kilkenny, Ireland; the son of a relative of Lord Berkeley of Stratton, Irish viceroy, 1670-72; his mother belonged to the same family as General Wolfe. He entered Trinity College, Dublin, 1700, of which he became fellow, 1707. Here he studied Descartes and Newton, while Locke's *Essay*, pub. 1690, was already influencing the study of philosophy. The early trend of his mind is shown by his valuable *Commonplace Book*, 1705-6, first pub. in 1871, which gives the first working out of his new principle in philosophy, that matter, substance, and cause have no meaning apart from the conscious spirit. In 1709 he pub. *A New Theory of Vision*, followed by a fuller statement, 1710, *Principles of Human Knowledge*. In 1711 appeared a *Discourse on Passive Obedience*, and in 1713 Swift introduced him to the court

and the intellectual society of London, and a popular exposition of his new theories in the form of *Dialogues between Hylas and Philonous* was pub. From 1714 to 1720 he travelled in Europe as chaplain to Lord Peterborough and as tutor to the son of Bishop Ashe. On his return, the disastrous condition of society, due to the collapse of the South Sea Bubble, led to his *Essay towards Preventing the Ruin of Great Britain*, 1721. In 1722 he was made dean of Dromore, and in 1724 dean of Derry. He then embarked on a scheme for the founding of a college in the Bermudas, to christianise from there the Amer. continent. Through Walpole he obtained a promised grant of £20,000, and in 1728 he went to Rhode Is., where he lived till 1731, returning when he realised the money promised would not be paid. In 1733 he pub. *Alciphron, or the Minute Philosopher*, a Platonic dialogue on the philosophy of religion, with criticism of the free-thinking of the age. He was made bishop of Cloyne, 1734. He pub. *The Analyst*, 1734, and *The Querist*, 1735-37, the last a series of questions on sociology and economics. In 1744 was pub. his last work, *Siris*, which nominally dealing with the use of tar-water as a specific in small-pox and other diseases, contains some of his most profound metaphysical speculations. In 1752 he resigned his bishopric and moved to Oxford, where he *d.*

B. is the direct successor to Locke, and much of his work consists of attempts to solve the problems that Locke had failed to solve. The central principle of B.'s philosophy, that the essence of all reality is its being perceived, or in other words, the impossibility of anything existing independently of perception, was suggested to B.'s mind by an early study of Locke. As for Kant, he himself has left it on record that he was awakened from his 'dogmatic slumber' by Hume's trenchant but not altogether accurate attack on B. B.'s *New Theory of Vision*, *Principles of Human Knowledge*, and the *Dialogues between Hylas and Philonous* (Everyman's Library, 483), although written before he was 30, contain, nevertheless, the main exposition of his philosophy. This main principle was that nothing existed apart from perception, a principle which B. declared to be intuitively obvious and manifest common sense. But the *soi-disant* men of common sense among his contemporaries—including Dr. Johnson—persisted in regarding B.'s doctrine, at best, as a subtle metaphysical paradox, at worst, as an ingenious sophistry. He was charged with attempting to prove the non-existence of matter, and that everything in the universe was merely ideal. B. protested against this assumption, asserting that everything that is seen, felt, heard, or in any way perceived, is a real being, i.e. exists, whilst, on the contrary, a thing which is not perceived cannot be known, and, not being known, cannot exist. The only intelligible cause of all phenomena is a mind. Neither pain nor

pleasure exist apart from their being felt. Standard ed. of B.'s complete works, A. Campbell Fraser, 1871, new and revised ed., 1901, with life, letters, etc.; also *Selections*, 1899, and *Berkeley in Blackwood's Philosophical Classics*; see also G. Sampson's ed. of *Works*, 1899, with biography by A. J. Balfour; J. M. Hone and M. M. Rossi, *Bishop Berkeley*, 1931.

Berkeley, Lennax Randal Francis (b. 1903), Eng. composer, partly of Fr. origin. Educated at Oxford Univ. Studied music in Paris. Has written piano music, orchestral and chamber music, and an oratorio, *Jonah* (1936).

Berkeley, Miles Joseph (1803-89), Eng. botanist, b. at Biggin Hall, Northamptonshire; educated at Rugby and Cambridge. In 1886 he became rector of Sibbertoft. He was one of the earliest investigators on the potato murrain, on grape mildew, and on diseases of other vegetables. His chief works are *Introduction to Cryptogamic Botany*, 1857, and *Outlines of British Fungology*, 1860.

Berkeley Sound, opening on the N.E. coast of E. Falkland Is.

Berkhamstead (Great Berkhamstead), tn. of Hertfordshire, England, 28 m. distant by rail from London. It is on the Bulborne R., and near the Grand Junction Canal. Straw-plaiting is the chief industry. The grammar school dates from 1541, and there is a large church, St. Peter's, of many styles and dates, chiefly Perpendicular. There are remains of the once important castle. Pop. 8000.

Berkovitz, tn. of Bulgaria, on the Ogost, a trib. of the Danube. It lies 40 m. N.W. of Sofia. Pop. 6000.

Berkshire (A.-S. *Berroc-scir*, from the 'wood of Berroc where the box-tree grows'), co. of England, in the S. midlands, lying between Oxford and Bucks, N.; Hampshire, S.; Surrey, E.; and Wiltshire, W. The area is 462,367 ac. Pop. 311,000. There are 3 co. parl. divs., Abingdon (N. div.), Newbury (S.), and Windsor (E.). Reading, the co. tn., returns 1 bor. member. The Thames forms the natural N. boundary, on which are situated the old tns. of Abingdon, Wallingford, Maidenhead, Reading, and Windsor. In the N.W. is the Vale of the White Horse, so called from the rude figure of a horse, 374 ft. long, cut out of the chalk on White Horse Hill (856 ft.). It is probably of far greater antiquity than Alfred's Dan. victory it is said to commemorate. Through the rich pastoral vale on which lies Wantage runs the Ock. S. and E. are the valleys of the Pang, meeting the Thames at Pangbourne (near is Bradfield College, founded 1850), and of the Lambourn, draining to the Kennet, a beautiful trout-fishing stream, which runs to the Thames at Reading; on its S.W. reaches lie Hungerford and Newbury. Near is Inkpen Beacon (1011 ft.), the highest point in the co. Windsor Forest, the castle, and the tn. are on the E. border, and S.E., stretching into Surrey, are the sandy pine-clad heaths of Bagshot, where are Ascot and Wokingham, near which are the Royal Military

College at Sandhurst and Wellington College. The co., except for Reading, is chiefly agric., sheep-farming on the chalk Berkshire downs and dairying being of great importance. The B. breed of pigs is famous. See F. A. Brabant, *Berkshire*, 1911; H. W. Monckton, *Berkshire*, 1911; Arthur Mee, *Berkshire*, 1939.

Berkshire Hills, name given to the mt. dist. of Berkshire co., Massachusetts, U.S.A. The scenery and healthy situation attract thousands of visitors annually; the mts. are a continuation of the Green Mts. of Vermont. The highest point is Greylock (3535 ft.).

Berkshire Regiment, The Royal 1st Battalion (formerly 49th Foot), formed in 1714 in W. Indies from independent companies which were regimented in 1744; fought in the Amer. war of 1777; in 1782 became the Hertfordshire Regt. As marines it served in Baltic fleet in 1801. Took part in the Amer. war of 1812-14, China war of 1841-42, and Crimean war. In 1881 became the Berkshire Regt., title Royal being granted in 1885. 2nd Battalion (formerly 68th Foot) raised 1755; served under Wellington in the Peninsula. Garrisoned St. Helena during Napoleon's captivity. In 1881 was linked with the 49th to form the Berkshire Regt. During First World War raised 16 battalions for service in France, Flanders, Italy, and Macedonia. In the Second World War the B. R. fought in France and Belgium and in Burma. They were part of the 168th Brigade of the 56th (London) Div., and fought in the last stage of the Tunisian campaign, and as part of the allied landing force in Salerno Bay on Sept. 9, 1943. The next month they crossed the Volturno and Garigliano, being engaged in battles fought over very difficult terrain. Afterwards their div. was moved to the Anzio 'beach-head' (Jan.-Feb. 1944), and in Aug. of that year were again moved over to attack the defences of the Adriatic coast, and thereafter took part in the thrust in Apr. 1945 to the line of the Po. Another unit rendered conspicuous service at Mandalay in 1945.

Berlad, cap. tn. of Tutova, Rumania, on the railway from Jassy to Galatz. Pop. 25,000. Noted for its ann. horse fair; manufs. soap and candles.

Berlichingen, Götz von (sixteenth century), Ger. knight of Swabia, the subject of Goethe's poem bearing his name (trans. by Sir Walter Scott). Went to war with his neighbours, and in 1513 was put under the ban of the empire for attacking Nuremberg; besieged by Maximilian the Emperor, and d. in defence of his castle.

Berlin, city of Germany in the prov. of Brandenburg, cap. of the former Ger. Reich, also (before the Second World War) cap. of the republic of Prussia, seat of the former royal and imperial palaces, of the Federal Council (Bundesrat), of the (pre-1945) Republican Parliament (Reichstag), of the Prussian Parliament (Landtag), and of all the chief administrative and gov. offices of the Ger. republic, with the exception of the Supreme Court of

Justice (Reichsgericht), which is at Leipzig. The R. Spree flows through the city from the S.W. to the W., and the confluence of the Spree and the Havel is at Spandau, to the W. of Greater B. The city lies 84 m. from Stettin and 180 m. from Hamburg. It covers an area of 340 sq. m., and the pop. in 1939 was 4,332,242, so that in point of pop. the city ranked fourth after London, New York, and Tokyo.

Industries. The industry and commerce of the city showed rapid growth

the city. There are electric tram lines, an overhead electric railway, and a shallow underground railway. The Spandau and Teltow canals link B. to the R. Havel, and thus connect it with the systems of the Oder and the Elbe.

Education. The Friedrich Wilhelm Univ. was founded in 1810, and through its association with many famous names it came to hold an important place in European scholarship and learning. The institution at Charlottenburg and other technical and scientific schools and

D. McLeish

UNTER DEN LINDEN AND THE BRANDENBURG GATE IN 1939

after the Franco-Ger. war of 1870. By 1939 its industries were almost as varied as in London. The woollen industry is the oldest estab., and grew to cover a number of allied trades. The chief industries, however, came to be in the manuf. of machinery, especially locomotives and electrical machinery. Dyeing, furniture-making, brewing, and metalwork are also important. B. began to rival Leipzig in book production. It also became the chief centre and market for the E. European trade in corn and other cereals. Consequent upon the city's commercial importance, its banks and stock exchange exercised increasing international influence.

Communications. B. was (before 1945) the centre of the Prussian state railway system, and the junction of 12 main lines. The city itself is served by an outer circle (Ringbahn) and by the Stadtbahn, running E. and W. through

colleges, with numerous general schools of all grades, also helped to make B. an educational centre of the first importance.

Buildings. The following account of the chief streets and buildings of B. describes briefly the growth and adornment of the city under the Empire, the Republic, and the Third Reich as it appeared before the devastation of the Second World War. The prin. streets are Unter den Linden, leading from the royal palace in the Schlossplatz W. to the Brandenburg Gate (built 1789, a copy of the Propylaea at Athens); S. lie the banking street, Behrenstrasse, and the Wilhelmstrasse, the official quarter, where was the Reich Chancellery. Fine shops and restaurants lined the Friedrichstrasse; Viktoriastrasse was one of the many thoroughfares of the fashionable dist., S.W.: Königstrasse and Kaiser Wilhelmstrasse were the business streets of the city proper. Outside the Brandenburg Gate

lies the Tiergarten, a beautiful park crossed by the Siegessallee (1901), with its marble statues of Hohenzollern rulers, given by the last emperor. The Tempelhoferfeld, to the S., was the parade and review ground of the B. garrison. The royal palace, standing in the Schlossplatz, was one of the few old buildings in B., dating from the sixteenth century; it contained over 600 rooms, including the great Weissesaal and the halls of the Black and Red Eagle orders, etc. Other palaces were those of the Emperor William I. and of Frederick III. The Parliament House, N. of the Tiergarten, was designed by P. Wallot. The only old churches were the Marienkirche and Nikolaikirche. The new cathedral, by J. Raschdorff, was begun in 1893. The most striking bridge is the Schlossbrücke, by F. Schinkel, with colossal marble figures. No city had so many statues and monuments to the national heroes, king or military, or to those famed in literature, science, and art. The royal library, once in the palace, but subsequently in a building built in 1909 on Unter den Linden, contained nearly 5,000,000 printed books. The univ. library was housed in the same building. There was a large public library and 28 municipal libraries. The royal museum, in the Lustgarten, N. of the Schlossplatz, divided into the old and the new museums, contained the treasures of classical and medieval sculpture, the Egyptian collection, etc. The National Gallery contained the modern Ger. paintings. In the Kaiser Friedrich Museum (1904) was housed the magnificent art collection of paintings, medieval bronzes, etc.

History and Administration. The nucleus of the tn. were the 2 small palaces of Kölln and B., on the arms of the Spree. Here Frederick II. (the Iron) built a castle, and John (Cicero) made it a court of the Brandenburg electors. It suffered greatly during the Thirty Years war, and it was not till the time of the Great Elector and his successor that the tn. grew and were consolidated as one under its present name. After the Napoleonic wars, much of the city was rebuilt, mainly under the influence of F. Schinkel, but its rise to the position of a cap. city of the first importance dates from the formation of the Ger. Empire. The city consequently grew with the expansion of trade and the centralisation of gov., and increased from a pop. of 826,000 in 1871 to 2,000,000 in 1905, and 3,000,000 in 1910. This growth in pop. meant that since 1878 the city was practically rebuilt. Sanitation, water supply, and public hygiene were reorganised, and overcrowding obviated by an extension of the city's boundaries. In 1911 a plan was carried out to bring the city and the tns. of Charlottenburg, Lichtenberg, Neukölln, Schöneberg, Wilmersdorf, with the administrative areas of Teltow and Niederbarnim, under a common authority for the administration of streets, roadways, and the elevated railway. Common police regulations were to be in force in

these places. Under the scheme large areas of land suitable for development were to be acquired. The scheme became operative on Apr. 1, 1912, and functioned during the 1914-18 War, but after the armistice it was deemed desirable to effect further co-ordination in the municipal gov. and services. After protracted discussions between the different authorities concerned, a common basis of agreement was reached, and a Bill was passed in the Prussian Constituent Assembly on Apr. 27, 1920, to establish a new municipality of B., which would take under its administrativeegis all the usual services and other matters of general application to the area as a whole; but a large measure of self-control in strictly local affairs was left to the dists. which had been absorbed. The municipal gov. covered schools, poor law, hospitals, water supply, drainage, lighting, etc. The city council consisted of paid and unpaid officials, and the elected common council was presided over by an *Oberbürgermeister*, and a *Bürgermeister*. The police authority extended over building, markets, crime, and trade.

The old familiar provincialism of the city, which was dear in the eyes of many Gers., disappeared, and during the second decade of the twentieth century the city became more European in character and less Ger. It was a formless city, never having been Germany's natural centre. It lies on the edge of the Reich, not only geographically but also historically and culturally. Under the Nazi regime a programme was laid down to make B. the focus of Ger. pride and the centre of Ger. culture as understood in the Third Reich. By this time, B. already covered an area of 340 sq. m.—a larger area than that occupied by any other tn. in the world except Los Angeles—and as regards pop. it ranked fourth. The municipal authorities planned in the expectation that in a further 40 years B. would become the cap. of central Europe with a pop. of 10 million inhab. Greater B. was, in fact, almost a country in itself, stretching from Staaken to Schmokwitz, from Buch to Wannsee, and embracing within its area lakes, cornfields, and fir woods. With its fields and windmills standing between its factories, B. served as a model of what the municipal authorities hoped the whole Reich would become in time.

In 1939 Germany entered upon a war, fully believing that its cap. city would remain invulnerable. Its leaders pledged themselves to this. The city became, however, one of the most heavily bombed of all the cities of Europe. Some of its severest trials under air attack came in 1943. In Jan. of that year it was bombed 4 times, including the first daylight raid, which marked the beginning of the offensive of the U.S. Eighth Air Force. In Mar. with an improvement in weather conditions, the R.A.F. returned to the attack, and on Mar. 27 made a concentrated raid with a powerful force of 4-engined bombers carrying 900 tons of high-explosive and incendiary bombs. The sixth attack of the year was on Mar. 1, when a heavy

concentric raid was made, lasting 30 minutes. Strong defences were encountered on the outskirts of the city. As a result of these raids various gov. depts. were transferred to other cities, including the central offices of the Gestapo, which were moved to Prague, and the foreign ministry, which was moved to Vienna, while the majority of the schools were evacuated to Lodz and Poznan. By this time, also, about 500,000 of the inhabs. were sent into Poland. On the night of Aug. 23, 1943, a

land, and the travel agency, Mitteleuropäisches Reisbüro, in the Leipziger Platz were destroyed. The only building comparatively undamaged in the Wilhelmstrasse was the Reich Chancellery. The total losses also included the Hotel Kaiserhof in the Wilhelmsplatz, and the Ger. Foreign Office. By this time the Luftwaffe had been driven underground, and B. was a wrecked, cold, hungry city, in which food, fuel, and tobacco were bartered for clothing. But the largest force of R.A.F. bombers, chiefly Hal-

BERLIN: THE KAISER FRIEDRICH MUSEUM

'The Times'

strong R.A.F. force of 700 bombers, manned by 5000 airmen, broke through a strong fighter screen and dropped 1700 tons of bombs on B. in 50 minutes, for the loss of 58 bombers and 1 fighter. Large-scale damage was done by this raid, especially to the central parts of the city, including the Mittelstrasse near Unter den Linden, the Wilhelmstrasse, and also the outlying industrial dists. of Siemensstadt and Spandau, while the railway stations, the Potsdamer, Anhalter, and Stettiner were ruined. Terrific damage was again wrought by the R.A.F. in attacks on the nights of Nov. 22, 23, 1943, the destruction being particularly great in the central dists. The whole way from the Potsdamer Platz, through the gov. quarters around Wilhelmstrasse, and towards the Tiergartenstrasse was a sea of fire and smoke. The Columbus Haus skyscraper was burnt out, the landmark Haus Vater-

faxes and Lancasters, attacked the cap. on the night of Feb. 15, 1944, when more than 1000 aircraft dropped 2500 tons in 30 minutes, while Mosquitoes followed them to hamper the work of B.'s fire brigades. The raiders lost 43 aircraft. Another big attack was made in co-ordination with the allied invasion of Europe when, on June 21, 1944, more than 1000 Flying Fortresses and Liberators of the U.S. Air Force escorted by 1200 Lightnings, Thunderbolts, and Mustangs bombed various targets in Berlin, for the loss of 43 machines. With the advance of the Soviet army, B. also became threatened from the land. By Feb. 21, 1945, Marshal Zhukov's forces were within 34 m. of the city. Air attack continued, the raid of Mar. 18 by a U.S. force of 1300 Liberators and Fortresses being the largest daylight attack B. had yet sustained. Over 3000 tons of bombs

were dropped. On land the Amer. Ninth Army had reached the Elbe, 70 m. from B., on Apr. 11, 1945. The same month the Soviet forces were fighting over the approaches to the city, and, on May 2, the city surrendered to Marshal Zhukov. For further details of the Russian military operation against B., see EASTERN FRONT IN SECOND WORLD WAR. After the cessation of hostilities, Greater B. was occupied by the forces of the U.S.S.R., the U.S.A., Great Britain, and France, and the city was administered by an Inter-allied gov. authority.

About 75 per cent of the city was literally destroyed in the Second World War; 25 per cent of the buildings remained habitable, though dilapidated and partly damaged. Generally speaking, these houses which were still intact were in the outlying residential areas, so that the pop. (3,000,000 in 1946) of the city then had about one-fourth of its former living space. In the central parts most buildings were gutted. Thus the Charlottenburger Chaussee from the Adlon Hotel to the former technical high school was burnt out. This was typical of the main arteries. In the Tiergarten only a few trees survived the bombs, the fires, the shelling, and the fuel shortage. All secondary roads, lanes, and passages seemed to have disappeared, buried under a wild growth of rough grass, rubble, and dirt. In the Diplomaviertel and, opposite, the more bourgeois Hansaviertel or residential area, everything was lifeless, and nothing seemed so deathly as the few crippled statues, wretched survivors of Kaiser Wilhelm's monstrous Siegesallee, lying decapitated in a wilderness of cabbage, grass, and dirt. Eighteen months after the war was over the streets had been cleared, and the ruins looked much tidier than in most Ger. cities. Late in 1946 day by day new shops with minute windows and nothing to sell began to appear all over B., though mainly in the W. Anglo-Amer. zone. Pre-Hitler parties were revived. The old trade unions came back. Newspapers with new names copied, almost unintentionally, the manners of the past. Less than 1 per cent of the famous old cafés reopened with nothing to offer except coloured synthetic lemonade. The scene at the end of the year was a hollow show of political meetings, violent newspaper polemics, foodless cafés, dancing, well-dressed men without home or hope of work, shops without wares, serious concerts and frivolous cabarets, election campaigns, and skilled workers drawing a weekly wage worth five cigarettes on the black market. All around was the passionate hope of a return to 'normality' where nothing could be normal for the simple reason 'that yesterday's social order, its symbols and values, had simply vanished into nothingness' (Paul Anderson, *Impressions of Berlin*, 1946).

In 1948 the introduction of the W. Deutsche mark improved the situation for most Berliners. The ensuing Russian ban on rail, road, and canal movements from the W. into B., however, forced the

three W. powers to supply essentials by air. At the end of Oct. negotiations had failed to obtain the lifting of the blockade.

See A. Rutenberg, *Das alte Berlin*, 1913; J. Laforgue, *Berlin and its Environs*, 1923; E. Kaebler, *Berlin Im Weltkrieg*, 1921; id., *Erforschtes und Erlebtes aus dem alten Berlin*, 1917; Baedeker.

Berlin, tn., Coos co., New Hampshire, U.S.A. The falls of the Androscoggin R. provide the power for the large pulp, paper, fibre, and saw mills. Pop. 19,000.

Berlin, Congress and Treaty of (June 1878), a convention of the representatives of the chief European powers called by Prince Bismarck. The object of the treaty was the reconstruction of the Russo-Turkish treaty of San Stefano (1878). The congress met under the presidency of Prince Bismarck at B. Great Britain was represented by Lord Beaconsfield, Lord Salisbury, and Lord Odo Russell. By the treaty Rumania, Servia, and Montenegro were recognised as independent states. The boundaries of Bulgaria were enlarged, and it became an autonomous Turkish trib. state under an elected prince. Rumelia also became self-governing, under a Christian minister-in-chief, but was still held under the power of the sultan. The boundaries of Greece were also enlarged. Bosnia and Herzegovina were transferred to the control of Austria. Rumania obtained the Dobrudja, and in return ceded to Russia the Bessarabian ter. she took from Russia at the treaty of Paris. Ardahan, Kars, and Batum were ceded to Russia. Most of these provisions stood unchanged until the First World War (see, however, BOSNIA AND HERZEGOVINA; RUMELIA, EASTERN). But they have been very profoundly modified (see peace treaties after the First World War: LAUSANNE, TREATY OF, 1923; NEUILLY, TREATY OF, 1919; ST. GERMAIN-EN-LAYE, TREATY OF, 1919; and VERSAILLES, TREATY OF, June 28, 1919; and also ASIA MINOR; Bessarabia; and YUGOSLAVIA).

Berlin, Irving (b. 1888), Amer. songwriter, b. in Russia; his parents migrated to the U.S.A. in 1933. Educated, for 2 years only, at public schools. His songs have been so popular in the U.S.A. that he became president of an incorporated company for their production. Among the best known of his compositions are *Alexander's Ragtime Band* and *When I leave the World Behind*.

Berlin, Pact of (1940), alliance between Germany, Italy, and Japan, signed in Berlin on Sept. 27, 1940. Its essential provisions were contained in the third article; after promising mutual respect for the new order (see NEW ORDER) in Europe under Germany and Italy, and the new order in 'Greater East Asia'—a significant acceptance of that vaguely minatory phrase—under Japan, the 3 signatories undertook to 'assist one another with all political, economic, and military means when one of the three contracting parties is attacked by a power not at present involved in the European War or the Chinese-Japanese conflict.'

Only 2 Powers of the first rank came within this definition—Soviet Russia and the U.S.A. But the pact then went on to exempt Russia by the specific statement that the prevailing relations between that state and the contracting parties were not affected. The purpose of the pact was therefore to try to weaken the resistance of Britain by an alliance against the United States, and to limit the scope of the European War by raising a menace which might deter the U.S.A. from either active or even indirect intervention. Yet even if the U.S.A. should intervene in the Pacific, it was not clear how Germany or Italy could put forth any further effort in a form that could be of any real use to Japan; but if the U.S. should take positive action in Europe, Japan appeared to be committed to a declaration of war. But at least Japan might reasonably have expected Germany to use her influence over the Vichy Gov. (see EUROPE: History; FRANCE: History) to facilitate her ultimate absorption of the whole of Fr. Indo-China, in which Japan then already had a foothold. She might, too, have counted on Hitler's bringing diplomatic pressure to bear on the U.S.S.R. which would restrain Russia from interfering with Japan's southward advance. But there were very soon to be disillusionments in this nefarious bargain; for Hitler, pursuing his own objectives with the harassed Fr. Gov. at Vichy, evinced but little concern to promote Jap. ambitions in the E., and Japan's pressure for a base at Saigon met with a rebuff from Vichy. One good effect of the pact of Berlin was to deal the death-blow to the lingering spirit of Brit. appeasement; for the Brit. Gov. decided to reopen the Burma Road on Oct. 18 and thereby allow munitions to find their way to the Chinese forces. The prospect that the Axis (*q.v.*) would challenge America for the sake of Japan or that Japan would defy her in the interests of the 2 other contracting parties dwindled in the face of the vigorous reaction of the U.S.A. to the dual threat implied in the pact.

Berlin Spirit, a potable spirit distilled from comparatively inexpensive material, such as potatoes and beetroot. It contains a large proportion of deleterious by-products, and is used for adulterating brandy and fortifying wines of poor quality.

Berlioz, Hector (1803–69), Fr. composer, b. near Grenoble, the son of a doctor; was trained for that profession, but broke with his family, and after many difficulties entered the Conservatoire. He gained the Prix de Rome in 1830 with a cantata, *Sardanapalus*. His *affaires du cœur* were characteristic of his inborn romanticism and artistic associates, and, like Ronsard, he was for ever seeking a new charmer to distract him from the loss of an earlier love and becoming heartbroken over some real or fancied neglect on either side. Almost crazed by the indifference of Harriet Smithson, the Irish Shakespearian actress, he consoled himself by turning to a pianist who afterwards achieved distinction as Mme Pleyel. Having lost

Mme Pleyel, he seems in 1833 to have overcome Harriet Smithson's opposition, but their marriage was unhappy and they separated in 1840, B. having an affair with Mlle Recio, a singer with whom he toured Europe. During this period he wrote the dramatic symphonies, *Episode de la vie d'un artiste*; *Harold en Italie*; *Symphonie funèbre et triomphale*, which contains a magnificent march for a military band; and *Roméo et Juliette*. From 1838 to 1864 he was musical critic for the *Journal des Débats*. His opera *Benvenuto Cellini* was refused a hearing in Paris, 1837. In 1846 he produced his most

BERLIOZ

popular work, the symphonic cantata *La Damnation de Faust*. His sacred work include the requiem, *Grand Messe des Morts*, 1837; *Te Deum*, 1855; and the trilogy, *L'Enfance du Christ*, 1855. His last works were *Beatrice et Bénédict*, 1861, and *Les Troyens*, 1863. In 1842 he had first visited Germany, where, owing to Schumann's praise in the *Neue Zeitschrift für Musik*, he was received with enthusiasm by the new school, as he was later in Vienna and St. Petersburg. He d. in Paris. B. was one of the prin. exponents of 'programme' music, but his fame will rest chiefly on his original mastery of orchestration, in which his romantic imagination found full scope. A great musician, the influence of B. is felt to-day in European music; he is really the origin of all that revolutionary movement which has been carried on, in the search for new forms, by the Fr. musicians during the last half-century and more. He was, above all, a marvellous inventor of orchestral sonorities. His faults, the results of impatience of discipline, have

no doubt turned away many musicians, but these have nevertheless not seldom profited from his discoveries. B. had the soul of a poet and his 'fiery romantic periods of genuine creation attained an admirable balance and transferred into the language of tone the harmonies brought to light by Virgil' (Henry Prunières). Dr. Scholes's opinion is that B. 'is little likely to be appreciated, even when well interpreted, by those who know nothing of his life and of the literary and artistic school to which he was attached—the school that on enormous canvases or in 3-vol. novels depicted scenes of horror, glory, or passion.' His *Traité d'instrumentation*, 1844, has been ed. with additions by Richard Strauss, 1906. His *Memoirs and Letters* were pub. in 1870 and 1882; see selections, Eng. translation, in Dent's Everyman's Library. See also Alfred Ernst, *L'Œuvre dramatique d'Hector Berlioz*, 1884; W. H. Hadow, *Studies in Modern Music*, 1894; Filson Young, *Master Singers*, 1908; Breitkopf and Hartel's ed. of complete works, 1911; J. G. Prod'homme *Unpublished Berlioziana (Music Quarterly)*, Apr. 1918. The standard life is by Adolphe Boschot (3 vols.), 1906–13; others by Adolphe Jullien, 1888; J. G. Prod'homme, 1923; W. J. Turner, 1934; T. S. Wotton, 1935; J. H. Elliot (Dent's Master Musicians series), 1937.

Berme, or **Berm** (Ger. *Berme*, the edge of a field), technical term of fortification, both temporary and permanent. In the former kind of fortification it is the name given to an earthen mass which separates the parapet from the ditch, and whose function is to uphold the weight of the parapet in order to prevent it from causing the earth of the scarp to fall in. In permanent fortification the B. is a block of freestone which crowns the scarp and, projecting slightly over the ditch, serves the same function as the temporary B. When public works are in course of construction, the narrow passage between the canal or ditch and the earth which is excavated therefrom, is called a berme.

Bermejo, Rio, riv. of Argentine Republic, rising on Bolivian frontier and flowing S.E. into the R. Paraná. Much of its course is navigable by shallow-draught vessels. Total length over 1000 m.

Bermeo, seaport of Vizcaya, Spain, on bay of Biscay, 14 m. N.E. Bilbao. Pop. 10,000.

Bermondsey, metropolitan bor. of the S.E. dist. of London, Eng., on the S. side of the Thames. Rotherhithe and part of B. form the B. div. of the parl. bor. of Southwark. The prin. industry is that of leather, but the Surrey Docks and riv. wharves employ a large amount of labour. Nothing now remains of the Cluniac abbey, 1399. Pop. 112,000.

Bermudas, group of is. in the W. Atlantic Ocean, 32° 15' N. and 64° 51' W., 580 m. off Cape Hatteras, the nearest point on the N. Amer. coast. According to Juan Bermudez, the Sp. navigator and historian, B. was discovered at some earlier date than that of his own visit in 1515 but the exact date is unknown.

In Peter Martyr's *Legatio Babylonica* there is a map, pub. in 1511, which shows the is. in an approximately accurate position. In 1609, when Admiral Sir George Somers's ship the *Sea Venture* was wrecked on a reef off the is., they were uninhabited. This reef was afterwards known as the Sea Venture Flat. Somers, who had escorted sev. other ships containing a body of settlers, d. the following year, and his companions, ignorant of the prior claims of Bermudez, named the is. after Somers. Reports of the fertility and beauty of the is. induced the Virginia Company to petition for an extension of their charter so as to embrace the B. James I. granted their petition, but the company soon after sold the is. to a body called The Governor and Company of the City of London for the Plantation of the Somers Is. In the ensuing two or three decades the is. were prosperous under the administration of this company but, later, the gov. was neglected and the settlers became subject to so many grievances and abuses that in 1679 they appealed to the Crown for redress. A writ of *quo warranto* (q.v.) against the Bermuda Company was successful and the administration was transferred to the Crown. The first General Assembly for the B. was held at St. George in 1620, and when the gov. passed to the Crown, the commission to the first royal governor confirmed the grant of representative institutions. Geologically the is. are formed of eolian limestone deposits and coral reefs, being the N. limit of the coral builders. There are some 260 is., of which all but 20 are small, uninhabited rocks, forming an oval ring, lying N.E. to S.W. The total area is 19 sq. m. Great Bermuda, or Main Is., 14 m. long, contains the cap., Hamilton (pop., 3000); the only other tn. is St. George (pop. 1000), on that is., which, with Paget, Smith, and other is., encircles Carth Harbour, N.E. of Main Is. At St. George is the great floating dock, 545 by 100 ft., towed out in 1902 to replace the earlier one of 1869. The islets of Ireland, where is the naval station, Somerset, etc., enclose the Great Sound at S.W. of Main Is. There being no streams or wells the is. are entirely dependent upon rainfall. The vegetation is nevertheless prolific; the juniper or Bermuda cedar grows in great quantities, and was formerly invaluable in ship-building. The temperate climate, 87—49°, makes the B. a popular winter resort for Amers. and Canadians, and there is considerable export trade in early onions, potatoes, and green vegetables, spring flowers, and lily bulbs to the U.S.A. Agriculture is the chief industry, and it is entirely in the hands of small tenants. Arrowroot and bananas are grown, and fish is plentiful around the coasts. The quantity of shipping is remarkable for so small a place. All meat, flour, and such necessities have to be imported. On account of the strategic position of the group, there are a military garrison and a naval dockyard and station. A railway (21½ m.) connects Hamilton, Somerset, and St. George, crossing the sea inlets or

bays at a dozen points. Regular round trips are made by the *Monarch of Bermuda* (27,000 tons) of the New York-Bermuda service. There are about 105 m. of colonial and 15 m. of military roads. Bermuda is a naval base on the N. Amer. and W. Indies station. During the First World War it sent 2 contingents to France, and also contributed £40,000 towards the cost of the war. The pop., excluding army and navy, is about 32,000, about 12,300 being white. The is. are a Brit. crown colony, administered by the governor and commander-in-chief, an Executive Council, Legislative Council, both appointed by the Crown, and House of Assembly (36), elected by the 9 pars., 4 members each. The franchise was extended to women in 1944. The B. are included in the diocese of Newfoundland. Facilities for the setting up and use of naval and air bases on the E. coast of Bermuda and on the Great Bay were granted in Sept. 1940 to the Gov. of the U.S.A., and in 1944 a training base for ships of the Royal Canadian Navy was estab. A conference was held in Bermuda early in 1946 between Great Britain and the U.S.A. to settle routes and rates of the air services between their respective ports. The agreement, which arose out of this conference, was pub. as a White Paper (Cmd. 6747). See Hellprin, *Bermuda Islands*, 1889; Coles, *Bermuda*, 1907; W. B. Hayward, *Bermuda, Past and Present*, 1923; H. M. Chapin, *Bermuda Privateers, 1625-1708*, 1925.

Bermudez, a state in Venezuela, S. America, has been divided into 3 states: Anzoategui, Monagas, and Sucre.

Bern, or **Berne**, canton of Switzerland; area, 2650 sq. m. The fertile valleys of the Aar and the Emmen divide the mountainous alpine region in the S. from the Jura Mts. in the N. Among the peaks of the Oberland are the Jungfrau, the Schreckhorn, the Elger, etc.; among the lakes of the canton are those of Thun, Neuchâtel, and Bienné. The prin. riv. is the Aar. The N. part of the canton is hilly; it produces corn, wine, and fruits. The S.E. part, the Oberland, produces fruits in its lower valleys, and excellent pasturage higher up. Cows and horses are reared, the horses of Emmenthal specially being noted; the lakes abound in salmon and trout. Quarries of sandstone, granite, and marble are worked, and iron mines, whilst a little gold is also found. The manufs. of the canton, which are not extensive, comprise linen and woollen goods, leather, wood articles, and watches. The canton, which is made up entirely of lands acquired by the city B. at various times, has a pop. of 689,000.

B., the cap. of the canton, and political cap. of the Swiss confederation, is situated on a high sandstone promontory, surrounded on 3 sides by the R. Aar; it is 68 m. S.S.W. of Basle. It is one of the best-built tns. in Europe. There is a magnificent Gothic cathedral, dating from the fifteenth century; a univ., the Federal Palace, a museum, public library, etc. The streets in the old tn., flanked with arcades, are those of a prosperous

eighteenth-century tn.; the numerous fountains mostly date from the sixteenth century. The chief industries are weaving, spinning, and the manuf. of machinery and chocolate. B. also trades in cheese, wine, coal, and cattle. It is celebrated for its splendid views of the Alps. B. was founded in 1191, and became a free imperial city in 1218, and gradually attained a state of independence. Between 1288 and 1339 it successfully resisted attacks by Rudolf of Hapsburg, Albert his son, and Louis of Bavaria. In 1405 much of the city was destroyed by fire, but was rebuilt. In 1528 B. embraced the cause of the Reformation, and in the ensuing war with the duke of Savoy added the Pays de Vaud to its dominions. From then till 1798 B. continued to prosper; in the latter year it opened its gates to the Fr. troops, and lost about half its possessions. The origin of the name of the tn. is said to be from old Swabian *bern*, meaning a bear, and certainly a bear is represented on the first known tn. seal, of the date 1224. Ever since 1513 bears have been kept in B. at the public expense, and the bear-pit is one of the sights of the tn.

Bern Convention, see under COPY-RIGHT.

Bernadotte, Jean Baptiste Jules, see CHARLES XIV. (of Norway and Sweden).

Bernalda, tn. in the prov. of Potenza, Italy. It is about 35 m. S.W. of Taranto. Pop. 6000.

Bernanos, Georges (1888-1948), Fr. novelist and polemic writer, b. in Paris, of mixed Lorraine and Sp. descent. Educated at a Jesuit college in letters and law. Began as an insurance official. Fought in the First World War, being awarded the Croix de Guerre. Contributed articles to minor periodicals and, at 38, took up literature as a career, his first novel being *Sous le soleil de Satan* (1926). His theme is almost always the struggle for the soul of man between the forces of good and evil, which he portrays with originality and intense conviction. In 1928 appeared *L'Imposture*, the portrait of the inner soul of an unbelieving priest, a masterpiece comparable with Duhamel's *Salavin*. In 1929 came the novel *La Joie*; in 1936 *Journal d'un curé de campagne*, trans. (1937) as *The Diary of a Country Parson*, which won him a European reputation. B., like Mauriac, stands firmly on the Rom. Catholic position, and is a severe critic of fallen humanity; hence some critics have regarded his *La Grande Peur des bien-pensants* — Edouard Drumont (1931) as really a condemnation of Catholics in the vein of works by Léon Bloy and Péguy. Other works: *Les Grands Cimetières sous la lune* (1938), a polemic against France and his followers of remarkable power; *Nous autres Français* (1939), on the decline of spiritual values. B. went to Brazil in 1939 in voluntary exile, and there wrote *Lettre aux Anglais* (1942), his sympathies being with de Gaulle and the allies. His last work was *Monsieur Ovine* (1946), a complex work of fiction on his misgivings about the future of Christian civilization.

Bernard (*A.* 865), It. traveller in Palestine, called Sapiens who has been confused with a Scottish monk of the same name. He set out from Rome, between 863 and 867, to Palestine, and on his return went to the monastery of Mont St. Michel, in Brittany. To him has been attributed a work, *De Ipsa Urbe Hierusalem et de multis adjacentibus Locis*, and also a short tract, of which a manuscript exists at Oxford and another in the Brit. Museum. Consult *Early Travels in Palestine* (Bohn's Antiquarian Library, 1847).

Bernard, Claude (1813-78), Fr. physiologist, *b.* near Villefranche; began the study of medicine in 1834 and worked with Majendie at the Collège de France, becoming deputy prof. in 1847, and succeeding him the chair, 1855. His prin. researches and discoveries were in the digestive function of the pancreas, the sugar-making (glycogenic) secretion of the liver, and, perhaps his most epoch-making, the discovery of the vaso-motor system. His study of the action of poisonous drugs, chiefly curare, is also of importance. He pub. *Introduction à la médecine expérimentale*, 1866; *Physiologie générale*, 1872; but his work is best judged by the 17 vols. of his lectures (*Leçons*); see his life by Sir M. Foster, 1899.

Bernard, Edward (1638-97), Eng. oriental scholar and mathematician, *b.* at Towcester, Northamptonshire; 1655, elected scholar of St. John's College, Oxford; studied Hebrew, Syriac, Arabic, and Coptic; 1669, Christopher Wren appointed B. his deputy in the Savilian chair of astronomy. B. supervised the reprinting of the old mathematicians. He *d.* at Oxford.

Bernard, Jean Jacques, Fr. playwright, son of Paul B. (*q.v.*); *b.* at Enghien, July 30, 1888. His best plays are *L'Ami en peine* (1921), *Martine* (1922), and *L'Invitation au voyage* (1924). In vivid contrast with the mockery and satire of the elder B., the younger's work is notable for penetrating psychology and is often concerned with the secret, almost inarticulate, purgatory of the soul. This is exemplified in *Le Feu qui reprend*, his earliest production.

Bernard, Mountague (1820-82), Eng. lawyer, *b.* at Tibbington Court, Gloucestershire. He studied at Trinity College, Oxford, of which he became a Vinerian scholar and fellow; he was called to the Bar at Lincoln's Inn, 1846. He was influenced by the High Church movement, and became one of the founders of the *Guardian*, 1846. He was appointed the first prof. of international law at Oxford, 1859-74. In 1871 he went to America, and was one of the high commissioners who signed the treaty of Washington.

Bernard, Paul (called Tristan) (1866-1947), Fr. author and dramatist, *b.* at Besançon, son of a house builder; educated at the lycées of Besançon and Condorcet. He graduated in law and took a post first in an aluminium factory (1887-90) and then in the Court of Appeal, Paris. Later he was sports

director at the Vélodrome Buffalo (1894-1896); then editor successively of various papers, including the *Echo de Paris*, *Gil Blas*, *Journal*, *Auto*, etc. This varied experience of life is reflected in his more ambitious plays and novels, his earlier work being vaudevilles of irony and mocking humour like: *Le Fardeau de la liberté*, 1897; *Franches hippées*, 1898; *Le Seul Bandit du village*, 1898; *Le Vrai Courage*, 1899. The best of his later plays are *Triple Patte* (with André Godfrenaux), 1905; *La Peau de l'ours*, 1907; *M. Codomat*, 1908; *Le Petit Café*, 1911; *Les Deux Canards*, 1913; *Le Prince Charmant: Ce que l'on dit aux femmes*, 1922; which, like his best novels, cleverly satirize human weaknesses. His novels include *Mémoires d'un jeune homme rangé*, 1899; *Un Mari pacifique*, 1901; *Amants et voleurs*, 1906; *Deux amateurs de femmes*, 1907.

Bernard, William Bayle (1807-75), Eng. dramatist, *b.* at Boston, U.S.A.; came to England in 1820; was clerk in the Army Accounts Office, 1826-30, later becoming a professional dramatist. His plays include: *The Pilot*, 1827; *Rip Van Winkle*, 1832; *The Man about Town*, 1836; *His Last Legs*, 1839; *The Round of Wrong*, 1846.

Bernard, St., of Clairvaux (1090-1153), mediæval saint, monk, preacher, and theologian, *b.* near Dijon in 1090, the son of a crusading knight; his mother was of a noble Burgundian family. He joined the newly founded monastery of Cîteaux, and in 1115 founded the daughter house of Clairvaux, of which he was the first abbot. His saintly and ascetic life, his preaching, and his reforming zeal made him the most influential churchman of his time, and the abbey the most important of Cistercian monasteries, from which during his life sprang some 90 other houses. From 1130 to 1138 he played the chief part in establishing Innocent II. in the papacy as against the anti-pope Anacletus, and thus ended the schism which threatened the Church. The elevation of his pupil, Eugenius III., to the papacy in 1145 made him almost a second pope. He presided at the condemnation of Abelard at Sens, and of Gilbert of Poitiers at Rheims, and by his preaching checked the spreading heresies in Languedoc. As preacher of the second crusade in 1146 he won Louis VII. of France and Conrad of Germany to take the cross. The disastrous ending shook his power, and his falling health and the call of his order prevented his undertaking the third crusade. He *d.* at Clairvaux, 1153, and was canonised by Alexander III., 1173. St. B. is one of the great figures of mediæval Christendom; apart from his political influence, the power of his preaching, and the example of his ascetic life, he stands out as the practical mystic opposed to the subtleties of scholastic theology. His voluminous writings include letters, sermons, and dogmatic and mystical treatises; some of his hymns are still used in Protestant churches. Complete works first pub. 1508; ed. by Mabillon, 1667; Eng. trans. Eales, 1889-95; see also J. C.

Morison, 1863. S. J. Eales, 1890. E. Vaccaudard, 1895. R. S. Storrs, 1893, and D'Haussonville, 1906.

Bernard of Morlaix, Fr. monk of the twelfth century, who belonged to the Benedictine order. He was the author of *De Contemptu Mundi*, a poem, which was pub. at Paris in 1843. It was complete in 3 vols., each containing 1000 stanzas, and has been widely read in a translation by Neale.

Bernard-Beere, Mrs. Fanny Mary (*née* Whitehead) (1856-1915), Eng. actress, b. at Norwich, 1856; prepared for the stage by Hermann Vezin; first appeared at the Opera Comique. In 1877 she joined the St. James's company, London, taking the parts of Julia in *The Rivals* and Lady Sneerwell in *The School for Scandal*. She was engaged in 1883 by the Bancrofts for Sardou's *Fédora*, in which she scored a great success. In 1887 she became manager at the Opera Comique, and produced *As in a Looking-Glass*, *Ariana*, and *Masks and Faces*. She appeared at Wyndham's in *The End of a Story* in 1902, and at the Coliseum in *The Spy*, in 1905.

Bernardin de Saint-Pierre (1737-1814), Fr. author and engineer, b. at Havre; educated at Caen; became an engineer and entered the army, but was dismissed and travelled over Europe till 1765, when he settled in Paris. His work, which is influenced by Rousseau, and deals almost entirely with sentimental and imaginative themes, has influenced Fr. prose style. His best-known books are: *Voyage à l'Île de France*, 1773; *Études de la nature*, 1783-88; *Paul et Virginie*, 1787; *La Chaumière indienne*, 1791; and *Harmonies de la Nature* (pub. posthumously). His works and correspondence were collected with a life by Aimé Martin, 1818-20. See also biographies and critical studies by Lescure, Maury, and Arvède Barine.

Bernardines, name sometimes given to the Cistercian order of monks. See CISTERCIANS.

Bernardino of Siena, Saint (1380-1444), It. Franciscan friar, b. at Massa di Carrara. Entered Franciscan order, 1404; appointed vicar-general, 1438. He restored the strictness of the early monastic rule, was famed as a preacher and wrote sev. mystic works. He founded the Frates de Observantia, a branch of the Franciscan order, numbering over 300 monasteries in Italy in his own times. B. was canonised as a saint, 1450. His writings were pub. in Venice, c. 1594, again in 1745, and in Paris in 1636. Consult Mary Allies, *Three Catholic Reformers*, 1879.

Bernau, tn. of Brandenburg, Germany, 13 m. N.E. of Berlin. It has woollen, cotton, and silk weaving industries. Pop. 10,000.

Bernauer, Agnes, daughter of a poor barber-surgeon of Augsburg, was married secretly to Albert, eldest son of Ernest, duke of Bavaria, Munich, in 1432; banned from a tournament by his father for his apparent illegal connection with Agnes, Albert openly acknowledged her as his wife, but in his absence she was charged with witchcraft, condemned, and drowned in the Danube. One of Heibel's prin. tragedies, *Agnes Bernauer*, 1855, is based

on the story, and Otto Ludwig left an unfinished play on the same subject.

Bernay, tn. in the dept. of Eure, France, on the Charentonne, 31 m. from Evreux; pop. 5973. A great fair for Normandy horses is held annually, and there are cotton manufactories, and bleaching and dye-works. The abbey, round which the tn. grew, was founded in the eleventh century. Pop. 7500.

Bernays, Jakob (1824-81), Ger. philologist, b. in Hamburg, of Jewish parentage; educated at the univ. of Bonn, where he became librarian and prof. in 1866. His works, dealing with classical philology and Gk. philosophy, were ed. by Usener and pub. at Berlin in 1885. His most important book is an ed. of Lucretius, 1856.

Bernburg, tn., Anhalt, Germany, till 1865 cap. of the duchy of Anhalt-B. Pop. 35,000. In the Bergstadt, on r. b. of the Saale, is the old ducal castle. Machinery and boiler-making, pottery and chemical works were the chief industries.

Berne, see **BERN**.

Berners, John Bouchier, Lord (1467-1553), Eng. translator, son of Sir Humphrey B. (a descendant of Edward III.), who was killed at the battle of Barnet, fighting for Edward IV. John was sent to Oxford at an early age. Henry VIII. made him chancellor of the exchequer for life; he was also made governor of Calais, where he d. At the king's command he trans. the *Chronicle of Froissart*, 1523-25, the work being printed by Pynson; *The Golden Book of Marcus Aurelius*, 1534; *History of Arthur of Lytell Brytaine* (Brittany); and the *Romance of Huon of Bordeaux*. He also wrote a comedy called *Ite in Vineam meam* (Go to my vineyard).

Berners, or **Barnes**, Juliana (b. 1388), reputed author of the *Boke of St. Albans*, a treatise on hawking and hunting. The first eds., of which 3 copies remain, appeared in 1486. It seems likely she was the prioress of Sopwell nunnery, near St. Albans. Having passed her girlhood at court, she must have retained her love of field sport after entering the convent. John Haslewood, who pub. a facsimile of the work in 1811, claims that she is the earliest Eng. author of her sex.

Bernese Oberland, strictly the upper country or 'highlands' in the S. of the canton of Berne, Switzerland, but often extended to include the range of the Alps from the upper Rhône valley northwards, and from the lake of Geneva to the lake of Lucerne, thus lying also in parts of Valais, Vaud, Fribourg, Lucerne, Uri, and Unterwalden. It is the most frequented of Alpine dists. by tourists and visitors, not only in the summer but also in the winter. The chief centres from which expeditions are made are: Thun, the cap. of the B. O., which formed a separate canton of the Helvetic Republic, 1798-1802; Interlaken, 17 m. by rail from Thun; Schynige Platte, Lauterbrunnen, and Grindelwald, one of the most frequented resorts in Switzerland; Melringen, the meeting-place of many routes; Mürren and Kandersteg. The prin. peaks of the B. O. are the Finsteraarhorn, 14,096 ft.;

the Aletschhorn, 13,721; the Jungfrau, 13,669 (the splendid view from Interlaken is famous); Mönch, 13,468; Gross Schreckhorn, 13,386; Gross Viescherhorn, 13,285; Eiger, 13,042; the 3 peaks of the Wetterhorn, 12,166, 12,149, and 12,110. The views from the Sparrhorn, 9928, Eggishorn, 9626, are well known. The highest passes are Lauithor, 12,140, Mönchjoch, 11,680, and Jungfrauoch, 11,385, leading to the Eggishorn from Lauterbrunnen, Grindelwald, and the Wengern Alp respectively. The Gemmi, 7641, leads from Kandersteg to Leukerbad, the Grimsel, 7100, with a carriage road, from Meiringen to the Rhône glacier, and the Great and

and Thaur, and the capture of one of the strongest fortresses in Europe, Brelsach.

Bernhardi, Friedrich von (1849-1930), Ger. general and author, b. at St. Petersburg (Leningrad), son of Theodor von B., a diplomatist. He entered the army in 1870, and fought in the Franco-German war; later became military attaché at Berne, and was appointed a general of cavalry in 1908. He retired in 1909, and wrote *Germany and the Next War*, a complete and undisguised exposition of Pan-Germanism and the Ger. ideal of *Weltmacht*. B. may be regarded as a disciple of Nietzsche and Treitschke, but went beyond them in the frank proposal of the

Swiss Federal Railways

INTERLAKEN AND THE JUNGFAU (13,699 ft.) FROM THE NORTH

Little Scheidegg, 6434 and 6772, from Grindelwald to Meiringen and Lauterbrunnen. The 3 largest glaciers in the Alps are in the B. O., viz. the Great Aletsch, 16½ m., the Unteraar, and the Fiescher, 10 m.

Bernesque Poetry (*poesia bernesca*), see BERNI, FRANCESCO.

Bernhard of Saxe-Weimar, Duke (1604-1639), Protestant general of the Thirty Years war, was the youngest son of John, third duke of Saxe-Weimar. At the beginning of the war he was present at the defeats of Wieslock, Wimpfen, and Stadtlohn, 1622-23. He joined Christian IV.'s Dan. army in 1625, and later rose to high rank in the army of Gustavus Adolphus. His leadership in command at Lützen, 1632, after Gustavus's death, and his successful invasions into Germany and Bavaria made him the most formidable opponent of the Imperialists. In 1623 he captured Regensburg, but was crushingly defeated by Gallas at Nördlingen in 1634. On the entry of France into the war he took service with her, still being general in command of the Protestant forces. His campaign of 1638 was successful with victories at Rheinfelden, Wittenwehler,

ruthless means for attaining the end of immediate Ger. world dominion. The book was held to establish Germany's aggressive designs, which culminated in the invasion of Belgium in 1914. A second book by B., *The War of the Future*, was pub. in 1921.

Bernhardt, Theodor von (1802-87), Ger. historian and diplomatist, b. in Berlin. He wrote on historical subjects, his works including *Denkwürdigkeiten aus dem Leben des Russischen Generals Karl Friedrich von Toll*, 1856-58, and *Geschichte Russlands und der Europäischen Politik in den Jahren*, 1814-31, 3 vols., 1863-77.

Bernhardt, Sarah (1845-1923), Fr. actress, b. in Paris, Oct. 23, of a Jewish family named Bernard, the eleventh of fourteen children. She was baptised with the name of Rosine and was brought up in a convent school at Versailles. After gaining prizes for tragedy and comedy at the conservatoire she appeared in a small part in Racine's *Iphigénie* at the Comédie Française in 1862; in 1867 she joined the Odéon company and made her first marked successes as Zanetta in Coppée's *Le Passant*, 1869, and as the Queen in Hugo's *Ruy Blas*. Returning to the Française

after the Franco-German war, her great performances in the title role of Racine's *Phèdre* (1874), the test part of Fr. tragedy, and as Doña Sol in Hugo's *Hernani* (1877), proclaimed her as the successor to Rachel's vacant place on the Fr. stage. In 1880 she broke with the Comédie Française on the production of Augier's *Les Aventuriers* and had to pay heavy damages. She began her triumphal tours of the world, appearing principally in Sorbie's *Adrienne Lecouvreur*, Dumas fils's *Dame aux camélias*, and Melhac and Halévy's *Frou-Frou*. Sardou's plays *Fédora*, *Théodora*, *La Tosca*, and *Cléopâtre* were specially written round her emotional and magnetic personality. These with Richépin's *Nana*, *Sahib* and Barbier's *Jeanne d'Arc* were her chief successes during her occupancy of the Porte St. Martin theatre (1883-90). During these years and from 1891 to 1893 she visited not only the chief tns. of Europe and the U.S.A., but also Australia and S. America. She moved to the Renaissance Theatre in 1893 with Jules Lemaitre's *Les Rois*, where she also played in Sardou's *Gismonda*, 1894. In the first of Rostand's poetic dramas, *La Princesse lointaine*, 1895, she created the part of Mélisande, to be followed by Photine in the same author's religious drama, *La Samaritaine*, 1897. Her appearance in *Magda*, 1895, a Fr. trans. of Sandermann's *Heimat*, marked a new departure, to be followed (1899) by her impersonation of Hamlet, a doubtful though daring experiment. She repeated the impersonation of male characters as the hapless duke of Reichstadt in Rostand's *L'Aiglon* in 1900 at the Théâtre Sarah Bernhardt. Her adaptation of De Musset's *Lorenzaccio* and the revival of Hugo's *Angelo* must be noticed. Gifted with a wonderful voice, which could range over every note of human passion, and with a vivid personality the 'divine Sarah' represented at its highest the emotional as distinct from the intellectual type of actress. To compare her playing with that of Eleonora Duse in such parts as *Magda* or the *Dame aux Camélias* is to realise the creative powers of two actresses of distinct schools of art. It was perhaps the freedom given for her emotional style that was the special appeal made to S. B. in the constructed and mechanical plays of Sardou. She married in 1882, a member of her company, M. Jacques Damala, a Gk., from whom she separated in the following year. There was one son, Maurice Bernhardt. As a result of an accident, her right leg—inclusive of the thigh—was amputated in Paris, Feb. 22, 1915. Nevertheless she continued to act, and toured in America 1917. In London, Apr. 1921, she played a man's part in Verneuil's *Daniel*. In 1913 she had received the cross of the Legion of Honour; she became officer in 1921. Her life has been written by Jules Huret, 1889; Sir G. Arthur, 1923; and M. Baring, 1933. See also her autobiography, *Ma Double Vie*, 1907, Eng. trans. 1908.

Bernhardy, Gottfried (1800-75), Ger. philologist, b. at Landsberg, Brandenburg; was prof. at Berlin Univ., 1826-29, and afterwards prof. in Halle Univ. and direc-

tor of the Philological Seminary. His works include: *Grundriss der römischen Literatur*, 1830; *Grundriss der griechischen Literatur*, 1836-45, and an ed. of Suidas, 4 vols. 1834-53.

Berni, Francesco (1597-1535), It. comic poet. His popularity is evidenced by the fact that since his time burlesque poetry is referred to as *poesia bernesca*. Having held a secretaryship at Rome, he gladly renounced what was to him a drudgery for a canonry in the cathedral of Florence. His fame rests largely on his complete revision of Boiardo's *Orlando Innamorato*, which was the basis of Ariosto's masterpiece, *Orlando Furioso*. His witty, graceful verse forms a pleasant contrast to the unpolished lines of Boiardo.

Bernicia, A.-S. kingdom, said to have extended from the Tyne to the Forth; the first king was Ida, 547-59, and his cap. Bamburgh. In 605 Æthelfrith united the S. independent kingdom of Deira with B. as one kingdom, Northumbria. After the death of his conqueror Edwin, 633, it was divided again, but shortly afterwards the Bernician dynasty under Oswio became supreme. The see of the bishopric of B. was at Lindisfarne and later at Hexham.

Bernicle, see BARNACLE.

Bernicle, or **Barnacle**, Goose (the *Anser bernicla*), Arctic bird which visits Britain in winter. It receives its name from an auct. fable that it was an offspring of the barnacle (q.v.). It is about 2 ft. in length, weighs about 5 lb., is black and white in colour, marbled with blue and grey, the beak is black, streaked with red. It was bred in Britain by the earl of Derby in 1834, and its flesh is used for food.

Bernier, François (d. 1685), Fr. traveller, b. at Angers in Anjou; took the degree of doctor at Montpellier; he set out on his travels in Palestine and Egypt; left Egypt and went to India, and was physician for 8 years to the Mogul Emperor Aurangzebe. He wrote on his return to France a *History of the Empire of the Great Mogul*, which appeared in 1670, and a continuation of this the next year; they were reprinted under the title of *The Travels of François Bernier*, and have been trans. into all European languages.

Bernina, name of a mtn., Piz B., 13,304 ft., and of a pass, 7645 ft., in the Rhaetian Alps, canton of Grisons, Switzerland. The pass, over which there is a carriage road, leads from Pontresina, Upper Engadine, to Tirano in the valley of the Adda, Italy. The B. Alps form a group lying between the Maloja and the Reschen Scheldeck passes. The Piz B. was first climbed in 1850.

Bernini, Giovanni Lorenzo (1598-1680), It. sculptor, painter, and architect, was invited by Pope Urban VIII. to submit designs for the embellishment of St. Peter's at Rome. The splendid colonnade was the fruit of the invitation. In 1663 he was called to Paris by Louis XIV., and although his design for the Louvre was rejected in favour of Perrault's, he returned to Rome enriched by gifts as well as honours.

Bernoulli, or **Bernoulli** name of a family of mathematicians and scientists. Originally residents of Antwerp, they were driven by the persecution of the Spaniards to find refuge first in Frankfurt, and afterwards in Basle:

Jacques Bernoulli (1654-1705), *b.* at Basle, was esteemed in his own day as a versifier in Latin, Ger., and Fr. He taught himself the elements of geometry against his father's wishes, and from 1676 to 1682 travelled in France, England, and Holland. In 1687 he was appointed to the chair of mathematics at Basel, where he remained until his death. Amongst other investigations, he solved Leibnitz's problem of the isochronous curve, determined the curve formed by a chain hanging between 2 supports and the curve formed by an elastic rod supported at one extremity and bent by a weight at the other.

Jean Bernoulli (1667-1748) was aided by his brother Jacques in his early mathematical studies, but has achieved a higher reputation as an independent discoverer. He became prof. of mathematics at Groningen, and after holding the position for 10 years, succeeded his brother in the chair of mathematics at Basel. His works are numerous and important, and amongst his discoveries was that of the exponential calculus. Three of his sons achieved distinction in mathematics.

Nicolas Bernoulli (1695-1726), son of the preceding; was appointed prof. of mathematics at St. Petersburg, but *d.* after holding the office for about 8 months.

Daniel Bernoulli (1700-82), brother of the preceding, studied medicine as well as mathematics, and in 1725 was appointed prof. of mathematics at St. Petersburg. In 1733, disturbed by the state of his health, he returned to Basel and occupied the chair of anatomy and botany. His work was concerned mainly with the investigation of the problems of hydrodynamics and consideration of the theory of probability with respect to some of the practical issues of life.

Jean Bernoulli (1710-90), the third son of Jean B., *b.* at Basel, studied in France, and became prof. of eloquence in Basel. He succeeded his father in the chair of mathematics in 1738. On three occasions he received the prize of the Academy of Sciences at Paris, his subjects being the capstan, the propagation of light, and the magnet.

Jean Bernoulli (1744-1801), son of the preceding; became astronomer royal at Berlin at the age of 19, and subsequently held the office of director of mathematical studies at the academy of Berlin.

Jacques Bernoulli (1759-89), brother of the preceding, studied law, but could not be restrained from his natural enthusiasm for geometry. After acting as a substitute for his uncle Daniel at the univ. of Basel for some time, he became prof. of mathematics at St. Petersburg in 1788.

Bernoullian Numbers, series of numbers used in determining the sum of certain mathematical series; named after Jacques Bernoulli (1654-1705). For example, the sum of the same powers of the natural

numbers from 1 to n may be expressed by the following formula, r denoting the power:

$$S_n = \frac{n^{r+1}}{r+1} + \frac{1}{2}n^r + B_1 \frac{r}{2}n^{r-1} - B_2 \frac{r(r-1)(r-2)}{4}n^{r-2} + B_3 \frac{r(r-1)(r-2)(r-3)(r-4)}{6}n^{r-3} + \dots$$

the signs of the series being alternately + and -, starting at the third term. The quantities symbolised by B_1, B_2, B_3 , etc., are known as B. N., the first six of which are $\frac{1}{2}, \frac{1}{6}, \frac{1}{42}, \frac{1}{30}, \frac{1}{42}, \frac{1}{42}$. Thus the sum of the series $1^2 + 2^2 + 3^2 + \dots + n^2$ becomes

$$\frac{n^3}{6} + \frac{n^3}{2} + B_1 \frac{5}{12}n^2 - B_2 \frac{5.4.3}{4}n + \text{zero} + \frac{n^6}{6} + \frac{n^5}{2} + \frac{5n^4}{12} - \frac{n^3}{12}$$

The value of the first 250 B. N. to nine figures in each case have been pub. by Glaisher in the *Cambridge Philosophical Society Transactions*, xii, 384.

Bernstein, **Eduard** (1850-1932) (Ger. democratic leader, and political writer, *b.* in Berlin, son of an engine-driver); was engaged for some time in journalism. On account of his political views he was obliged to leave Germany in 1878; he then resided in Switzerland, and with Bebel conducted the *Sozialdemokrat* at Zürich, 1881-90—moving to London in 1888, and living there until his return to Germany in 1901. He then became editor of the *Dokumente des Sozialismus*, and *Welt am Montag*. He was a member of the Reichstag 1902-6, 1912-18, and (for Breslau) since 1920. His works, mainly critical of the doctrines of Karl Marx, include *Gesellschaftliches und Privateigentum*, 1891; *Zur Geschichte und Theorie des Sozialismus*, 1901; *Die Geschichte der Berliner Arbeiterbewegung*, 1907; *Die deutsche Revolution*, 1921; *Sozialdemokratische Volkspolitik*, 1917; *Der Sozialismus einst und jetzt*, 1922; *Von 1815 bis 1872*, 1926.

Bernstein, **Henry** (b. 1876), Fr. dramatist, *b.* in Paris, of Jewish extraction. Was educated at Cambridge Univ. for two years, where he achieved distinction as an oarsman, but took no degree. He incurred criticism for leaving the army before his time, but in 1911 was allowed to re-enter it. Had a duel with Léon Daudet over this matter in 1911, when both were wounded. From the outset B. opposed Socialism; this and his bitter feeling towards the anti-Semites are apparent in his plays, a number of which have been performed in England. The best of the earlier plays are *Le Délour* (1902); *La Rafale* (1906); *Israël*, on an anti-Semitic theme (1906); *Le Voleur* (1907), the theme being a husband's discovery of his wife's theft; and *Samson*, 1909. In 1911 B. fought a bloodless duel with Francis Chevasu, dramatic critic of the *Figaro*, and there was further trouble on the production of his *Après Moi* at the

Comédie Française in the same year. Owing to the disorders instigated by the Camelots du Roy, the play was withdrawn, the only instance of such occurrence in the Fr. national theatre since the withdrawal of Sardou's *Thermidor* in the nineties. One of his greatest triumphs was *Judith* (1922), on the theme of the Biblical story, re-interpreted *suo more*, for Judith enters the tent of Holofernes no longer to save her people, but to play the *grande amoureuse*. Other plays: *L'Assaut* (1912) (Eng. translation *The Attack*, produced in 1924), which turns on the blackmailing of a political leader; *Félix* (1926); and *Mélo* (1929).

Bernstein, Herman, Amer. writer and diplomat, *b.* in Russia 1876, of Jewish parentage. He came to the U.S.A. with his parents in 1893, and finished his education in New York City. He acted as correspondent for the *N.Y. Tribune* with the American Expeditionary Force in Siberia. *The Willy-Nicky Correspondence*, pub. in 1918, was sensational in revealing the secret telegrams exchanged between the ex-Kaiser Wilhelm II. and Tsar Nicholas. In 1928 he pub. a biography of Herbert Hoover, who in the same year was elected President.

Bernstorff, Albrecht, Count von (1809-1873), Ger. diplomatist, *b.* at Drellutzw, Mecklenburg-Schwerin. He was sent as envoy to Naples, 1840; appointed ambassador at Vienna, 1848; Naples, 1852; London, 1854-61, 1862-73. In 1861-62 he acted as minister of foreign affairs.

Bernstorff, Andreas Peter, Count von (1735-97), Dan. statesman, *b.* in Hanover, the nephew of Johann Bernstorff. As minister of foreign affairs in 1773, he brought about the 'armed neutrality' compact with Russia, and adopted an anti-Swedish policy. His understanding with Great Britain as to the term 'contraband of war' displeased Russia and he was obliged to resign office in 1780. However, he was returned to power in 1784, and during the Fr. wars maintained a neutral policy. He was a keen supporter of Liberalism and of the freedom of the press, and brought about the emancipation of the serfs.

Bernstorff, Christian Günther, Count von (1769-1835), Dan. diplomatist, the son of Andreas Peter B., *b.* at Copenhagen, *d.* in Berlin. He became minister of foreign affairs, 1793-1810, and Dan. plenipotentiary at the Congress of Vienna, 1814. He entered the Prussian service in 1818, and was minister of foreign affairs from 1818 to 1831.

Bernstorff, Johann Hartwig Ernst, Count von (1712-72), Dan. statesman, of an anct. Ger. family; was educated by his grandfather, minister of George I. Having been for 6 years ambassador at Paris, for 21 years following he controlled the foreign policy of Denmark (1750-70), his adopted country. The settlement of the disputes between Russia and Denmark on the question of Holstein-Gottorp was not the least of his achievements. By the treaty of 1765, Catherine II. renounced all pretensions to Holstein.

Bernstorff, Johann Heinrich Andreas

Hermann Albrecht, Graf (Count) von, Ger. diplomat, *b.* in London Nov. 14, his father being Count Albrecht von B., Prussian minister—afterwards Ger. ambassador. Educated at the gymnasium at Ratzeburg (Lauenburg). In 1890 he was employed in the Foreign Office, and was secretary to the embassy in London, 1902-6. Then he was consul-general in Egypt until, in 1908, he was sent as ambassador to Washington. He married, and remained in America until the U.S.A. declared war in Apr. 1917. President Wilson sent to him notes protesting against the sinking by Ger. submarines of ships on which Amer. lives were lost. In due course B. presented notes to the President from the Ger. Gov. apologising, but the outrages continued. The public, rightly or wrongly, thought it was he who maintained an espionage system in the U.S.A., and that it was due to him that the Ger. language press in America adopted so violent an attitude in favour of Germany. In time his position became untenable, and he returned to Germany in 1917. For the next 3 years he was 'ier. ambassador to Turkey. In 1921 he entered the Reichstag as a Liberal delegate, and also became president of the League of Nations Union in Germany. In 1926 he headed the Ger. delegation to the League of Nations Preparatory Commission on Disarmament. When Hitler came to power in 1933, he went into self-imposed exile in Switzerland, and *d.* in Geneva. His book *Deutschland und Amerika: Erinnerungen aus dem fünf-jährigen Kriege*—trans. as *My Three Years in America*—was pub. in 1920.

Beroe, marine organism belonging to the coelenterate order of Ctenophora, subclass Nuda. It differs from the other genera of Ctenophora in having no tentacles of any kind, and in having a capacious stomodaeum resembling the cavity of a thimble. It is conical or oval in shape, and there is a coelenteric network all over the body, formed by anastomoses of the meridians and paragastric canals. It is transparent and gelatinous, and shines at night with phosphoric radiance, produced by the 8 bands of fused cilia, by means of which it moves.

Beroea: (1) Anct. name of Veria, or Kara-Feria, tn. of Macedonia, Greece, 35 m. S.W. of Salonika. It was besieged by Athens in 432 B.C., occupied by Rome in 168 B.C., and captured by Turkey in 1375 A.D. Paul preached there in A.D. 54. (2) Anct. name of Aleppo, cap. of a vilayet of the same name in N. Syria, on R. Kuweik, 70 m. E. of the Mediterranean. The name of Beroea was given it by Seleucus Nicator, and it is mentioned as Helbon (i.e. Aleppo) in Ezek. xxvii. 18.

Berosus, Babylonian priest, *fl.* c. 260 B.C. Josephus has preserved some fragments of his Babylonian-Chaldean history, which he wrote in Gk. They are considered trustworthy because he had access to native documents stored in the temple of Bel.

Berosus, genus of coleopterous insects of the family Hydrophilidae. The species inhabit ponds, in which they swim in an

inverted position, and they probably feed on vegetable substance. They are nearly oval in shape, and of a dusky yellow hue.

Beroun, see **BERAUN**.

Berre, tn. in dept. Bouches-du-Rhône, France. The salt-water lagoon, *Étang de B.*, covering nearly 60 sq. m., lies near the sea, with which it is joined by the canal de Bonc. N.W. is the Crau, an expanse covered with pebbles like a beach.

Berri, or **Berry**, former prov. of France, bounded by Orléannais on the N., Nivernais and Bourbonnais on the E., La Marche on the S., and Touraine and Poitou on the W. It now forms the depts. of Cher and Indre, and part of those of Creuse, Nièvre, and Allier.

Berri, or **Berry**, **Charles Ferdinand**, **Duc de** (1778-1820), *b.* at Versailles, 1778, a younger son of the comte d'Artois, afterwards Charles X. of France. At the revolution he escaped with his father to Italy, fought under Condé (1792-97), and came to England in 1801, where he married a Miss Anna Brown; this marriage was annulled in 1814, and in 1816 he married Caroline Ferdinande Louise, daughter of Francis I. of Naples, *b.* 1798, by whom he had a daughter, later duchess of Parma, *b.* in 1819, and a son, Henri, duc de Bordeaux, better known as the comte de Chambord (*q.v.*), *b.* posthumously, 1820, after his father had been assassinated by L. P. Louvel at the opera house, Feb. 13 of that year. After the revolution of 1830 the duchess landed in France in the hope of gaining the throne for her son; she was imprisoned, but on her secret marriage with Count Lucchesi-Palli being discovered, her political power vanished and she was released. She *d.* in Switzerland, 1870.

Berrima, township in Camden co., New South Wales, 40 m. N.E. of Goulburn. In a coal, shale, iron, and copper mining dist. Pop. 10,000.

Berrow's Worcester Journal, Britain's oldest surviving newspaper. Celebrated its 250th anniversary in 1941. In its early years it pub. only news of war and high politics, and it was a long time before any appreciable space was given to local affairs. When H. Berrow acquired it in 1748, his name was added to the title. Earlier files of the paper show that it sold not only news and advertising space, but books and stationery and even 'elixir for dropsy, powder for the gout, Hypo drops' and other remedies which the printer kept in his cupboard. After the death in 1894 of Charles Henry Birkbeck, one of its most noted proprietors, a number of local Conservatives, including Alfred Baldwin, M.P. (father of Lord Baldwin) and the then Lords Dudley and Beauchamp formed a private company and purchased it. In 1937 the control was acquired by Mr. Ivor Griffiths, and later developments include amalgamation with other newspaper concerns in Worcester and the absorption of its chief competitor, the *Worcestershire Advertiser*.

Berruguete, **Alonso** (1480-1561), Sp. painter, sculptor, and architect, the son of a painter, Pedro B. (*q.v.*). Charles V. appointed him court painter and sculptor

and superintendent of certain public building enterprises. B. completed the royal palace at Granada, and designed the town hall at Seville and the palace of the archbishop of Toledo at Alcalá. His finest piece of sculpture is 'The Transfiguration' in the Toledo Cathedral.

Berruguete, **Pedro** (*d.* 1503), Sp. painter who lived towards the end of the fifteenth century. Little is known of his life. Most of his paintings were hung in the museum at Madrid. The frescoes in the cathedral at Toledo are thought to be the joint work of B. and another artist. Other works attributed to him are the 'Miracles of the Life of St. Peter,' 'St. Thomas Aquinas,' and 'St. Dominic' (at Avila), and 'Christ in the Garden' and 'The Resurrection' (at Madrid).

Berry, name of a bacate or fleshy fruit, which differs from the drupe (*e.g.* cherry) in having no hard part but the seeds; while the drupe has a strong endocarp. All these fruits are soft and succulent, and have their seeds embedded in the pulp. Many so-called berries have no right to the name, *e.g.* the holly-berry, which is a drupe; the strawberry, a pseudocarp formed from an etærio of achenes on a fleshy thalamus; while raspberries and blackberries are etærios of drupes. True berries are the gooseberry, tomato, currant, bilberry, and grape, while the orange, melon, and cucumber come under this head, and the banana, in which over-cultivation has destroyed the seeds.

Berry, tn. of Camden co., New South Wales, on Berry R., 70 m. S.W. of Sydney.

Berry, **Sir Edward** (1768-1831), Eng. naval officer. In 1796 he first came under the notice of Captain Nelson, and for his services at the siege of Porto Ferrajo B. received promotion to the rank of commander. He distinguished himself for his daring at the battle of Cape St. Vincent. B. was captain of Nelson's flagship at the battle of the Nile, of which he later wrote a narrative. B. carried Nelson's dispatches home on the *Leander*, when he was taken prisoner by the Fr. He also took part in the battle of Trafalgar, 1805. He was knighted 1798; K.C.B., 1815; rear-admiral, 1821.

Berry, **James** (*f.* 1655), Eng. soldier and parliamentarian, *b.* in Shropshire. He enlisted under Cromwell and became one of his favourite officers. He fought at the battle of Gainsborough, 1643, where he slew Charles Cavendish. In 1647, B. was elected president of the council of adjutors in the disputes between Parliament and the Army. In 1655 he was sent to Nottinghamshire to suppress a rising there, and was subsequently made major-general of Hereford, Shropshire, and Wales. He sat in Parliament as member for Worcestershire in 1657, and was made a member of the council of state in 1659. B. took part in the overthrow of Richard Cromwell, which he afterwards regretted. On the Restoration, he was imprisoned for life in Scarborough Castle. According to Richard Baxter, however, B. was released and 'became a gardener, and lived in a safer state than in all his greatness.' The chief authority on B.'s life is Baxter

in his autobiography, *Reliquiæ Baxterianæ*.

Berry, Sir John (1635-90), Eng. admiral, b. in Devonshire. He first went to sea in the merchant service, his first naval appointment being in 1663, when he served as boatswain of the *Swallow* in the W. Indies. In 1667 he commanded a squadron against the combined forces of Fr. and Dutch near St. Nevis and St. Kitts. In 1672 he distinguished himself at the battle of Sole Bay, and was knighted for his services. His death, at Portsmouth, has been attributed to poisoning. Consult J. Campbell, *Lives of the British Admirals and Eminent Seamen*, 1779.

Berry, John Bennington (1851-1928), Amer. railway engineer, b. at Paterson, New Jersey; educated at the Polytechnic Institute at Brooklyn. He entered the railway service in 1874, and served successively, as assistant or chief engineer, the Chicago and N.W., the Union Pacific, and the Chicago, Rock Island and Pacific railways. Set up as railway consultant in Chicago in 1914 and wrote authoritatively on railway gradients.

Berry, Mary (1763 - 1852), Eng. authoress, b. at Kirkbridge, Yorkshire. In 1788 she and her younger sister, Anne, made the acquaintance of Horace Walpole, who held them in great affection, and left them in his will £4000 each and some property at Little Strawberry Hill. Mary B. collected and ed. the *Works of Horace Walpole*, 1798, and also pub. *England and France: a Comparative View of the Social Condition of both Countries*, 1844; and a *Life of Rachael Wriothseley*, 1819. See her *Journals and Correspondence*, 2nd ed., 1866.

Berry, William Ewart, see CAMROSE, BARON.

Berryer, Antoine Pierre (1790-1868), Fr. barrister and politician, the son of a distinguished advocate and supporter of the Bourbons. After the Restoration he defended Ney before the chamber of peers, and was successful in his defence of other of Napoleon's generals. His chief political trials in which he appeared for the defence were those of Lamennais, 1826, Chateaubriand, 1833, and Montalembert, 1838. Elected before the revolution in 1830, he remained the only legitimist deputy till 1851; a Liberal, he never ceased to further the restoration of the Bourbons. He was elected to the Academy in 1854. He d. at Angerville.

Bersaglieri, t.e. sharpshooters, a *corps d'élite* of infantry (rifemen) in the It. army. They were raised in 1836 for the Sardinian-Piedmontese army under King Charles Albert on the suggestion of Captain Alessandro La Marmora of the *Granatieri-Guardia* (Grenadier Guards), who was the original commander. They were trained in scouting, rapid marching, and shooting (*bersaglio* = target). Originally consisting of two companies, the B. before 1914 comprised 12 regiments, and, during the First World War, were expanded to 21 regiments. Their uniform is a dark blue with a red stripe and facings, but their chief distinguishing mark is the wide black slouch hat with heavy droop-

ing plumes of cocks' feathers. They have a distinguished record and are regarded with pride in Italy. They have participated in all It. campaigns. During the Crimean war 5 battalions served with the Allies, but their creator and leading spirit, La Marmora (then a general) d. of cholera. During the First World War their 3rd Regiment was awarded the Gold Medal for Valour, the highest It. distinction, for service on the Piave. In 1895 a cyclist company was added to the B. as an experiment, the success of which led to a general creation of cyclist companies in the army. Since 1928 the B. have been composed entirely of cyclists. In 1940 the It. army was reorganised, and provision made to include 12 regiments of B. in the infantry.

Berseem, or Bersim (*Trifolium alexandrinum*), Egyptian name of a species of white clover which thrives well on salt land newly reclaimed from the sea. In the Nile Delta it is grown as fodder for animals, and its cultivation prepares the land for subsequent crops.

Berserker (from the 'sark,' or shirt, of the bear, or the skins of other animals), name given, in Scandinavian mythology, to the 12 sons of the hero, Berserk, by the daughter of King Swafurilam, whom he had killed in battle. Berserk was the grandson of the fair Alfhilde and the eight-handed Starkadder. His sons inherited his martial fury, which was called berserker rage, as well as his courage. They so terrified their enemies that they were regarded as being possessed of an evil spirit. According to one legend they perished together in one combat.

Bersim, see BERSEEM.

Bert, Paul (1833-86), Fr. physiologist and politician, b. at Auxerre; first studied engineering, but then under the influence of L. P. Gratiolet became a pupil of the great physiologist Claude Bernard. He was prof. of physiology at Bordeaux and the Sorbonne, Paris. His prin. scientific researches and experiments were on the effects of air-pressure (*La Pression barométrique*, 1878), of the highest value for the disease known as caisson disease; on anaesthetics and respiration, and on the effect of light on plant growth. In 1876 he became a deputy, entering threw himself into politics as a violent anti-clerical; he was minister of education, 1882, in Gambetta's ministry; in 1886 he was appointed resident to Indo-China, and d. there at the end of the same year.

Bertani, Agostino (1812-86), It. revolutionist, b. at Milan. He practised medicine in Lombardy till the outbreak of the revolution of 1848, in which he was implicated. He organised the ambulance service during the Rom. republic, 1849, and, with Sir James Hudson, worked in Naples for the liberation of political prisoners. Later, he joined Garibaldi's force as a surgeon, and organised 4 Sicilian volunteer expeditions. When Garibaldi went to Naples B. became his secretary-general. In this capacity he superintended the police, abolished the secret service, and founded infant asylums. He entered Parliament in 1861,

and during his parliamentary career made inquiries into the sanitary conditions existing among the peasants. *Consult* his life by Mario, 1888.

Bertha, the name of sev. reigning princesses of the early Middle Ages: (1) Daughter of the Frankish Christian king, Haribert or Charibert, married Ethelbert (560-616), king of Kent. She brought to England her confessor, Bishop Lindhard; she was allowed by the king to practise her religion at her oratory, St. Martin's, Canterbury, and thus paved the way for the success of Augustine's mission. (2) Mother of Charlemagne, called Bertrada or Bertha Greatfoot. She was the daughter of Charibert, count of Laon, and married Pepin before 742. Round her have grown many legends set forth in Adenes's thirteenth-century romance *Berte aus grans piés*. Charlemagne married Bertha (or Desiderata), daughter of the Lombard king Desiderius. (3) Daughter of Otto, count of Savoy, wife of the Emperor Henry IV. (4) Daughter of Conrad of Burgundy, married Endes, count of Blois, and then Robert II., king of France (970-1031). (5) Daughter of Burkhardt of Thurgau, and wife of Rudolf II., king of Burgundy (912-37). Her deeds of charity and piety gained her the name of the Good.

Bertha, **Big**, nickname given to the specially prepared long-range Ger. naval gun (or guns) which fired on Paris from the neighbourhood of Coucy, a distance of 75 m., during the First World War. The name was in allusion to the fact that Frau Bertha von Bohlen was one of the proprietors of Krupp's (q.v.), which firm made the gun. Twenty-one shells, of over 200 lb. each, were fired on Mar. 23, 1918, the first day on which the gun was used against Paris, and thereafter there was intermittent firing for sev. months. It is difficult to estimate the total casualties, because sometimes the firing synchronised with bomb-dropping, but the deaths are variously given at between 100 and 200 for the whole period of firing.

Berthelot, **Marcellin Pierre Eugène** (1827-1907), Fr. chemist and politician, b. at Paris in Oct.; the son of a doctor. He was appointed a member of the staff of the Collège de France in 1851, at which time his long intimacy with Renan began. His paper *Sur les combinaisons de la glycérine avec les acides* made him famous in 1854, and in 1865 he accepted a chair of organic chem. in the Collège de France, an appointment which had been specially created for him. He succeeded Pasteur as permanent secretary to the Academy of Sciences in 1889. In 1895 he was minister of public instruction during the Goblet ministry. His works include many papers and books, among them, *Chimie organique fondée sur la synthèse*, 1860; and *Les Carbures d'hydrogène*, 1901; *Science et philosophie*, 1886; and *Science et morale*, 1897.

Berthelot, **Philippe Joseph Louis** (1866-1934), Fr. diplomat, b. at Sèvres, Oct. 9; son of Marcellin Berthelot (q.v.); educated at Lycées Saint Louis and Henri IV. He entered the diplomatic service in 1889,

and in 1920 was appointed secretary-general to the Ministry of Foreign Affairs, with rank of ambas. In 1922, as a result of inquiry into the affairs of the Industrial Bank of China, B. was suspended for 10 years. Under the premiership of Herriot in 1925 he was 'amnestied' and re-appointed secretary-general, and he was instrumental in the creation of the Little Entente.

Berthier, Pierre Alexandre (1753-1815), Fr. general; proclaimed the republic in Rome in 1798. As chief of the staff he accompanied Napoleon to Egypt, and also in the campaigns of 1812-14. On Louis XVIII's accession he surrendered Neuchâtel, of which he had been created prince in 1806, and submitted to the king. When Napoleon returned from Elba he committed suicide.

Berthierite, dark steel-grey mineral, composed of sulphides of iron and antimony. It occurs in elongated prisms, has a hardness of 2 to 3 and a sp. gr. of 4 to 4.3. B. is found in Auvergne and the Vosges, in Saxony, in Cornwall, and in Lower California. It receives its name from the Fr. chemist, Pierre Berthier (1782-1861).

Berthold von Regensburg (1220-72), Ger. Franciscan preacher, b. at Regensburg; educated in the Franciscan monastery there under David of Augsburg. His teaching was mainly directed against luxury, the abuses of so-called chivalry, and the vices of the clergy. His *Sermons* have been ed. by Pfeiffer and Strebl (2 vols. 1862-80), and by Göbel (trans. into modern Ger. 1873). See his life by J. Paul, 1896, and Unkel, 1882.

Berthollet, Claude Louis (1748-1822), Fr. chemist, b. at Talloire, in Savoy. He graduated in medicine at Turin, settled in Paris in 1772, and was elected a member of the Academy of Sciences in 1780. Five years later he declared himself a convert to the new theories of combustion propounded by Lavoisier, although previously he had pub. papers in support of the old. He helped Lavoisier to reform chemical nomenclature, and was the first to advocate the use of chlorine as a bleaching agent. As he regarded chlorine as oxygenated muriatic acid, he could not appreciate the nature of the chlorates which he discovered. He also devoted serious attention to the process of smelting and converting iron into steel. Napoleon proved for him a generous patron.

Bertholletia, genus of Lecythideae growing in tropical S. America, and having only 2 species. The tree grows to a height of about 100 ft., and branches gracefully near the top. The fruit is a spherical case as large as a man's head, with 4 cells, in each of which are 6 or 8 triangular seeds with hard and wrinkled shells. The seed is the Brazil nut of commerce, which is nutritious as a food and yields an oil well suited for lamps.

Berthon, Edward Lyon (1813-99), Eng. inventor, b. in London. He studied surgery at Liverpool and Dublin, and lived for some years (1834-40) abroad, where he experimented on screws for propelling ships. His model of a screw propeller was, however, rejected by the Admiralty,

though afterwards adopted. In 1841 he went to Cambridge, and took holy orders in 1845. His other mechanical inventions were 'Berthon's log' for measuring the speed of ships, an instrument for discovering the trim of a boat, and collapsible boats, which were first ordered by the Admiralty in 1873. He wrote his reminiscences under the title *Retrospect of Eight Decades*, 1899.

Bertie, Peregrine, Lord Willoughby de Eresby (1555-1601), Eng. soldier, son of Richard and Catherine B., Baroness Willoughby de Eresby. He was b. at Lower Wesel, Cleves, at the time of the Marian persecution in England. His family returned to England in 1559, when a patent of naturalisation was obtained for him. He married a daughter of John de Vere, earl of Oxford, and in 1580 succeeded to his mother's title. In 1585 he petitioned Frederick II. on behalf of Henry of Navarre; and was made governor of Bergen-op-Zoom, 1586, in succession to Sir Philip Sidney. Later, he succeeded the earl of Leicester as commander of the Eng. forces in the Low Countries. Subsequently he was placed at the head of an army which went to the assistance of Henry of Navarre at Dieppe, 1589, and was present at the capture of Vendôme, Mons, Alençon, and Falaise.

Bertie, Richard (1517-82), the husband of the duchess dowager of Suffolk, in her own right Baroness Willoughby de Eresby, and father of Peregrine B. (q.v.). He was b. in Hampshire, and became a scholar of Corpus Christi College, Oxford. He was attached to the household of Thomas Wriothesley, the lord chancellor; as his wife was not a Catholic, he felt the danger of living in England under the rule of Queen Mary, and in 1555 escaped with her to France, and after running great dangers, they finally were received by the king of Poland, and remained in that country till the death of Mary. He sat in Parliament in 1562-63 as a knight of the co. of Lincoln. There is a monument to his memory and to that of his wife in Spilsby church, Lincolnshire.

Bertie, Robert, first Earl of Lindsey (1582-1642), the eldest son of Peregrine B. (q.v.), and godson of Queen Elizabeth. He joined the Sp. expedition of the earls of Essex and Nottingham, and was knighted in the market-place of Cadiz, on its capture, 1597. In 1628, after the assassination of Buckingham, he was appointed admiral of the fleet, and headed an expedition (which failed) for the relief of La Rochelle. He loyally supported Charles I. during the Civil war, and d. from wounds received at the battle of Edgehill in 1642.

Bertie, Willoughby, fourth Earl of Abingdon (1740-99), Eng. statesman. He was educated at Westminster School and at Magdalen College, Oxford. He early made the acquaintance of Wilkes, whose democratic principles he supported. B. succeeded to the earldom in 1760, and frequently spoke in the House of Lords, taking care to procure the insertion of his speeches in the newspapers. His pub. numerous pamphlets, which include

Thoughts on Burke's Letter on Affairs of America, 1777, and *A Letter to Lady Loughborough*, 1798, which is a eulogy of the Fr. Revolution.

Bertillon System. Name given to a system of anthropometry invented by Alphonse Bertillon (1853-1914). It consists of measurement of certain parts of the human body, which he found by research to be practically unchanging after full growth. By these it is possible so to classify any individual as to be able to identify him without fail for the rest of his life. For police purposes this was invaluable, and Bertillon's system was adopted in most civilised countries. The essential measurements are these: (1) Length of head, (2) breadth of ditto, (3) length of middle finger, (4) of left foot, (5) of forearm from elbow to tip of middle finger. Each of these measurements was classified as small, medium, or large, and height, length of little finger, and colour of eyes were also observed. The measurements, however, had to be so extremely accurate, and required such carefully trained observers, that the process of 'Bertillonising' was slow and expensive. As the slightest mistake in one respect might vitiate a whole record, it was necessary to take the mean of at least three measurements. In 1897 the system was superseded in India by Galton's simpler and cheaper finger-print records, which were adopted in England three years later.

Bertin, Louis François (1766-1841), Fr. journalist, the 'father of Fr. journalism,' b. in Paris in Dec. 1766. He wrote for the *Journal Français* during the Fr. Revolution. He founded the *Journal des Débats* after the 18th Brumaire. In 1801 he was banished for suspected royalist tendencies. Three years later he returned, taking up the management of the paper. Meanwhile Napoleon had altered the title to *Journal de l'Empire*. Gov. censorship and control followed. He regained possession in 1814, still supporting the royalist cause till his death in 1841. He was of a family possessing many famous members, all of whom were concerned with the *Journal des Débats*.

Bertinoro, episcopal tn. of Forlì, Italy, 7 m. S.E. of Forlì. It has mineral springs. Pop. 9000.

Bertran de Born, Viscount of Hautefort in Périgord (b. c. 1140), Provençal troubadour, b. of noble family, near Limoges. He became a vassal of England by the marriage of Eleanor to Henry II. of England, and was patronised by Henry Curtmantle, son of Henry II. Dante has placed him (*Inferno*, canto xxviii.) among the sowers of discord in hell, where he appears carrying his severed head before him; this referring to the way in which he fostered and took advantage of the ill-feeling existing between the 3 sons of the king. During 1182-83 he joined with the barons of Limoges, Poitou, and Périgord in their revolt against Richard I. of England. He was besieged at Hautefort, and ultimately became reconciled to Richard. About 1196 he entered a Cistercian monastery at Dalon, where he d. early in the thirteenth century. H

poems, of which 45 are still extant, deal with 'arms and men,' and are either in praise of his patrons or depreciation of his enemies. The style is rough but effective, and the love-poems and two *planhs* on the death of Prince Henry, are tender and sincere. They have been ed. by Stimming, 1879 and 1892, and Thomas, 1888.

Bertrand, Henri Gratien, Count (1773-1844), Fr. general. He entered the army at the outbreak of the Fr. Revolution. He was made a colonel by Napoleon during the Egyptian expedition, and was afterwards his aide-de-camp at Austerlitz. Napoleon appointed him grand marshal of the court in 1813. In 1814 he accompanied Napoleon to Elba, and returned after Waterloo to St. Helena with him. After Napoleon's death he was elected deputy in 1830 in the reign of Louis XVIII., and later brought the remains of Napoleon to France. He d. at Châteauroux.

Bertrand, Jacques Louis (1807-41), Fr. poet, also known as Aloisius and Ludovic, b. at Ceva, Piedmont, d. in Paris. Son of a captain of gendarmérie, his mother being lt. His style, both in prose and verse, is marked by purity and rhythm; indeed, the love of language was almost an article of faith with him. His poetry was little in output but excellent in quality. He began his literary career with mixed verse and prose contributions in the *Provincial*, a Dijon publication. He was in Dijon again when the Revolution of July broke out, and he served it with enthusiasm, contributing to the Dijon publication, *Le Patriote de la Côte d'Or*. Most of his prose-poems were produced in Paris, where on his return he lived in poverty, yet delayed publication in spite of his condition. His most notable work, *Gaspard de la nuit*, was pub. at Angers, posthumously by his friends, the title being theirs. The best in the collection are *La Barbe pointue* and *Madame de Montbazou*.

Bertrand, Joseph Louis François (1822-1900), Fr. mathematician, b. in Paris; educated at the Polytechnic School. In 1856 he became a member of the Academy of Sciences, in 1874 perpetual secretary of that body, and in 1884 a member of the Fr. Academy. He pub. works on arithmetic, algebra, calculus, thermodynamics, and probabilities.

Bertrand, Louis Marie Émile (1866-1940), Fr. author, b. Mar. 20 at Spincourt (Meuse); educated at lycées Bar-le-Duc and Henri IV. From 1897 until 1900 he was prof. of classics at Aix, Bourg, and Algiers. His first novel, *Le Sang des races*, was pub. in 1899, being a tale of the Fr. pioneers in Algeria. Other novels: *Le Rival de don Juan*, 1903; *Mademoiselle de Jessincourt*, 1911; *Sanguis Martyrum*, 1918; *L'Infante*, 1920; *Cardenio*, 1922. His also written: *La Grèce du soleil et des paysages*, 1908; *Le Livre de la Méditerranée*, 1911; *Les Villes d'or*, 1921. In biography: *Saint Augustin*, 1913; *Louis XIV.*, 1923; *Sainte Thérèse*, 1927. Later works include: *Carthage*, 1930; *Le Roman de la conquête*, 1931; *Histoire d'Espagne*, 1932. Died at Cap d'Antibes, Dec. 6.

Beruni, or Al-Beruni (d. 440), Arabian historian, who fl. at Ghazni during the reign of the Emperor Mahmud. His works, dealing with Indian hist., include *India* (trans. 1888), and *Chronology of Ancient Nations* (trans. 1879).

Bervie, Charles Clément (1756-1822), Fr. engraver, b. in Paris. His full-length engraving of Louis XVI. from the portrait by Callet ranks among the finest works of its kind extant.

Bervie (Inverbervie), mrkt. tn. and seaport in Kincardineshire, Scotland. Pop. 1100.

Berwick, James Fitz-James, Duke of (1670-1734), illegitimate son of the duke of York, afterwards James II., by Arabella Churchill, the sister of the famous general, Marlborough. Educated in France, on his father's accession he entered the imperial army, serving his apprenticeship as a soldier in Hungary under the duke of Lorraine. Later he accompanied his father into exile, took part in the battle of the Boyne, and in 1690 was made generalissimo of the Irish forces on the side of James. Having witnessed the ruin of his father's cause at the naval battle of La Hogue, he transferred his services to France. In 1693 he was taken prisoner at the battle of Linden, but was exchanged for the duke of Ormonde. His attempt in 1696 to stir up an insurrection against William III. was a failure. After suppressing the religious wars in the S. of France, he distinguished himself, during the Sp. war of Succession, by defeating the allied forces under General Stanhope in the battle of Almanza.

Berwickshire, co. of Scotland, bounded on the N. by Haddingtonshire and the N. Sea; on the E. by the N. Sea; on the S.E. by Berwick; on the S. by the Tweed and Roxburghshire, and on the W. by Midlothian. Its area is 457 sq. m., and its coastline 21 m. There are 3 natural divs. of the co.: (a) Lauderdale, the valley of the Leader; (b) Lammermuir, the mountainous dist. of the hills of that name; and (c) the Merse (march or borderland), the widest area. The average height of the Lammermuirs is 1000 ft., and their highest peak is 1749 ft. (Mt. SAYS LAW). The coast of B. is precipitous, and only accessible at Eyemouth Harbour, Coldingham, and Burnmouth. St. Abb's Head rises to 310 ft. and possesses a lighthouse. Of the rivs., the Eye flows directly to the sea. The others, Leader, Eden, Leet, and Whiteadder, are tribs. of the Tweed. The largest of these is the Whiteadder. Small lochs are at Coldingham, Legerwood, and Spottiswoode.

The climate of B. is suitable for the cultivation of vegetables, and it is not severe in winter owing to its maritime situation. The prin. grain crops are oats and barley, though wheat is raised in parts. Sheep and cattle are pastured in large numbers. Fishing is second in the industries. The chief tns. engaged in the fishing industry are Eyemouth, Burnmouth, Coldingham, and Cove. The chief fish caught are cod, haddock, herring, ling, lobsters, and crabs. As far as mineral wealth is concerned, coal, copper-ore,

and ironstone exist, but in quantities too small to work, while the large deposits of limestone lie too far from the coal area to be of any value. Gingham and woollen cloth stuffs are manufactured at Earliston, while blankets and plaids are produced at Cumledge. Other industries are distilling and brewing. Pop. 27,000.

The hist. of the co. reveals traces of Rom. and anct. Brit. settlement. The co. became included in the kingdom of Northumbria after the Rom. occupation.

was taken from the Scots by the Eng. in 1174, 1272, 1295, retaken by the Scots under Bruce in 1318, by the Eng. in 1333, the Scots in 1353, the Eng. in 1354, surprised in 1377, taken by the first cannon ever used in England about 1406, and in 1551 declared a neutral ter. Pop. 12,300.

Berwyn, tn. in Cook co., Illinois, U.S.A. It is one of the residential suburbs of Chicago. Pop. 48,400.

Beryl, mineral consisting of silicates of beryllium and aluminium, represented by

'Scotsman'

FISHERMEN'S COTTAGES AND BOATS AT COVE HARBOUR, BERWICKSHIRE

In 1018 the co. was annexed to Scotland, but was taken by England finally in 1482. The co. contains many picturesque ruins, among them being Fast Castle, Cockburnspath Tower, Dryburgh Abbey, and Hume Castle. See F. H. Groome, *A Short Border History*, 1887; W. S. Crockett, *Minstrelsy of the Merse*, 1889, and *Berwickshire and Roxburghshire*, 1926.

Berwick-upon-Tweed, seaport, municipal bor., and administrative co. of England. It is situated at the mouth of the Tweed on its N. bank. Among its ruins are those of a bell tower which was used to alarm the neighbourhood during border raids. Of its public buildings the chief is the tn. hall (1760). The tn. is connected to the S. side of the riv. by 2 bridges. The prin. exports are grain, coal, and fish. Among its sea fisheries are those of the herring and salmon. The tn. has iron works and shipbuilding yards. It was one of the first 4 royal bors. of Scotland,

the formula $\text{Be}_3\text{Al}_2\text{Si}_6\text{O}_{18}$. It crystallises in hexagonal prisms, usually of a greenish colour. The transparent green varieties are known as emerald, and those possessing a bluish-green colour are termed aquamarine. Transparent B. is known as precious B., and the opaque varieties are known as common B. B. is widely distributed, being found in Aberdeenshire, the Mourne Mts. in Ireland, Siberia, Brazil, Ceylon, and many localities in the United States.

Beryllium, or Glucinum, metal of the magnesium group, discovered in the form of oxide in the mineral beryl in 1798. The oxide was first called glucina from the sweet taste of its salts, but was afterwards called beryllia by the Ger. chemists. The metal was first obtained by Wöhler in 1828 by reducing the chloride with potassium, when the metal appears as a dark grey powder. In 1855 Debray prepared it in a compact state by heating B.

chloride and metallic sodium in separate receptacles in an atmosphere of hydrogen. The metal thus produced has a sp. gr. of 1.64, is silver-white in colour, melts at a lower temp. than silver, and in the powdered state takes fire when heated in air. B. oxide, or beryllia, is obtained by fusing beryl with twice its weight of potassium carbonate. The molten mass is allowed to cool, and is then treated with sulphuric acid, the excess of acid evaporated off, water added, and the silica filtered out. On cooling, the liquor contains mainly the sulphates of B. and iron. It is poured into a hot and strong solution of ammonium carbonate, allowed to stand for some days, and then filtered. The filtrate contains the B., and on boiling B. carbonate is precipitated. The precipitate is redissolved in ammonium carbonate solution and steam blown through the liquid, when the beryllia is precipitated.

Beryllonite, mineral consisting of beryllium sodium phosphate, represented by the formula BeNaPO_4 ; discovered in Maine, U.S.A., in the form of orthorhombic crystals. It has been used as a gem.

Beryx, genus of acanthopterygious fossil fish of the family Berycidae. It was a deep-sea fish, perch-like in form, and some species, e.g. *B. ornatus*, are found fossilised in the chalk of Sussex.

Berzeline, or **Berzelianite**, silver-white mineral composed of copper selenide (Cu_2Se), occurring at Skrikerum in Sweden and also in the Harz Mts. B., as named by L. A. Necker, is a white translucent mineral found near Albano, and composed of silicates of aluminium, sodium, and calcium.

Berzelite, or **Berzelite**, yellow or yellowish-red mineral occurring as isometric crystals and consisting of orthoarsenate of calcium, magnesium, or manganese. It is found at Långban in Sweden. Pyrrharsenite, in which antimony takes the place of part of the arsenic, is lighter in colour and occurs at Örebro in Sweden.

Berzelius, **Jöns Jakob** (1779-1848), Swedish chemist, b. at Vätersunda Sörgård, Sweden. In 1818 he became perpetual secretary to the Stockholm Academy of Science. His special study was devoted to the significance of atomic and molecular weight, and he pub. a table of results remarkable for their accuracy. He held that the essence of chem. was based upon oxygen. Later he developed an acute interest in electrochemistry. He was the first to adopt the symbol system of alluding to chemical substances. His works include *Lehrbuch der Chemie* and *Jahresbericht*, both works notable for their literary quality besides their scholarship. Of the latter work, which was a yearly record of Stockholm Academy science progress, he issued 27 vols. He invented many improvements of the blow-pipe and threw much light upon the substances tellurium, selenium, silicon, thorium, titanium.

Bes, deity worshipped among the ant. Egyptians. He was the god presiding over art, song, dancing, and childbirth. He was also worshipped in Cyprus and

Phoenicia. He is represented as a deformed dwarf, dressed in panther-skins and with a feather crown.

Besançon, city of France in the dept. of Doubs, of which it is the cap. Hills surround its position on the l.b. of the Doubs, at the foot of the W. Jura Mts. A feature of the tn. is its shady promenades. It is the seat of an archbishop. The chief industry is watchmaking. Lesser industries embrace enamelling, saw-mills, printing works, and the manuf. of paper, boots, machinery, and artificial silk. A tunnel under the city allows the passage of the Rhine and Rhône Canal. The city is of great antiquity. In the time of Julius Caesar it was known as *Vesontio*, while Marcus Aurelius made it a *colonia*. Till 1789 it was the seat of a parlement. Pop. 60,000.

Besant, see **BEZANT**.

Besant, **Annie**, Mrs. (*née* Wood), (1847-1933), Eng. theosophist, b. in London. In 1867 she married the Rev. Frank B., vicar of Sibsey, Lincolnshire. In early life she was a ritualistic High Churchwoman, but became a free-thinker, and was legally separated from her husband in 1873. In the following year she joined the National Secular Society; she co-ed. with Charles Bradlaugh (*q.v.*), the *National Reformer*, and took a prominent part in its free thought and radical movement. She joined in various labour movements, became a member of the Fabian Society, and of the London School Board, 1887-90. In 1889 she became a pupil of Mme Blavatsky, and joined the Theosophical Society, of which she was president from 1907. She lectured on theosophy in all parts of the world, and founded at Benares the Central Hindu College, 1898, and the Central Hindu Girls' School, 1904. In 1910 she founded the Order of the Star, and devoted her energies to preparing the way for the 'new Messiah' whom she believed embodied in a young Indian named Krishnamurti, proclaimed by her as a 'world teacher.' Her later life associated chiefly with the advocacy of the cause of Indian Home Rule. She founded the Indian Home Rule League, and became its president in 1916. The Indian National Congress elected her its president in 1917, and she was interned by the Indian Gov. in the same year. She pub. her life, under the title *Through Storm to Peace*, 1893. Her many works include: *Reincarnation*, 1892; *Death and After*, 1893; *The Building of the Kosmos*, 1894; *Four Great Religions*, 1897; *Avataras*, 1900; *A Study on Consciousness*, 1904; *Theosophy and the New Psychology*, 1904; *The Wisdom of the Upanishads*, 1908.

Besant, **Sir Walter** (1836-1901), Eng. author, b. at Portsmouth on Aug. 14, the son of William B. During his education he passed successively through King's College, London, and Christ's College, Cambridge. In 1859 he graduated as eighteenth wrangler. An interest in young and inexperienced authors caused him to found a Society of Authors with the object of protecting the rights of new authors. This was founded in 1884, and

Sir Walter filled its chair till 1892. He married in 1895 Mary Foster-Barham, of Bridgwater, and shortly afterwards was knighted. On June 9 he d. at Hampstead. Though Sir W. B. plunged into many fields of literary art, his greatest success was in writing novels. He collaborated with James Rice in the production of the first of these works of fiction: *Ready-Money Morthoy*, 1872, and *The Golden Butterfly*, 1876, are two of the best. The influence of Dickens is apparent, not least in the vigour with which he portrayed social evils. The establishment of the E. End Institute, known as the People's Palace, in the Mile End Road, was one of the direct results of his powerful *All Sorts and Conditions of Men*, 1882, which he wrote alone. James Rice having died, The sweating evil next received his attention, and expression of his indignation was found in *Children of Gibeon*, 1886. Among other novels are *Dorothy Forster*, 1884; *Armour of Lyonesse*, 1890; and *Beyond the Dreams of Avarice*, 1895. Besides fiction, he wrote *The French Humorists*, 1873; *Rabelais*, 1879; and biographies of Whittington, Captain Cook, and Richard Jefferies. His monumental work, *A Survey of London*, on the list, and archaeology of London unfortunately was never completed. See *An Autobiography*, 1902.

Beseler, Hans von, Prussian general (1850-1921). At outbreak of the 1914-18 War he was on retired list, but was recalled. Engineering had been his specialty. He captured Antwerp in Oct. 1914. In Aug. 1915 he took a distinguished part in the siege of Novogeorgievsk on the E. front, and became governor-general of Poland until the armistice.

Besier, Rudolf, Eng. playwright; b. 1878, in Java, of Dutch parentage. Educated Elizabeth College, Guernsey, and Heidelberg. Sev. years a journalist, principally on the Pearson publications. Chief plays: *The Virgin Goddess*, 1906; *Oliver Latimer's Husband*, 1909; *Don*, 1909; *Lady Patricia*, 1911; *Kings and Queens*, 1915; *Buzell*, 1916; *Robin's Father* (with Hugh Walpole), 1918; *The Prude's Fall* (with May Edginton), 1920; *The Barretts of Wimpole Street*, 1930. The play last named is about the family of Elizabeth Barrett Browning.

Besika Bay, bay on the N.W. coast of Asia Minor. It is situated opposite to Tenedos, to the S. of the entrance of the Dardanelles. During the disturbances arising from the E. Question, 1853 and 1877, the Eng. fleet was stationed there.

Beskow, Bernhard von, Baron (1796-1868), Swedish poet and dramatist, b. in Stockholm. In 1825 he was appointed to the position of private secretary to the Crown Prince Oscar. He was director of the Royal Theatre in 1831-32. His chief works are the poems, *Karl XII.*, 1819, and *Sveriges Anor*, 1824, and the tragedies *Erik den Fjortonde*, 1827-28, and *Thorkel Knutsson*, 1830. See Rydqvist, *Bernhard von Beskow*.

Besna, or **Beshni**, tn. of Turkey, 50 m. N.W. of Urfa. Pop. 15,000.

Besnard, Paul Albert (1894-1934), Fr.

painter, b. in Paris; he entered the studio of Cabanel in 1866, and won the Prix de Rome in 1874. In 1882 he received a commission to paint frescoes for the School of Pharmacy. His prin. works are: 'Saint Benoit et enfant,' 'La Vie renaissante de la mort,' 'Femme qui se chauffe,' etc., and numerous delicate pastel drawings. In 1879 he married Charlotte Vital Dubray, a sculptor of some note. In 1924 he was elected a member of the Fr. Academy.

Bessan, see BEISAN.

Bessarabia, region of U.S.S.R., forming (with Moldavia) the Moldavian S.S.R. The R. Pruth separates it from Bukovina and Moldavia on the W. and Dobruja on the S. The R. Dniester divides it from the Ukraine on the E.; while the S. is bounded by the Black Sea and the N. by Ukraine. The area is 17,614 sq. m., and the pop., which is racially very mixed, is estimated at about 2,000,000. The chief tns. are Akkerman, Bender, Byeltsi, Izmail, Khotin, and Kishinev. Spurs of the Carpathians invade the N. at a height of 800 to 1150 ft. The soil is fertile and agriculture is the prevailing occupation, the chief crops being wheat, maize, barley, flax, tobacco, watermelons, fruit, vine, saffron, and madder. The central belt is rich in timber, while lower are the rich pastures of the Budjuk Steppes. Sheep, cattle, and goats are raised here. The climate is extreme, while the rainfall is over 25 in. annually. Manufs. are in their infancy, wine, cloth, iron goods, and soap being the chief articles produced. The name B. is derived from Bassarab, 'the Great Voyevod of all the Rumanian lands,' the founder of the first national dynasty, in the beginning of the fourteenth century. For centuries B. was under Tartar domination and suffered from frequent invasions of Ottoman Turks. The union with Russia in 1812 signified for B. liberation from Turkish despotism. In 1876, by the treaty of San Stefano, Russia received B. unconditionally, and its inhab. were granted Russian citizenship. In 1905, during the first revolution, after the Russo-Japanese war, an awakening of national spirit was experienced in B., but all attempts at independence were soon suppressed. In Sept. 1917, when the *ancien régime* was crumbling in Russia, a soviet of peasants' and soldiers' deputies was formed in Kishinev. The first Military Moldavian Congress took place in Kishinev in Oct. 1917. The congress decided to elect a local council, Sfatul Tseret, to govern B. It consisted of 162 deputies. In Nov. 1917, Sfatul Tseret declared B. to be autonomous, and later in the same year proclaimed B. the 'Moldavian Democratic Republic,' part of the Federation of Soviet Republics. But early in the following year B. withdrew from the federation and declared itself the 'Independent Moldavian National Republic.' This declaration of the formation of a new state was not acknowledged by any of the powers, and the phase lasted for 61 days only. Apparently the Moldavians felt incapable of maintaining an autonomous position,

for on Mar. 27 of the same year Sfatul Tsereli voted for political union with Rumania, and this was accepted by the Rumanian Gov. with certain conditions. Entirely unconditional incorporation with Rumania took place on Nov. 27, 1918, and next year B. for the first time sent its delegates to the Parliament in Bucharest. The union of B. with Rumania was acknowledged by the Supreme Conference of the Allies on Mar. 3, 1920, and also explicitly by the treaty of Paris, Oct. 28, 1920. The union remained a matter of controversy between the U.S.S.R. and Rumania, and negotiations at Genoa (1922) and Vienna (1924) led to no settlement. In 1939, following the Ger.-Russian partition of Poland, the Soviet threat to B. became evident, and as a result of the ultimatum of June 27, 1940, B. and N. Bukovina were ceded to Russia. In their invasion of Russia in 1941 the Gers. delivered a series of powerful thrusts from B. in the battle of the Ukraine during July and Sept. For some time the Russians held firm, and bombed Ploesti. After three weeks' fighting, however, the Gers. had secured B., which was not retaken until Apr. 1944. The cession of the ter. to the U.S.S.R. was confirmed by the armistice between the Allies and Rumania on Sept. 12, 1944. (See EASTERN FRONT IN SECOND WORLD WAR.)

Bessarion, John (c. 1395-1472), medieval scholar who was instrumental in spreading the knowledge of Gk. literature over the W. of Europe. When the Gk. emperor went to Italy to effect the union of the two churches B. accompanied him. Having joined the Rom. Church, he became bishop of Frascati, and later papal legate at Bologna. Pope Eugene IV. had made him cardinal, and he might himself have been pope but for his strong sympathies with Plato and other pagan philosophers. He bequeathed his valuable collection of Gk. MSS. to St. Mark's Library, Venice.

Bessborough, Vere Brabazon Ponsonby, ninth Earl of, Brit. administrator, b. Oct. 27, 1880; educated Harrow and Cambridge Univ. He was called to the Bar in 1903; Unionist M.P. for Cheltenham, 1910-13, and for Dover, 1913-20. In 1915 he served in Gallipoli with the Imperial Yeomanry, and, later, on the staff in France. He has been chairman and director of many concerns, notably De Beers Consolidated Mines, and the Underground Electric Railway Company of London. In 1931 he was appointed governor-general of Canada, and remained in this office until 1935. He was president of the Council of Foreign Bondholders in 1936, and chairman of the League Loans Committee in 1937. Privy councillor, 1931; G.C.M.G., 1931. The earldom of Bessborough in the Irish peerage dates from 1739; included in peerage of the United Kingdom in 1937.

Bessbrook, mrkt. tn. of Armagh, N. Ireland. Main industry, linen weaving and bleaching. Pop. 3000.

Bességes, tn. in the dept. of Gard,

France. Has coal mines and iron works. Pop. 7000.

Bessel, Friedrich Wilhelm (1784-1846), Ger. astronomer, b. at Minden on July 22. His investigations on Halley's comet led to recognition by H. W. M. Olbers (q.v.), who pub. his results. Following investigation the 1807 comet, he was installed by the king of Prussia as director of a new observatory at Königsberg. Here he stayed from 1813 till his death. He tabulated a catalogue of 3222 stars, and pub. it under the title *Fundamenta Astronomiæ*, 1818. Among his secondary achievements was the improved heliometer. His most important astronomical work is *Astronomische Untersuchungen*, 1841.

Bessels, Emil (1847-88), Ger. scientist and Arctic explorer, b. at Heidelberg, and studied natural science and medicine there and at Jena. His first polar journey was made in 1869, and enabled him to demonstrate the presence of the Gulf Stream E. of Spitzbergen. In 1871 the U.S.A. Gov. appointed him chief of the scientific dept. to the expedition under C. F. Hall in the *Polaris*. The vessel was wrecked and all B's. collections lost in 1873. He pub. an account of the expedition in 1876, and also *Die Americanische Nordpolarexpedition*, 1878.

Bessel's Functions, in mathematics, indicate certain relationships between two variables. F. W. Bessel (q.v.) introduced them in 1817 in investigating mathematical relationships in connection with planetary orbits. Later they have been employed in calculations concerned with the vibrations of a stretched membrane, thus contributing to the theory of sound; and in calculations connected with almost every branch of mathematical physics. Bessel's function of order m is indicated by the symbol $J_m(\rho)$, and satisfies the differential equation:

$$\frac{d^2\mu}{d\rho^2} + \frac{1}{\rho} \frac{d\mu}{d\rho} + \left(1 - \frac{m^2}{\rho^2}\right)\mu = 0.$$

See A. Gray and G. B. Matthews, *Treatise on Bessel's Functions and Applied Physics* (second ed.), 1922.

Bessemer, tn. of Jefferson co., Alabama, U.S.A., 16 m. S.W. of Birmingham. It has blast furnaces, rolling mills, foundries, machine shops, etc. Pop. 22,800.

Bessemer, Sir Henry (1813-98), Eng. engineer, b. at Charlton, Herts. He was the author of many inventions, particularly the special process of steel manuf. called the Bessemer process (q.v.). B. profited to the extent of over a million pounds by his discovery. Among his minor inventions were gold paint and a movable die for embossed stamps.

Bessemer Process, process for freeing wrought iron and low carbon steel from mechanically entangled clinder. It was first introduced in 1865 by Henry Bessemer (q.v.). By its cheapness and effectiveness, it displaced other methods, and is still widely used in Britain, the U.S.A., and other countries, especially for making rails, ship plates, boiler plates, etc., though other processes, such as the Siemens-Martin process, have come into

competition with it. The principle of the B. P. is briefly as follows. Molten pig-iron is converted into steel by having a large number of fine streams of air forced through it, causing the oxidation of its impurities, such as carbon, silicon, and often its phosphorus and sulphur. The intense heat thus generated, without the use of any other fuel, is sufficient not only to melt the iron and keep it in a molten state, but to raise its temp. to above the melting point of steel, that is, to 1500° C. The B. converter, in which this process is carried on, is an immense retort, made of boiler plates, and lined with some refractory material, such as dolomite, firebrick, or ganister. It is suspended aloft, and mounted on axes at or near its centre of gravity. It is turned on trunnions, through the right one of which the blast is carried to the gooseneck, which delivers it to the tuyères at the bottom. There are two varieties of converters. The original one is undephosphorising, because it is lined with refractory material, such as siliceous acid. The dephosphorising or Thomas Gilchrist process is the name applied when the converter is lined with basic materials. It was patented in 1878, but it is only a modification of the B. P. For further details as to the proportions of carbon, silicon, sulphur, phosphorus, manganese, and copper in the different varieties of B. steel, and the character of the spectrum of the flames, etc., see the article on STEEL.

Bessenov, Peter Alexievitch (1828-98), Russian philologist, b. at Moscow; became prof. of Slavonic literature at the univ. of Cracow in 1879. He pub. a large number of valuable works dealing with Bulgarian and Servian language and literature, and also made critical collections of the popular songs and folklore of the Servian, Bulgarian, and Russian peoples.

Bessus (d. 328 B.C.), satrap of Bactria under Darius III. In 331 B.C., after the battle of Gaugamela, he captured Darius, and, on being pursued by Alexander, murdered him. He was betrayed to Alexander and put to death by him.

Best, George (d. 1584?), Eng. navigator, who accompanied Martin Frobisher in 1576, 1577, and 1578 on his 3 voyages to discover the N.W. Passage. B. pub. an account of these journeys under the title, *A True Discourse of the late Voyages of Discoverie for the Finding of a Passage to Cathaya by the North-west, under the conduct of Martin Frobisher, Generall*, 1578. The work was trans. into Fr., Lat., and It. Copies of the *True Discourse* are rare; it was included in Hakluyt's *Voyages*, vol. iii. (1600). It is probable that B. was killed in a duel by Oliver St. John, Viscount Grandison, about 1584.

Best (afterwards **Beste**), **Henry Digby** (1768-1836), Eng. writer, b. at Lincoln and educated at the grammar school there. In 1791 he took holy orders, but later was received into the Rom. Catholic Church. In 1818 he left England for a time and lived in France and Italy. His works include: *Four Years in France . . . preceded by some Account of the Conversion of the Author to the Catholic Faith*, 1826;

The Christian Religion briefly defended against the Philosophers and Republicans of France, 1793; *Italy as it is*, 1828.

Best, Thomas (c. 1570-1638), Eng. naval officer, who went to sea about 1583. In 1612, while in command of the *Red Dragon*, defeated the Portuguese at Surat, and his victory estab. Eng. trading rights in India as equal to those of the Portuguese. In 1623 B. headed an expedition against the Dutch, who had blockaded a privateer at Aberdeen and commanded the *Vanguard* in the unfortunate expedition to Rhé, 1627.

Best, William Thomas (1826-97), Eng. organist, b. at Carlisle. He was appointed organist of the Liverpool Philharmonic Society in 1849, and of St. George's Hall, Liverpool, 1854. He was himself a composer, and arranged pieces for the organ. His publications are: *The Modern School for the Organ*, 1853, and *The Art of Organ-Playing*, 1870.

Bestiary (Fr.), name given to the natural hist. books which were popular during the Middle Ages. They set out to describe all known animals, both living and fabulous. Part of the description was usually versified, and many illustrations illuminated the works. In addition to their zoological value, which was small, they included moral lessons and entertaining stories in allegorical form. All the varying qualities of good and evil in the heart of man were personified by some creature or other of the beast world. On churches and other buildings of the Middle Ages there are many weird and fantastically conceived creatures sculptured. It is believed that these were derived from the current Bs. The famous *Physiologus* of the Gks. was the source whence the earliest Lat. Bs. were derived, but the Gk. text of *Physiologus* exists only in late MSS. and must be corrected from the translations. This *Physiologus* contained about 50 allegories. Old Syriac, Armenian, Ethiopic, Arabic, Icelandic, and numerous Lat. versions of it were issued. Earlier than the eleventh century a Ger. version was made. Philippe de Thaun and Guillaume, a priest of Normandy, made a Fr. version in the twelfth century. Richard de Fournival's *Bestiaire d'amour* is a satire upon the earlier works. Most of the information now obtainable is found in the following works: *S. Epiphanius ad Physiologum*, ed. Ponce de Leon, Rome, 1857; *S. Eustathii in Hexameron Commentarius*, ed. Allatius, Lyons, 1629; *Physiologus Syrus*, ed. Tycheon, Rostock, 1795; *Classici Auctores*, ed. Mal. vol. vii., Rome, 1835; G. Herder, in *Archiv für Kunde Österreich, Geschichtsquellen*, Vienna, 1850; Cahier and Martin, *Mélanges d'archéologie etc.*, Paris, 1851; Cahier, *Nouveaux Mélanges*, 1874; and works by Cardinal Pitra, Maetzner, J. Victor Carus, J. P. N. Land (*Anecdota Syriaca*, Leyden, 1874), Möbius, and Hommel.

Bestushev, Alexander (1797-1837), Russian author. A captain in the army, he was exiled to Yakutsk for conspiracy in 1825, but entered the army of the Caucasus in 1829. Most of his novels deal

with military life in the wild dists. of the Caucasus. They include *Mullah Nur* and *Ammal Beg*, and sev. of them have been trans. into Ger. His collected works appeared in 1839 under the title of *Martinski's Tales*.

Beta, second letter of Gk. alphabet. See ALPHABET, and B.

Betaine (Lat. *beta*, beet), chemical formula $C_5H_{11}NO_2$, called also trimethylglycine B., occurs as a natural alkaloid in beetroot, in mangel wurzel, in the leading branches of *Lycium barbarum*, and in putrefying flesh. It has the constitution trimethylglycine, and can be obtained by the oxidation of choline hydrochloride. Choline occurs in the bile and brain of animals, and also in the white of eggs. B. can be obtained as a hydrochloride synthetically by heating trimethylamine, $(CH_3)_3N$, with monochloroacetic acid, $CH_2Cl.CO.OH$. It crystallises from alcohol in shining deliquescent needles containing a molecule of water. It is neutral, has a sweet taste, and is decomposed by boiling alkalis or baryta. It may also be prepared by boiling diluted molasses with baryta, and, in the later stages of the process, removing the barium from the filtration by H_2SO_4 , the B. hyochloride crystallising in evaporation.

Beta (B) Orionis, see RIGEL.

Betanzos, tn. of Spain. It is situated to the S.E. of Corunna about 10 m. Its pop. is 9000. Anciently it was called *Brigantium Flavium*.

Beta Particles, electrons, or negatively charged particles, of very small mass. Emitted at high speed during radio-active changes. They are lighter and more penetrating than alpha particles (q.v.), and their velocity approximates to that of light.

Beta Persei, see ALGOL.

Betatron, high potential induction electron accelerator, in which electrons are introduced from a hot cathode injector into a vacuum chamber. Acceleration of the electron beam is accomplished by the time-changing flux. Confinement of the beam to repetitive paths to permit extended acceleration is achieved through interaction of the electron velocity with the appropriately space-shaped magnetic field of the accelerating unit. The accelerated electron beam travelling at speeds up to 185,000 m. per second strikes a target and generates x-radiation, which passes through the walls of the chamber. The B. is used to transmute elements, to generate the most powerful x-rays known, and investigate cosmic ray effects.

Beteiguse, or Alpha Orionis, a bright star situated in the E. shoulder of the constellation of Orion. It is a long-period variable of about 196 days during which it declines in magnitude from 1.0 to 1.4. B. is the brightest star in Secchi's third type, i.e. it is reddish in colour and of a comparatively low temp. The spectroscopic reveals the presence of sodium, magnesium, and iron in its composition, but no hydrogen. B. has a small parallax, 0.02", which means that it is very remote, its distance being 160 light-years. Its brilliancy exceeds that of the sun many

hundred times, and it is estimated that it is receding from the solar system at the rate of 15 m. a second.

Betel-nut Palm (*Areca catechu*), tree indigenous to Malaysia, but cultivated also in S. India, Ceylon, Siam, and the Philippines. It grows about 50 ft. high, branchless, but bearing a crown of large fronds. The fruit, nearly the size of a hen's egg, contains the nut used by Asiatics for mastication. Gathered and husked before they are fully ripe, the nuts are then boiled, sliced, and sun-dried. Each piece for chewing is wrapped in a leaf of the betel pepper-vine, with some lime and often an aromatic flavouring. The betel reddens the mouth and blackens the teeth, but preserves them.

Beth, see BERT.

Betham-Edwards, Matilda (1836-1919), Eng. poet and novelist, the daughter of Edward Edwards, and of his wife Barbara, *nee* Betham. She became Officier de l'Instruction Publique de France, 1891. In addition to her vols. of poems, she wrote a number of books on France and Fr. life, notably *Anglo-French Reminiscences* (1899), *Home Life in France* (1905), and *Twentieth-Century France* (1917).

Bethania, post vil. of Forsyth co., N. Carolina, U.S.A. It is situated 8 m. from Salem.

Bethany: (1) Vil. 2 m. E.S.E. of Jerusalem. It is called El Azariyeh among the Arab inhab. of Palestine, for it was the residence of Lazarus and his sisters. The only object of interest is the supposed tomb of Lazarus. Of the ecclesiastic buildings erected about the fourth century little or no trace is existing. It is situated on the Mt. of Olives at a height of 2208 ft. above sea level. Pop. 200. (2) The same name, B., is given to 3 tns., or rather mission station, in S. Africa. They are situated in Great Namaqualand, Orange Free State, and Transvaal respectively.

Bethel, a pile of ruins called to-day Beitin, and situated about 11 m. N. of Jerusalem. The name trans. is 'house of God.' Scriptural mention of it makes it the scene of Jacob's dream. Formerly the place was known as Luz. Abraham stayed here, while afterwards the ark of the covenant was deposited in its precincts. Still later it became a royal residence and a centre of heathenish adoration. Pop. 500.

Bethell, Richard, see WESTBURY, BARON.

Bethesda: (1) A public bath of Jerusalem. Here Christ's healing of the impotent man occurred. Birkat Israel, situated in Jerusalem, has been identified with it since the year 1102. It is in that part of the city near the gate of St. Stephen and Omar's Temple. Other declarations of its site are those of Condor, who claims it to be identical with a spring called Gihon and En Rogel in the Kedron valley; and Sobiek who, in 1889, made a discovery of the remains of the pool's construction near St. Anne's Church. (2) A small tn. of Carnarvonshire, Wales, from whose Nonconformist chapel it derives its name, and situated about 4 m. from Bangor to the S.E. The Penrhyn slate

quarries, adjacent to the tn., employ most of its inhab. Pop. 4500.

Beth-horon, Upper and Lower (modern Beit 'Ur et Teahia and Beit 'Ur el Foka), two vils. of Palestine, 10 m. N.W. of Jerusalem, on frontier between Benjamin and Ephraim. Joshua defeated the Amorites in the pass between the two (see Joshua x. 1-11), and Judas Maccabeus defeated the Syrians here in 166 B.C.

Bethlehem: (1) The modern Beit Lahm, situated 5½ m. S. of Jerusalem, 2350 ft. above sea level. It is reached by a main road which passes, after 4 m., the Tomb of Rachel. B. stands on a high, narrow

ridge, restored by Justinian in the sixth century. The roof was repaired in the fifteenth century with lead sent by Edward IV. of England. The church is now shared by sev. communities. The grotto of the Nativity lies beneath the choir; on the E. side a silver star traditionally indicates the spot where Christ was b. Around it is the inscription 'Hic de Virgine Maria Jesus Christus natus est.' In 1935, as the church was in need of repair, the Colonial Office appointed a Brit. architect to report on its state as well as on that of the church of the Holy Sepulchre. A few m. to the S. of B. are the reservoirs known

BETHLEHEM

Terraces and the Church of the Nativity.

ridge, and is a typical old Jewish tn. of biblical times. Its structure explains many descriptive phrases of it in the Bible: thus external stairways still lead to the flat roofs, while the roofs are often conjoined so as, in effect, to facilitate flight from one dwelling to another. It has no natural springs, but wheat, olives, etc., grow in its neighbourhood, and its wine is excellent. It is famous as the home of David, the scene of Ruth's story, and above all as the bp. of Jesus. Christian pilgrimages thither began before A.D. 132. In A.D. 326 Constantine built a basilica, over which in 1099 the crusaders raised their standard and Baldwin I was crowned king of Jerusalem within it. In 1244 the Khwarizmians, who had conquered both Christians and Muslims, devastated it and in 1489 it was again destroyed and became a ruin. It now consists of 2000 houses with a pop. chiefly Christian of about 7000. The church of the Nativity is the oldest Christian church still in use, being the original basilica built by Constantine in 330, and partly

as the Pools of Solomon, which have now been brought into use in conjunction with other auct. sources of supply at Arrub. Adjoining the pools is a khan for Moslem pilgrims attributed to Sultan Soleiman, and known as the Qala't al-Burak. During the First World War B. was taken by the Brit. on Nov. 22, 1917.

Publications dealing with the hist., archæology, and architecture of Bethlehem: *Les Églises de la Terre sainte*, by Count Melchior de Vogüé, 1860, the classic architectural and historical description; *The Church of the Nativity at Bethlehem*, by W. Harvey, W. R. Lethaby, and others, 1910, an illustrated architectural and descriptive survey; *Bethlehem: le sanctuaire de la Nativité*, by Vincent and Abel, 1914, a fully documented historical and archæological study, written prior to recent important discoveries, now supplemented by articles in the *Revue biblique*, 1936, 1937; *Structural Survey of the Church of the Nativity, Bethlehem*, by William Harvey, 1935, a fully illustrated architectural survey of the present

condition of the church, including a record of recent archaeological discoveries; *Excavation in the Atrium of the Church of the Nativity, Bethlehem*, by R. W. Hamilton; *Basilica of the Nativity, Discovery of the Remains of an Earlier Church*, by E. T. Richmond.

(2) A post-bor. in the co. of Northampton, Pennsylvania, U.S.A. It is situated on the R. Lehigh, and is connected by rail with Philadelphia, 55 m. distant. The Moravians founded the tn., whose inhab. are still mostly of that sect. Silk, paint, and flour are its chief products. It is joined to South B. by two bridges across the Lehigh, and to West B. by Monocacy Creek. Total pop. 70,000. South B. is a centre of the steel and iron industry. Here are located some of the chief works of the B. Steel Corporation. In Nov. 1915 a fire attributed to Ger. agents caused a loss of material worth £250,000. South B. is the seat of the important Lehigh Univ., a Moravian theological seminary, and a woman's college.

(3) Tn. of Grafton co., New Hampshire, U.S.A., on Ammonoosuc R., 75 m. N.W. of Concord. A favourite summer resort of the White Mt. dist., having an elevation of 1460 ft. Pop. (resident) 872.

(4) Tn. of Orange Free State, S. Africa, 125 m. N.E. of Bloemfontein, in an agric. region, with an excellent climate. White pop. 6300.

Bethlehem Hospital, see BEDLAM.

Bethlehem Steel Corporation, the largest steel company in the world; incorporated under perpetual charter in N. Jersey in 1904, since when it has acquired control of extensive iron, coal, shipbuilding, and other interests. The corporation has steel and manufacturing plants at Bethlehem, Steelton, Lebanon, Johnston, and Coatesville in Lackawanna, Wilmington, Seattle, and San Francisco. Its chief products are pig-iron, ferro-manganese, spiegeleisen, iron and steel bars, slabs, guns, ammunition, bridges, viaducts, etc. Its shipbuilding and repair plants are at Quincy, Sparrow's Point, Baltimore, Alameda, San Francisco, San Pedro, and Boston.

Bethlehemites, the name of various societies following: (1) Order of monks of England who lived in the thirteenth century, and who founded a monastery at Cambridge, 1257. (2) Military order founded by Pope Pius II. to prevent an attack from the Turks in 1459. (3) Society of Guatemala, founded in 1659 and patronised by Pope Innocent XI. in 1687. Bethlehem Church in Prague gave the name also to its followers who were led by John Huss.

Bethlen, Stephan, Graf (Count) Bethlen von, Prime Minister of Hungary, b. Oct. 8, 1874, at Kornešty; son of Count Stephan Bethlen, of an old Transylvanian family. He was educated at Vienna and at Budapest Univ., where he studied law. He also took an agric. course at Magyaróvár; he then travelled, visiting America. In 1901 he entered the Hungarian parliament as a Liberal, but refused Count Tisza's offer of a place in the gov. Francis-Joseph made him a privy coun-

cillor. After the First World War, when Bela Kun (*q.v.*) headed the Communist revolution, Count B. was a leader of the counter-revolution. When this succeeded, the country was declared to be still a monarchy with the succession in suspense. In 1921 B., at the request of the Regent Nikolaus Horthy, became Prime Minister. He settled the W. frontier amicably with Austria, and in 1923 he succeeded in obtaining suspension of the reparations order against Hungary, and a loan from the League of Nations. In 1927 he signed a treaty with Italy, whose regime had much in common with his own. He was Prime Minister for 10 years from 1931, and, after that, leader of the opposition. In May 1939 he retired from political life, saying in his valedictory letter that he was 'opposed to Bolshevism, which seemed to be the trend of politics in Hungary.'

Bethlen-Gabor (1580-1629), member of an anc. Hungarian Protestant family. He was the chosen prince on the death of Gabriel Báthory in 1613. In 1619 he led the Bohemians against the Austrians in defending their rights. His victories led to his proclamation as king of Hungary in 1621. Varying fortunes, which finally resulted favourably to him, ended in a peace with Ferdinand II. of Austria. Gabor relinquished the title of king of Hungary, though he gained large acquisition of ter. and the title of prince of the Empire. The breaking by Ferdinand of the treaty saw Gabor's invasion with 60,000 men and consequent renewal of the violated conditions. In 1629 he *d.* Besides the high standard of military skill attained, he aided and endowed science and art.

Bethmann-Hollweg, Dr. Theobald Theodore Friedrich Alfred von (1856-1921), Ger. Imperial Chancellor, b. at Hohenfinow by Eberswalde. The Bethmanns were a banking family into which one Johann Jakob Hollweg had married—he was Theobald B.-H.'s great-grandfather. Johann Jakob's son, Moritz August von B.-H. (1795-1877), Theobald's grandfather, was Prussian minister of public instruction 1858-62, ennobled by Frederick William IV. in 1840. Theobald B.-H. studied law from 1875 to 1879, at Strasburg, Leipzig, and Berlin; and then occupied various posts in the civil service. He was assessor in Potsdam, 1885; Landrat (sheriff) of Ober-Barnim, 1886; member of the Reichstag for a brief period in 1890; president's counsellor, Potsdam, 1896; president of the local board at Bromberg, 1899; three months later, president of Brandenburg Province; acting privy counsellor, Jan. 1901; Prussian minister of the interior as well as vice-chancellor of the Empire, 1905; vice-president of the Prussian Ministry of State, and imperial secretary of state for the interior, 1907. On July 14, 1909, on the resignation of von Bülow (who was opposed to the Reichstag's scheme of indirect taxation), B.-H., although he had little experience of foreign affairs, was appointed chancellor. He became known as the upright chancellor. His mild Bill for the amendment of the Prussian

constitution was rejected in 1911. In that year he was instrumental in giving Alsace-Lorraine a more popular constitution, and came to an understanding with Russia as to the Near East. He was responsible for sending the warship *Panther* to Agadir (q.v.). The elections of 1912 gave the Socialists one-third of the votes in the Reichstag, and the militarism of the other parties was intensified. In 1913 the Zabern (q.v.) incident undid whatever mollifying influence had been exercised by the new constitution of Alsace-Lorraine. In 1914, from the date of the Sarajevo murder, June 28, till Aug. 1, the Foreign Affairs Committee of the Federal Council did not assemble. When it met on the latter date, B.-H., who presided, said: "When Austria-Hungary informed us that she would have to take action, we replied: 'We do not pretend to be able to judge what you ought to do; that is not our business. But it goes without saying that if the *casus foederis* should arise, we shall stand loyally by you.'" On Aug. 4 the Brit. ambas., Sir Edward Goschen, had his last interview with B.-H., who said: "Just for a word, 'neutrality'—a word that in wartime has so often been disregarded—just for a scrap of paper, Great Britain is going to make war on a kindred nation, which desires nothing better than to be friends with her." Count Bernstorff, the ambas. to U.S.A., while trying in 1916 to bring about peace through the mediation of President Wilson, strongly objected to the beginning of a submarine war against all vessels trading with Britain; but the military chiefs insisted, and on Sept. 25, 1916, B.-H. telegraphed to Bernstorff supporting them. The 'unlimited' warfare began Feb. 1, 1917. It became clear, however, that B.-H. was neither enthusiastic nor sanguine. Hindenburg and Ludendorff came to Berlin to negotiate with leaders of the various parties; and B.-H., recognising that he was pushed aside, resigned July 14, 1917, and was succeeded by Georg Michaelis. On June 25, 1919, he offered himself for trial by the victorious powers; in Oct.-Nov. 1919 he was examined before a Reichstag committee of inquiry. He d. at Hohenfinow Jan. 2. His *Betrachtungen zum Weltkrieg* were pub. between 1919 and 1921.

Bethnal Green, suburb in the E. of London, and a parl. bor. since 1885. A large portion of its pop. consisted formerly of silk-weavers from the Huguenot settlement, Spitalfields. In 1872 Queen Victoria opened a branch of the S. Kensington Museum here. Now the prin. occupations are matchbox-making, boot-making, and cabinet-making. Pop. 108,000.

Bethphage, associated with Bethany in the N.T., was a vil. near the Mt. of Olives, on the road from Jerusalem to Jericho.

Bethsaida, vil. on the W. shore of Lake Galilee. It was the bp. of Peter, Andrew, and Philip. Nothing now remains save a pile of grass-covered ruins. Another B. is situated at the E. extremity of the lake. It was named Julius by Philip the Tetrarch, after a daughter of Emperor Augustus.

Bethsan, see BEISAN.

Beth-shemesh: (1) Anct. city of Palestine, probably the modern Ain Shems, a vil. 15 m. S.W. of Jerusalem. Frequently mentioned in the O.T. as a city of N. Judah, between Kirjath-jearim and Timnah, originally a Levite city and later the chief city of Dan. Jehoash, king of Israel, captured Amaziah, king of Judah, here. See Joshua xxi. 16, and 2 Kings xiv. 11. (2) City of Naphtali, Upper Galilee. See Joshua xix. 38. (3) City of Issachar. See Joshua xix. 22. (4) Temple of On, Lower Egypt. See Jer. xliii. 13.

BETONY

Bethulie, tn. of Orange Free State, S. Africa, near Orange R., 39 m. S.W. of Bloemfontein. There are coal mines near. Pop. 2000.

Béthune, tn. in the dept. of Pas-de-Calais, France, 25 m. N.W. of Arras. It is the cap. of an arron., and the centre and market of the neighbouring coal mines. Its industries include oil and sugar refineries. The tn. was founded in the eleventh century, and did not come finally under Fr. rule until ceded to Louis XIV. by the treaty of Nimeguen (1678). The tn. suffered severely from bombardment in the First World War, but this did not prevent subsequent expansion. In the Second World War the B. area was heavily raided by the R.A.F. on Sept. 17, 1941. The tn. possesses a magnificent belfry of the fourteenth-sixteenth centuries and the church of Saint Vaast partly of the thirteenth century. Pop. 20,000.

Bethune, Cardinal David, see BEATON.

Bethune, Edward Cecil (1855-1930), Brit. soldier. He entered the R.A. in 1874, and a Highland regiment in 1875. He attained the rank of major-general in 1908. He served in the Afghan war, 1878-80, and in the Boer wars of 1881 and 1899-1902; for the last-named war in S. Africa he raised and commanded Bethune's horse. After that war he commanded the S.E. Sub-Dist., Cape Colony. Promoted to lieutenant-general in 1913. Was director-general of the Territorial Force, 1912-17. Retired 1920.

Bethune, James, see BEATON.

Bethune, Maximilien de, *see* SULLY, DUC DE.

Bethylus, in entomology, genus of small hymenopterous insects of the family Proctotrypidæ. The species are four-winged flies remarkable for their large depressed heads, and somewhat resemble ants in appearance. They are found chiefly in dry and sandy situations.

Bethylus, in ornithology, genus estab. by Cuvier and placed among the Laniidæ, butcher-birds or shrikes (*q.v.*). The species described by him is a native of Guiana and Brazil, and is particoloured, black and white, like the common magpie.

Betony (*Stachys betonica*), plant belonging to the Labiatae order. It is found in Great Britain in damp shady places, in hedgerows, woods, etc. The leaves are long, with toothed edges, and the blossoms, which appear in July and Aug., are of a purple colour. It was formerly regarded as a medicinal herb. It can be used to extract a kind of yellow dye.

Betrothal (A.-S. *treowth*, truth), term signifying pledging oneself to marry, *i.e.* giving one's troth. It was anciently a more formal ceremony than it is to-day, having most of the binding force of a marriage. Rom. law (*sponsalia*) imposed the duty on betrothed persons to become husband and wife in a reasonable time, except where death intervened. The custom was practically abolished in the Christian Church by the Council of Trent, because it so frequently led to clandestine marriages; but subsequently it became common again on the Continent. Since a betrothal is a legal contract, it is valid only between parties whose capacity is recognised by law, as, for instance, the persons must be of age. Betrothals induce a strict obligation to marry, and should either party eventually refuse, the other may obtain damages in an action for breach of promise. Betrothal as a term of art in Eng. law has fallen into disuse, it being rather the mere promise to marry than any formal betrothal that gives rise to the legal obligation.

Betsileo, S. part of the central plateau of Madagascar, inhabited by the Betsileos, numbering 470,000. Cap. Fianarantsoa.

Betterment, term used to describe the additional value a tenant has caused his landlord's land to possess. *See also* FIXTURES; LANDLORD AND TENANT.

Betterton, Thomas (1635-1710), the leading Eng. actor of his time, b. in Westminster, son of an under-cook in Charles I.'s household. Apprenticed to Rhodes, a bookseller of Charing Cross, who had been wardrobe-keeper to the theatre in Blackfriars. In 1659 Rhodes obtained a licence to form a company of players at the Cockpit, Drury Lane, and here B. made his first appearance on the stage. In 1662 Sir Wm. Davenant, patentee of the new theatre in Lincoln's Inn Fields, engaged B. and all Rhodes's company to play in his *Siege of Rhodes*. B. became so great a favourite of the king that he was sent to France to make improvements in the Fr. theatres. Cibber says that it was after B.'s return that shifting scenes first replaced tapestry on the Eng. stage.

In 1670 B. married Mrs. Sanderson, a capable actress of the same company. Later B. built a new playhouse in Lincoln's Inn Fields, which opened in 1695 with Congreve's *Love for Love*, B. taking the part of Valentine. But the venture was not financially very successful, and B., with impaired health, decided to leave the stage. His performance of Hamlet after this time, however, was especially noteworthy. In 1710 he made his last appearance in his celebrated part of Melantius in *The Maid's Tragedy*. On his death in the same year his remains were interred with much ceremony in the cloisters of Westminster. He wrote sev. dramatic works which had a vogue in his day. *See An Apology for the Life of Mr. Colley Cibber, Comedian*, 1740, 1879; R. W. Lowe, *Thomas Betterton*, 1891.

Bettia, tn. in Bihar, India. It consists of 10 different dists. Indigo is principally cultivated.

Bettinelli, Saverio (1718-1808), It. writer. After being educated at a Jesuit college, he became a member of that society. On the suppression of his order in 1773, he wandered from city to city. His chief work is the *Risorgimento*, wherein he traces the progress of science and art in his country, whilst his tragedy of *Xerxes* added considerably to his renown. But he is equally well known for his attack on Dante in *Lettere Dieci di Virgilio agli Arcadi*, 1756.

Betting, the act of staking money on the result of some future event, usually of a sporting nature, but not necessarily so. The word is supposed to be derived from the Old Fr. *abeter*, to instigate. The origin of the custom is not exactly known, but it dates back to the very earliest days, especially in E. countries. By far the largest part of B. in England takes place over horse-racing, and the men who make a profession of taking bets are known as bookmakers. Up to the early part of the nineteenth century none of these existed, as such, but the first man to take bets in a really scientific and business-like manner was William Ogden in 1793, who can be called the first proper bookmaker. B. is illegal except at properly authorised race meetings, and then it must be in Tattersall's Ring. The B. is of two kinds: post B., when the wagering begins when the numbers of the horses are hoisted on to the board just before the race, and ante-post B., when the wagering takes place weeks before the event. Bets on all big races, such as the Derby, the Oaks, the St. Leger, the Cambridgeshire, or the Cesarewitch, often take place nearly a year previous to the race meeting. Bets are quoted in most newspapers, and as the public take them up so the prices are regulated. The theory of B. is simple, but in practice it is more complicated. The bookmaker will make a book for a certain amount, say £50, £100, or £1000, and his endeavour is to lay an equal amount of his book against every horse in the race. The odds, of course, change with the current quotations of each horse. (For further details consult Tattersall's *Rules on Betting* and Rowntree's

Betting and Gambling.) Bookmakers who wish to carry on their business otherwise than at race meetings are styled 'commission agents,' and profess only to take money on behalf of others. The Betting Acts of 1853 and 1874 were made to prevent bookmakers having too much power, while the Gaming Act was designed to check the evils attendant on this custom. The Betting Acts above mentioned enforce that 'no house, office, room, or other place' shall be resorted to for the purpose of B. The word 'place' has been held to mean even an umbrella or stool belonging to a bookmaker at a race meeting who is outside Tattersall's ring. B. debts cannot be recovered in a court of law. Welshing is the term given to the practice on the part of a dishonest bookmaker of disappearing with the stake-money before a race. The laws on street B. are severe, especially upon those making books with persons under the age of 16. For the first offence any one taking bets in a public place is fined £10; for the second offence, £20; and for the third offence, £50 or six months, and so on, according to the number of convictions. Among some of the famous bets that have taken place may be mentioned that of Lord George Bentinck, who won £20,000 when Crucifix won the Oaks in 1840, and 3 years later the same nobleman stood to win £150,000 if his horse Gaper had won the Derby; the horse lost, but Lord George won £30,000 on another horse. John Gully and Ridsdale won £100,000 over the Derby and the St. Leger in 1832, and Sir Joseph Hawley won £80,000 when Beadsman won the former race in 1858. Lord Glasgow once laid £90,000 to £30,000 with Lord George Bentinck. Capt. Machell gained over £60,000 when Hermit won the Derby, while over the same race the notorious plunger, the Marquess of Hastings, lost the enormous sum of £103,000. The totalisator system of B. is now in operation on many race-courses in England. This system was first used in France, the apparatus being known as the *pari mutuel*. It is a large frame with a pigeon-hole for each horse, into which the stakes are placed; the better obtains a voucher for his money, and the numbers are exhibited after the race. The Fr. municipal authorities deduct a certain percentage from the stake-money, and another percentage is also set aside for the poor before the money is divided up amongst the winners. This system was introduced into France in 1865, and a few years later into England, where, however, it did not find favour, and was soon abolished and declared illegal as being a gaming machine. The difference between the 'tote' and the *pari mutuel* is that the former is operated automatically by electricity. Both the *pari mutuel* and totalisator systems again came into favour in Great Britain and were legalised by the Racecourse Betting Act, 1928. Such B. is controlled, under the Act, by a board of control. The system is also used in the dominions.

Wagers are a form of B. not usually associated with the race-course, but are a

hazard on any event, sporting or otherwise, sometimes on things of an absurd nature. Lotteries, still another method of B., take the form of taking tickets for small or large amounts on the chance of winning big sums of money. The earliest lottery properly estab. was one in Florence in 1530, and in 1571 a special official was appointed in Venice to supervise these affairs. From Italy the lottery passed into France and gradually spread over Europe. The first one known in England was at the end of the seventeenth century. Lotteries are now illegal in England, however, although they still flourish on the Continent, where they are sometimes run by the states, in fact Austria, Denmark, and Prussia have raised loans by this means. In America, as in England, they are now forbidden by law. The Betting and Lotteries Act, 1935, restricts betting by totalisator and bookmaker to 104 days on any racing track; regulates greyhound racing and authorises the establishment of totalisators on dog tracks; bans all lotteries, with the exception of certain small private ones organised by clubs and other institutions; prohibits the publication of lottery advertisements, 'matter descriptive' of the drawing of lotteries, and lists of prize-winners; and imposes penalties ranging from a fine of £50 to a fine of £750, or two months' imprisonment to a year's imprisonment. The publication of matter descriptive of the drawing or intended drawing of a lottery is only an offence if it is 'calculated to act as an inducement.' A justice of the peace, before issuing a search warrant, must be satisfied that premises are being used for the sale or distribution of lottery tickets. In connection with trafficking in lottery tickets, and, in particular, in Irish Sweepstake tickets, the gist of the offence is the sale and distribution of tickets in Great Britain. It is not an offence for an individual to send money to Dublin for tickets for himself; but if the individual were to sell the tickets to someone else, or to hand money on to another person for the purpose of purchase, that would be an offence under the Act. (See also LOTTERY.) The gaming-table is also a popular form of B.; this is now also illegal in England, though in 1820 it was licensed in London and was popular in the eighteenth century, but in the early part of last century the games of faro, basset, hazard, and roulette were prohibited. Gaming continued, however, to be in vogue at many of the health resorts on the Continent, but only quite small sums are allowed to be staked at one time, generally not exceeding 5 Swiss frs. Ostend has a large kursaal with many tables, and although officially abolished in France in 1838, gaming-tables for the small amounts alluded to above are still to be found at places like Dieppe and Boulogne. Baden-Baden, the famous watering-place, and Homburg, the Prussian spa, were at one time two of the most famous resorts in Europe of gamblers. Since the suppression of the gambling facilities of most of these places, Monaco is the only European state where gambling

on a large scale is lawful. See MONTE CARLO.

Betting Tax. This tax was imposed by the Conservative Gov., with Mr. Winston Churchill as chancellor of the exchequer, in the Finance Act of 1926. It provided that the following excise duties should be levied on and after Nov. 1, 1926: (a) On every bet made with a bookmaker a duty of 3½ per cent of the amount wagered, or in the case of a bet in respect of a horse race on a race-course 2 per cent of the amount wagered; (b) on a certificate to be taken out annually by the bookmaker a duty of £10; (c) on a certificate to be taken out annually by the bookmaker in respect of the entry for any betting premises kept or used by him a duty of £10. The Act declared that no part of this Act in so far as it related to betting should render lawful betting in any manner or place in which it had hitherto been unlawful. The above figures of 3½ per cent and 2 per cent were amended in 1928 to 2 per cent and 1 per cent. The tax was abolished by the Labour Gov. in 1930.

Bettws-y-coed, urban dist. of Carnarvonshire, Wales, situated 4 m. from Llanrwst and 16 from Llandudno. Its name signifies house of prayer (from O.E. *bede*-house) of the wood. Artists and tourists are attracted to the spot. Fishing for trout and salmon yields large results. Among its waterfalls the best known are Llugwy, Lledr, and Conwy. Pop. 1000.

Betty, William Henry West (1791-1874), Eng. actor; popularly known as the 'young Roscius.' He was b. at Shrewsbury, Shropshire, and first appeared on the stage at the age of 12 as Osman in *Zara* by Aaron Hill, which was Voltaire's *Zaïre* in Eng. Spontaneous success led to a journey to Dublin. While here he is said to have memorised the part of Hamlet in 3 hours. The House of Commons was adjourned by Pitt one night to allow members to attend a performance where he was appearing. He made his last appearance as a boy actor in 1808; was a fellow commoner at Christ's College, Cambridge, from 1809 to 1911; returned to the stage in 1812; retired in 1824 to enjoy the fortune he had amassed.

Betul, or Baitul: (1) Dist. of Central Provs., India. Mountainous, with large forests and some coal mines. Cap. Badnūr. Area 3826 sq. m.; pop. 400,000. (2) Tn. of above dist., 112 m. N.W. of Nagpur. Pop. 6000.

Betula, generic name of the birch, and gives its name to the natural order *Betulaceæ*. See BIRCH.

Betulaceæ, an order of dicotyledonous trees or shrubs found largely in N. lands. It comprises 6 genera, of which typical plants are the birch, alder, hornbeam, and hazel-nut.

Betuwe, dist. of the Netherlands, situated between the Waal R. and the Rhine R., in the prov. of Gelderland. It is very fertile.

Betwa, riv. in India, rising in Bhopal in Malun. It joins the Jumna after a course of 360 m. A canal 168 m. long is

fed by it for irrigation purposes in the Jalaun dist.

Betzdorf, tn. of Rhineland, Germany, 45 m. S.E. of Cologne. Has iron and machine works. Pop. 8600.

Beulé, Charles Ernest (1826-74), Fr. archaeologist and politician, b. at Saumur. He became prof. of archaeology at Athens, where he discovered the propylæa of the Acropolis. His publications were numerous and include: *L'Acropole d'Athènes*, 2 vols., 1854; *Études sur la Péloponnèse*, 1855; *Les Monnaies d'Athènes*, 1858; *Phidias, drame antique*, 1863; and *Histoire de l'art grec avant Périclès*, 1868. *Consult* Ideville, *Monsieur Beulé, souvenirs personnels*, 1874.

Beurnonville, Pierre de (1752-81), Fr. general under the republic, b. at Champignolle.

Beust, Friedrich Ferdinand von (1809-1886), Austrian count and statesman, b. at Dresden; descended from a distinguished and noble family who had been connected with the Mark of Brandenburg. Educated at Leipzig and Göttingen, he entered the public service of Saxony. In 1836 he became secretary to the legation at Berlin. His later appointments led him to London, Paris, and Munich. He was the champion of the minor Ger. states against Prussian hegemony; but his chief title to fame is that, as foreign minister to the Emperor Francis Joseph, he brought to a successful issue the negotiations for the *Ausgleich* between Austria and Hungary.

Beuthen, or Bytom, tn. of Silesia, on R. Oder 110 m. S.E. of Wrocław, centre of the metal-working and mining industries. The tn. dates from the sixteenth century, when it was part of Bohemia, the cap. of the duchy of B. It remained within the Ger. prov. of Silesia after the partition of Upper Silesia between Germany and Poland in 1921, but was incorporated in Poland in 1945 after the Second World War. Pop. 101,000.

Beuvry, tn. of Pas-de-Calais dept., France, 3 m. S.E. of Béthune; pop. (commune) 6000.

Beuzeville, tn. in the dept. of Eure, France, 7 m. S.E. from Honfleur. Pop. 2000.

Bevagna, tn. of Umbria, Italy, 18 m. S.E. of Perugia. Has a trade in wine. Pop. (tn.) 3800, (commune) 6400.

Beveland, North and South, two is. in the Scheldt estuary, Netherlands. They are of the Zeeland Is., of which group S. B. is the largest and most fertile. It has a pop. of 23,000. N. B. is a low marshy tract.

Beveren, tn. of Belgium, situated in E. Flanders. It became noted for the manuf. of point-lace. It contains a famous church. Its pop. is 13,000.

Beveridge, William (1637-1708), Bishop of St. Asaph, studied the classical and Semitic languages as sizar of St. John's College, Cambridge. In 1661, having obtained his M.A. degree, he was ordained deacon and priest. Before finally accepting his bishopric he refused that of Bath and Wells. Piety and devotion distinguished him through all his preferments. In 1824 9 vols. of his sermons and other

writings were pub. His *Private Thoughts upon Religion* was pub. in 1709.

Beveridge, William Henry, first Baron **Beveridge of Tuggal** (b. 1879), Eng. economist, b. at Rangpur, Bengal, son of Henry B. of the I.C.S.; educated at Charterhouse and Balliol College, Oxford; Stowell Civil Law Fellow of Univ. College, Oxford, 1902-9. He was leader-writer for the *Morning Post*, 1906-8; member of the Central Unemployed Body for London, 1905-8, and first chairman of Employment Exchanges Committee. He entered the Board of Trade in 1908, and was director of labour exchanges, 1909-16; then assistant secretary in charge of Employment Dept. He was director of

E.N.A.

LORD BEVERIDGE

London School of Economics and Political Science, 1919-37. He holds degree of D.Sc. (Econ.), London, 1930, and was a senator of London Univ., 1919-37, and again in 1944; vice-chancellor, 1926-28. From 1941 to 1943 he was president of the Royal Statistical Society. He has served as chairman of various social services committees, notably, since 1934, of the Unemployment Insurance Statutory Committee, and, during 1941-42, of the Inter-Departmental Committee on Social Insurance and Allied Services. This body was formed as a committee of experts, including the gov. actuary and representatives of many gov. depts., to undertake a survey of the existing national schemes of social insurance, including workmen's compensation, and to make recommendations. The outcome of these labours was the celebrated report made by B. as chairman, and signed by him alone. It

was pub. by the Stationery Office under the title of *Social Insurance and Allied Services* (Cmd. 6404 of 1942). Its main feature was a far-reaching scheme of social insurance against 'interruption and destruction of earning power and for special expenditure arising at birth, marriage, or death.' The plan was intended to cover the whole community, without upper income limit, and embodied 6 fundamental principles: namely, 'flat rate of subsistence benefit; flat rate of contribution; unification of administrative responsibilities; adequacy of benefit; comprehensiveness; and classification.' It provided for the conditions of unemployment and disability benefits, retirement pensions, training benefits, maternity grants, children's allowances, widows' allowances, and recommended a national health service organized under the health depts., while at the same time advocating the creation of a Ministry of Social Security to unify the administrative work of the whole scheme. The report, which was the basis of subsequent legislation, created a widespread interest at the time of its publication, and summaries of it were broadcast to the world. Apart from its merits, it was held to symbolize the stability and confidence of Great Britain in that, during the course of a world war, in which its existence was at stake, the country could nevertheless concern itself with plans for the betterment of social conditions. K.C.B., 1919; raised to the peerage in 1946. Other works pub. by B. are as follows: *Unemployment: a Problem of Industry*, 1909 (new ed., 1930); *Insurance for All*, 1924; *British Food Control*, 1929; *Causes and Cures of Unemployment*, 1931; *Planning under Socialism*, 1936; a pamphlet, *The Unemployment Insurance Statutory Committee*, 1937; *Full Employment in a Free Society*, 1944; and a book about his father and mother, *India Called Them*, 1943.

Beverland, Adrian (c. 1654-post 1712), Dutch scholar, b. at Middelburg, Zeeland. His pamphlet, *Peccatum Originale*, was produced in 1678, and was burned publicly, while its author suffered imprisonment. His *De Stolatæ Virginitatis Jure*, pub. in 1680, caused a still greater storm of obloquy. Later he became mentally deranged, and d. not long afterwards.

Beverley, tn. in the E. Riding of Yorkshire, Eng. It is connected with the R. Hull by a canal. It is 8 m. N.N.W. of Hull city. Corn and coal are its chief articles of trade, while tanning and the manuf. of agric. tools are the chief industries. The tn. possesses a magnificent Gothic minster in the collegiate church of St. John. For architectural beauty it compares with York Minster itself. There is also a grammar school whose foundation is of such antiquity that its exact date is unknown. Pop. 14,000.

Beverley, St. John of (d. 721), Eng. ecclesiastic, b. at Harpham in Yorkshire, was for 33 years archbishop of York, and was tutor to the Venerable Bede. He founded a college at Beverley for secular priests. After his death he was canonised, and William the Conqueror spared the tn.

of Beverley when he ravaged the rest of Yorkshire. Among B.'s works are *Pro Luca Exponendo*, addressed to Bede, and sev. epistles.

Beverley, John (of fourteenth century), Carmelite monk; he was doctor and prof. of divinity at Oxford and wrote *Questiones in Magistrum Sententiarum* and *Disputationes Ordinariæ*.

Beverly, tn. of Essex co., Massachusetts, U.S.A. It is situated on an inlet of the Atlantic opposite Salem. By rail it is 18 m. N.E. of Boston. Its importance is due to its harbour, its fisheries, and a large manuf. of shoes. Pop. 25,000.

Beverwijk, com., prov. of N. Holland, 7 m. by rail from Haarlem. Pop. 26,000.

B.B.C.

ERNEST BEVIN

Bevin, Rt. Hon. Ernest (b. 1881), Eng. politician. He was for many years general secretary of the Transport and General Workers' Union, being popularly known as the Dockers' K.C. He was appointed chairman of the General Council of the Trades Union Congress in 1937, and has been M.P. (Labour) for Central Wandsworth since 1940. When Mr. Winston Churchill formed his gov. in May 1940 B. was appointed minister of labour, and it fell to him, at a difficult time, to mobilise the man-power of the country without so straining the principle of industrial conscription as to excite the hostile criticism of the left-wing elements in the country. In this he was certainly successful. In 1945, when the term of the Coalition Gov. was approaching its end, B. made it clear that Labour proposed to revert to party 'warfare.' On Labour's return to office in the summer of that year, B. became foreign secretary in Mr.

Attlee's Gov. In Jan. 1946 he took part in the Foreign Ministers' Conference in Moscow, where he supported the establishment by the United Nations of a commission for the control of atomic energy. In the House of Commons (Mar. 1946) he took a strong line with regard to Russian intransigence over Persia, the Polish army in Italy, and other questions. At the meeting of the U.N.O. Security Council he strongly defended Brit. policy in Greece against allegations made by the Ukrainian delegates; and he took an equally firm stand on Brit. policy in the question of the Russian military occupation of Persian Azerbaijan. At the foreign ministers' conferences in the summer of 1946 his name was associated with a plan for the formation of a Federated Germany composed of a number of semi-autonomous 'states.' In Feb. 1946 B. was made an honorary citizen of Missolonghi as a token of gratitude for his services to Greece—an honour which was awarded to Lord Byron in 1824. In 1947-48 he was largely responsible for the conception of a W. European pact by way of counteracting the gradual westward infiltration of Russian Communist influence. A W. European treaty, valid for 50 years, finally took shape at the Brussels conference in March 1948. (See BRUSSELS TREATY, 1948.) He was awarded the order of Suvarov, 1944; Privy Councillor, 1940. His speeches and broadcast addresses were pub. in 1942 under the title *The Job to be Done*.

Bevis of Hampton, prin. character of an Eng. medieval romance. His father was Sir Guy, earl of Hamptoun (Southampton). On the murder of his father by the Emperor Divoun of Almayne, his mother sold him to heathen merchants as a slave. Thus he journeyed to Ermonyn (Armenia), where he won the affection of the King Ermyrn and the love of his beautiful daughter, Josian. The conquest of Brademond of Damascus, the slaying of a ferocious boar, and of a dragon, and the overthrow of a giant named Ascapart, whose life he spared, are among his achievements. He possessed a celebrated sword called Morglay. His death after 30 years of domestic felicity took place at the same time as that of his wife and his horse, Arundel. The story was retold by Michael Drayton in *Polyolbion* (1622). Dr. Kölbinger ed. the romance for the Early Eng. Text Society in 1885.

Bewdley, bor. of Worcestershire, Eng., on the Severn, 14 m. N.N.W. of Worcester. It has manufs. of leather, combs, brass and iron ware, malt, bricks, and rope. The tn. is an anct. one, and its prosperity dates from the fifteenth century. Pop. 3000. See also BALDWIN OF BEWDLEY, EARL.

Bewick, Thomas (1753-1828), Eng. wood-engraver, was the son of the lessee of a small colliery. Showing small aptitude for learning, but decided talent for art, he was apprenticed, in 1767, to Ralph Beilby, a Newcastle engraver, with whom he afterwards entered into partnership. Having pub. many woodcuts in his *Select*

Fables, he estab. his reputation as a dexterous, accurate engraver by the vignettes and tail-pieces of his *Quadrupeds*, which appeared in 1790. His self-taught genius, and virile humour, however, are most conspicuous in his *History of British Birds*.

Bewsher, Samuel (1852-1915), Eng. schoolmaster, and once bursar at St. Paul's School. He was the founder (1881) of the preparatory school of Colet Court which prepares boys for St. Paul's School.

Bex, tn. of Switzerland, in the Rhône Valley, about 30 m. from Lausanne, with which it is connected by rail. There are salt mines. Pop. 5000.

Bexhill, holiday resort, 51 m. W. by S. of Hastings, on the coast of Sussex, Eng. Pop. 21,000; in 1881 it was 2000.

Bexley, tn. on the Cray, in Kent, England, 5 m. S.E. of Woolwich. Pop. 33,000.

Bexley, Nicholas Vansittart, first Baron (1766-1851), Eng. politician. *b.* in London, Oct. 29, 1766, son of Henry Vansittart, a governor of Bengal. Began political life by writing pamphlets in support of the Pitt Gov. Entered the Commons as M.P. for Hastings in 1796, and sat for various constituencies, without a break, for 25 years, until he was raised to the peerage. He was joint secretary to the Treasury in 1801, and again, under Sidmouth, in 1806, and estab. a reputation as a financial expert. Thereafter and in times of national difficulty he generally succeeded in getting his resolutions passed, but it is open to question whether they were not rather more complicated than sound. His contention that cash payments had no connection with the then unfavourable rate of exchange was clearly unsound; his contention that the public regarded promissory notes of the Bank of England as legal coin of the realm is, however, perfectly sound to-day. It was with such arguments that he defeated the bullion committee, which had been appointed to make recommendations. In 1812, as chancellor of the exchequer, he brought forward a 'new plan of finance,' a complicated measure for abrogating much of the existing sinking fund statutory provisions of 1802 and, despite the opposition of Huskisson and Tierney, his plan passed the House. After Waterloo, when the nation confidently anticipated a reduction of taxation, he declined to abolish the property or income tax and instituted further complicated schemes for effecting economies in the National Debt services. He was now highly unpopular and, eventually, in 1822, resigned. *D.* at Foot's Cray, Kent, Feb. 8. *Consult* Spencer Walpole, *History of England*, 1890.

Bev, see Bkg.

Beysers, Christian Frederik (1869-1914), S. African soldier, *b.* in Cape Colony, practised as lawyer at Witwatersrand. On Boer side in war of 1899-1902, became general. Under Brit. rule, Speaker of Transvaal House of Assembly, 1906. Commandant-general of Defence Force of S. Africa, 1910; visited England, 1912. At outbreak of the First World War, re-

signed, and joined in Maritz's rebellion. Caught trying to cross Vaal at Greyling, Dec. 7, 1914, he was shot at and fell into the riv., where he was drowned.

Beyle, Marie Henri (1783-1842), Fr. author, known by his pen-name of *Stendhal*, *b.* at Grenoble. He was in turn soldier, shopman, and diplomatist. After some years spent in the commissariat, he accompanied Napoleon on the Russian campaign, and was present during the retreat from Moscow. After the fall of Napoleon, he refused to continue in his position, and took up his residence in Milan. In 1821 he was compelled to leave this city, and returned to Paris, where he soon became known in literary circles. In 1830 he was appointed consul at Trieste and then at Civita Vecchia, and in this post he continued till his death at Paris in 1842. His works are numerous, chiefly falling into the divs. of critical works and novels, and they are all remarkable for fineness of observation and for the extraordinary abundance of their ideas. Of the first div. are *Histoire de la peinture en Italie*, 1817; *Rome, Naples, et Florence*, 1817; *Racine et Shakespeare*, 1823, 1825; *Promenades dans Rome*, 1829. His chief novels are: *Armance*, 1827; *Le Rouge et le Noir*, 1831; *La Chartreuse de Parme*, 1839. Amongst a variety of miscellaneous works the following are interesting: *Essai sur l'amour*, 1822; *Mémoires d'un touriste*, 1838. *Correspondance*, 1855; *Journal de Stendhal*, 1888; *Vie de Henri Brulard*, 1890; *Souvenirs d'égoïsme*, 1892; and *Lettres à sa sœur*, 1892, all pub. posthumously, are valuable as autobiography. Stendhal's chief characteristic is his egotism. He had the gift of psychological analysis, and it is for this, rather than for continuity and arrangement of plot, that his novels are so outstanding. He was one of the *idéologues* of the early nineteenth century (c. 1822), and has been hailed as a precursor of romanticism and realism. B.'s stock has risen appreciably in recent times, and it has been justly said that he was a century before his true era. Balzac said of him: 'M. Beyle is one of the superior men of our time. It is difficult to explain how this observer of the first order, this profound diplomat who, whether in his writings or in his speech, has furnished so many proofs of the loftiness of his ideas and the extent of his practical knowledge should find himself nothing more than consul at Civita-Vecchia. No one could be better qualified to represent France at Rome.' His works are many in number, and they are remarkable for fineness of observation and for the extraordinary abundance of their ideas. See A. Paton, *Henri Beyle*, 1874; E. Rod, *Stendhal*, 1892; F. C. Green, *Stendhal*, 1939.

Beylerbey, see BEGLERBEK.

Beypur, seaport of India, Malabar dist. of Madras, near mouth of Beypur R. It is on the railway from Madras across India. Some iron and coal are found in the vicinity. Pop. 7000.

Beyrich, Heinrich Ernst (1815-96), Ger. geologist and paleontologist, *b.* at Berlin. In 1856 he became prof. of geology and

palaeontology at Berlin Univ., and in 1873 director of the geological dept. His pub. works include *Beiträge zur Kenntniss der Versteinerungen des rheinischen Übergangsgebirges*, 1837; *Konchylien des Norddeutschen Tertirgebirges*, 1853-57.

Beyrout, see BEIRUT.

Beysohlag, Willibald (1823-1900), Ger. Protestant theologian and writer, b. at Frankfurt-on-Main. His numerous works include: *Die Christologie des Neuen Testaments*, 1866; *Leben Jesu*, 2 vols., 1855, 3rd ed. 1893; *Neutestamentliche Theologie*, 2 vols., 1891-92; *Christenlehre auf Grund des kleinen lutheranischen Catechismus*, 1900; and an autobiography, *Aus meinem Leben*, 1896-98.

Beza, or **de Béze**, Theodore (1518-1605), Fr. theologian, b. at Vézelay in Burgundy. He studied at Orleans, under the learned Melchior Volmar, who both taught him Gk. and also inspired him with his first leanings towards Protestantism. He studied law for some time, but gave himself largely to polite society and literature these two influences producing his *Poemata juvenilia*, a vol. of loose verse pub. 1548, the thought of which later gave him great pain. In 1548 he had a severe illness, which brought about his conversion. He had already given up the idea of taking orders in the Rom. Church, and now, after marrying his mistress, Claudine Denosse, he joined Calvin at Geneva, and became prof. of Gk. at Lausanne. In 1550 he pub. a drama on *The Sacrifice of Abraham*, and began a series of lectures on parts of the N.T., which ultimately led him to trans. the whole of it into Lat. In 1559 he returned to Geneva, where he was prof. of theology with Calvin. In 1561 he represented the Protestants at the Conference of Poissy, returning to Geneva in 1563. Next year Calvin d., and B. was called on to take his place as head of the reformed churches of France and Geneva. In 1571 he presided over the synod of La Rochelle. His best-known works are an ed. of the Gk. Testament, *De Hæreticis a civili magistratu puniendis*, and the doubtful *Histoire ecclésiastique des églises réformées du royaume de France*; while his *Confessio and Tractationes Theologicæ* are still of value to theologians. Beza's Codex, the Codex Bezae, or Codex D. is a Gk. MS. of the N.T. in uncial characters, dating from about the sixth century. B. presented it to the univ. of Cambridge in 1581, with a rather untrustworthy account of its hist. See lives by Heppé (1861), Baird (1899).

Bezant, or **Byzantine**, name of a coin of the Byzantine empire. The value of the gold B. varied from 10s. to a sovereign, that of the silver B. from 1s. to 2s. They were not made in the same impression as earlier Rom. coins, and in sev. cities where the Byzantine standard was adopted they were copied. Owing to the commercial relations which the Byzantine empire then had they were distributed throughout the known world. They were in use in England and India until the reign of Edward III. The fact of their being brought home by crusaders led to their use in Eng. heraldry, for which see BEZANT (heraldry).

Bezant, in heraldry, belongs to the group of roundels or pellets, disks or balls of different colours. The name B. is generally confined to the golden roundel, though occasionally the silver roundel is included. In olden times it was considered that the B. and the silver roundel, as representing coins, should be drawn as a flat surface, the other roundels being drawn as balls. The arms of Beulay of Wharfedale were 'gules a bezant.' For further particulars see under HERALDRY.

Bezdan, tn. of Yugoslavia, co. of Bács-Bodrog, on a canal joining the Danube and the Theiss, near the former riv. Pop. 8000.

Beziers, cap. of an arron. in the dept. of Hérault, France, on R. O.b and Canal du Midi, is beautifully situated on the slope of a hill. It contains architectural monuments, of which the chief is the early Gothic cathedral, rebuilt in the fourteenth century. The tn. also possesses remains of Rom. occupation in the ruins of an aqueduct and an amphitheatre. In 1209 the tn., which was a centre of the Albigenses, was taken by Simon de Montfort and the inhab. were put to the sword. In later times it was a centre of the Huguenots. It manufs. silk and woollen goods, brandy, wines, chemicals, etc. Pop. 72,000.

Bézique (corruption of Fr. *bésigue*, origin uncertain), game at cards which, under varying rules, may be played by 2, 3, or 4 persons, the number of packs being the same as the number of players. Usually played by 2 players. The piquet pack of 32 cards is used, but in duplicate, the 2 packs being shuffled together. The dealer then deals 8 cards to each player, dealing 3, 2, 3, and the cards that remain are laid on the table between the players, forming the 'stock.' Trumps are fixed either by turning up the top card of the stock or by the suit of the first marriage or sequence (see below) which occurs during the game. The non-dealer then plays the first card, and the second player is not compelled either to win the trick (which he can do by trumping or by playing a higher card of the same suit) or to follow suit. Unless he has something to declare, he will probably avoid winning the trick. After each trick, each player takes a card from the stock and places it in his hand, the winner taking the top card. This continues until only 2 cards remain in the stock. The trick that follows is called the 'last trick,' and after the stock is exhausted the last 8 tricks are played under different rules. The aim in B. is not to gain tricks. It is (1) to secure certain combinations of cards in the hand, which, when declared, add to the score; (2) to gain in play briques, i.e. as many aces and tens as possible; (3) to win the 'last trick,' which, as explained above, is not the last trick of the game. Scores are gained as follows: *Marriage* (king and queen of any suit), 20; *Royal Marriage* (king and queen of trumps), 40; *Sequence* (ace, ten, king, queen, and knave of trumps), 250; *B.* (queen of spades and knave of diamonds), 40; *Double B.* (all the B. cards), 500; four aces (of any suit,

whether duplicates or not), 100; four kings, 80; four queens, 60; four knaves, 40. These are all gained by declaration. Winning of last trick, 10. In addition to this, if the dealer turns up the seven when turning up for trumps, he counts 10. If the seven of trumps is in the hand, the player may either exchange it for the card turned up, or declare it and count 10. Lastly, at the end of play, each player counts up the number of aces and tens in the tricks he has won, and registers 10 for each.

The deal goes on alternately until one of the players has scored 1000. This closes the game. If the loser has scored less than 500 points, the game counts double. Three and four-handed B. are played under almost the same rules. In four-handed B. the players may form partners, declarations may be made after a win by either partner, and B. may be from either hand. Other forms of the game are Polish (or open) and Rubicon Bézique.

Bezoar, or **Bezoar Stone**, concretion or hardened mass occasionally found in the stomach or intestines of ruminating animals, as goats, llamas, antelopes, cows, etc. The name is of Persian origin, and means antidote to poison, the stones obtained from the Persian wild goats being at one time much esteemed in that connection. They appear to be formed through the presence of some irritating substance in the alimentary tract. Balls of hair are found in the intestines of Brit. cattle, but these have little or no accretion. The term is sometimes applied to the fossilised dung of extinct animals found in the Lias beds of Gloucestershire.

Bezwađa, tn. in Madras, India, on the l. b. of the Kistna, 44 m. N.W. of Masulipatam, a rapidly growing centre for riv., canal, and railway traffic. Pop. 46,000.

Bhagalpur: (1) City of India in Bihar in dist. of the same name, on r. b. of Ganges, 265 m. by rail from Calcutta. Pop. 70,000. (2) A dist. in Bihar, divided into 2 nearly equal divs. by the Ganges. Lowlands are fertile and well cultivated. The chief manuf. is indigo, and rice and other cereals are well cultivated. Area 4226 sq. m. Pop. 2,100,000.

Bhagavad-Gītā (the song of the blessed), religious and philosophical poem of India which is inserted as an episode in the sixth book of the *Māhābhārata*. It begins with describing the state of war between the 2 tribes of the Pāndus and the Kurus. The 2 tribes are closely united in blood, and this renders Arjuna, chief of the Pāndus, unwilling to slaughter his adversaries. But Krishna is with him in the form of his charioteer, and now recalls him to his duty, and instructs him in the work of a warrior. As the instruction continues it becomes more elevated and mystical, until at last Krishna reveals himself as the supreme lord of creation. The work is the greatest ethical product of Indian philosophy, but there is much confusion of elements caused by the various alterations it has undergone. Pantheistic and monotheistic ideas are mingled with high ethical teach-

ing. The main aim of the book is to teach the way of mystic souls to the Yoga or absorption in the Deity, which it proposes as the highest aim of humanity. The later recension of the work shows traces of the influence of Buddhist and possibly even of Christian thought. *The Song Celestial* is a translation or paraphrase of the B. done into blank verse by Sir Edwin Arnold. See N. Macnicol (ed.), *Hindu Scriptures* (Everyman's Library); S. Radhakrishnan, *The Bhagavad-Gītā*, 1948.

Bhagirathi: (1) One of the chief head-streams of the Ganges, rising on the W. slopes of the Himalayas. It is regarded as sacred by the Hindus. (2) Branch of the Ganges which flows past Murshibad. Later it takes the name of Hugli, and forms one of its prin. outlets.

Bhainsar, fort and tn. on the top of a high rock in Rajputana, Udaipur, India. Famous for remains of temples to Siva.

Bhamo, tn. of Burma, on Upper Irrawadi, 40 m. W. of the Chinese frontier. Early in the twentieth century it became a centre on the trade route to the Yunnan prov., to which an Anglo-Chinese convention in 1893 gave special trading rights to Britain. Its chief industry is the transit of goods. During the military operations in Burma in 1944, B. fell to Chinese forces on Dec. 16. Pop. 7800.

Bhandara, cap. of dist. of B. in Central Provs., India, about 35 m. E. of Nagpur. Pop. 14,000.

Bhandarkar, Sir Ramkrishna (1837-1925), Indian orientalist, son of a Brahman civil servant. Was recognised as one of India's most distinguished orientalists, and represented the Bombay Presidency at the Vienna Congress of orientalists. He was the founder of the *Indian Antiquary* (1872); pub. *The Early History of the Deccan*, in 1884.

Bhang (Hindu word), name for Indian hemp (*Cannabis indica*), but applied to a narcotic drug formed from its dried leaves. It is used sometimes for smoking, either alone or with tobacco, sometimes it is strained in water to produce an intoxicating drink, sometimes it is used for chewing. It is in common use among the Indian races, and also among the Arabians and Egyptians. In addition to intoxicating effects, it produces various kinds of hallucinations, in the same way as opium.

Bhanpura, tn. of India, native state of Indore, on the Rewa; pop. 15,000.

Bharatpur, or **Bhurtpoor**, state in Rajputana, India, ruled by a maharaja. The surface is generally level and fertile, but the country suffers somewhat from lack of water, being traversed by only one riv. The cap. of the state is the tn. of B., whose immense mud walls still remain. It successfully resisted a siege by the Brit. in 1804, but was captured by storm by them in 1826. Area of state 1978 sq. m.: pop. (1941) 576,000. Pop. of tn., 36,000.

Bhartrihari, Indian poet who is supposed to have lived during the first century B.C. The best-known work attributed to him is a collection of apophthegms, arranged in 3 centuries or groups of 100. It is possible that they are the

work of various hands. The first century deals with love, the second with ethics and morality, the third with asceticism, and devotion to the Divine Being. A critical ed. by Böhlen appeared at Berlin in 1833.

Bharuch, see BAROACH.

Bhatgón, or Bhatgong, tn. of Nepal, 5 m. S.E. of Khatmandu. It is a favourite residence of the Brahmans. Pop. 30,000.

Bhatkal, tn. in the S. of Bombay, India, 80 m. N. by W. of Mangalore. Was a prosperous mart from 1300 to 1600. Pop. 6000.

Bhattacharya, see KUMARILA BHATTA.

Bhau Daji, or Ramkrishna Vital (1822-1874), Indian physician, a Sarasvat Gond Brahmin, b. at Mandra, Goa; educated in Bombay, and became a teacher in the Elphinstone School; studied medicine at the Grant Medical College, 1845-50. He did some valuable research work in connection with the cure of leprosy.

Bhaunagar, or Bhavnagar, state of Baroda, India, ruled by a maharaja; formerly part of the Bombay presidency, but in 1943 was transferred for administrative purposes to Baroda. The cap. is the tn. of B., a port on the gulf of Cambay, 60 m. N.W. of Surat. Area of state, 2981 sq. m. Pop. (1941), 618,000; pop. of tn., 65,000.

Bhavabhuti, Indian dramatic poet who fl. at the beginning of the eighth century of our era. He came of an illustrious Brahman family, and is the author of 3 Sanskrit dramas which raise him to the level of Kālidāsa and Harsha. The 3 are the *Maha-vira-charita*, *Uttara-rāma-charita*, and *Mālati-Mādhava*, the story of the two first being drawn from the legend of Rama. All three have been trans. into Eng. separately.

Bhavagad Gita, see BHAGAVAD-GITA.

Bhavani-Kudal, tn. of Madras Presidency, India, on Bhavani and Cauvery Rs., 58 m. N.E. of Coimbatore, containing temples to Vishnu and Śiva. Pop. 10,000.

Bhera, tn. on the Jhelum, in Punjab, Pakistan; dist. Shahpur. Pop. 17,000.

Bhils, aboriginal, pre-Aryan people of Central India, found scattered over the hilly dists. there, but especially in the Khandesh dist. of Bombay and the Vindhya Hills. They were driven out of the fertile dists. by the Aryan invaders, and thenceforth led the wild, nomadic life of outlaws. An unsuccessful attempt having been made to subdue them, the Bhil Corps was formed in 1825 to utilise their fighting instinct, and this corps secured some order in their dists. The Bhil is short, dark, active, and a great woodman; he is brave but superstitious. They number about a million.

Bhilsa, tn. of India, on the Betwa R., 26 m. N.E. of Bhopal. It grows a coarse tobacco, in which it carries on some trade. To the S.E. of B. is Sanchi, remarkable for a group of Buddhist topes, chief of which is the Great Top. B. itself also possesses some of these buildings.

Bhima, riv. of India, 398 m. long, rising in Bombay. After flowing through Hyderabad, it joins the Kistna near Muktl.

Bhir, tn. on Pandsura R., in Hyderabad, India.

Bhiwani, tn. in Hissar dist. of Punjab, India, 38 m. S.E. of Hissar by rail. Commercial centre, with trade in salt, spices, and metal goods. Pop. 35,000.

Bhobaneser, see BHUVANESWAR.

Bhojpur, tn. of Shahabad dist., Bihar, India, 8 m. E. of Buxar. Pop. 10,000.

Bhopal, state of Central India, founded in 1723 by Dost Mohammed Khan. In 1818 a treaty of dependence was concluded between Britain and this state, which had always shown itself friendly. It is crossed by the Vindhya Hills, and is hilly but generally fertile. The cap., also named B., 325 m. S.W. of Allahabad, is watered from 2 large artificial lakes in the dist. Pop. 50,000. Pop. of state (1941) 785,000; area 6900 sq. m.

Bhor, state of India, formerly in the Bombay Presidency, but since 1933 grouped within the Agency of the Deccan and Kolhapur States. Area 1491 sq. m.; pop. 131,000. The cap. is the tn. of B., 30 m. S. of Poona; pop. 4000.

Bhownagree, Sir Mancherjee Merwanjee (1851-1933), b. in Bombay, the son of a Parsee merchant; educated at Elphinstone College and Bombay Univ.; became sub-editor of the *Statesman* in 1871. In 1873 he became state agent in Bombay for the maharaja of Bhaunagar, and in 1881 came to England to study law. In 1895 he entered Parliament as Conservative member for Bethnal Green. He was created K.C.I.E. in 1897. Author of *History of the Constitution of the East India Company*, 1871, and a Gujarati translation of Queen Victoria's *Life in the Highlands; Loyalty of India*, 1916.

Bhuj, cap. of the state of Cutch, India. The tn. has a pretty appearance on account of its white-topped mosque and pagodas. Pop. 19,000.

Bhurtpoor, see BHARATPUR.

Bhusawal, tn. in the dist. of Khandesh, in Bombay, India, 115 m. S. of Indore. Has important railway works. Pop. 26,000.

Bhutan, independent state in the E. Himalayas, bounded on the N. by Tibet, on the E. by various independent mt. states, on the S. by Assam and Bengal, on the W. by the independent state of Sikkim. The surface is extremely varied, and B. presents a series of lofty, forest-clad mt. ranges, alternating with deep-cut valleys. Through these valleys swift rvs. run in a southerly direction, ultimately joining the Brahmaputra. The chief of these are the Mānas, the Machu, and Chinchu. The dist. has only been explored during the last few decades, and in 1904 an expedition was sent there which did much valuable surveying work. There were formerly 2 supreme chiefs of the state, the Dharm raja, head in spiritual matters, and the Deb raja, head in temporal affairs. But in 1907 the governor of West Bhutan was elected hereditary maharaja by the Buddhist ecclesiastics and people. The Bhutians are industrious, their agric. produce being their chief exports. Among these are the famous horses, mules, native cloth, salt, etc. Nominally the religion is

Buddhism. The area of the state is estimated at 13,000 sq. m., and the pop. at 250,000. Chief tns. are Tassissudon and Punakha (the cap.). There was war between Great Britain and B. in 1865, and the Deb raja threatened to send against the invading Brit. a force of 12 gods who were 'very ferocious ghosts.' For a time the prestige of Brit. arms was shaken, but a treaty was signed on Nov. 11, and thenceforth the 2 countries have been on friendly terms. The huge feudal castles of B. and the Buddhist temples in inaccessible situations, such as Tak Thsang, the Tiger's Nest, are described by the Earl of Ronaldshay in *Lands of the Thunder-bolt*, 1923.

Bhuvaneswar, or **Bhubaneser**, city of Puri dist., Orissa, India, 16 m. S. of Cuttack. While largely in ruins, it has a temple to Siva, and a trade in cloth and rice. Former cap. of Resari dynasty of Orissa.

Biafra, Bight of, bay on the W. coast of Africa, on that part of the gulf of Guinea lying between Cape Formosa on the N. and Cape Lopez on the S. It contains the is. of Fernando Po (Sp.), Prince's and St. Thomas (both Portuguese). Into it flow various important rivs., the Niger, New Calabar, Old Calabar, Rio del Rey, Cameroon, and Gaboon.

Biala, tn. in Poland, 34 m. E.S.E. of Siedlce, on the main line between Warsaw and Moscow. Pop. 15,000.

Bialik, **Chaim Nachman** (1873-1934), Hebrew poet, b. in the Ukraine. Opposed the Bolshevik regime mainly because of its suppression of the Hebrew language; and went to Palestine where he became a national hero. He is indeed looked upon as the best modern Hebrew poet and numerous streets in Jerusalem and other Zionist cities are named after him. *D.* in Vienna.

Bialystok, tn. of Poland, in the co. of the same name, situated on the R. Biala. It has manufs. of silk goods and hats, and a trade in grain and manufactured products. It belonged to Prussia from 1795 to the time of the treaty of Tilsit in 1807, when it was ceded to Russia. During the First World War B. was the scene of one of the final battles in the Ger. campaign against the Russians in 1915. In the Second World War the Gers. made a thrust towards the H.-Breit-Litovsk railway with the intention of hemming in the Russians in that area and completely destroying them, so as to be free to devote their energies to the W. Front. Sev. hard-fought encounters took place, but the Gers. eventually defeated the Russians towards the end of Aug., and B. was captured by the Ger. Eighth Army on Aug. 25. Taken by the Gers. in the invasion of Poland (Sept. 1939), but given up to the invading Russian army from the E. (See EASTERN FRONT IN SECOND WORLD WAR.) Pop. of the co. is 1,700,000 and of the tn. 92,000.

Biana, or **Bayana**, tn. of India, state of Bhartpore, near l. b. of the Gambhir R. It contains 2 anct. Hindu temples, and in ages past was a city of importance. Pop. 7000.

Blancavilla, tn. of Sicily, 20 m. N.W. of Catania, on the S. slope of Mt. Etna. The dist. produces wine and grain, and cotton-stuff is made and exported. Pop. 21,000.

Bianchina, **Francesco** (1662-1729), It. astronomer, b. at Verona. He was a favourite of Pope Alexander VIII., whose librarian he had been, and continued in favour under Clement XI., who made him secretary of the committee for the reformation of the calendar. He wrote works of astronomical and archaeological interest, and *Istoria Universale*, 1697.

Biandrata, **Giorgio**, see **BLANDRATA**.
Biard, **Auguste François** (1798-1882), Fr. genre painter, b. at Lyons. He visited the Levant, Greenland, and Brazil, and his pictures show the influence of these journeys. Among his best-known paintings are the 'Beggar's Family,' the 'Slave Market,' the 'Fight with Polar Bears,' the 'Wandering Players,' and the 'Mad-house.' In addition to this type, on which his fame chiefly rested, B. also painted historical scenes.

Biarritz, watering-place of S.W. France, dept. Basses-Pyrénées, on bay of Biscay, about 5 m. W.S.W. of Bayonne. Under the patronage of the Emperor Louis Napoleon, or rather of the Empress Eugénie for whom that monarch erected the Villa Eugénie here, B. rose from a small fishing vil. to a large tn. It depends for its prosperity entirely on its visitors, for it has no important industries. The air is salubrious, and the country pleasing. It has 2 casinos, luxurious villas and hotels, bathing, golfing, etc. Pop. 21,000.

Bias (c. 550 B.C.), son of Teutames, b. at Priene, in Ionia, was one of the seven sages of Greece. He became a distinguished citizen of his native tn., and many of his apophthegms have been preserved. The stories associated with his name, such as his persuasion of the Ionians to settle in Sardinia, are probably unauthentic.

Bias, **India**, see **BEAS**.
Bib, **Whiting-pout**, or **Brassy**, popular names of the *Gadus luscus*, a fish belonging to the family Gadidae and of the same genus as the cod, whiting, and haddock. It is about a foot long and less than 5 lb. in weight. It occurs in the N. Sea and Arctic Ocean.

Biban-el-Moluk, valley of Upper Egypt, near ruins of Thebes, in which are the tombs of the anct. Egyptian kings of the eighteenth, nineteenth, and twentieth dynasties.

Bibbiena, tn. in the prov. of Arezzo, in Tuscany, Italy. Pop. of commune, 9000. The church of S. Lorenzo was hit sev. times by bombs in the Second World War, and its roof was holed, but the two great Della Robbia reliefs were undamaged.

Bibbiena, **Bernardo Dovizio da** (1470-1520), It. cardinal, was the son of poor parents. Having entered the service of Cardinal Giovanni de' Medici, he followed him to Rome after the death of Alexander VI., and was there entrusted by Pope Julius II. with sev. important commissions. When his patron became pope in

his turn as Leo X., he presented B. with his cardinal's hat in the year 1513, and some years later dispatched him to France as legate. On his return to Rome he *d.* suddenly, his death having been accelerated by a heated argument with the pope, who accused him of intriguing to succeed him in the papacy. He had a lively interest in the progress of literature, and himself wrote plays in the manner of Terence.

Bibby Steamship Line. This line has traded with India for over a century, having been founded by John Bibby in 1807. The fleet now consists of motor vessels (Diesel), besides sev. twin-screw steamers, averaging 8000 tons and built at Belfast by Harland and Wolff. They carry cargo, mail, and first-class passengers, and run principally to S. India, Ceylon, and Rangoon. The line is now operated by the firm of Bibby Bros. & Co., bankers and shipowners, of 6 Water Street, Liverpool.

Biberach, tn. of Württemberg, on the R. Riss, 23 m. S.S.W. of Ulm. B. is mentioned in the eighth century as a vil. and in the fifteenth century it became a free Imperial city. During the Thirty Years war it was held by the Swedes for some time. In 1796 Moreau defeated the Austrians here and St. Cyr defeated them again in the neighbourhood in 1800. A monument to Wieland, who was *b.* in the vicinity, was erected in front of the theatre. Before the Second World War B. had manufs. of machinery, leather, and toys. Pop. (1939) 11,000.

Bibirine, see BEBERINE.

Bibiru, see GREENHEART.

Bible, *The*. The name *B.* comes to us from the Gk. *βιβλία*, which means the (sacred) books. In the original Gk. it is a plural form, but was treated, because of its ending, as a singular noun in medieval Lat., and as such has passed into most of the modern European languages. The *B.* consists of 2 parts, the one the O.T., the other the N.T. In the O.T. are given the records of the covenant between the God of Israel and His chosen people, the Hebrews, a covenant which, being proved to be insufficient, was to be increased by a New Covenant which is distinctly promised by the prophets, and which is founded by the life, teachings, and death of the Lord Jesus Christ. Christ Himself speaks of the new dispensation which was to be the New Covenant. In the early Christian Church the 2 divs. of the *B.* were known respectively as the Old and the New Covenants. The word covenant was rendered incorrectly by the Lat. word *testamentum*, and so has passed in the language of the modern world for the 2 divs. of the *B.*, the O.T. and the N.T.

The religion of the Hebrew race was a national religion—a religion which affected the state as a whole, in which the individual was unimportant. This national religion which bound them together, and this sense of unity, had come to them with the exodus from Egypt. From the time of the founding of the theocracy by Moses, the people had been bound into one united whole. Israel

was conscious of her sacredness and singularity as a people from the time that the promise had been sounded from Mt. Sinai: 'I am the Lord thy God, which have brought thee out of the land of Egypt, out of the house of bondage.' In this way and for this reason, the literature of Israel reflects the hist. of the people, and this hist. shows us a people now carried away by the enthusiasm of its ideals, now still convinced that it is a chosen people, but chosen by a God whose care was for Israel alone, and was independent altogether of moral conditions.

Historic tradition, which is essentially the feeling of a united people, traced the descent of the race from earliest times. The race had originally come from the E., had in the fullness of its power gone into Egypt, until there rose a Pharaoh who knew not Joseph, and then the period of their oppression follows. That they were not a united people then is obvious from the hist. of their Egyptian sojourn, but with the release from Egypt and the march to the promised land we get the beginning of that feeling of national unity, a unity which was bound up altogether with their religion. They were, however, in no sense a united nation as nations are united at the present time. They came from their wanderings in the desert to the promised land, but from the death of Joshua to the time of the prophet Samuel their unity is broken by constant warfare between the tribes; and with the vanishing of the common danger which had welded them together we get also the vanishing of the spirit of unity among the people. The book of Judges reflects the broken unity of the children of Israel, and shows us the people divided amongst themselves, and united only in the face of common dangers. But through the whole of this unsettled period we find that the tradition of unity lives on, especially in the minds and hearts of the greater men amongst the tribes, and this idea of national unity leads to the desire for a king who shall be to Israel the symbol of their unity and the anointed of God. Up to this time the centre of the monotheistic religion of the Hebrews was the sacred ark and the priesthood. This priesthood was aristocratic and conservative, and was at this period supplanted by the power of the prophets. The difference between priesthood and prophecy is that priesthood tends to conserve all that has been regarded as good and great in religion, but makes little forward progress; prophecy, on the other hand, is direct inspiration from God, by which religion is portrayed to the prophet in a new light and as a practical solution of the problems which were troubling the men of the day. The first of the great Israelitish prophets was Samuel. The spiritual tradition which runs so obviously through the O.T. and to which the N.T. is linked up, takes its beginning, to a great extent, in the work of Samuel and from his inspiration. Samuel was himself a priest, but is important in the hist. of Israel as a prophet. A new danger had arisen which it was necessary for the Israelites to face as a

united race. The incursions of the Philistines meant for them the renewal of the demand that they should have a king who would lead them in battle as a united nation. Samuel had the ideal of a united nation, but did not relish the idea that an ideal which he cherished of a nation united by the worship of Jehovah should be actually united by the headship of an earthly king. But he was wise enough to realise that for the preservation of the children of Israel as a nation it was necessary that they should have a king, and accordingly he gave them Saul. Then came the disobedience and downfall of Saul and the elevation of David, in this way beginning the great Davidic dynasty. Under the brilliant rule of David the Heb. race became a great nation, the rulers of a great empire, an empire which became their ideal. During the days which followed the downfall of the Hebrews, during the days of their captivity, they regarded the period of the Davidic empire as a period to be looked back to and revered as the greatest period of their rule. But they did also more than this: the recollection of their bygone greatness gave them the vision of a still greater kingdom which they would found with the Messiah as their leader, and so the days of the kingdom of David came to be regarded as the forerunner of the time when they should rule all the world. The ideal of the universal kingdom of God which their Messiah was to found was the outcome of the greatness of the temporal kingdom of David. This period of temporal greatness had also other effects as far-reaching as the former: from this time the hist. of Israel is bound up with the hist. of her prophets. The magnificent conceptions of the spiritual religion of the children of Israel to be found in the literature of the O.T. takes its rise from this period. Prophets had probably been in existence in Israel as long as the priesthood itself, but they had probably dwelt apart, and had taken no great part in the life of the people. From this time forth the prophetic writings of the prophets give the best conception of the greatness of the religion of Jehovah and lead up to the N.T. and the new dispensation which is actually joined up to these wonderful writings. Another effect this period had was to make Jerusalem the city of God and the centre of the national and religious spirit of the Hebrew people. The heart of the people turned in captivity to 'Zion,' the city of David, and Jerusalem became the symbol on earth of the heavenly city in which is the throne of Jehovah himself. The final view which must be taken of this short sketch of the hist. of the O.T. is the outcome of rivalry between the N. and S. tribes, leading to the div. of the kingdom into two, Israel and Judah. In the main, although at times unfriendly, the tendency of the two kingdoms was to remain on good terms. For a time they were able to subdue the smaller kingdoms which surrounded them, to offer resistance to the larger kingdom of Syria, but with the rise of the empires of Syria and Babylon the two

kingdoms fell and the captivity began. The shame, the horror, the self-contempt which were felt by the race for themselves is evident in the writings of the O.T. They felt that the idolatrous departures from the worship of the God of Israel had been punished deservedly by their exile and captivity, but throughout it all runs the idea that God will not leave them to perish ignobly in their chains, but will restore His chosen people and make them a great race with the coming of the Messiah. But with their first captivity their era of greatness ended as an independent nation. Empire succeeded empire, Babylon, Persia, Greece rose and fell, but the Hebrews remained as a race dependent upon their successive conquerors. Only for a century did they restore themselves as an independent race, and then again they fell before the rising tide of the great Rom. race. They were self-governing, that is, they governed themselves according to the law of Moses, but they were always the inferior, the conquered race. Such is the later hist. of Israel up to the destruction of Jerusalem (their Zion, the city of David, and the prototype of the city of God) by the Rom. legions in A.D. 70.

The main div. of the B., as has already been pointed out, is into 2 great divs., the O.T. and the N.T. The O.T. is divided in the Eng. language into 39 books, in the Heb. B., however, the div. was only into 24, 1 and 2 Kings, 1 and 2 Sam., 1 and 2 Chron., Ezra and Neh., and the 12 minor prophets being respectively counted as one book. This div. is not altogether stationary as far as the Heb. B. is concerned, the number being reduced by Josephus and increased by Epiphanius. The books were grouped together into 3 main groups or divs. The first the Torah or the Law, the second the Nebiim or the Prophets, and thirdly the holy writings or Kethubim. The Torah consists of the books of Moses or the Pentateuch; the writings of the prophets include the historical books, or the former prophets and the latter prophets—that is, the prophetic writings proper; while the poetical books comprise, in addition to the Ps., Prov., and Job, the 5 rolls, Ruth, Lam., Eccles., and Esther, together with the books of Dan., Neh., and Ezra.

The Law Books of Moses, and the Historical Books.—The tradition of the Jews ascribes to Moses the writing of the first 5 books of the B., to Joshua the book named after him, and to Samuel the books which take their name from him. Since all Jewish authorship was anonymous, it is obvious that this classification is conjecture, and a detailed examination shows that the question of authorship, not regarded as important amongst the Jews, is more complicated than it appears. Throughout the whole of the Pentateuch there are differences of style and language which show themselves also in the book of Joshua, and which prove that the books were not all written by the same hand, and that it was not all written at the same time. The evidence goes to prove that the books of the Pentateuch and the book

of Joshua, which cannot well be separated from the previous 5 books, are not subsequent narratives, but a series of independent narratives which have been carefully collected and ed. by one man. This view is supported also by the fact that sev. incidents are related more than once, and that many of the laws are repeated. Whenever reference is made to the name of Moses he is referred to as a prophet, i.e. a man who spoke to the people from God. But it is hardly to be credited that the books of the Pentateuch, which comprise a highly-organised priestly ritual, should have come in their present state from the hand of the prophet himself. In a close examination of the Pentateuch it became obvious that a part of it gave evidence of being pre-Mosaic: references were made to kings who ruled over the land of Edom before the children of Israel had kings; there were, as has already been pointed out, many parallel and double references, and one of the authors had a strong bias in favour of the priestly section of the community, devoting a great part of his writings to matters affecting the ritual of the Heb. These points were noticed by a Fr. physician, Jean Astruc (q.v.). The div. which he made corresponded with the div. that was emphasised by the writings, some of which were prophetic in tone, the others adopting the attitude of the priest. Astruc concluded that the difference corresponded with the employment of the term Jehovah (Lord) and Elohim (God). Exod. vi. 3 states distinctly that the name Jehovah was a name the employment of which only came into being with the Exodus. 'And I appeared unto Abraham, unto Isaac, and unto Jacob, by the name of God Almighty, but by my name Jehovah was I not known to them.' Accordingly, in this way the writings of the Pentateuch were divided according to their sources in Elohist and Jehovistic writings. The name God was taken as showing that the employment of that term indicated the earliest or primary writings, while the term Jehovah was used in what were regarded as supplementary writings. In this way arose the theory of the supplement-hypothesis. Hupfeld proved practically the existence of a third writer who agreed largely with the Elohist writer, but was also in many places widely different from him. He also expressed the opinion, which found wide acceptance, that the writings of this third author and of the 'Jehovah' authority were not supplementary, but were altogether independent writings. The 3 writers who have been mentioned interpret 3 different tendencies, 3 different points of view, expressing the prophetic mind, the priestly mind, and the mind of the layman. How these 3 points of view came to be united into one set of writings is only explained by the normal tendency of the Heb. genius, and more particularly by the methods of the Heb. copyists. The order of the writings seems to be the Book of the Covenant, followed by Deut., followed by the code of the priests, which is the out-

come of the time when the priesthood had assumed the position of a ruling caste, that is, after the Restoration. The books of the Pentateuch can be regarded as the outcome of the combination of writings of various periods in the hist. of the Jews, combined together and probably added to by the copyists who transcribed the writings. The Heb. copyist allowed himself a great amount of licence, since he copied equally from different authorities and gave any necessary harmony by his own additions. Almost all the writings of the O.T. may be regarded as compilations from various sources. The main idea running through the Heb. mind was the addition of part to part, not the development of a single idea, and this is exemplified in their genius of architecture, in the poetical books and the books of the law, and the historical books also.

The Poetical Books. The tendency of the Hebraic mind was not to express abstract ideas, but to use the medium of personal action and desire for the expression of feeling. The reduction of all experience to personal standards is reflected throughout the whole of the poetical books. To view things from the point of view of a theory only was to be almost impossible; they expressed themselves as the subject in question impressed them personally, and *not* in relation to the subject apart from its effect on them. The poetic structure of these books remains almost unchanged from the earliest examples of the Hebraic poetic art down to the latest; the rhythm consisted not of the fall of accent or the quantity of the syllables, but in a rhythm of the sense alone, a rhythm best known as a sense rhythm or parallelism. The authenticity of the Ps. as we have them at the present time is, as with the historical books, open to very grave doubts and very obvious criticisms. The Ps. which are ascribed to David, Asaph, and Solomon, to name only 3 of the authors given in the book itself, cannot be regarded as being strictly correct. The tendency is always to ascribe some anct. and honoured name to them, but while it is impossible to believe the authorship in every case, it is also wrong to deny any Davidic origin to any of the Ps. A number of them undoubtedly originated with David and with the other authors to whom they are ascribed. But, as with the historical books, it is impossible to overlook cases of parallelism, as e.g. Ps. xiv. and Ps. lili., which may be the result of the licence allowed to the copyist. It is also impossible to agree with the conclusion that all the Ps. are of the great exile period, since we have many examples of earlier Ps. and songs in the B. However, since the period of the exile the Ps. undoubtedly became the means of expression of religious feeling for the whole of the Heb. race. Amongst the other poetical books to which a similar criticism can be applied is the book of Prov., which is ascribed to Solomon. Solomon almost certainly contributed much of the wisdom of that book, but the whole of it cannot be ascribed to him. The book of Eccles., another example of

Hebrew poetic philosophy, was written probably some considerable time after the exile. The book of Job sums up the whole question of the religion of the O.T., the goodness and justice of God in relation to the merit of the sufferer. It asks the question why the lover of God is afflicted with grievous punishments, and the subject is debated and answered by the various speakers. Here, too, however, an obvious interpolation can be noted in the speeches of Elihu, who disconnects the argument, and whose speeches may be assigned to a later author.

The Prophetic Books. The prophetic writings begin with Amos, after whom the succession of prophets is regular. The older school of prophets, Samuel, Elijah, and Elisha, left no writings, neither did the prophet Jonah, the book called after his name being only an episode in his life. The later prophets wrote down their teachings or doctrines which they had not spoken but wished to be known. The office of a prophet cannot be likened to the priestly office, which was appointed. A prophet was a man of the moment, a man sent by God, with whom God spoke, to whom God appeared, and who was given a message to tell to the people directly from God. He did not even of a necessity see into the future, he need not as a prophet foretell events, he was there in order to interpret to the people the various acts of God, and to guide them over a crisis in the affairs of the nation. That he foretold the joys and splendours of the heavenly kingdom is due to the fact that it was necessary, in order that the people should strive after the kingdom of God, that the image of that kingdom should be ever before their eyes, and that they should be reminded of the greatness and goodness of Jehovah.

The customary Jewish div. of the prophets is the former prophets and the latter prophets. The former prophets were the records of Judges, Sam., and Kings; the latter are the writings of the prophets of the later period. These again are subdivided into the greater prophets and the minor prophets. The books of the former prophets are distinctly historical books, written round the central characters of the period, and influenced by the earlier Hebraic writings. Judges is simply a compiled narrative completed and arranged by the compiler; Sam., a book which centres round the doings of the prophet Samuel and the kings Saul and David. The book of Kings is again simply a compilation which, in conjunction with these other books, completes the hist. of the Jews from the entrance into the Holy Land down to the fall of Jerusalem. The latter major prophets consist of the writings of Isaiah, Jeremiah, and Ezekiel. The prophecy of Isaiah falls into 2 very distinct parts, the div. being chapters 1-39 and chapters 40-66. The latter is much later than the former, and even of the former it may be doubted whether Isaiah did actually write it all. The latter portion seems to have been written just previous to the restoration, a century and a half after the

original prophecies of Isaiah himself. Jeremiah's prophecies began during the greatness of the empire of Babylon, and were directed against the sins of the people; but while lamenting their sin and trying to turn aside the wrath which he saw must come, he eventually prophesies the restoration. Ezekiel *fl.* at the beginning of the sixth century B.C. He was carried off together with other exiles to Babylon, and from here he prophesied the coming fall of Jerusalem (586). Towards the end of his prophecies comes the prophecy of the future restoration of the nation, and he describes in detail the reorganisation of the restored nation. The 12 minor prophets were—as has been pointed out—regarded as the second div. of the latter prophets by the Jews, and also as a single book. The approximate dates of these minor prophets are: Amos and Hosea, 740; Zephaniah, 620; Nahum, about 600; Habakkuk, about the same time; Obadiah, after 586; Haggai, 520; Zechariah, 520; Malachi, 450; Joel, fifth century; Jonah, fourth century.

Canon of the Old Testament. The word canon is Gk. In its original meaning it signified a straight rod or rule. In its scriptural application it probably means the books which were considered the standard books by the Hebrews. All the writings included in the canon were held by the Jews to be the direct inspiration of God. The Jewish canon was divided into 3 distinct parts. The Torah, or the Books of the Law; the Prophets, consisting of 8 books—the former prophets and the latter prophets; and the Sacred Writings—the hagiographa—which consisted of the poetical books, the Psalms, and Dan., Ezra, Neh., and Chron. This div. represents probably the stages in the canonising of the various books. Since the closing of the whole canon by Ezra cannot be accepted, it is necessary to form an opinion from the internal evidence given in the books themselves as to the probable date when these 3 divs. became parts of the canon. The earliest canon seems to have consisted of the Torah, about 444 B.C., supplemented probably some 200 years later by the prophets, and again 100 years later by the hagiographa. The Heb. canon contained none of the books which form the Apocrypha. The Gk. translation of the B., the Septuagint, contained these, but they were pronounced against by Jerome at the end of the fourth century A.D. The old Lat. version and the Vulgate still, however, contained them, and the Council of Trent canonised them into the Catholic B. The Protestants of the Reformation, however, treated them in the same way as they had been treated by Jerome, and while acknowledging their utility as books of moral teachings, denied the divinity of their revelation. By the advanced sections of the Reformed Church they have been entirely rejected, and the canon of the O.T. is to them identical with the canon of the Hebrews.

The New Testament. During the period of Jewish hist. just previous to the birth of Christ the hopes of the coming of the

Messiah were revived. Some of the books of the Apocrypha, written during the last 2 centuries before Christ, had given full vent to this feeling. But it is necessary to state that the Jews did not put forward in any way the idea of a Christ who was to come and suffer death in this world. The rise of the literature of the N.T. did not come, however, with the beginning of the Christian religion. Christ himself left no writings; his disciples and followers at first did not realise the necessity for a literature to instruct future generations in the truths which they themselves had experienced. They looked forward to their release from this earth by the second coming of the Messiah, and this coming was daily, almost hourly, expected. The literature of the N.T. arose because ultimately there arose a situation which needed a literature; it was not written from any desire to emulate the writings of the older Heb. book. By undertaking his missionary journeys, Paul also undertook the necessity of creating a literature. When many small settlements of Christians grew up in all parts of the Rom. world, it became necessary either to visit them personally or to send letters of advice and counsel. In this way and for this purpose were written the epistles to the Thessalonians, which are the oldest Christian documents which we have, and both these epistles were written with the object of calming the agitation which had arisen from a belief in the immediate second coming of the Messiah. In the various epistles which St. Paul addressed to the Christian colonies he developed his ideas of the doctrines of Christ, and puts forward his view of the teachings. Beyond the 'eschatological' views which were beginning to subside, there was also now arising other views of doctrine which were a disturbing influence in the Christian Church, and which many of the Pauline epistles were written to rebuke.

The epistle to the Romans was a practical summing up of the gospel of St. Paul. He had planned a journey to Rome, but he knew that his visit to Jerusalem first was fraught with danger. Hence he sent his epistle to the Romans, in which we get a full and clear account of the Pauline doctrine. After this letter most of his epistles contain theories (Eph. and Col. are examples of this), but through most of these epistles runs his idea of the unity of the Church which was to unite both Gentile and Jew, 'that God might have mercy on all.' His epistles to Timothy and Titus are purely pastoral letters, written to his helpers when the charge of a church had been committed to them. The epistle to the Hebrews was not written by Paul, but probably by a disciple of his. Many theories have been put forward; Barnabas, Apollos, and Luke all being given by different authorities as possible authors.

The other epistles of the N.T. are to a great extent the following of the impulse already given by the 'apostle of the Gentiles.' They are usually known as the 'Catholic' epistles, a name given them since they were to appeal not to a special section of the Church, but to the 'univer-

sal' Church of Christ. The name Catholic also amongst the followers of the early Church was equivalent to the word canonical. First Peter was written for the Christians of the N. prov. of Asia Minor, who were probably at this time suffering persecution. The epistle of James is addressed to a larger section of the community of Christians. The epistles of James and Jude were written by the brothers of Christ, the epistle of Jude being addressed to a section of the Christians who appear to have fallen under the influence of men who were making the propagation of the gospel the work of mountebanks.

The Gospels and the Acts. The rise of the historical literature of the N.T. was probably delayed in much the same way and for much the same reasons as the beginnings of the epistolical literature. The early Christians did not consider it necessary to record the doings and sayings of our Lord, they were simply awaiting the coming of the Messiah. Gradually, however, there would grow up a tradition of the life and sayings of the Christ; the apostles and disciples travelling from place to place, would begin to feel the necessity for some written account of the life of Christ. They were constant travellers, they tarried but little in one place, it was probably long before they returned. During their absence it was necessary that instruction of some description should be given to their converts and followers. Hence came the desire for a written literature which would give that instruction, and would contain the beginnings of the historical literature of the N.T. The constant intercourse of the disciples one with another, the recollection of the sayings and doings of our Lord supplemented by one another, would give the necessary basis for a written account of the life of Christ, and would fix that life on definite lines.

Probably the earliest form of gospel that we have is to be found in the sayings of Christ which were written down in Heb. by Matthew, and which are generally known as the Logia. The writing of the Logia is confirmed by the statement of Papias (q.v.), bishop of Hieropolis, and it forms the core of the gospels of St. Matthew and St. Luke. The Logia did not supply the full needs of the Christian community, they in no way professed to be a complete record of the life of Christ, but it was for this complete record of the life of Christ that the Christians, as their hope of the immediate coming of the Messiah grew fainter, wished. And St. Mark, supplementing the tradition already held by the teaching of St. Peter, gave us our first complete gospel. This was written at Rome, probably between the years A.D. 64 and 70. The gospel according to St. Matthew was in reality simply the Logia together with the gospel according to St. Mark, and in the course of time this gospel superseded almost entirely the use of or the need for the original Logia. St. Luke's gospel is written largely from the historical point of view. It is addressed to a particular individual; it is

composed of much the same materials as the gospel according to St. Matthew, but is supplemented by the author from other sources. This was the first vol. of that writer's work, since it is generally accepted that St. Luke was also the author of the Acts of the Apostles. These 3 gospels form what are called the Synoptic gospels. The fourth gospel, that according to St. John, was written probably about the end of the first century. It contains much the same information as the synoptic gospels, and was probably written with full knowledge of what those gospels contained. But it is written from a highly ethical and idealistic point of view, and formulated the doctrines of the Christian creed in such a way as to reconcile them and make them more acceptable to the Gentiles. The fourth gospel has played the most important part in the hist. of Christian theology, and in the formation of the Christian creed. The Acts of the Apostles, as mentioned above, form the second contribution of the writer Luke, and seem, from internal evidence, to have been written in part at least by an eyewitness. They trace the hist. of the Christian Church from the death of Christ down to the coming of Paul to Rome, where they leave off abruptly, leaving the later hist. of the 'apostle to the Gentiles' in obscurity. The writings included in the N.T. form by no means the end of the writings of the early Christian Church. We have a number of writings of the followers of the apostles, who followed the traditional writings. Amongst these may be mentioned the gospel according to the Hebs., the Ebionite gospel, the Protevangelium of James, and the Acts of Paul. The canon of the N.T. was much disputed. The various churches adopted varying canons for the literature of the N.T., but early in the fourth century Eusebius gives us an account of the disputes, and reviews the books which were generally accepted. He gives 3 classes, the first of which was generally accepted, and included the Gospels, the Acts, the Pauline Epistles, 1 Peter, and 1 John, together with the Apocalypse. The other epistles, Jude, James, Peter, and 2 and 3 John, are questioned. Books such as the Acts of Paul and the shepherd Hermas are rejected. But the church of Antioch and the church of Syria give other lists. Under the influence of Athanasius, however, and at the Council of Carthage, the canon of the N.T. was fixed as we have it at the present day. Disputes, however, still rose with the Eastern Church, but in the course of time the canon as fixed by Athanasius and Jerome was generally adopted, since when the Christian Church has become the guardian and interpreter of the scriptures.

In the nineteenth century the rapid advance of natural science and materialist philosophy was thought by some to discredit the authority of the B. In recent years, however, the pendulum has swung the other way, and not only have the scientists realised and publicly avowed the limitations of scientific method, but also it has been shown that modern discoveries in archeology, astronomy, and psycho-

logy, correctly interpreted, and modern textual research, serve to throw new light on the spiritual truths revealed in the B.

Bible, English. Early translations in the Eng. tongue were made in MS. directly from the Vulgate. Bede tells us that Cædmon instructed by an angel put into poetical form 'the creation of the world and the beginning of the human race,' whilst Bede himself, although none of the work is now extant, is said on reliable authority to have trans. part of the gospel according to St. John into the Eng. tongue. During the centuries which passed between the death of Bede and the Norman Conquest no great attempt seems

The first Chapter.

It began
nynged
God
created hea
uen & earth
and y earth
was voyde
and empie,
and dar-
nes was v-
pon the de-
pe, & y spe-
ce of God
mued vps
the water.

And God sayde: let there be light, & there was light. And God sawe the light that it was good. Then God deuoyded y light from the darcknes, and called the light, Daye, and the darcknes, Night. Then of the eueninge and mornynge was maide the first daye.

to have been made at independent translations, and for the most part the work takes the form of glosses. With the coming of the Normans this translation ceased. But with the ultimate separation from the Continent, and the union of the Saxon and Norman people into the one Eng. race, the preponderating section of the community imposed their language and their customs on the conquering race. During the period of absolute Norman influence such translations as were done were into the language of the conquerors, but now versions were made in Eng. Previous to the great version by Wycliffe we have some evidence of parts of the B. have been trans. into Eng. during the fourteenth century. The early Wycliffe version was issued probably about 1382, and the later version 4 years after the death of Wycliffe, that is in the year 1388. What part Wycliffe himself actually took in the translation is not definitely known, it is, however, supposed on fair evidence that he trans. the gospels. The work began by the translation of the gospels,

and this part was probably finished some 20 years before the B. was pub. The probability is that the O.T. portion of the early version was the work of Nicholas of Hereford. The later version was probably the work of the successor of Wycliffe, John Pusey, and is certainly, as far as idiomatic Eng. is concerned, a great improvement on the early version. It was also popular, many copies of it remaining at the present day, in spite of the persecutions of the Lollards. These versions were the last of the MS. Bs. of England. In the fifteenth century William Caxton had introduced

In the beginning
God created the
heaven, and the
Earth.

2 And the
earth was with-
out forme, and
void, and dark-
nesse was upon
the face of the deepe: and the Spirit
of God mooued vpon the face of the
waters.

3 And God said, 'Let there be light:
and there was light.

4 And God saw the light, that it was
good: and God diuided the light from
the darknesse.

5 And God called the light, Day,
and the darknesse he called Night: and
the evening and the morning were the
first day.

6 And God said, 'Let there be a
firmament in the midst of the waters:
and let it diuide the waters from the
waters.

VERSION (1611 EDITION)

the art of printing into this country. The printing of an Eng. B. did not, however, immediately follow the introduction of the art of printing into the country. The B. had been printed in the Ger. states at least 70 years before an Eng. printed version appeared, and no complete Eng. B. was printed in England before 1535. A printed ed. of the N.T. by Tyndale appeared in 1525, having been trans. into the vernacular, and printed under difficulties. During the 10 years which followed, Tyndale also trans. and printed various other portions of the B. The characteristic point of the translations of Tyndale are their independence of the work of any other translator. The first full translation of the Eng. B. is the work of Miles Coverdale, which, although it must have been in progress at the same time as the work of Tyndale, was done independently of this. Coverdale prob-

ably, the Vulgate, and, from some evidence, Tyndale's. The first Eng. B. printed in England was the work of one Thomas Matthew (pseudonym of John Rogers, q.v.), who cannot claim to be an independent writer, since the greater part of his work is a reproduction of Tyndale and Coverdale. This B. was printed by the king's licence, and from this ed. of the B. we get all our subsequent eds., this being taken as the standard work. The next ed. of the Eng. B. was the 'Great B.', undertaken under the patronage of Thomas Cromwell, and giving on its title-page a picture of Henry VIII. presenting the B. to Cranmer and Cromwell, who in turn presented it to the clergy and laity. This B. was printed under the supervision of Coverdale, and while the printing of it was begun in Paris, it was finished in London, owing to the action of the Inquisitor-General, who attempted to stop the printing in Paris. In 1560 appeared the Genevan, or the 'Breeches' B., so called from the translation of Gen. iii. 7: 'They sewed fig leaves together and made themselves breeches.' The printing and publication of this B. were done at the expense of the congregation at Geneva. The B. was a thorough revision of the 'Great B.' The Bishops' B. was printed about the year 1568, and was undertaken as an authorised version of the Great B. But although it was intended to drive out the Genevan B., it never succeeded in its object. At the end of the sixteenth century and the beginning of the seventeenth century respectively appeared a N.T. and an O.T. trans. into Eng. by Catholics. The N.T. was printed at Rheims, and the O.T. at Douai in 1582 and 1609-10 respectively. They had a fair amount of influence on the A.V. of the B. which appeared in 1611. The work of bringing out the A.V. of the B. was one of the results of the Hampton Court Conference, called by James I. in 1604. He suggested the revision of the Eng. B., a work to be done by the best scholars in the kingdom. The version was to be without notes, since the notes of the Genevan B. seemed to the king to be seditious and dangerous. The men who were employed to do this work were divided up into 6 committees, each committee having a special section of the B. to work upon. The whole of their work was revised by a general committee. That the work was carefully revised is obvious from the fact that over 2 years were spent in that revision, and altogether the work took about 7 years. This version continued to be used, and still, in spite of the R.V., continues in general use in this country at the present time. The R.V. was the work of Convocation, it being determined in Convocation in 1870 that 2 committees should be formed for the revision of the Scriptures of the O.T. and the N.T. respectively. These committees were to have the power to invite the co-operation of any eminent scholar, no account being taken of nationality or creed. Co-operation was invited with America, and the work ultimately became the work of Eng.-speaking Christians throughout the world. The Rom. Catholic

Church alone refused co-operation. The version was completed by 1881, and was in that year presented to Convocation.

The Texts and Versions of the B. The earliest of all extant Heb. MSS. of the O.T. only dates back to the ninth century A.D. That is sev. centuries later than the earliest texts which we have of the Scriptures of the N.T. All the Heb. MSS. which we have at the present time are essentially Massoretic texts. The Massoretic texts are the work of a sect known as Massoretes, who, continuing in a way the work already done by the Targums and the Talmudists, set themselves the task of sifting from the mass of tradition and commentary of the Talmudists, and from the paraphrases of the Targums, the real, actual text of the O.T. Their work continued from about the sixth to the eleventh century. They provided the text with points to indicate the vowels, and thus went far in fixing the correct interpretation of doubtful passages. In this work they were making a distinct advance on the work of the Talmudists, who had said much concerning the correct vowel pronunciation of the Hebs., but had not actually provided vowel points for the MSS. After the production of an actual text from the mass of tradition of the Talmudists, extraordinary precautions were adopted for the safe preservation of the corrected MSS. Another text is that of the Samaritan Pentateuch, which differs in many places from the Massoretic text, the differences being usually of small importance, but the Massoretic text is preferred to this. This text contains only the Pentateuch, and is therefore not of very great importance. One of the most important versions which we have is that of the Septuagint, which is a copy of the books of the O.T. written in Gk. and probably made in Egypt during the third century B.C. The Septuagint version, however, when completed contained not only the books of the Heb. canon, but the books which have formed the books of the Apocrypha since the Reformation period. Of Syriac versions the most important is the Peshitto Syriac or the Simple Version made probably about the third century A.D. This version became a necessity to the Christian missionaries who were spreading abroad the doctrines of Christianity in the lands of Syria and Mesopotamia. There are also Coptic and Ethiopic versions which were used for much the same purpose in Egypt and the neighbouring countries. Of Lat. versions the 2 most important are the old Lat. version, which is far more important from the point of view of the N.T. than of the O.T., since it is not only a Lat. version of the Septuagint in the O.T. but an actual translation of the original Gk. in the N.T.; secondly, the Vulgate, the B. of the Rom. Church even at the present day, the O.T. of which was a translation by Jerome of the old Heb. text, the text which we now call Massoretic, and which, although it had not yet passed through the hands of the Massoretes, was substantially the same from about the second Christian century. See also SEPTUAGINT; TARGUM; VULGATE.

Bible Christians, a society founded in 1815 by William O'Bryan, or Bryant, who was a Methodist lay preacher. The name B. C. was given to the sect because they appealed only to the Bible for the doctrines which they taught. The society was founded at Shebbear, in N. Devon, and the ministrations of the Wesleys undoubtedly had great influence on the development of this sect. In these days they did not differ essentially from the Methodists in any point, but yet in the early days they suffered much even at the hands of the Methodists. The B. C. in 1907 joined with 2 other Methodist communities to form the United Methodists. These 2 other bodies were the Methodist New Connection and the United Methodist Free Churches. An Act of Parliament

sanctioning the fusion received the royal assent in 1907. Outstanding names in their denomination are those of O'Bryan, Thorne, and Billy Bray. In 1932 the United Methodist Church, having over 2200 churches, with a total membership of over 150,000, joined with the Wesleyan Methodist Church and the Primitive Methodist Church, and became 'The Methodist Church.'

Bible Communists, founded in 1848 by J. H. Noyes, and known as the Oneida Community. The primary object of the community was essentially religious. They practised not only community of property and life, but by means of a system called complex marriages, community of women also. In 1879 this system of complex marriage was discontinued, and 2 years later the movement was turned into a joint stock company. It has been successful financially, but with the abolition of the complex marriage system its only really distinct feature was banished.

Bible Societies, the name given to various associations which have as their chief work the translation and propagation of the Scriptures amongst all nations. Such societies became prominent about 200 years after the Reformation; but previous to the Reformation, and during the period immediately following the Reformation, we find the Scriptures being trans. and to a certain extent disseminated throughout Europe. That the Reformation and the doctrine that the Bible is the religion of the Protestants had a great influence on this movement cannot be denied. Before or during the eighteenth century we find the following societies formed: The Society for the Propagation of the Gospel in Wales, 1662; the Society for Promoting Christian Knowledge, 1698; the Dan. Society for Sending Missionaries to India, 1705; the Society for the Propagation of the Gospel in Foreign Parts, 1709; the Society for Promoting Christian Knowledge amongst the Poor, 1750; the Naval and Military Bible Society, 1780. All these societies had the same object in view—the spreading of Christian knowledge and the translation and propagation of the Gospels. In Germany various societies had been formed with the same object, and the society formed in 1792 for the Propagation of the Gospel in France was brought to an end by the Revolution. The evangelical revival of the eighteenth century naturally had a great influence on these societies, and led to the establishment of many new ones.

The British and Foreign Bible Society. This society was founded in 1804. It had its origin in the difficulty which the Rev. Thomas Charles of Bala found in the work of propagating the gospel in Wales, owing to the lack of Welsh Bibles. The society was therefore formed with the object of sending out copies of the Gospels trans. into the necessary languages to those countries where the need for them was felt. They were to be neutral as far as doctrinal translations were concerned, and were to help in the circulation of the

Holy Scriptures 'without note or comment.' The original society founded in London in the year already mentioned consisted of a committee of 36, 6 of whom were to be distinguished foreigners who lived in or near London, and the remaining 30 members were to be equally divided representatives of the Church of England and representatives of nonconformity. The society found support from all Christian bodies, and developed rapidly, having at the present day 6000 auxiliary societies in England and Wales, and over 5000 abroad. The society issues over 1,000,000 copies of the Bible every year, and the same number of Testaments, besides upwards of 10,000,000 portions of Scripture, including large quantities among the peoples of Asia. The number of languages into which the Bible, or parts of it, have been trans. is over 1000. The society has met with many difficulties, especially from its adhesion to the principle of the distribution of the Scriptures without note or comment, but it has in most cases been able to surmount its difficulties. One such trouble arose in 1831, when the society resolved to demand a belief in the Trinity as a condition of membership. Arising out of this the Unitarian Bible Society was created.

Other Brit. Bible societies which may be noticed briefly here are the Edinburgh Bible Society, 1809; the Glasgow Bible Society, 1812, which, owing to difficulties as to the form in which the Scriptures should be pub. by the Brit. and Foreign Bible Society, disassociated themselves from that body, and became in 1861 the Scottish National Bible Society. The Dublin Bible Society was founded in 1806, and afterwards, by amalgamation with kindred societies throughout Ireland, became the Hibernian Bible Society. It is associated with the Brit. and Foreign Bible Society, and contributes annually to the funds of that society. Amongst the more important of the European B. S. may be mentioned the Prussian Bible Society, 1814, originally started as the Berlin Bible Society in 1806; the Russian Bible Society (Revel), 1807; the Swedish Bible Society, 1814; and the Finnish Bible Society, 1813. Most of these societies found considerable support in the early days from the Brit. and Foreign Bible Society, and many continental societies have been bitterly attacked by Rom. Catholics. There are no Rom. Catholic Bible Societies, the Catholic *Encyclopædia* saying on the subject: 'The Church believing herself to be the divinely appointed custodian and interpreter of Holy Writ, she cannot, without turning traitor to herself, approve the distribution of Scripture without note or comment.' In this connection it is of interest to quote from the speech of the duke of Gloucester at the annual meeting in 1930 of the Brit. and Foreign Bible Society. After stating that in scattering the Scriptures no questions are asked about churchmanship, nor religious formulae dictated, he said the sole purpose of the society was to circulate one Book, and that without note or comment, for

interpretation is left to the Church. In America the Philadelphia Bible Society was founded in 1808, and gradually a number of societies grew up which by 1839 had all amalgamated into the Amer. Bible Society. The Amer. society is one of the most active of all Bible societies, distributing over 12,000,000 copies of the Scriptures every year, and translating these into nearly 300 different languages. The society is wealthy, and since its inception has distributed 100,000,000 copies of the Old and New Testaments. The Gideons, or Christian Commercial Men's Association of America, formed at Janesville, Wisconsin, in 1899, which claims to be the oldest interdenominational laymen's evangelical association in the world, began, in 1908, to place bibles in every hotel guest room and this work was followed in later years by distributions to hospitals and the armed forces. Nearly 2,000,000 bibles have been placed by the organisation since its inception.

Biblia Pauperum, a Lat. term meaning poor men's Bible, is the name which has been given in modern times to a series of MSS. and printed books which contain rude illustrations of biblical subjects, with a short explanatory text accompanying each picture. Very often these pictures represented events in the life of Christ, together with the corresponding prefigurations or types that occur in the O.T.; the text was in rhyming Lat. verse. On an antependium or altar-front in the Leopold Chapel of Klosterneuburg in Austria 15 scenes from the life of Christ were executed in enamels. Each scene was accompanied by 2 O.T. prefigurations, and the date of the work was 1181. The MS. at St. Florian, in Austria, dating from the early fourteenth century, is the first one known to contain a similar triple arrangement. The books which contain such pictures belong to the class of block-books (see BLOCK-BOOKS).

Bibliography is derived from the post-classical Gk. word βιβλιογραφία, which when first used, meant the writing of books, and was so used in France (*bibliographie*) till the eighteenth century, and in England till the nineteenth century. It was mainly owing to the Rev. T. F. Dibdin that the change was then made in England; Southey preferred the term bibliography, which has now dropped into desuetude. The early Fr. bibliographers considered that it came within their province to classify books from the point of view of their value as literature, their artistic excellence, etc. It is now recognised, however, that the proper function of B. is to suggest certain general principles of arrangement and their application. These principles are not many in number nor particularly abstruse, and the main requisite of any B. is that a definite idea should exist as to the use of the finished work. Thus one school of bibliographers has for its special study such subjects connected with books as the hist. of printing, book-collecting, book-binding, book-illustration, and other allied topics. The London Bibliographical Society, the Edinburgh Bibliographical

Society, the Grollier Club of New York, and other such institutions, are concerned with such subjects. In addition to the publications of the societies mentioned above, sev. periodicals have, at one time or another, been pub. to cater for persons interested. These periodicals, among which may be mentioned *The Bookworm*, 1888-94; *Bibliographica* 1895-97; *Le Livre*, 1880-89; and *Zeitschrift für Bücherfreunde*, 1897, have not as a rule been long-lived. Information may also be found in *The Library*, 1893, by Andrew Lang; *The Printed Book*, trans. from the Fr. of Henri Bouchot by E. C. Bignmore in 1890; *Connaissances nécessaires à un bibliophile*, 1899, 5th ed., by E. Rouveyre; *Best Books: a Reader's Guide and Literary Reference Book*, 6 vols., 1910-35, by W. S. Sonnenschein; *Guide to the Best Fiction*, 1932, by E. A. Baker and J. Packman; *Courses of Study*, 1932, by J. M. Robertson; *Literary Stock and Assistance to Readers* (a valuable guide to reference books), 1936, by L. R. and E. R. McColvin; *Three Thousand Books for a Public Library*, 1939, by W. A. Munford; *Cambridge Bibliography of English Literature*, 4 vols., 1940, by F. W. Bateson (ed.); and *The Bookman's Manual*, 1941, by Bessie Graham.

The usual definition of the science of B. is the science of books as such. It thus comprehends the subject and class of the work, the size, the pagination, the type, the plates, the rarity, etc. It will thus be seen that the ideal of bibliographical work is the provision in an accessible form of a comprehensive description of a copy of any book, possessing any typographical, historical, or literary interest, in its original form as first pub., and of any different issues of it. When such a catalogue has been compiled and verified, each individual work could be described by a simple reference. Such an ideal is, of course, impossible at the present time, owing to the enormous quantity of books already printed and being printed every year, and consequently bibliographers are obliged to restrict the scope of their catalogues to the special object for which they are required. Thus catalogues are found of the books of a certain author, e.g. Eblisch and Schiecking, *Shakespeare Bibliography* (1931); or of those pub. in a certain period, e.g. W. W. Greg, *Bibliography of the Eng. Printed Drama to the Restoration* (1939); or of those dealing with special subjects or with the literature of a particular country or countries, such as, for instance, the various book lists and readers' guides of the National Book League, and *Subject Catalogue of the Library of the Royal Empire Society*, by Evans Lewin, 4 vols., 1930-37. The standard description of any book generally consists of the following sections: (a) A transcript of the title-page, the colophon (if any), and any other distinguishing headings. (b) Description of the number of leaves in the book, the measurements of such leaves, and the different kinds of type employed, etc. (c) A description of the literary contents of the book and the extent thereof, etc. If any other point

not included in the above requires to be mentioned, as imparting some distinctive or necessary information about the particular work, it is put at the end of the above descriptions.

When a bibliographer wishes to describe a book, he examines it first of all to discover its origin, and to test the statements as to the publisher, etc., and to see if it is in perfect condition. Ultra-violet rays and chemical analysis are among the scientific aids in establishing whether a book of supposedly anct. origin is what it purports to be. It is also necessary for the bibliographer to satisfy himself that the type corresponds to the alleged date of the work, and whether any leaves have been inserted from another copy in order to supply omissions. This can be discovered by observing whether the 'signatures' of the folios correspond as they should do. The 'size' of a book is the relation of the size of the separate pages to the original sheet of paper of which they formed a part. Thus when the sheet is simply folded in two the book is in folio, when in four it is in quarto, when in eight octavo, or 8vo, etc.

Among the best-known general catalogues, etc., the following may be mentioned: *General Catalogue of the Library of the Brit. Museum*; Watt's *Bibliotheca Britannica*, 1824; *Subject Index of the Modern Works added to the Library of the British Museum in the years 1881-1900*, ed. by G. K. Fortescue, 3 vols., 1902-3; Heinsius's *Allgemeines Bücher-Lexikon*; Kayser's *Index Locupletissimus Librorum*; Quérard's *La France littéraire*; and the *Short Title Catalogue of Eng. Books*, 1475-1640, pub. by the London Bibliographical Society in 1926.

Among notable bibliographers are the following: Thomas Frognal Dibdin (q.v.); Sir Samuel Egerton Brydges (q.v.), who pub. *Censura Litteraria*, 1805-9, and *The Brit. Bibliographer*, 1810-14; Robert Watt, whose *Bibliotheca Britannica or a general index to Brit. and Foreign Literature*, 1824, is the earliest outstanding bibliographical work produced in Scotland; William Thomas Lowndes (q.v.), whose *Bibliographer's Manual* (1834) was revised and enlarged by H. G. Bohn; Ludwig Hain's *Repertorium Bibliographicum* (1826-38) and Dr. Copinger's *Supplement to Hain* (1902); Henry George Bohn (q.v.), whose *Guinea Catalogue of Old Books* (1841) is a valuable early bibliographical work; William Carew Hazlitt (q.v.), author of sev. series of *Bibliographical Collections and Notes* (1876-89) and of a *Handbook to the Popular, Political, and Dramatic Literature of Great Britain*, etc. (1867); Bernard Quaritch (q.v.), whose *General Catalogue of Old Books and MSS.* appeared in 1887-89; R. B. McKerrow, a joint secretary of the Bibliographical Society, and author of an *Introduction to Bibliography for Students*, 1927; and Melvil Dewey, the Amer. librarian who originated the decimal system of classification for library cataloguing.

Bibliomancy (Gk. βιβλίον, book, and μαντεία, prophecy), name given to a

method of obtaining prognostics of the future. The procedure is as follows: The person wishing to obtain information opens the book at random, and then endeavours to apply the passage displayed to the particular case. The book usually chosen now for the purpose is the Bible; the ancients used Homer or Virgil, the process being then termed *sortes Homerice* or *sortes Virgilianæ*.

Bibliothèque Nationale, the Fr. national library in Paris. There is mention of a collection of MSS. by Charlemagne, but the most famous of the early collections is that of Charles V. The library has had many homes, as, for example, at Fontainebleau under Francis I. and later in Mazarin's palace. The Hôtel Tubœuf No. 8, destined with adjoining mansions to become the B. N., was, it is said, staked at the gambling table and won by Mazarin. The vast mansion he built on the site was divided among his heirs and in its different parts was put to various uses till, in 1721, it was bought by the Crown. The king's library was then taken there from the rue Vivienne, where it had been placed in 1666, and opened to the public. The modern part of the building, dating from 1854, has been reconstructed in recent times and enlarged. The chief entrance to the library is in the rue de Richelieu.

The Petite Librairie of Louis XI. was the true embryo of the actual B. N., or what has been successively the Bibliothèque Royale, Bibliothèque Impériale, and now the B. N.; but the B. N. owed its first real impetus to Napoleon, who increased the gov. grant; and at the opening years of the nineteenth century it had 500,000 printed vols. and 80,000 MSS., besides a great many engravings which Napoleon had taken from conquered cities. Numbers of these acquired treasures, however, were returned after the fall of Napoleon.

Acquisitions, gifts, sometimes confiscations, state seizure of the estates of émigrés or of the clergy during the Revolution, and, finally, the *dépôt légal* or regulation by which Francis I. compelled every printer to deposit a copy of every book issuing from the press, swelled the royal library enormously, so that from a few hundreds of vols. it has to-day grown to nearly 6 million printed books, 123,000 MSS., 3,500,000 stamps, maps, periodicals, music, engravings, and works of art of various kinds connected with letters, and a considerable number of coins, tokens, and medals. From last century the importance of the collections determined their div. into 5 depts.: Printed Books; MSS.; Stamps; Music; Medals. The Dept. of Printed Books is the one that occupies the most space. In the time of the second empire it was found necessary, in order to house so large a collection, to instruct the architect, Labrousse, to transform the old premises of the library, comprising at that time a part of the Mazarin palace, the hôtel de Nèvers, and those of Chivry and Tubœuf; and it was then that Labrousse built his reading hall, one of the earliest rustic architectural works to be produced in France, and one

of the most successful. The ceiling of the Galerie Mazarin is covered with splendid frescoes by Romanelli. The heart of Voltaire is said to be encased in the statue to be seen there. It is impossible in a short article to give even a brief sketch of all these collections even while limiting it to the most important. But the following are among the rarest items in the Dept. of Printed Books or Département des Imprimés: A Gutenberg Bible dated by the binder; a Theophrastus with *ex-libris* autographed by François Rabelais; a copy of Pascal's *Pensées* anterior by one year to the first edition, and not carrying the corrections authorised for that edition; a book, which belonged to Racine, adorned with sev. portraits of the great writer drawn in crayon by his son Louis; numerous prints on vellum with illuminations (see ILLUMINATION OF MANUSCRIPTS) and miniatures in the style of medieval MSS.; luxury works reserved for monarchs, one of which is adorned with a portrait of Charles VIII.; and also, rare curiosity indeed, the sole copy of the book *Christianisme restitué* by Michel Serret, snatched from the stake to which he and his work had been condemned by Calvin.

After the First World War, with the fall of the franc, the library was faced with economic difficulties, but by amalgamating with other Parisian libraries under a council of management and securing legislative action in the matter of holding funds and acquiring books, the situation was restored.

Bibra, Baron Ernst von (1806-78). Ger. writer, travelled in Brazil, Chile, and Peru, and brought home good natural hist. and ethnological collections. He pub. the results of his explorations in *Reisen in Südamerika*, 1854, and also wrote works on chemistry and novels remarkable for their excellence of description.

Bibulus, Marcus Calpurnius, consul with Julius Cæsar in 59 B.C. His efforts to oppose Cæsar's agrarian law and other democratic measures being futile, he excited ridicule by spending 8 months of his consulate shut up in his own house. As proconsul of Syria he further displayed his incapacity. He d. about 82 B.C.

Bilbury, a picturesque old vil. in Gloucestershire, England, in the Cotswold Hills, about 7 m. N. of Cirencester. Pop. 600.

Bicarbonate, an old name for acid carbonate. The gas carbon dioxide (CO_2) when dissolved in water is looked upon as carbonic acid, which may be represented as H_2CO_3 . If both hydrogen atoms are replaced by a metal, the resulting compound is called a carbonate, as sodium carbonate, Na_2CO_3 ; but when one hydrogen atom only is replaced, the result is a bicarbonate, as sodium bicarbonate, NaHCO_3 , the name being due to the fact that the proportion of the carbonic acid group to the amount of sodium is doubled. The term bicarbonate usually refers to bicarbonate of soda, which is useful medicinally as a gastric sedative and antacid. **See SODIUM AND SODA.**

Bice, name of two pigments, of blue and green respectively. In the natural B., formed with clay mixed with yellow ochre, the blue and green colours are due to the carbonate of copper in the B. The artificially manufactured B. is not so durable as the natural. B. is known to artists under various names, but its use is dying out. The etymological origin of the name is obscure.

Biceps (Lat., from *bi*, two, *caput*, head), anatomical term meaning two-headed. It is used to denote two muscles of the human body, one of the arm, the other of the leg. Each has two 'heads' or points of origin. The former, the B. flexor cubiti, is the muscle on the upper arm, which serves to flex the elbow; the B. flexor crucis extends along the whole of the back of the thigh and flexes the knee. In popular use biceps generally denotes the muscle of the arm.

Bicester, mrkt. tn. of Oxfordshire and the seat of the county courthouse, situated 12 m. N.N.E. of Oxford. The ruins of a Rom. settlement lie at a distance of a mile and a half to the S.W. of B., on the Ake-man Street of the Romans. Fairs are held annually in the tn., at Easter, in June, in Aug., at Michaelmas, and in Dec.; there are manufs. of rope, clothing, and pale ale. Pop. 3000; (rural dist., 9500).

Bicêtre, a noted hospital of Paris, situated on an eminence on the S. side of the city. Founded by Louis IX. as a Carthusian monastery, it was in the possession of John, bishop of Winchester, in 1290, hence the name of B., a corruption of Winchester. Destroyed in 1632, it was rebuilt, and, after having been a hospital and a prison, became a home for indigent old men and incurable lunatics.

Bichat, Marie François Xavier (1771-1802), Fr. anatomist and physiologist. In 1797 he was appointed lecturer in anatomy, surgery, and experimental physiology at the Hôtel-Dieu, and in 1800 he was made physician. He is regarded as the founder of general anatomy. His chief works are *Traité des membranes*, 1800; *Recherches sur la vie et la mort*, 1800; *Anatomie générale, appliquée à la physiologie et à la médecine*, 1801.

Bichromate Cell, a voltaic cell in which the electric current is associated with the chemical action of a mixture of potassium bichromate and dilute sulphuric acid upon zinc. The mixture is contained in a bottle-shaped vessel in which a zinc plate fixed to a brass rod is placed between two carbon plates. When the cell is not in use the brass rod should be raised and secured by a screw so that the zinc is clear of the exciting liquid. The electromotive force of the cell diminishes rapidly after a short time, so that it is not used in batteries where a current is needed for long periods.

Bickerdyke, John, pseudonym of Charles Henry Cook (1858-1933), Eng. writer, b. in London; educated at Baden-Baden and Cambridge Univ. In 1880 he became a barrister of the Inner Temple. His works were mainly on sporting subjects, and include *Sea Fishing in the Badminton Library* (1895), *Wild Sports*

in *Ireland* (1897), and *The Book of the All-round Angler* (1923).

Bickerstaff, Isaac, pseudonym adopted by Dean Swift, when in 1709 he pub. the pamphlet burlesquing Partridge, the almanac-maker, whose death he solemnly foretold and proved.

Bickerstaffe, Isaac (c. 1735-c. 1812), dramatic writer, in early life a page to Lord Chesterfield when lord Lieutenant of Ireland; produced, between 1756 and 1771, many dramatic pieces, which had considerable popularity, the best known of which are *Love in a Village* (1672) and *The Maid of the Mill* (1765). Owing to misconduct he was dismissed from his post as an officer in the Marines, and had to flee the country. The remainder of his life seems to have been passed in penury. The exact date of his death is unknown.

Bickersteth, Edward (1786-1850), Eng. clergyman of the Church of England, b. at Kirkby-Lonsdale, Westmorland. He was a solicitor at Norwich from 1812 to 1815, but later took holy orders, and became a rector in Herts, and secretary of the Church Missionary Society. His *Christian Psalmody* (1833), comprising 700 hymns, ran to over 50 eds. and was the basis of the *Hymnal Companion* compiled by his son, the Bishop of Exeter.

Bickersteth, Edward (1850-97), Eng. missionary of the Church of England, grandson of above, b. at Banningham, in Norfolk. He went to Delhi in 1877 to be the first head of the Cambridge Mission there, which he founded. He returned to England in 1882, and was made rector of Framlingham, Suffolk, where he remained till 1886. In the latter year he went to Japan, and was made bishop of S. Tokyo. He worked in Japan till 1896.

Bickerton, Sir Richard Hussey (1759-1832), Eng. admiral. He took part in 1781 in the action between Hood and de Grasse off Martinique. In 1799 he was made rear-admiral, and from 1804 to 1805 was with Nelson in the Mediterranean before Trafalgar. Later he was commander-in-chief at Portsmouth.

Bicycles, see CYCLES.

Bickley, residential dist. of Kent, England, 12 m. from London, and near Bromley.

Bida, the fortified cap. of Nupe in N. Nigeria, W. Africa. The Niger flows 20 m. S. Elevation, 450 ft. B. was taken by Col. F. S. Lugard (see LUGARD, LORD) in 1903 in his campaign against the N. emirates, whose sultans would not give up slave-trading without a fight. Pop. 100,000.

Bidar, tn. of India, in the state of Hyderabad, 75 m. N.W. of the state cap., Hyderabad. It is noted for manufs. of Bidri ware, which are made of an alloy of tin, copper, lead, and zinc. Pop. 29,000.

Bidasoa, riv. which rises in the mts. round the valley of Baztan in Sp. Navarre, and flows into the bay of Biscay at Fuenterrabia, after a course of 33 m. It forms the boundary between Spain and France, and was the scene of sev. battles in the Peninsular war.

Biddeford, city in York co., Maine, U.S.A. Has large cotton manufs. It stands on the Saco, which supplies power for factories. Pop. 19,700.

Bidder, George Parker (1806-78), Eng. engineer, was carried round the country as a 'calculating phenomenon,' until someone, interested in his extraordinary powers, educated him at a Camberwell school and Edinburgh Univ. He was the inventor of the swing bridge for railways, and the founder of the Electric Telegraph Company, which was the first of its kind. Victoria Docks was his greatest engineering achievement, but his claim to renown rests rather on his faculty for rapid, accurate, and elaborate calculation.

Biddery Ware, see under BIDAR.

Bidding-prayer (O.E. *biddan*, to pray), the exhortation to prayer which is said in England in cathedrals, at univ. sermons, in the Inns of Court, and elsewhere on special occasions. Such prayers are to be found in anct. Gk. liturgies, and in Gallican and pre-Reformation liturgies of England. The main characteristic of the B. is that it informs the congregation of the object for which they are to pray. It ends with the Lord's Prayer. The B. is commanded to be used before every sermon, lecture, or homily in the canons of the Church of England of 1603; save in the places above mentioned, a collect is now generally substituted. Forms of Bs. which have been used at various times, from the eleventh to the fifteenth century, have been collected in the *Manual*, *Rituale*, 1874, of the Sarcee Society. For further information on the subject, see the *Bidding of Prayers before Sermons*, written by Wheatley in 1845.

Biddle, John (1615-62), 'the father of Eng. Unitarianism,' was b. at Wotton-under-Edge, Gloucestershire. In 1645, he pub. his *Twelve Questions or Arguments*, against the deity of the Holy Spirit. He was imprisoned, but next year pub. his *Confession of Faith touching the Holy Trinity*, etc., and he followed this by a tract bringing the fathers of the Church to support him. In 1655 B. was banished to the Scilly Is., where he stayed for 3 years. After the Restoration, he was again brought to trial, and fined heavily. He was unable to pay, and so was sent to prison, where he d. See his life by J. Toulmin, London, 1791.

Biddulph, urban dist. of Staffs., England, 4 m. from Congleton by rail. Pop. 8500.

Bideford ('by the ford'), seaport of N. Devon, England, 8 m. S.W. of Barnstaple. It is situated on both sides of the Torridge, 3½ m. above its confluence with the estuary of the Taw, and an old bridge of 24 arches unites the 2 divs. of the tn. Vessels of 500 tons burden can come to the quay. B. had formerly a very extensive trade, and is known as the starting-place of Sir Richard Grenville's last voyage, whilst it also figures prominently in Kingsley's *Westwood Ho!* Its manufs. are ropes, sails, earthenware, leather, etc. Pop. 9000.

Bidens, genus of Compositæ, of which 2 species, the bur marigolds, are common to

Britain. It received its name from 2 bristles which frequently surmount the angles of the fruit and serve in its distribution. The Brit. species, *B. tripartita* and *B. cernua*, grow in wet places, while *B. beckettii* is an Amer. water plant.

Bidloo, Godefrid (1649-1713), Dutch anatomist and surgeon, b. at Amsterdam, d. at Leyden. For some time he was prof. of anatomy at The Hague, and later occupied the same position at Leyden, where he also taught chem. He was physician to William III. of England. His chief work is the *Anatomia corporis humani*, an elaborate treatise on anatomy in Lat., pub. in folio at Amsterdam, 1685. It is adorned with 105 plates by G. de Lairese. These plates were the cause of controversy with George Cowper, a London surgeon, who had stolen them and used them as his own.

Bidpai, or **Pilpay**, a legendary Indian philosopher, to whom a famous collection of E. apologies known as *The Fables of Bidpai* were once attributed. According to tradition, this B. (the title, derived from the Sanskrit, means master of knowledge), lived under a king called Dabshelin, by whom he was imprisoned, because of his free condemnation of the royal tyranny. He was later released to discuss the affairs of the kingdom, and was then commanded to write down his advice in Sanskrit in fable form. The fables early became popular, and the news of them having reached Persia, the King Khosrû Anushirvan (A.D. 531-79) sent Barzoi, his court physician, into India to make a collection of them, and to translate them into Pahlavi. The physician made this trans. under the title *Kalilah and Dimnah*, from the names of 2 jackals in the Sanskrit version. From the Pahlavi, a translation into old Syriac was made, and the same version was again made the basis of a more important translation about A.D. 750. Then Abdullah-ibn-al-Mokaffah turned it into Arabic, and it was from this version that the fables were trans. into most of the European languages. The chief sources of the *Fables of Bidpai* are the *Pancha Tantra* and the *Hitopadesa*. The stories, which made animals speak and reason as human beings, are didactic in aim, their purpose being to infuse Buddhist doctrine, in the same way as do the *Jatakas*, or birth stories, of the Buddha, with which the fables have much in common. The fables were trans. into Heb. by the Rabbi Joel, and from this work was trans. the *Directorium Vitæ Humanæ* of John of Capua, a converted Jew. This was trans. into It., and from the It. into Eng. by Sir Thomas North, 1570. They have been about 20 Eng. translations during the last century. See J. G. N. Keith-Falconer's *Kalilah and Dimnah*. Cambridge, 1895.

Bidri Ware, see under **RIPAR**.

Bieberstein, Adolf Marshall, Baron von (1842-1912), Ger. diplomatist, b. in Baden and educated at Heidelberg and Berlin. He held sev. administrative posts in the Grand Duchy of Baden, following Prince Bismarck as state secretary

for foreign affairs. He acted as the mouthpiece of the 'good Ger. conscience' at the Hague Conference of 1907. As the Ger. delegate there he declined to accept Great Britain's proposal to restrict the use of mines; and he claimed the right to destroy neutral shipping and fishing fleets 'if that were necessary.'

Biedermann, Friedrich Karl (1812-1901), Ger. historian and politician, b. in Leipzig, Sept. 25. Was a president of the National Assembly held at Frankfurt, 1848, and which made him one of a deputation to Berlin to urge the king of Prussia to constitute himself Ger. Emperor. He took a leading part in Saxony in the movement in favour of the unification of Germany. Elected to the Reichstag, 1871-74. D. at Leipzig, Mar. 5, 1901. His most important historical works are: *Erinnerungen aus der Paulskirche*, 1849; *Deutschland im 18. Jahrhundert*, 1854-80; *Friedrich der Grosse und sein Verhältnis zur Entwicklung des deutschen Geisteslebens*, 1859; *Geschichte Deutschlands*, 1815-71, 1891; *Deutsche Volks- und Kulturgeschichte*, 1901. Plays: *Kaiser Heinrich IV.*, 1861; *Kaiser Otto III.*, 1863; *Der letzte Bürgermeister von Strassburg*, 1870.

Biel, the Ger. name of **Bienne**, a tn. in the canton of Bern, Switzerland, 20 m. N.W. of that city. Overlooked by the Jura, it is pleasantly situated on the lake of Bienne. Gardens and villas encircle the tn., which is composed of an old quarter and a modern quarter, the one semi-medieval in its irregularity, the other modern in its regular elegance. From 1262 to 1352, B. belonged to the bishops of Basle; in 1352 it was allied to Bern, and was a free and independent city until 1798, when France obtained it, but in 1815 it was again united to Bern. Its industries are watch-making, cotton-spinning, cigar-making, tanning, and dyeing. Pop. 35,000.

Biele, Wilhelm, Baron von (1782-1856), Ger. astronomer, devoted his life to the fine arts and to astronomy. He is famous because of his discovery of a comet, which bears his name. This comet, after appearing in 1772 and 1805, was seen by B. at Johannsburg in 1826, 10 days before Gambart saw it at Marseilles. Its return in 1832 caused widespread alarm, as it was believed it would strike the earth.

Bielaya, riv. of Russia, some 500 m. long, rising in the Ural Mts. in the gov. of Orenburg, joins the Kama.

Bielefeld, walled tn. in the Ger. prov. of Westphalia, 27 m. S.W. of Minden. Pop. 122,000. The tn., which dates back to the eleventh century, is picturesquely situated on the small R. Lutter at the foot of the Teutoburger Forest. The anct. walls, which withstood their last siege in 1673, were converted into broad promenades. The old castle of Sparenburg is the most notable building. The colony of Bethel is situated at a distance of 7 m. from the tn. This began as a home for people subject to epileptic fits, but later included houses for the training of deacons and deaconesses, and a workmen's home. The tn. is the

centre of the linen industry of Westphalia. There are also large bleaching-grounds, and the bleaching industry is very active. Other manufs. include silk, velvet, sewing-machines, leather, damask, soap, and meerscham pipes. On July 5, 1941, during the Second World War, the tn. suffered a heavy air attack, and on Mar. 7, 1945, R.A.F. Bomber Command used bombs of 10 tons for the first time in the war, the target being the railway viaduct at B. B. was the birthplace of Horst Wessel, who was killed in a brawl and became the subject of the Nazi propaganda song. A huge cairn was erected at B. in his memory and this was demolished by the Royal Engineers in May 1946.

Bielena, tn. of Yugoslavia, near R. Save, 75 m. N.E. of Sarajevo. Pop. 10,000.

Bielew, or **Bieloff**, tn. of the R.S.F.S.R., on the R. Oka, 160 m. S.S.W. of Moscow. It is an old tn., and has 14 churches and sev. convents. It became in 1468 the cap. of a vassal principality of Lithuania, but was captured by the Russians in 1494. It has a trade in grain. Pop. 10,000.

Bielgorod, see BELGOROD.

Biella, tn. in the prov. of Novara, Italy, situated on the R. Cervo, 33 m. N.E. of Turin. It has been noted for the manuf. of woollen stuffs for many hundred years, and is the see of a bishop. Corn, rice, and hemp are grown. Pop. 26,000.

Bielostok, see BIALYSTOK.

Bielsk, tn. of Poland, in the prov. of Grodno, situated 112 m. N.E. of Warsaw. It was the scene of a Polish victory over the Russians in 1831. Pop. 5000.

Bielski, **Martin** (1495-1576), Polish chronicler. His *Kronika Polska* was the first book of chronicles written in the Polish language, and is the first important hist. of Poland. The work, which is still valued, was continued by his son.

Bielsko, or **Bielitz**, tn. in Polish prov. of Cracow. The dist. is one of the most important centres in Poland. There is a great cloth industry. Pop. (1939) 20,000.

Bieltsi (Rumanian *Baltsi*), tn. of the Moldavian S.S.R., on the direct line of railway from Czernowitz to Odessa, and about 80 m. from Kishinev. There are brickworks and soap factories, also a trade in cattle and horses. Pop. 10,000.

Bienne, see BIEL.

Biennials, name given to plants which require 2 seasons of growth to produce their flowers and fruit, and differ from anns. only in this fact. In the first year they produce only vegetative shoots, in the second, flowers, fruits, and seeds, after which they perish.

Bienteveo, see BENTIVO.

Bienville, **Jean Baptiste LeMoyne** (1680-1768), Fr. governor of Louisiana, b. at Montreal, Canada. He founded New Orleans in 1718, and estab. there the seat of the gov. He was obliged to return to France (1724) to answer accusations made against him; but he returned (1733) as lieutenant-general. He failed in a number of expeditions against the Indians and was recalled in disgrace. He d. in France.

Bierce, **Ambrose**, Amer. author, b. in Ohio, 1842, son of a farmer, and the youngest of 12. He enlisted in the Union Army at the outbreak of the Civil war, 1861. After distinguished service he was invalided out in 1865. He then joined his brother Albert in San Francisco, and found his entry into journalism. In 1872 he came to London, and was on the staff of *Pan* for 4 years. Under the pseudonym 'Dod Grile' he collected 3 vols. of his journalistic ventures. From 1876 to 1897 he was in journalism in San Francisco. In 1891 his first book of stories, *Tales of Soldiers and Civilians*, was pub., notable for his capacity to see war in all its horrors. In 1913, he left Washington for Mexico, where civil war was in progress. A last letter was received from him in Dec., saying he was attached to Villa's army. Nothing is known beyond that date. One story states that he was shot by Villa himself. His books include: *Cobwebs from an Empty Skull*, 1874; *The Monk and the Hangman's Daughter*, 1892; *Can Such Things Be?*, 1893; *Fantastic Fables*, 1899; *The Cynic's Word Book*, 1906; *The Shadow on the Dial*, 1909.

Bierley, **North**, township in the E. div. of the W. Riding of Yorkshire. It forms part of the city of Bradford, and it has coal and iron resources. Pop. 16,000.

Bier's Congestion Treatment, a method of dealing with certain diseases by inducing an increased supply of blood in the part affected. Strictly speaking, the congestion treatment refers to the method consisting of the retention of venous blood, but Dr. Bier's name has also been associated with certain methods for increasing the supply of arterial blood. His general name for the latter treatment is the artificial production of active hyperemia, as opposed to passive hyperemia artificially produced, which includes all methods of hindering the departure of the venous blood from the part affected. Both treatments are based on the principle of assisting nature by increasing the supply of the blood, and consequently of those agencies whose function it is to resist and overcome the disease producing elements in the particular part of the body affected. The prin. method of producing active or arterial hyperemia is the application of heat. (See also AEROTHERAPEUTICS.) The apparatus used by Dr. Bier and his assistants for this purpose consists of hot-air boxes adapted to enclose the different extremities, the openings being well packed with fireproof asbestos cotton. The source of heat is a Bunsen burner or a spirit lamp which may be regulated. A thermometer is fitted to the box so that the temp. may be continually under observation and moderated if necessity arises. The usual effect of the treatment is to produce a copious perspiration, which must be appropriately dealt with when the application is discontinued. The treatment should only be adopted on the advice of a physician experienced in aerotherapeutics, as it entails considerable demand upon the general strength; and in women has produced irregularities and abnormalities

in menstruation. For these reasons, Dr. Bier developed a passive or venous hyperæmia treatment, where the object to be attained is the retention of blood in the affected part for a longer period than the normal. Under properly supervised conditions, the Bier treatment has proved very successful.

Bierstadt, Albert (1830-1902), Amer. artist, b. at Solingen, near Düsseldorf, but at the age of 2 was taken to America by his parents. He returned later to Europe and studied at the academy of Düsseldorf 1853-57. Returning to America he took part in General Lander's expedition across the Rocky Mts. As a result of this trip his picture of 'Lander's Peak' attracted attention at the Paris Exposition of 1863. B. was a landscape painter who, with Swain Gifford, Thomas Moran, and Edward Gay belonged to the middle period, and reflected the traditions of the Hudson R. school to some extent.

Biga, see **BIGHA**.

Bigamy. In Eng. law, by the Offences against the Person Act, 1860, sec. 57. 'Whosoever, being married, shall marry any other person, during the life of the former husband or wife, whether the second marriage shall have taken place in England or Ireland or elsewhere, shall be guilty of felony, and being convicted thereof, shall be liable to be kept in penal servitude for any term not exceeding 7 years'; but no offence is committed: (1) If the second marriage is contracted by a person not a Brit. subject outside England and Ireland; (2) If the former husband or wife has been continually absent for 7 years, and is not known to be living by the person marrying a second time; (3) If the first marriage has been dissolved by a divorce or a decree of nullity; (4) If there was a *bona fide* belief based on reasonable grounds that the former husband or wife was dead. To support a charge of B. a valid first marriage must be proved; thus if a man marries a woman while his first wife is alive and after the first wife's death marries a third, the last marriage is not bigamous, for his second marriage was a nullity. In Scotland, by the statute of 1551, the offence is one of perjury; at common law B. is punishable as an offence with imprisonment.

In U.S.A. law the statutory provisions of the various state criminal codes against B. or polygamy (q.v. as to Utah) are for the most part copied from the statute of 1803 (replaced by the Criminal Law Consolidation Act, 1861). The various exceptions to this statute are likewise practically the same in the Amer. Acts, e.g. continuous absence of former spouse for a space of 5 years, without being heard of; dissolution of former marriage by the decree of a competent court, etc. The punishment for the offence differs in different states. In case the prior marriage was made abroad, the prosecution must show that such marriage was valid by the law of the country where it was made. The second marriage must be within the jurisdiction; if in a foreign state it is not B. Again, the second

marriage need not be a valid one. Even though the first marriage be contracted under any of those disabilities or impediments which render it *voidable*, yet a second marriage, whilst the former is in fact subsisting, comes within the criminal law, for the first is a marriage in legal theory until it is avoided. But if the first marriage were contracted under disabilities or incapacities which rendered it *void ab initio*, the case is otherwise.

John H. Stone

BIG BEN'S CLOCK TOWER

The sculptured horse is part of the Boadicea statue group at the north end of Westminster Bridge.

In Maine, Pennsylvania, and other states, the defendant's admissions as to a former marriage may be given in evidence against him, but apparently this is not so in Massachusetts, Connecticut, and a few other states. Consummation is not necessary to the validity of either marriage. The fact, if so, that polygamy is allowed by any religious creed is not even in Utah a defence in law to a charge of B. As in England, so in U.S.A., a woman who, having a husband living, marries another person, is guilty of B., even though her husband has voluntarily withdrawn from her and remained both absent and unheard of for any period less than 7 years, and even though she honestly believed him to be dead at the time of her second marriage.

Bigelow, Erastus Brigham (1814-79), Amer. inventor, contrived, whilst still a boy, a loom for weaving suspender webbing and piping cord. His other inventions were a machine for making knotted counterpanes and a power-loom for the

carpet weaver, which reduced the cost of carpet manu.

Bigelow, Jacob (1787-1879), Amer. physician and botanist, graduated in 1806 at Harvard Univ. where he was afterwards prof. in more than one capacity. For more than 40 years he practised medicine in Boston. His title to renown rests on his original research in botany, as well as on his introduction of single-word nomenclature in the *American Pharmacopœia*, 1820.

Bigelow, John (1817-1911), Amer. journalist and statesman, b. at Malden, New York. From 1849 to 1861 he was managing editor and, with William Cullen Bryant, joint owner of the New York *Evening Post*. Amongst the offices which he filled in his political career were those of United States consul at Paris 1861-64, minister to Franco in 1864-67, and secretary of state for the state of New York, 1876-77. His best work is his ed. of Franklin's *Autobiography and Complete Works*, to which he added notes based on personal knowledge. See Margaret Clapp, *Forgotten First Citizen: John Bigelow*, 1946.

Big Ben, the great bell in the clock tower of the Houses of Parliament, Westminster. It was so named after Sir Benjamin Hall, who was first commissioner of works in 1856 when it was installed. It cost some £40,000 and weighs 13½ tons. A light is displayed from this tower when Parliament is sitting.

Big Game. The pursuit of the larger fauna has had a fascination for men in all ages; anct. cave-dwellers, Assyrian kings, and modern sportsmen have all taken pleasure in hunting, and in recording their adventures. But to-day, instead of finding the bear, elk, or aurochs close at hand, the European hunter must go far afield if he desires to pursue large game. Even in Africa things have greatly changed. When the Great Trek took place, and long after, there were vast regions in S. Africa where lions and buffaloes were numerous, but now only small game can be found; the larger animals have retreated, and long journeys with horse and ox-wagon are needed to get into their neighbourhood. Then follow days of stalking with native trackers. All this means expense, hard work, and often privation; a Cape wagon and team may cost £200 or more, or can be hired at perhaps £30 per month; horses, unsaddled, are fairly cheap, but if saddled, are cheaper at three times the price. Drivers and horse-boys must be hired, and provisions and medicine taken in good quantity. In E. and Central Africa native carriers are necessary, also native hunters, and in swampy dists. all the work must be done on foot, which involves great fatigue and almost a certainty of sickness. For Central and E. Africa the best start will be by rail to Mafeking or beyond, or by sea to Beira, for the lower Zambesi, or to Mombasa for Brit. E. Africa. The animals to be found include the lion, elephant, hippopotamus, rhinoceros, giraffe, buffalo, eland, and

many species of antelope. Lions are especially plentiful in Brit. E. Africa and the Congo State, as also elephants and rhinoceros. Herds of buffalo were once frequent in Cape Colony, but have been killed off or driven N.; they were greatly thinned also in 1890 by a kind of rinderpest. They are now to be found mostly among the swamps of the Zambesi and Limpopo, and hunting them is difficult and dangerous. A wounded buffalo will hide and try to surprise the hunter, and even a 'dead' one must be approached with caution. There are close times for shooting, varying in the different states, and licences run from a few shillings for small game up to many pounds for the larger animals. India has always been famous for its wild animals, but money and, above all, influence are necessary for enjoying the best sport. Without these one might spend many months in a tiger country and see nothing, but with them India affords splendid chances. There is an immense variety of game, tigers, panthers, leopards, a few lions, wild boar, rhinoceros, and buffalo, besides deer and gazelles, from the lordly sambur downwards. The tigers are unmatched elsewhere; one was shot which measured 10 ft. 22 in. in length, including tail, and weighed 540 lb. Even the cubs at a year old are 4 or 5 ft. in length. Tigers are to be found in many parts of India, but especially in the Terai jungles (along the foot of the Himalayas), and in the Sunderbunds. They are generally shot from elephants, but sometimes from trees, towards which they are driven by beaters. Lions are now only found in the W.; they are sometimes very large, quite equal to those of Africa. Panthers and leopards are numerous: the snow leopard of the Himalayas is one of the finest prizes a sportsman can secure. Rhinoceros are found in the Terai and the Sunderbunds, and the gaur, or Indian bison, in the Sâtpurâ and other mt. ranges. One of the most noted sports of India is 'pig-sticking,' i.e. hunting the wild boar on horseback with spears. This always takes place over rough country, and requires pluck, hard riding, and dexterity; a wild boar at bay is a dangerous opponent. The Indian buffalo, living in swampy dists. overgrown with tall reeds, has to be hunted on elephants, but sometimes in the Central Provinces the reeds are set on fire, after which the buffalo may be pursued on foot. The quarry itself is somewhat dangerous, but malarial fever is more to be dreaded. Up in the Himalayas those who enjoy the toilsome delights of mountaineering may stalk the markhor, ibex, and wild goat; brown and Himalayan bears also, and snow leopards, are sometimes met with. At a great altitude (10,000-17,000 ft.), the bharal, or blue wild sheep, needs expert stalking, and furnishes excellent mutton. Pamir sheep are said to stand 4 ft. high, and weigh over 400 lb., and the argali, or *Ovis ammon* of Tibet (of which there is a specimen at S. Kensington), is nearly as large as a donkey. Burma also affords plenty of sport, its fauna including the

elephant, rhinoceros, tiger, and leopard, besides innumerable deer. Elephant-shooting, however, is strictly prohibited both here and in India. Good shooting may be had in some parts of Europe, especially Russia, Scandinavia, and the Alps. In the former wolves and bears are plentiful, and their skins are prized. Bears are sometimes tracked down, about Nov., to their winter hiding-places and not infrequently the tracker, having located sev., goes off to the city and sells his discovery to some sportsman. Then after a sledge journey of many days, the hunter, with his guide and probably a dog, has a long tramp over the snow to the place of hibernation. The animal is waked out of his sleep, comes out with a rush, and either bolts or charges his assailants. Further S., in the Caucasus, wild boars abound on the lower slopes, and bears and bison also are found. Higher up there are chamois, ibex, and other mt. game; but though sport is plentiful, it is expensive, and involves much difficult mountaineering. Bison are also found in Lithuania; they are often called aurochs, but this is not correct, the true descendants of the anct. aurochs being the wild white cattle of Chillingham, Northumberland. A Caucasian wild bull has been killed which stood 6 ft. high, was 10 ft. 1 in. in length (without including tail), and 8 ft. 4 in. in girth. Chamois and ibex are stalked also in Switzerland, the Tyrol, the Carpathians, and the Pyrenees. In Scandinavia the brown bear is hunted by men on skis, with hounds in leash. The bear has keen scent, but poor vision, and keeps to windward if he can; when cornered, he is dangerous, and not least so when apparently dead. Bears in Norway are now scarce. In our own is. the only large wild animals left are the red deer of Scotland and Exmoor, and the Chillingham herd of white cattle, the last representatives of the anct. quarry of the men of the Stone Age. Bears and wolves lingered longer in Scotland than in England; there is a record of a fierce bear being killed by one of the Gordons in the eleventh century, and wolves are said to have been numerous and destructive down to the sixteenth century. In N. America the hunter may find abundant sport, though the great herds of bison have vanished from the prairies; they were mainly slaughtered by the Indians. After they found they could sell their 'buffalo-robies' to white men, they slew at a great rate. The last big herd was destroyed in 1883. The black bear also is becoming scarce, having been killed for his fur, but in the Rockies grizzlies and other bears are still to be found. Many sportsmen declare hunting the grizzly to be one of the most dangerous sports in the world. He has keen scent and hearing, is quick, savage, and powerful, having been known to carry a wapiti carcass, 1000 lb. in weight, a considerable distance. He is generally caught by baiting with the body of a deer or other animal; when this is found to have been mauled (perhaps buried), the hunter hides, and watches

for the bear's return. Sometimes he is tracked with dogs, who distract his attention, and afford an opportunity for a shot. Canada is rich in game, moose and caribou being the largest; these are also found in some of the States. The moose is often taken by 'crust-hunting', when the surface of the snow is sufficiently hard to bear a man on his snow-shoes, but gives way under the sharp hoofs of the heavy animal, who is thus quickly overtaken; the caribou, having larger feet, can more easily escape. Newfoundland also became noted as a shooting ground, but in E. Canada as a whole B. G. is becoming scarce. The 'bighorn,' rare elsewhere, is now preserved in Brit. Columbia and Kootenay; it is difficult to stalk, there being always a sentinel on some high peak, constantly on the watch. Musk-oxen are found in the N., and some bison, and the Alaskan bears are almost as large as the grizzly. Polar bears are said not to give much sport, but are immensely strong; Captain Markham found one eating the body of a white whale 15 ft. long, and weighing 3 to 4 tons, which he had dragged up on the ice. Walrus may be hunted either with a rifle or harpoon; and some men have found Arctic sport fascinating, but it is perhaps harder and more trying than any other. There is good shooting in S. America, but the country is difficult. The chief animals are the jaguar, puma, many kinds of smaller game, including wild pig, and on the plains there are herds of wild cattle. See F. C. Selous, *A Hunter's Wanderings in Africa*, 1881; F. Nansen, *'Farthest North'*, 1893-96; T. Roosevelt, *African Game Trails*, 1910, and *Hunting Adventures in the West*, 1923; Sir A. E. Peacock, *The Book of the Lion*, 1913; C. Phillips-Wolley, *Big Game Shooting*, 1913; H. F. Wallace, *Big Game of Central and Western China*, 1913; W. D. M. Biggar, tn. in the upper ward of Lanarkshire, Scotland, 25 m. S.W. of Edinburgh. It consists mainly of one lengthy street, and has a cruciform church with a tower in the middle. Pop. 1500.

Biggarsberg, range of mts. in S. Africa. It is practically an easterly extension of the Drakensberg Mts., and it separates the N. part of Natal and the dist. of Newcastle from the rest of the colony.

Biggleswade, mkt. tn. in Bedfordshire, England, on the r.b. of the Ivel. It has a

large weekly corn market, and there are many market gardens in the neighbourhood, which send their produce to London. It manufs. agric. implements, hosiery, and motor vehicles. Pop. 5900; rural dist., 21,000.

Bigba, or **Biga**, tn. in the prov. of Anatolia, Turkey, situated on the Bolki, about 18 m. from its entrance into the sea of Marmora.

Bigham, John Charles, *see* MERSEY, BARON.

Big Horn, riv. of the U.S.A., rising in the Rocky Mts., near Fremont's Peak in the N.W. of Wyoming. It is the largest affluent of the Yellowstone R., and is called Wind R. in its upper course. It is joined by the Little Horn R. at Fort Custer, to which point it is navigable. It traverses a mountainous country in a N.E. course for about 450 m.

Big Horn, co. in the N.W. part of Wyoming, U.S.A., drained by the Big Horn R. and its tributaries. On the E. are the Big Horn Mts., on the W. the Shoshone Mts. Stock-raising and agric. pursuits are carried on, and a system of irrigation is generally practised. The cap. is Basin. The dist. has an area of 12,226 sq. m. Pop. 12,000.

Big Horn, settlement in Custer co., Montana, U.S.A., situated at the confluence of the Big Horn and Yellowstone Rts., 240 m. E. of Butte city.

Big Horn Mountains, range of mts. lying principally in the N. part of Wyoming, U.S.A., on the E. of the Big Horn R. They are composed of anct. sedimentary rocks with a granitic nucleus. The range runs in a N.W. and S.E. direction for nearly 180 m., and has a number of summits over 9000 ft., covered by perpetual snow. The Sioux, the most belligerent of the Amer. Indians, had their fastnesses in these regions for a long time. In this dist., 15 m. to the S. of Fort Custer, occurred the famous massacre of Big Horn, in 1876, when 250 men under General Custer were annihilated.

Big Horn Sheep (*Ovis cervina*), species of large N. Amer. sheep with a known coat, which turns to bluish grey in winter; so named from the size of the horns of the ram, which often measure over 40 in. round the curve. The sheep are also named Rocky Mountain sheep.

Biglow Papers, The, satiric verses written in Yankee dialect supposedly by one Hosea Biglow, but really by James Russell Lowell (q.v.). The first series appeared in 1848 and dealt with the U.S. war with Mexico. The second series appeared in 1867 and dealt with the Civil war.

Bignonia, genus of plants of the Bignonaceæ, named by Tournefort after the Abbé Bignon, librarian to Louis XIV. All the species are splendid plants while in blossom, most of them are climbers, and they are natives of America. *B. caprea-lata* climbs by means of bluntly hooked tendrils, *B. Tweediana* by 3 sharply clawed tendrils.

Bignonaceæ, a natural order of dicotyledonous trees or shrubs, found chiefly in Brazil, but also in Africa and America.

The most interesting genera are *Bignonia*, *Tecoma*, *Catalpa*, and *Eccremocarpus*.

Bigod, Sir Francis (1508-37), Eng. rebel, took a degree at Oxford. He served Cardinal Wolsey, but was entangled in the Pilgrimage of Grace, undertaken as a protest against Henry VIII.'s church reforms. He was hanged at Tyburn because he was a leader in the ineffectual rising of Beverley. Some of his letters may be seen at the Public Record Office.

Bigod, Hugh and Roger, *see* NORFOLK, EARLS OF.

Bigorre, formerly a sub-div. of S.W. France, in the prov. of Gascony. It now forms part of the dept. Hautes-Pyrénées. The cap. is Tarbes; other tns. are Vic de Bigorre, Luz, and Lourdes.

Big Rapids, city and co. seat of Mecosta co., Michigan, U.S.A. It is situated on the Muskegon R., 55 m. N. from the city of Grand Rapids. It has an important trade in lumber, and there are iron foundries, mills, and furniture factories. Pop. 5000.

Big Sandy River: (1) Riv. of Tennessee, U.S.A., which runs into the Tennessee R. in Henry co., at the point where the Louisville and Nashville railway crosses the Tennessee R. It has a length of about 100 m. (2) Riv. of Wyoming, U.S.A., which runs into the Green R., 22 m. N. of Bryan, after a course of about 100 m.

Big Trees, post tn. in Calaveras co., California, U.S.A. It has an altitude of 4600 ft. Its famous grove of sequoia trees, over 300 ft. high, gives it its name.

Bihac, or **Bihacz**, fort, tn. in Yugoslavia, situated on an is. of the Unna, 65 m. W. of Banialuka. Its possession was often contested during the Turkish wars. Pop. 6000.

Bihar, or **Behar**, prov. of India. Until 1936 constituted, together with Orissa and Chota Nagpur, one single prov.; prior to that, all 3 sub-provs. had been divisions of Bengal presidency, but that association was ended in 1912 on the reconstitution of Bengal. Bihar and Orissa, as the prov. was then known, also included the Sambalpur dist., which was transferred to Bengal from Central Provs. in 1905. In 1931 the Oriyas demanded a separate administration for Orissa on the ground that they were racially and linguistically distinct from B., this demand was granted by the gov. of India, whose boundary commission reported on the question in 1932. B. is now under a governor, whose administration comprises a chief secretary, 5 commissioners of divs., and other officials. B., known as 'the Garden of India,' is bounded on the N. by Nepal, on the W. by the United Provs., Central India, and Central Provs., on the S. by Chota Nagpur and Orissa, and on the E. by W. Bengal. It has an area of 69,000 sq. m., and lies in the fertile Ganges Valley. Stretching from the foot of the Himalayas to the tropics, the prov. experiences extremes of temp. and a variety of vegetation. As in Bengal, rice is the staple crop, about half the cultivable area being devoted to it; maize, sugar-cane, tea, indigo, oil-seed and tobacco are also

grown, the cultivation of the last-named being greatly stimulated by the erection of a cigarette factory, one of the largest in the world, at Monghyr. Much of India's coal and mica are mined in the prov.; iron is also found, and there is a large iron and steel works at Jamshedpur. Other minerals include alluvial tin, salt-petre, and gold. There are many feudatory states. Patna, on the Ganges, is the cap. and chief tn.; Monghyr and Bhagalpur are other important cities. Gaya is a famous place of pilgrimage for both Buddhists and Hindus, and at the anct. city of B. are the remains of a once-important Buddhist college. B. is inhabited by a large number of races, and of the many tongues spoken Bihari, W. Hindi, and Oriya are the chief. B. prov. has a long hist. of lawlessness and violence. In the decade before the 1939-45 war cases of train-wrecking and looting were frequent. In Aug. 1942 B. was a hot-bed of revolution, and for some days the prov. was isolated, all railway lines and telegraph wires being cut and roads blocked. The army had to resort to extreme action before it could reopen lines of communication to the Burma front. During the Anglo-Indian negotiations for self-government in India the communal riots which broke out in Calcutta in Aug. 1946 spread eventually to B., and for over a fortnight in Nov. there was large-scale rioting in Patna, Bhagalpur, Monghyr, and Gaya. It seemed evident that this outbreak of communal frenzy was in retaliation for the Moslem excesses in E. Bengal (Aug.) and as the Hindus outnumbered the Muslims in B. by seven to one, the result might be imagined. The number of dead in the affected dists. has not been accurately computed, but the most reliable estimates were that they were probably between 2000 and 3000 dead. The pop. is over 36,300,000, 82 per cent being Hindus.

Bihar, or **Behar** (Sanskrit *vihar*, monastery), anct. city of the prov. of B., India, 35 m. S.E. of Patna. It was formerly a city of renown, being the cap. of the kingdom of Maghadha, and was a centre of pilgrimage to the Muslims. There is a trade in silk, muslin, and coloured prints and cottons. Pop. 32,000.

Bihar, range of mts. on the borders of Hungary proper and Transylvania. The range, of which the highest peak is B. (6000 ft.), contains the sources of the head-streams of the Koros, and on the E. side those of the Aranyos R.

Bihari, Alexander (1856-1906), Hungarian painter, b. at Grosswardeln. His most famous pictures are 'Gypsies with the Broken Violin before the Country Justice,' 'A Pleasure Trip on the Zagya,' 'Peasants at Supper on the Pusztá,' and 'A Rumanian Funeral.'

Bihe, dist. in Portuguese W. Africa situated about 12° 40' S. and 17° E. It lies at an altitude of 5300 ft. above the level of the sea, and has a sufficiently mild climate to allow of the cultivation of corn and other crops. The Benguela-Katanga railway connects B. with the coast.

Bijanagar, **Bijnagar**, or **Bisnagar** deserted city in the Madras presidency

India, 36 m. N.W. of Tumbuddra. It was an extensive place, 8 m. in circumference, and contains remains of temples to Shiva, Krishna, and Rama, besides other fine buildings. It was founded in 1336, and was a flourishing city when it was sacked by the Muslims in 1564.

Bijapur, or **Bejapoor**, dist. and city of India, in the Bombay prov., situated on a trib. of the Krishna, and 245 m. S.E. of Bombay. It was a flourishing city in the time of the Moguls, and now consists of 2 parts, the fort on the E. and the old city on the W. It is one of the most picturesque collections of ruins in India; all the remains of the former magnificent buildings are Mohammedan, save for one very early Hindu temple. Pop. (dist.) 79,700; (tn.) 32,000.

Bijawar, state of India in the agency of Bundelkhand. The tn. of B. is situated in 24° 37' N. lat., and 79° 31' E. long. The title of the chief, who is a Rajput of the Bundela clan, is maharaja. The state came under Brit. administration in 1901. Its area is 974 sq. m., and its pop. (1941) 120,990.

Bijbharu, or **Bijbahav**, tn. in the state of Kashmir, on the R. Jhelum. 25 m. S.E. of Srinagar.

Bijnaur, or **Bijnor**, tn. and dist. in the United Provs. of India, in the Rohilkand div. The tn., which is 3 m. from the l. b. of the Ganges, has a trade in sugar, and an Eng. high school for boys. Pop. 18,000. The area of the dist. is 1898 sq. m. Pop. 740,000.

Bika, see **CELE-SYRIA**.

Bikaner, state of India, in the Rajputana agency; area 23,315 sq. m. The pop., which was reduced by the famine of 1899-1901, was 584,000 in 1901, and by 1941 had increased to 1,293,000. The chief industries are camel-rearing and the carving of ivory and gold ornaments. Coal has been found in the dist. The tn. of B. manufs. carpets, blankets, and candy. The maharaja of B., Sir Ganga Singh, who succeeded to the throne in 1887 at the age of 8, was entrusted with full powers in 1898, and first visited England in 1902. He served in the First World War as staff-officer, in France and in Egypt, took part in the Peace Conference, and signed the treaty of Versailles. In 1917, at the second of the conferences of Indian princes inaugurated by Lord Chelmsford, the maharajah expressed a hope that the ruling princes would be considered in any general scheme of Indian reforms; and, when the Chamber of Princes was inaugurated, Feb. 1921, he was appointed its first chancellor, and so remained till 1926. He proved a most competent ruler of Bikaner. In his lifetime he made B. one of the leading states in India, his outstanding achievements being the introduction of large-scale irrigation works; changing his cap. from a medieval Indian tn. to a spacious modern city; and the grant of representative gov. He was the first Indian prince to be made a full general in the Brit. Army. In both world wars he offered all his state resources to the Crown. He d. in 1943.

Bikelas, Demetrius (1835-1908), Gk. poet. He drew his inspiration chiefly from the Klephtic songs, and he used the Epitrotic dialect. His poems are characterised by grace of style and imagination.

Bikh, Bish, or Vish (Hindu, poison), name given to the plant *Aconitum ferox*, which grows in the Himalayas and in Nepal; or, more specifically, to the fatal poison extracted from this plant.

BILBERRY

Bikrampur, anct. tn. of Dacca, Bengal, India; formerly the seat of gov. of the Hindu kings of Bengal, and an educational centre.

Bilara, tn. of India in Jodhpur, Rajputana, situated on the R. Luni.

Bilasapur, dist. in Central Provs., India, with an area of 7798 sq. m. The cap. is B., about 250 m. N.E. from Nagpur by rail. The products are rice, wheat, cotton, etc. Pop., tn. 24,000; dist. 1,232,000. The state of B., ruled by a raja, has an area of 453 sq. m. Pop. 110,000.

Bilbao, tn. of Spain, the cap. of the prov. of Biscay, on the navigable R. Nervion. The tn. lies in a plain a few m. from the sea encircled by mts. The picturesque old tn., with its churches and monasteries, is on the right of the riv., and is united to the new tn. on the left, with its broad business streets, parks, and squares by fine bridges. It possesses a Basque univ. and a commercial high school, chamber of commerce, museum, and learned societies. It owes its prosperity to the large deposits of iron-ore in the vicinity, of which about 5,000,000 tons are annually exported, mainly to Great Britain. Coal and coke are the prin. imports, as smelting is also carried on, and pig-iron exported in considerable quantities. Among the other industries are the manuf. of steel, tin-plate, chemicals, glass, and paper; shipbuilding is also carried on. The tn. has the largest dry dock in Spain, and in addition another dry dock and two graving docks. At the outbreak of the Sp. Civil war the Gov. held the B. area. In-urgent warships shelled the city on Aug. 1, 1936. When the Basques entered the war on the side of the Gov., Franco mined

the port of B. Pressure on the B. front, together with the loss of Malaga, led to the fall of the Caballero Gov. early in 1937, and later that year Franco's forces, after severe fighting, captured the city.

Bilberry (*Vaccinium myrtillus*), plant belonging to the Ericaceae, which is found on moors and hilly woodland dists. It has deciduous leaves and edible blue berries. Other names for it are whortleberry and blaeberry.

Bilbilis, anct. tn. of Spain, now called Calatayud (q.v.). In Rom. times it was celebrated for the manuf. of weapons, and had also baths, called Aquae Bilbilianae. In the time of the Rom. Empire it had Augusta added to its name.

Bilboes, tethers formerly used for offenders on board ship. This word and bilbo, a sword (both Shakespearean), were derived from the Sp. tn. Bilbao, or Bilboa, noted for its iron and steel.

Bilderdijk, Willem (1756-1831), Dutch poet, b. at Amsterdam. An accident in his youth compelled him to give himself up to study. He studied at Leyden, and after taking his doctorate in law degree at that univ., he started practice at The Hague. When, in 1795, the Fr. invaded Holland, he refused to submit to the new administration and quitted the country. After a visit to Germany, he took up his residence in London. Here he had a love affair with one of his pupils, Katharina Schweickhardt, whom he married in 1802, having divorced his first wife. This took place in Brunswick, and 4 years later his friends persuaded him to return to Holland. Here he was well received by Louis Napoleon, who made him his librarian. On the abdication of Louis B. fell into poverty, in which he d. He wrote nearly a hundred works, conspicuous for their command of language. His chief poetical works are *Het Buitenleven*, 1803; *De Ziekte der geleerden*, 1807; *De Ondergang der eerste wereld*, 1820.

Bile, a fluid secreted by the liver. Human B. is yellowish-brown or green in colour, is of a viscous nature, has a sp. gr. of 1010 (water = 1000), a bitter taste, an alkaline reaction, and a sickly odour. The quantity secreted by the liver averages 500-600 grains per 24 hours, but may amount to as much as 2400 grains. B. consists mainly of B. salts and B. pigments, with small quantities of fats, cholesterin and lecithin. The most important B. salts are sodium glycocholate and sodium taurocholate. The pigments are biliverdin, which is green in colour, and bilirubin, which is reddish. The former is most abundant in herbivorous animals, the latter in flesh-eaters, and the colour of the B. is determined by the relative proportions of these pigments. Both are waste products of the used-up haemoglobin in the blood, the iron from which is, however, retained for further use. B. is secreted from the blood by the liver; some of it is temporarily stored in the gall-bladder, while the remainder passes through the common B.-duct to the duodenum, the first part of the small intestine. B. in itself is not a digestive juice, but certain of its salts promote

greater activity in the pancreatic juices, and aid in the absorption of fats and fatty acids. The production of B. is practically continuous, but is stimulated by the processes of digestion. If by any means it is prevented from entering the intestine, digestion may proceed without much disturbance to health. If, however, excess of B. in the liver leads to its being reabsorbed by the blood, the condition known as jaundice is produced; the tissues are coloured yellowish by the B. pigments, and there is general derangement of the system. A *bilious attack* is only indirectly connected with B.; catarrh is set up by the ingestion of unsuitable or too abundant food, and sickness, headache, and giddiness result, with vomiting of food and bilious matter. Purified ox-bile has been used as an aperient and antiseptic. The B. of oxen which have d. of rinderpest has been injected in cattle in S. Africa for the prevention of that disease, and the B. of serpents is looked upon as a partial antidote to their poisons.

Bilge, see under SHIPS AND SHIP-BUILDING.

Bilgram, tn. in the United Provs., India. It is situated in the Oude prov., about 50 m. N.W. from Cawnpur. There are the ruins of a temple of Srinagar.

Bilharziasis (Bilharziosis, or Schistosomiasis), disease common in tropical and sub-tropical countries where unsanitary conditions prevail. Different forms occur, but all are due to a genus of flat worms, *Bilharzia*, named after Bilharz, who first discovered a species in 1851, in Cairo, and named it *Distomus hæmatobium* (later *Schistosoma* or *Bilharzia hæmatobium*). Another species (*S. japonica*) was found in China and Japan early in the twentieth century. B. was so prevalent in Africa and Asia that the Colonial Office appointed a commission (1913) to investigate the disease. The investigation was interrupted by the outbreak of war in 1914, but the infection of troops in Egypt stimulated research, and Leiper and other workers were able to trace the life hist. of the *Bilharzia*. In water, the eggs of *Bilharzia* develop into minute free-swimming larvae which infect snails. The infection is specific; each species of *Bilharzia* parasitises a particular species of snail, in which it forms spores. These develop into other free-swimming forms, cercariæ, which enter man either in drinking water or by getting on his skin during bathing, and boring their way in. They then bore through tissues until they reach the portal veins, where they remain until adult. The male coils round the female, and they migrate through the mesenteric veins until they reach the wall of the bladder. This the female *B. hæmatobium* pierces, causing the symptom hæmaturia, and lays her eggs which are evacuated with the urine. (Cercariæ can live for only 2 days, so water enclosed for this period may subsequently be used without danger of infection.) The eggs of *B. mansoni* are laid near the anus, and are expelled with the faeces. If only males of this species infect man they remain in the liver, for migration is only necessary to lay

eggs in a suitable place. In the early stages, B. may be cured by the injection of tartar emetic into the veins; the late stages of the disease are incurable. Recent research on the prevention of B. includes attempts to eliminate the snail, and to destroy cercariæ by the addition of compounds such as chloramine to contaminated water. See R. T. Leiper, *Researches on Egyptian Bilharziasis*, 1918; A. H. Hall, 'Bilharziasis in Iraq' (*Journal of the Royal Army Medical Corps*, vol. xlv., 1925).

Billary Calculi, see GALL-STONES.

Bilimbi, see BLIMBING.

Bilin, tn. in Czechoslovakia, 7 m. S.S.W. of Teplice. It has 2 castles, one having a collection of arms and minerals. B. exports alkaline mineral waters, and sugar is manufactured. Pop. 10,000.

Bilin, riv. in Burma. Its course lies between the Salween and the Sittang, for more than 280 m. It enters the gulf of Martaban. In the Second World War the inadequate Brit. defence force at Thaton fell back on the B. to escape piecemeal destruction at the hands of the Jap. on the Salween R. (Feb. 1942). After fierce and costly fighting for both sides the Brit. units fell back on the Sittang. (See BURMA, SECOND WORLD WAR, CAMPAIGNS IN.)

Biliousness, a condition characterised by loss of appetite, headache, lassitude, coated tongue, and constipation. It is popularly supposed to be due to over-secretion of bile, but is more probably occasioned by catarrh or other disturbances of the gastric regions.

Bill, or **Beak**, in natural hist., the term applied to the horny toothless jaws of birds. The foremost bones of the skull are elongated, and covered with a horny sheath or rhamphotheca; the same with the lower jaw, or mandible. No living birds have any teeth, but the earliest forms of birds, such as the archæopteryx, undoubtedly possessed some. The Tertiary Period appears to be the time when birds ceased to have teeth; traces can still be found in certain species. The bill is not usually sensitive, though in some aquatic birds, and in the woodpecker, it is much more sensitive than usual. The chief uses of the B. of a bird are for dividing food, for fighting, preening, nest-building, etc. It varies in shape in different species of birds, its conformation being adapted to the nature of its food and habits. Among peculiar beaks may be noticed the raptorial beak of birds of prey, the fissirostral beak of swallows, etc., the tenuirostral beak of sunbirds, etc.

Bill, legal term. In Eng. criminal law the accusation is drawn up in writing in the form of a 'B. of indictment,' which is presented to the grand jury, who, after hearing the witnesses on behalf of the prosecution, either find a 'true B.' i.e. are satisfied there is a *prima facie* case, or find 'no true B.' i.e. ignore the case. The B. of indictment so endorsed is presented to the court.

Bill-broker, name applied to one who deals with bills of exchange, receiving bills from merchants, foreign or other

banks, etc., and disposing of them for the best terms, and receives a commission on the transaction. But now the B. usually buys bills outright and sells them to banks and other buyers. He is financed by the banks by loans at call and short notice. He acts as prin. and not agent, and the name of broker does not strictly apply to him.

Bill Chamber, a dept. of the Court of Session in Scotland which deals with business of a summary nature, such as applications for interdict, etc. During the sitting of the Court of Session the B. C. is presided over by a single judge, called lord ordinary, who is the junior judge of the court. During the vacation the B. C. has many of the powers of the Court of Session, and is then presided over by the judges in rotation. It is so called because in former times summonses and executions were generally begun by a writ, called a bill, but since 1813 such a process is not necessary.

Billfish, see BONY PIKE.

Bill in Equity, or **Bill of Chancery**, formerly a statement in writing of a plaintiff's case, setting forth the grounds on which he claimed relief. It is now an obsolete form of pleading, and its place is taken by a writ and statement of claim.

Bill in Parliament, see PARLIAMENT.

Bill of Adventure, in maritime law, a writing signed by a shipmaster, merchant, or owner, declaring that merchandise shipped in his name are 'at the venture' of another, and his responsibility is limited to their safe delivery.

Bill of Costs, an itemised account setting forth in detail the work done and the charges and expenses paid by a solicitor on behalf of his client. By statute a solicitor must deliver a signed B. of C. to his client, and may sue if not paid within a month.

Bill of Exchange, a form of credit instrument of practically universal commercial use, and governed by laws and regulations which, with certain differences, are identical in all countries. In the United Kingdom, the law, founded on mercantile custom, judicial decisions, and separate statutes, was codified in the Bills of Exchange Act, 1882, which has been adopted by Brit. overseas dominions and colonies and agrees in the main with the law of the U.S.A. The original form from which the B. of E. developed was a simple means by which money could be paid in a distant place without sending cash; thus A living at X owes money to C living at Y; D also living at Y owes a debt to A; therefore A sends to C an order to D to pay the money to C; or suppose A sells to D goods on credit, but his business requires ready money; if he can get D's acknowledgment, and his credit is good, he can raise money now on D's promise to pay cash later for a consideration from a third party; thus arises the discounting of bills; D is going to pay A in 3 months for goods shipped, £100; C will lend A the money now at 4 per cent; he therefore will give £99 and collect £100 from D when the time expires. Various forms of such means of transacting commercial business

were no doubt in use in early times, but the B. of E., as a negotiable instrument, was evolved, it is said, by the Florentine Jews in the thirteenth century, and was in use generally in commercial Europe by the fourteenth century. There are 2 classes of bills, 'inland' bills, covering transactions in one country only, and 'foreign' bills, which are drawn in one country and payable in another. Bills may also be classified as good 'trade bills' where the transaction is based on produce or goods sold and coming into the market; such bills are said to pay themselves, and form the best kind of security for advances made on them; other bills, which are drawn on securities or on credit, are called 'finance' bills; lastly, there are 'accommodation' bills, or 'kites,' where no valuable consideration passes between the parties to the bill. By the Bills of Exchange Act, sec. 3, a B. of E. is defined as 'an unconditional order in writing, addressed by one person to another, signed by the person giving it, requiring the person to whom it is addressed to pay on demand or at a fixed or determinable future time a sum certain in money, to, or to the order of, a specified person, or to bearer.' Thus a cheque (*q.v.*) is a B. of E. drawn on a bank payable on demand. (It may be noted here that bills payable on demand, i.e. cheques, must have a twopenny stamp on them; other bills must be stamped *ad valorem*; the rates can be found in any almanac, postal guide, etc.). An example of a simple inland B. of E. will elucidate the definition:

£100

LONDON, 1st Nov. 1922.

Three months after date pay to the order of Mr. S. Robinson the sum of one hundred pounds, for value received.

SMITH & Co.

To Messrs. JONES & Co., Glasgow.

The last words, 'for value received,' are not legally necessary, as the law presumes that the bill was given for valuable consideration. Here Smith & Co. are the 'drawers,' Jones & Co. the 'drawees,' who on signing their name across the front of the bill become 'acceptors.' Robinson is the 'payee.' By accepting the bill Jones & Co. become the persons primarily liable on the bill. The acceptor may qualify the bill by attaching conditions, e.g. delivery of bills of lading, or making it payable at a certain place, such as his bank. When the bill falls due, that is, on Feb. 1, 1923, with 3 days' grace, it is presented to the acceptors for payment; if it is not accepted or not met by payment at maturity the bill is 'dishonoured,' and the holder must give notice at once to the drawer and any other persons who have indorsed the bill, from whom he can then claim payment. If the bill is a 'foreign' bill it must be 'protested' by a notary public on the day of dishonour. A bill dishonoured by non-acceptance, can be accepted by another 'for honour supra protest,' if for non-payment, can be paid 'supra protest'; the new acceptor and payee having rights against the party for whose honour he has accepted or paid. A

B. of E. is a negotiable instrument, the property in which passes, like money, by delivery, if the bill is made payable to bearer; if payable to order then it must be endorsed. In the example given above, the bill is made payable to the order of S. Robinson; if he wishes to transfer the bill he writes his name on the back. An endorsement in blank makes the bill payable to bearer; a special endorsement makes it payable to a specially named person's order, who to transfer the bill must again endorse it, and so on. A bill can, and often does, pass through a number of hands before it is discharged by presentation to the acceptor and payment by him, and the greater part of the law relates to the rights and liabilities between the various parties through whom it has passed. The person to whom a negotiable instrument is transferred by endorsement or delivery can sue in his own name, and if he is a 'holder in due course,' takes the bill free from all defects of title. To be a 'holder in due course' he must have given value for the bill, the bill must not be overdue or known to be dishonoured, and he must take the bill honestly and without notice of a defect in title, such as fraud, etc. See M. D. Chalmers, *Digest of the Law of Bills of Exchange*; Byles, *Bills of Exchange*; also J. A. Slater, *Bills, Cheques, and Notes* (for general readers).

Bill of Exchequer, or Exchequer Bill, a form of security on which the Brit. Gov. borrows money for the public service, under parl. authority. They were first issued in 1696. They used to be issued annually, and bore daily interest till 1861. They were current for 5 years, and renewable, and the rate of interest, fixed half-yearly, varied with the money market. They became extinct in 1897, and have been superseded by treasury bills, issued for a maximum period of 12 months, and exchequer bonds, issued for a specific period, and with a fixed rate of interest.

Bill of Health, a document given to the master of a ship when clearing from a port, by the consul or other port authority; it shows the sanitary condition and health of the port; where there is no infectious or contagious disease existing, it is a 'clean bill'; if disease is thought possible, it is a 'suspected' or 'touched'; if it actually exists, it is a 'foul bill.' Bs. of H. are necessary when the next port of call is one where the ship may be quarantined if there be no clean bill.

Bill of Lading, a document signed by the master of a ship or an agent of the owner, acknowledging that goods have been received on board, and stating the terms on which they are to be carried. The B. of L. serves as a receipt for the goods shipped on board, as the memorandum of a contract between the owner of the ship and the shipper of the goods, and as a document of title to the goods, and if, as is usual, the goods are deliverable to the consignee's 'order or assigns,' the B. of L. becomes a negotiable instrument, transferring by endorsement the rights to the goods and the various liabilities and rights of the contract. There are various

forms of Bs. of L., but they all contain the names of the shipper, of the ship, the port where the goods are loaded and the destination, the description of the goods, place of delivery, name of consignee, freight, the excepted perils, and shipowner's lien. With regard to the more important of these items, it should be noted that it is implied that there should be no deviation from the route of the voyage, and the shipowner is liable for loss or damage due to such deviation, except to save life but not property. It is usual, however, to insert in the B. of L. specified 'liberties'; the quantities and condition of the goods at the time of shipment must be described, as the contract is to deliver that quantity in the same condition. A 'clean bill' is one where the goods are not described with qualifying words, such as 'cases one or three in damaged condition,' or the like. The contract is to deliver at a certain place; the shipowner is liable if he does not do so, unless his failure is due to one of the perils excepted, or if, for example, war has closed the port. The B. of L. generally contains the name of the consignee to whom the goods are to be delivered, and usually adds to his 'order or assigns.' He can then transfer his rights and liabilities to a third person by endorsing his name and delivering the document. The bill thus becomes a negotiable instrument, and can be re-endorsed. On payment of freight the endorsee receives delivery of the goods. The amount of freight is either stated in the B. of L., or reference is made to the terms of the charter-party. The 'excepted perils' are those causes of loss or damage which exempt the shipowner from liability. The common law exemptions were 'act of God,' i.e. every act in which man has no part; and the act of the 'king's enemies,' i.e. from war. The shipowner is presumed to undertake absolutely that the ship is seaworthy, and that all reasonable care will be taken by his servants and agents. It may be noted that by Eng. law a shipowner may make any exceptions, but in the U.S.A. an Act of 1893 forbids the insertion of terms exempting the owner from liability for loss through his servants' negligence. Finally, the shipowner has a lien on the goods for freight by common law, and by the terms of the B. of L., usually for demurrage. See Scrutton, *Charter Parties and Bills of Lading*, 1925; T. G. Carver, *Carriage of Goods by Sea*, 1925.

Bill of Mortality, weekly statement, formerly issued by the par. clerks, showing the number of deaths and the causes that had occurred in each par. based on the reports of 'searchers.' They are said to date from 1538, when par. registers were estab. They were regularised in 1603, and continued till the Births and Deaths Registration Act, 1836, was passed. The age of the persons dying was not inserted till 1728, from which dates the science of life insurance.

Bill of Rights, the name commonly given to the Act declaring the rights and liberties of the subject, and settling the succession of the crown, 1689, which

embodied the Declaration of Right drawn up by a committee of the Commons and presented to William, prince of Orange, and his wife, afterwards William III. and Queen Mary. After declaring the crown vacant by the abdication of James II., the following acts are declared illegal: the suspending or execution of laws by royal authority without consent of Parliament; the power to dispense with laws; the establishment of courts, such as the commission for eccles. causes; the levying money by prerogation without consent of Parliament; the raising or keeping of a standing army in time of peace within the kingdom without such consent. The right to petition the king, the freedom of parl. elections, the freedom of speech in debates, and the necessity for frequent parliaments are asserted. The rest of the act is concerned with the settlement of the crown, to be superseded by the Act of Settlement, 1701. The B. of R. is the nearest approach to a written constitution which the United Kingdom possesses. Its provisions, so far as applicable, were embodied in the U.S.A. constitution.

Bill of Sale, a form of legal document, by which the grant or transfers to another (the grantee) the ownership, while retaining the actual possession, of personal chattels, such as goods, furniture, and other articles capable of transfer by delivery, including fixtures and growing crops, when assigned and charged separately from the building or land to which they are attached. The law on Bs. of S. is to be found chiefly in the prin. Act of 1878 and the amending Act of 1882. The objects of these Acts are widely different. The enactments prior to 1882 were designed to protect creditors and to prevent their rights being affected by secret assurances of goods which were permitted to remain in the ostensible possession of a person who had parted with the property in them. The Bs. of S. were therefore made void only as against creditors or their representatives, but as between the parties to them, they were perfectly valid. The Act of 1882 was designed for the altogether different purpose of preventing needy persons being induced to sign complicated documents which they might be unable to understand, and being subjected by their creditors to the enforcement of harsh and unreasonable terms; hence, a form was presented to which the Bs. of S. were to conform. Bs. of S. may be *absolute*, where the chattels are sold absolutely; they must be attested by a solicitor; the regulations as to such Bs. of S. are laid down in the Bills of Sale Act, 1878; non-compliance does not void the B. of S. as between the parties, but only as against the trustee in bankruptcy and execution creditors of the grantor. More important are the second class, Bs. of S. *by way of security for the payment of money*; they must be made in accordance with the form given in the Bills of Sale Act, 1882; which can only be departed from in verbal differences. The bill must be by deed, must contain the names and addresses of the borrower and the lender of the money for which it is security; the amount lent,

and the interest; the assignment as security of the chattels, of which an inventory must be attached; the time when the money lent, and interest, will be repaid; a covenant to insure the goods and pay all rent, rates, and taxes due on the premises where they are. The lender stipulates that the goods will not be seized except for the reasons set out in sec. 7, viz.: (1) Default in payment and covenants; (2) Bankruptcy or distraint for rates, rent, or taxes; (3) Fraudulent removal of the goods; (4) Unreasonable refusal to produce last receipts for rates, etc.; (5) Execution under a judgment. A B. of S. must be witnessed and stamped in accordance with the scale, and registered within 7 days of its execution. As trade protection societies pub. all such registrations, a B. of S. damages a grantor's credit. All Bs. of S. not complying with the regulations of the Act are void. There are no Bills of Sale in Scotland. See H. Reed, *Bills of Sale Acts* (14th ed.), 1926; Pitman's *Bankruptcy and Bills of Sale* (ed. W. V. Ball), 1921.

Bill of Light, a document given by an importer of goods to a customs officer, containing as good a description as possible of the goods, when a full description cannot be given. The goods can then be landed, but the full description must be given within 3 days.

Bill of Store, a permit granted by the customs house to reimport Brit. goods without payment of duty such as would have been imposed had they been foreign goods. It must be within 5 years of exportation.

Bill of Victualling, or **Victualling Bill**, an order to the master of a vessel by a custom-house officer for the withdrawal from bond or for drawback of such stores as are necessary for the crew and passengers. Stores not on the bill or if landed in the United Kingdom without authority, are liable to be forfeited and destroyed.

Billancourt, see BOULOGNE-BILLANCOURT.

Billardiera, or **Appleberry**, a genus of plants belonging to the order Pittosporaceæ. It is found in Australia, but some species of it are cultivated in Eng. glasshouses. It bears a fruit which, when ripe, is generally somewhat bluish in colour, and which possesses a strong resinous flavour. The Tasmanian *B. longiflora* is grown out of doors in this country, for the decorative value of its fruits.

Billaud-Varenne, Jean-Nicolas (1756-1819), Fr. revolutionary, the son of an advocate, b. at La Rochelle. His early home influences were bad, his parents being both of weak character. He joined a religious society when he was 19, but did not bind himself by vows; he worked instead at literature. In 1785 he went to Paris, and shortly afterwards married and became an advocate in the parlement. Political matters then absorbed his whole attention, and in 1789 he pub. a 3-vol. work on the subject, *Despotisme des ministres de la France*. From that time he became an acknowledged revolutionist. In 1791 he pub. *L'acéphalocratie*, for which he was obliged to

hide for a time. In 1792 he was elected deputy-commissioner of the National Convention. He worked for the abolition of monarchy. When the trial of Louis XVI. took place, he voted for 'death within twenty-four hours.' He was prominent in the overthrow of the Girondists in 1795, and in the same year he was made president of the Convention, and member of the Committee of Public Safety. Soon after this he was arrested, and banished to Cayenne. He refused the pardon offered him by Bonaparte, and in 1816 took refuge in St. Domingo, where he d.

Billbergia, a genus of perennial plants belonging to the order Bromeliaceae. They are chiefly found in Brazil, but also in S. America generally, and have stiff channelled leaves and tubular flowers of various colours.

Bille, Steen Andersen (1797-1883), Dan. admiral. He served in the Fr. marine during the campaign of 1823, was made rear-admiral and minister of the marine in Denmark, commanded an expedition round the world, and wrote an account of it.

Billericay, mrkt. tn. in Essex, Eng., 5 m. E. of Brentwood (Middlesex). Its old church has a tower which is considered one of the finest examples of brick architecture extant. Brickmaking is the local industry. Pop. 1500.

Billet, in architecture, a style of ornamentation, belonging to the Norman period, of which the distinctive feature is the rounded arch. The B. was formed by cutting a round moulding into notches, so that the remaining parts had the appearance of small logs. In the transitional period the B. moulding disappeared.

Billet, in heraldry, a bearing of the shape of a rectangle placed on end. Although Bs. are common in armorial bearings, their representation is uncertain. Some suppose them to represent bricks, and others letters. 'Billety' signifies that the charge is uniformly covered with Bs. The best-known instance of this is, no doubt, the coat borne on an escutcheon over the arms of England during the reign of William and Mary. See also HERALDRY.

Billeting, or **Cantoning**, as it is called, is a means of lodging officers and soldiers among the inhab. of a dist. Since the Army Act of 1881 B. is limited to the extent that only public-house proprietors, inn- and hotel-keepers are liable to have soldiers quartered on them, and keepers of livery stables to tend their horses. If the keeper of the house is unable to provide room, he is obliged to obtain accommodation in the vicinity. In 1909 'public buildings, dwelling-houses, warehouses, barns, and stables' were included in the official list of possible billets. During the two world wars B. became an obvious necessity, both in home tns. near the training centres and also in the tns. and vils. in the war area. In time of peace B. is only resorted to in England when the military is called out to assist the civil authority. The amount which is to be refunded to a householder to defray the cost of feeding one or more

soldiers is laid down in army regulations. B., however, may consist only of board without food, and in this event no compensation is allowed. The householder is compelled to afford shelter, but not necessarily to supply beds. In the U.S.A. the consent of the householder is a *sine qua non* in time of peace, and B. in wartime is regulated by legislation. In continental countries, however, B. prevails to a greater degree; no fewer than 8 or 9 men and 3 or 4 horses may be quartered on one private house during army manoeuvres. The sustenance for men and horses is provided by the commissariat.

From earliest times, when the monasteries afforded hospitality to soldiers, the system of B. has been in vogue. Natural and cordial resentment has invariably been aroused by these arbitrary proceedings, and the third article of the Petition of Right, passed in 1628, bound the king 'not to billet soldiers on private individuals.'

Billiards (probably from O.F. *billard*, a stick with a curved end), an indoor game of skill. It is not definitely known whether B. originated in France or England, and it is more than doubtful if the game seen by Anacharsis in his travels through Greece in 400 B.C. really had any analogy to even the most primitive form of the modern pastime. Among Eng. writers it is mentioned by Spenser in *Mother Hubbard's Tale*, 1591, and Shakespeare in *Antony and Cleopatra* (1607). Ben Jonson draws a simile from the game in praise of Chloris; Locke uses it to illustrate a passage in his famous *Essay Concerning Human Understanding*; Gayton in his notes to the 1654 ed. of *Don Quixote* refers to B. as being played in taverns; and Charles Cotton in *The Compleat Gamester* (1674) states that in England 'there are few towns of note . . . which hath not a public billiard table,' and proceeds to a description of the game and the rules then in force. Louis XIV. was an enthusiastic player, and in Louis XV.'s time the game had become popular with both the male and female members of the Fr. court. Early in the nineteenth century, the introduction of the cue (a flat-headed mace had previously been used), to which later a leathern tip was affixed, and the use of chalk which made possible the side-stroke, caused a revolution in the science of billiards. These were followed some years after by the substitution of slate beds for the former ones of oak and marble; and in 1835 india-rubber cushions for those of flock and list; these were later improved by being constructed of a composition manufactured for the purpose, which is impervious to variations in temp. Under these conditions, professionals, like John Roberts, Junior, Cook, Peall, Diggle, Reece, Dawson, Stevenson, Inman, and also the more recent champions, T. Newman, J. Davis, W. Smith, and W. Lindrum, have brought the game to such mathematical exactitude that the B. authorities have had to frame, from time to time, fresh rules in order to vary the monotony of certain shots. Up to 1919

B. was governed by the B. Association (founded 1885) and by the B. Control Club (founded 1903), but there was confusion between the rules formulated by each body. In 1919 an amalgamation took place under the title of the B. Association and Control Council, with the earl of Lonsdale as president. Since that time a great number of associations in all parts of the world have become affiliated to the Control Council. The first business of the council was to draw up a single code of rules, which has remained in force with only 2 revisions. In 1925 the council introduced a rule limiting consecutive hazards to 25 in order to prevent exploitation of the red-ball game. In the 1926 championship Reece first discovered the 'pendulum' stroke, and he was able to run up a record break of 1151, made mostly from 568 consecutive cannons. To avoid the future exploitation of the cannon sequence, an amendment to the rules was made limiting consecutive direct cannons to 35. A direct cannon is defined as being any cannon other than that made by the cue-ball striking the cushion after making contact with the first ball, and before making contact with the second. One of the most popular moves of the Control Council was to institute a Brit. Empire amateur B. championship in 1926. In 1929 interest in B. centred on C. McConachy, New Zealand champion, and the brothers Lindrum, who came on a tour to England. They were, however, not allowed to enter for the Eng. championship, but with the exception of F. Lindrum, the Australian champion, who was indisposed in England, they gave some remarkable performances. W. Lindrum scored 32 four-figure breaks during the tour, one being the record break of 3262. In 1932 he estab. a new record with a break of 4137. On Jan. 14, 1930, he met Joe Davis, the Eng. champion, and after a fortnight's play scored 29,056 points against Davis's 26,172. Davis maintained his position as Eng. champion, defeating Newman in 1938 and again in 1939, with a walk-over in 1946.

B. proper is divided into 2 distinct kinds: the Eng. game, as played, on a table with 6 pockets, in Great Britain and her dependencies all over the world; and the Fr. form, played, on a pocketless table, in the prin. European cities and in America.

English Billiards. The table consists of a mahogany or other hard wood frame, standing upon 6 legs sufficiently strong to support the massive weight of 5 slate slabs each measuring 2½ ft. by 6 ft. 1½ in., which, when proved by the aid of a spirit-level to be absolutely true all over, are covered with a green cloth of fine texture, and form the bed, at a height of 2 ft. 8 in. from the floor. The playing surface is bounded by cushions, covered with the same material, with openings at each corner and in the centre of its 2 sides (making 6 in all) to allow of the balls dropping into the hanging pockets. The surface of the table is marked out as follows: a baulk line is drawn 29 in. from the face of the bottom cushion and parallel

to it; the intervening space being termed the baulk. A semicircle, called the D, is described in baulk, striking from the baulk line with a radius of 11½ in. Spots, of black court plaster, are placed (on an imaginary line down the centre of the table) at 12½ in. from the face of the top cushion (the spot), another half way between the middle pockets (centre spot), and a third midway between the centre spot and the top cushion. Also spots are commonly placed on the baulk-line, at its exact centre, and at the intersecting ends of the D. Cues are made of old and seasoned wood, ash being generally used. They vary in weight from 14 oz. to 18 oz. or more. The striking end, on which is the leathern tip, is from 7½ to 8 in. in diameter. The length is about 4 ft. 9 in., but it varies according to the build and fancy of the user. The butt end is about 1½ in. and is often spliced with some heavier wood to give balance. Three balls are used, a red and 2 white, one of the latter being distinguished by a spot for easy identification throughout a game; hence one player is 'spot' and the other 'plain.' They should measure 2½ in. in diameter, and are either cut out of ivory, or made from compositions known respectively as bonzoline and crystalate. Two other implements are sometimes requisitioned, the half butt and the butt, for playing a ball when at an inconvenient distance from the striker. Points are scored either by the cannon; the cue (striker's) ball touching both object balls in its course; or by the losing and winning hazard. The losing hazard is made by the cue ball striking one of the object balls and going off into a pocket; the winning hazard consists in pocketing one of the object balls by striking the cue ball against it. The cannon counts 2; going in off, or pocketing, the white ball, 2; the red, 3. It is also possible to make combinations of these scores from one shot. The usual amateur game is '100 up.' A game is most frequently contested by 2 persons, but four-handed ones are sometimes played. A player continues until he fails to score, when he makes way for his opponent, and his 'break' is ended.

English Pool and Pyramids. The ordinary pool game consists of 2 or more players, each playing with a different-coloured ball in the following order: white, red, yellow, green, brown, blue, pink, spot-white, spot-red, spot-yellow, spot-green, and spot-brown. Each participant in the pool endeavours to 'pot' or pocket his opponent's ball, the one 'potted' losing a 'life' which usually possesses a monetary value, generally one-third that of the entrance to the pool. The game is commenced by a white going on the top spot, red playing upon it from baulk; the others playing upon each other in the order indicated. Pyramids consists of 15 red balls placed at the top end of the table in the form of a triangle, and is played by 2 players using the same white cue ball alternately. He who pots the most balls wins the game. It is usual to receive so much for each ball potted, double on the last one, and a stake on the

game. When more than 2 persons compete, it is designated 'shell-out.' Other varieties of pool are Snooker, Russian, Black, Skittle, Pin, Cork, and Indian Pool. The last-named is the only Eng. variety into which cannon play enters.

Snooker is played by 2 players, or 4 players in 2 partnerships, with 15 red and 6 coloured balls and the striking ball, white. The red is first potted, and this

form of B. is played upon a pocketless table, 9 ft. by 4½ ft., or for championship games, 10 ft. by 5 ft. and is confined strictly to cannon-play, or, as it is usually termed, carom, from the Fr. name, *carambolage*. Three balls are used, one red and two white, which are larger and heavier than those used in Eng. B. and the cues more powerful. The somewhat coarser nap of the cloth causes the balls to

THE BILLIARD TABLE

Left, spots and markings for billiards; right, arrangement of balls for snooker

entitles the player to pot any coloured ball, which is returned to its specific spot on the table. This procedure is followed, red and coloured alternately, until all reds are potted, leaving on the table only the coloured balls which are then potted in the following order, and with the scoring values shown: yellow (2), green (3), brown (4), blue (5), pink (6), black (7). The same values count for colours potted in the first part of the game, reds gaining 1 point each. An amateur championship of snooker was inaugurated by the B. Association in 1916 and a professional championship by the Control Council in 1927. The rules of snooker were revised in 1920 and again in 1926.

French and American Billiards. This

run slower, and they being, as stated, larger and heavier, more 'work' can be got upon them. Every type of game played on the pocketless table is commenced by placing the red ball upon a spot near the top cushion, and the 2 whites occupy parallel positions at stated points spotted within the lower half. The cue ball, in opening a game, must be played at the red, the endeavour of the striker being to bring the balls together so as to control them in a sequence of cannons. Each cannon counts one, and the player continues his break until he fails to score. The proficiency acquired by professionals like Vignaux on the continent and Slosson and Frank Ives in America caused the authorities controlling Fr. B., especially

in America, to devise restrictions in order to keep down the enormous sequences of cannons. Thus the game has become divided into 3 varieties: the plain cannon game, the corners lined off and the push stroke barred, and the baulk-line game, which latter can be varied according to the fancy of the players. An offshoot of the game proper is the three-cushion-cannon type; the cue ball having to strike 3 or more cushions before it can cannon on to the second object ball.

American Pool. Amer. or 15-ball pool is played upon the ordinary 6-pocket table, and the 15 balls, each bearing a number, are set after the manner in Eng. pyramids; a deep red ball (the one marked with the highest number—15) is placed upon the pyramid spot and forms the apex of the triangle pointing towards the baulk end of the table. The player endeavours to pocket as many of the object balls as possible with the white cue ball. The figures marked on each ball count towards the score, so it is a most important point to know the exact situation of the balls bearing the highest numbers. The player with the highest aggregate, after the last ball is potted, wins. Another form of this game is known as Continuous Pool—the one who first reaches 100 being the winner. Each time the whole of the balls are potted they are reset upon the table as for a fresh game, and play continues until one of the participants has scored the desired 100. Other varieties played in the States are Chicago and Bottle Pool.

Among the leading exponents of the game in Great Britain have been J. Roberts, W. Cook, Mitchell, C. Dawson, Diggle, Stevenson, Melbourne, Inman, Reece, Davis, Willie Smith, T. Newman, and H. Lindrum.

Billings, a city and the cap. of Yellowstone co., Montana, U.S.A., on the N. Pacific railway. It is noted for sheep and cattle raising. Pop. 23,200.

Billings, Josh, see SHAW, HENRY WHEELER.

Billings, Robert William (1813-74), Eng. architect and author, b. in London. He became a pupil of John Britton, a topographical draughtsman, when he was 13, and during the 7 years of his apprenticeship he developed a taste for illustration. In 1837 he illustrated a *History and Description of St. Paul's Cathedral*. In 1839 he illustrated Mackenzie's *Churches of London*, also assisted Sir Jeffry Wyattville with drawings of Windsor Castle. His greatest achievement was his work *Baronial and Ecclesiastical Antiquities of Scotland*. He directed the restoration of the chapel at Edinburgh Castle, and the Douglas room in Stirling Castle.

Billingsgate, a fish market in London, situated on the banks of the Thames, close to London Bridge, and to the W. of the

Custom House. It was opened in 1558 as a landing-stage for provisions, and was estab. in 1699 as a free and open fish market. It was rebuilt in 1852, and again in 1874. The name of B. has long been a synonym for abusive language.

Billingham, urban dist. of Durham, England, on the Tees, almost opposite Middlesbrough, with pop. of 21,000. It has large iron and steel works, besides the works of the Metal Oxygen Company, and other works belonging to Imperial Chemical Industries, the beginnings of which were gov. factories set up during the First World War when the place was only a vil.

Billington (née Wechsol), Elizabeth (c. 1768-1813), Eng. singer, b. in Soho, London. She was the daughter of a Ger. musician, from whom she received her first musical training. She was a child of 8 years when she made her first appearance as a pianist at the Haymarket. She commenced her singing career when she was 14, and about 2 years after she secretly married her singing-master, a Mr. B. The couple went to live in Dublin, and it was there that she made her début in opera, taking the part of Euryclea. In 1786 she returned to London and accepted an engagement at Covent Garden, at a salary unheard of at that time. Reigning favourite in London (1786-94), and on the Continent (1794-96), and in London again (1796-1811).

Billion Dollar Congress, the 51st Congress of the U.S.A. which came into power immediately after the passing of the McKinley Tariff Act of 1890 and was popularly so called because it appropriated roughly a total amount of a billion (thousand million) dollars during its 2 sessions to meet the excessive increase in national expenditure consequent on Republican legislation.

Billiton, is, belonging to the Netherlands E. Indies, situated between Borneo and Banca. It is about 53 m. long, 44 m. broad, and in area 1800 sq. m. Its coast is fringed with coral reefs and rocks, which render it difficult of access. It is marshy and sandy, but the interior is somewhat hilly, being at an altitude of nearly 3000 ft. The is. is noted for its tin mines, numbering over 80. The exports are rice, sago, nuts, gum, tortoise-shell, etc. Pandang is the chief t.n., and Tandjong is the harbour. Pop. 75,000, of whom a quarter are Chinese immigrants.

Billon, a Ger. coin-alloy of copper and silver, and in which the base metal greatly predominates. Usually one part of gold or silver to three of copper.

Billot, Jean Baptiste (1828-1907), Fr. general. He served with great distinction in Algeria until he was recalled to take command of the 18th Corps d'Armée on the outbreak of the Franco-Prussian war. He was elected a life senator in 1875, and was minister of war in the de Freycinet Cabinet.

Billroth, Theodor (1829-94), Ger. surgeon, b. at Bergen. He took his doctor's degree at Berlin, but his chief work was done in Vienna. During the Franco-German war he served voluntarily in the

military hospitals, and his work there, together with a famous speech on the war budget, made him instrumental in bringing about sev. reforms in the transport and treatment of the wounded. He wrote *Allgemeine chirurgische Pathologie und Therapie*.

Bilma, an oasis in Sahara on the route from Tripoli to Kuka. It is noted for its salt mines.

Bilney, Thomas, Eng. preacher and martyr, b. probably near Norwich about 1495. His education took place at Trinity College, Cambridge, and his ordination in 1519. He preached against formalism, and the worship of saints and relics; and his saintly influence caused such men as Latimer and Matthew Parker to be won over. In 1525 he was licensed to preach in the Ely diocese, and, while orthodox in the main, accepting the pope's authority, he still denounced the saint and relic worship. In 1527 he was tried by Wolsey as a heretic, and was imprisoned for a year in the Tower. He again began his preaching, but was once more condemned. He was burned at the stake in Norwich, 1531.

Biloculina, name given by d'Orbigny to a genus of minute protozoans of the family Miliolidae and order Testacea. They are marine animals. B., in geology, are a genus of Foraminifera which are found in the tertiary deposits of the North Sea.

Biloxi, city in Harrison co., Mississippi, U.S.A. It is on a branch line of the Louisville and Nashville railway, and is a summer and winter resort for the residents of Mobile and New Orleans. It does a trade in packing and shipping fruit, vegetables, and oysters. Pop. 17,400.

Bilsthorpe, a vil. of Nottingham, England, in Sherwood Forest. Coal is worked here.

Bilston, tn. of Staffordshire, England. It is 3 or 4 m. from Wolverhampton, and is one of the iron-smelting centres. There are considerable manufs., which consist of heavy iron goods—bars, machinery, engines, bedsteads, iron and brass castings, wire, etc.—tin, enamelled goods, japanned ware, and pottery. A hard stone is found in the neighbourhood which is utilised for grindstones, and also a fine sand for casting, is obtained. Pop. 31,000.

Bima, seaport, and the cap. of the is. Sumbawa, belonging to the Netherlands E. Indies. The is. is specially renowned for its teak forests and tamarinds. The exports are timber and horses.

Bimbia, a riv. of W. Africa, which enters the bight of Biafra, to the W. of the Kamerun R. It is known in its upper course as the Mungo R.

Bimetalism, the employment of both silver and gold coins as standard money or legal tender. The use of coins of both metals, as issued in the United Kingdom in 1946, pending issue of cupro-nickel currency, does not constitute B., if the standard is gold, and the silver and bronze coins merely tokens. That is to say, the value of the silver in 20 shillings is by no means equal to the value of a sovereign;

the silver coins are minted for convenience in dealing with small amounts. The distinction is marked by silver not being altogether convertible, as it is not legal tender for amounts over 40 shillings, and, on the other hand, silver may not be taken to the mint and freely converted into coinage. When gold and silver are both standard money, more or less freely convertible, a competition is set up which has disturbing effects on trade. Let it be supposed that by reason of new discoveries of metal the relative abundance of silver suddenly becomes greater. As metal it becomes cheaper, it is freely offered for minting, and the value of other commodities, including gold, increases; because abundance of money invariably means a rise in prices generally. Gresham's law, which may be shortly stated as 'bad money drives out good,' now comes into operation. Gold will be used in dealing with other countries where the gold standard only is maintained, and is thus driven out of the country. It has been observed that quite a small decrease in the relative price of silver is sufficient to encourage its importation in large quantities into countries where it is recognised as legal tender, that is to say, where the amount of gold or other commodities to be obtained for it is greater in value than in non-silver-standard countries. It is obvious, therefore, that the only way of preventing a large and disturbing transportation of one element of a double coinage is an agreement, internationally, to recognise both metals in the same ratio of value. This, then, is what the advocates of B. desired. It was hoped that if all the commercially important countries agreed to fix the ratio of the value of gold and silver at 15½ to 1, it would be possible to maintain that ratio by regulating the demand, i.e. by increasing or decreasing the coinage of gold or silver, and so stimulating or discouraging supply. The advantages claimed for a fixed ratio are greater stability in value of commodities generally, since there is likely to be a compensatory supply of one metal if the production of the other diminishes; the avoidance of depending on one metal, the supply of which may not be equal to the work required to be done; and the possibility of establishing a world currency, with consequent advantages to commerce universally. The great weakness of the case for B. has been the difficulty of establishing and guaranteeing the permanency of the desired fixed ratio. The influence of many important countries in adjusting the supply and demand of the precious metals would no doubt be enormous, but the conflicting interests of different countries would create difficulties as to the manner in which that influence should be exerted. This is well illustrated by the conditions which led to the bimetallic controversy. Between 1848 and 1860 great discoveries of gold took place in California and Australia. France, America, and the prin. European countries except Britain had a double coinage standard, and gold was minted in large quantities, a large amount of silver

being exported to India and other countries having a silver standard only. After 1870 the production of gold diminished, and that of silver increased enormously. The consequence was a general rush to mint silver and the operation of Gresham's law in causing the exportation of gold. An attempt to restrict the coinage of silver threw it on the market as metal, and caused a further fall in price. The Indian Gov., as large holders of silver, and the silver producers of America, thus suffered considerable loss. A great agitation now sprang up, chiefly in America, to bring about an international agreement to fix a ratio and make a double standard universal. Money conferences were held in Paris in 1878 and 1881, but without effect. Through the efforts of the U.S.A., another conference was held at Brussels in 1892, but the opposition of Britain and Germany again prevented the establishment of a silver standard. An attempt was then made in America to establish a bimetallic standard for that country independently of Europe, and the presidential elections of 1896 and 1900 were fought mainly on that issue. The Gold Standard Act of 1900, however, placed the country on a monometallic gold standard. By 1914 a gold standard was universal in all countries except China, which maintained a silver standard. The general adoption of gold dates back to the depreciation of silver after 1873. In this year Germany reorganised her currency on a gold basis, and by selling silver and buying gold on a large scale so affected the bimetallic countries of the Lat. Union that they suspended the free coinage of silver in order to protect their stock of gold. They were thus forced into a regime of incomplete or 'limping' B., which hardly differs in practice from the monometallic gold standard. Experience has shown that the 2 systems cannot exist side by side, for the bimetallic country suffers a depletion alternately of the metal, of which the monometallic countries are most in need, and receives in exchange the unwanted metal. The theoretic bimetallics, however, had hoped for an international agreement establishing the free coinage of both gold and silver in all civilised countries. In the first half of the nineteenth century, when B. was confined to France and a few other countries, a ratio of 1 to 15½ was maintained between gold and silver. This ratio successfully withstood the gold discoveries of 1850 and the increased ann. output, but Germany's demand for fifty millions in gold after the Franco-Prussian war decided the fate of B. At the Genoa Conference in Apr. 1922 it was decided that all countries must stabilise their currencies on a gold basis. To-day all countries have only one standard, usually gold. The idea of B. was revived, though, in a somewhat different form from the nineteenth-century agitation in America, during the economic crisis of 1931-32. Its introduction would greatly increase the value of silver; but the idea has not been seriously entertained in recent years. The bimetallic controversy may be

studied from the point of view of the bimetallicist in *International Bimetallism* by F. A. Walker; the opposing side is represented by Giffen in *The Case against Bimetallism*; whilst an impartial view is adopted by Leonard Darwin in *Bimetallism*.

Bimlipatam, chief port of the Vizagapatam dist. in the Madras presidency, India. It is situated on the bay of Bengal, about 18 m. N. of Vizagapatam. There is a large coasting trade, and its chief exports are sugar and oil seeds. Pop. 10,000.

Binan, or **Vinan**, pueblo of Laguna prov., Luzon, Philippine Is., on a trib. of Laguna de Bay, 41 m. from Santa Cruz. Very fertile. Pop. 11,000.

Binary Theory, a generalisation in chem. which is now of historical interest only. It assumed that every chemical compound consisted of 2 parts which might be elements, or groups acting as elements, one element or group being electro-positive and the other electro-negative. The theory has been discarded.

Binche, an industrial tm. of Belgium, situated in the prov. of Hainaut, 10 m. E.S.E. of Mons. Pop. 15,000.

Binck, or **Bink**, **Jacob** (c. 1500-c. 1568), Ger. painter and engraver, b. at Cologne. He studied under Dürer. His engraving is unequal; among his best productions may be named the 'Divinities of the Fable' and his various portraits.

Bindusara (297-272 B.C.), second Mauryan emperor of India; son of the conqueror Chandragupta, and father of Asoka, who succeeded him.

BINDWEED

Bindweed, name given to sev. plants of the order Convolvulaceæ, which climb by means of twining stems and are natives of Britain. The name is most often applied to the sweet-scented *Convolvulus arvensis*, or lesser B. *C. sepium*, larger B., often occurs in hedges, and is fertilised chiefly by means of a hawkmoth; *C. soldanella*, sea B., grows on the coast. The name black B. is given to *Polygonum convolvulus*, a species of Polygonaceæ.

Binet-Simon Test, in mental pathology, is a method of testing the intelligence of persons who are mentally defective, by putting to them a series of questions and getting them to perform a number of simple exercises, such as drawing, which can normally be performed by any children of various ages. The mentally defective may, by this test, be classified as possessing the degree of intelligence of a child of 4, 5, 6, etc. years. The test is named after Alfred Binet (1857-1911), Fr. psychologist, director of the laboratory of psychology at the Sorbonne. Much of his work was founded on the application, in certain conditions, of hypnotism. See INTELLIGENCE TESTS.

Bingen, tn. of Rhine-Palatinate in Germany. It is situated on the l. b. of the Rhine, about 15 m. W. of Mainz, and 40 m. S.E. of Coblenz. Near the tn. is the well-known Bingerloch, a whirlpool, which was at one time a most dangerous passage for navigation, until 1834, when the sunken rocks were blasted, leaving a wide channel of 210 ft. The Mäuseturm, or Mouse-tower, is situated on a rock in mid stream, the scene of the story of Bishop Hatto. The remains of a castle where the Emperor Henry IV. was imprisoned are in the neighbourhood, and almost opposite B. is the statue Germania, which was erected in 1877-83 in commemoration of the war in 1870. B. is the centre of a wine-producing neighbourhood, and is also the market for the sale thereof. It is the seat of a technical school with 900 students. The Festhalle was built in 1913. Pop. 12,000.

Binger, Louis Gustav, Fr. officer and explorer, b. at Strasburg in 1856. He studied the language of the Bambara in the Niger states, and pub. his work on the Niger. In 1887 he commenced his expedition from Senegal up to the Niger, and 2 years later he arrived at Grand Bassam. He described this journey in his work *Du Niger au golfe de Guinée par le pays de Kong et le Mossi*, pub. in 1891. In 1892 he again visited the Guinea Coast for the purpose of superintending the forming of the Eng. and Fr. boundaries. Appointed governor of the Ivory Coast, 1893. See Henri Mouézy, *Assinie et le royaume de Krinjabo* (Paris), 1942.

Bingerville, tn. of W. Central Africa, situated a little to the N.W. of Grand Bassam. Named after Louis Binger (q.v.). It is now the cap. of the Fr. Ivory Coast, having been constituted in Nov. 1900, and is inhabited solely by officials. Pop. 750.

Bingham, Joseph (1668-1723), Eng. divine, b. at Wakefield in Yorkshire. He was educated at Oxford, and was made fellow of his college in 1689, and tutor in 1691. After some time he was forced to resign his fellowship, and leave the univ. because of an accusation brought against him of heresy. This originated from a sermon which he preached upon the terms 'Person' and 'Substance' as applied to the Trinity. Shortly after, a living was given him at Headborough, close to Winchester, and it was here that he wrote his great work, entitled *Origines*

Ecclesiasticæ, or Antiquities of the Christian Church, in 10 vols., 1708-22.

Bingham, small mrkt. tn. of Notts., England, 8 m. from Nottingham. Pop. 1600.

Binghamton, co. seat of Broome co., New York, U.S.A., situated at the junction of the Chenango and Susquehanna Rs., and 80 m. from Syracuse. Manufs. boots and shoes, tobacco, cigars, flour, engines, etc. Pop. 77,000.

Bingley, mrkt. tn. in W. Riding, Yorkshire, England. It stands on the Aire, 6 m. from Bradford, and 15 m. from Leeds. Its manufs. are woollen goods, worsted, cotton, paper; there are extensive iron works in the neighbourhood. It possesses sev. fine buildings; among them are technical schools, a free library, a cottage hospital, etc. Pop. 21,000.

Binh-Dinh, tn. of Annam, Fr. Indo-China, 11 m. from the coast and 205 m. S.E. of Hue. Kwihon or Quinon is its port. Pop. 75,000.

Bink, Jacob, see BINCK.

Binmaley, tn. in the prov. of Pangasinan, Luzon, Philippine Is., 5 m. W. of Dagupan. Has important fisheries; manufs. salt, pottery, and wine. Pop. 16,000.

Binnacle, the framework or case or box in which is kept the nautical compass. It is fitted with lighting apparatus, so that the compass can be seen at night. It is as a rule placed on the deck of a ship, in front of the steersman. A double B. is occasionally carried, one on each side of the steering wheel. On board a man-of-war, one B. is for the use of the officer on watch, while the man at the wheel has the other. At one time the B. was just a locker with sev. compartments, to contain the compass, lights, watch-glasses, etc. In the middle div. was placed the small lamp, and as the sides were of glass, a light could be thrown on the compass all the time at night. The modern B. has been improved, for it is so constructed that the compass needle is made proof against vibration or shocks.

Binney, Edward William (1812-81), Eng. geologist, b. at Morton, Notts. He was articled to a solicitor in Chesterfield, and in 1836 went to Manchester, where he practised successfully as a lawyer. His leisure was devoted to the study of geological phenomena of the dist. Chiefly through his influence the Manchester Geological Society was formed in 1838. From 1857 to 1859 he was president of the society, and also from 1865 to 1867. In 1853 he was elected a fellow of the Royal Society. He was considered to possess the most accurate knowledge of the coalfields of Cheshire and Lancashire.

Binney, Thomas (1798-1874), Eng. Congregational minister, b. at Newcastle. He received his education at an ordinary day school, and then was apprenticed to a bookseller for 7 years. During this time he studied Lat. and Gk. Later he entered a theological college to prepare for the ministry. His first call was to the Isle of Wight in 1824. In 1829 he took up work at Weigh House Chapel, London. He

was strongly against the Church of England. In 1845 he visited Canada, and in 1857 he went to Australia. He ranked high among nonconformists of his time.

Binnie, Sir Alexander Richardson (1839-1917), Eng. engineer, b. in London, educated at private schools and under J. F. Bateman, F.R.S., president of the Institute of Civil Engineers; was engaged on Welsh railways, 1862-66; in Indian Public Works Dept., 1868-74; was appointed engineer to the city of Bradford, 1875; and chief engineer to the L.C.C., 1890-1901; his engineering feats include the Blackwall Tunnel; Bradford Waterworks; and Barking Road Bridge.

Binocular, see Vision.

Binoculus, term formerly used instead of *Apus* for a genus of phyllopodous crustacea of the family Apodidae. They inhabit fresh-water ditches, pools, and stagnant waters, and are gregarious. Males are seldom produced, the females carry their eggs about on specially modified appendages, and these eggs preserve the living principle for a long time in a dry state.

Binomial (Lat. *bis*, twice, *nomen*, a name), the name given in algebra to an expression consisting of 2 terms, as $a+b$, $a-b$. The *binomial theorem* is a method of expanding any power of a B. expression into a series. It is given in the following formula, where n may be any power integral or fractional, positive or negative, rational or irrational:

$$(x+y)^n = x^n + nx^{n-1}y + \frac{n(n-1)}{1.2}x^{n-2}y^2 + \frac{n(n-1)(n-2)}{1.2.3}x^{n-3}y^3 + \dots + y^n.$$

Thus, the expansion of

$(x+y)^5$ is $x^5 + 5x^4y + \frac{5.4}{1.2}x^3y^2 + \frac{5.4.3}{1.2.3}x^2y^3 + \frac{5.4.3.2}{1.2.3.4}xy^4 + \frac{5.4.3.2.1}{1.2.3.4.5}y^5$ or $x^5 + 5x^4y + 10x^3y^2 + 10x^2y^3 + 5xy^4 + y^5$. The theorem owes its origin to Sir Isaac Newton, who first pub. it in 1676.

Bintang, the chief is. of the Riau archipelago, in the Netherlands E. Indies. It is situated on the S. of the strait of Singapore. The coast is beset with rocks and small is., while the interior of the is. is low and marshy. Pepper, gambier, rubber, and rice are cultivated and exported. There is also a trade in timber. The chief port is Tanjong Pinang. Pop. 18,500.

Binturong, or 'black bear cat,' a small black animal, found in India, Sumatra, Java, etc. It possesses a large head, and a thick long tail, prehensile at the tip. Its habits are nocturnal and solitary, slow and crouching. It feeds upon birds and insects. Its howl is very loud. It is easily tamed.

Binué, see BENUÉ.

Binyon, Laurence (1869-1943), Eng. poet and orientalist, son of the Rev. F. B., was educated at St. Paul's School and Trinity College, Oxford, and won the Newdigate prize in 1890. He received an appointment in the dept. of printed

books at the Brit. Museum in 1893, was transferred to the dept. of prints and drawings in 1895, and became assistant keeper in 1909. He pub. sev. books of poetry, showing traditionalist tendencies; but will probably be best remembered as the greatest authority on oriental art. He compiled the official catalogues of Jap. colour prints in the Brit. Museum, and Chinese frescoes in the Eumorfopoulos collection; also the four-vol. catalogue of Eng. drawings, begun in 1898. During his 20 years in charge of the subdept. of oriental prints and drawings, he made it the most representative in Europe. His larger and harder task was to build up a really representative collection on historical lines, in accordance with the tradition of the museum, of Chinese and Jap. painting. Far Eastern painting was necessarily the central point of the collection, and the main subject of his book, *Painting in the Far East* (first pub. in 1908), which still holds its unique place as an introduction to the subject. This book also contains sections on Indian and Persian painting, and these subjects were also treated by him in later publications, especially in the *Court Painters of the Moguls*, pub. in collaboration with Sir Thomas Arnold; in the museum collection of Nizami's *Khamseh* and in his lectures at Harvard (1934); which were afterwards pub. as *The Spirit of Man in Asian Art*. As a result of his stay in Japan in 1929, with shorter visits to China and Angkor, he treated the whole range of E. art. In his later years he wrote a life of Akbar (1932). No one in Britain did more to further an interest in the arts of the E. and through them an understanding of the spiritual and cultural ideals of those great civilisations. In 1926 he brought out the *Letters of Maurice Hewlett*. His taste in recent verse is recorded in a *Golden Treasury of Modern Lyrics* (1924), and he added a supplementary fifth book to Palgrave's *Golden Treasury*. He also trans. Dante's *Inferno* into Eng. verse, 1933, and the *Purgatorio*, 1938.

Select Bibliography: *Lyric Poems*, 1894; *London Visions*, 1895; *Porphyryion*, 1898; *Death of Adam*, 1903; *England*, 1909; *The Anvil*, 1915; *The Secret*, 1920; *The Idols*, 1927. Plays: *Paris and Oenone*, 1906; *Attila*, 1907; *Arthur*, 1922; *Boadicea*, 1925. *Belles Lettres: The Flight of the Dragon*, 1911; *Painting in the Far East*, 1913; *Botticelli*, 1913; *Court Painters of the Grand Mogul*, 1921; *Drawings and Engravings of W. Blake*, 1922; *English Water Colours*, 1933.

Biobio, the largest riv. in Chile, S. America. It is 220 m. long. Its source is in the volcano of Antuco, in the Andes, and it takes a N.W. direction to Concepción, a port on the Pacific coast. It is more than 2 m. wide at its mouth, and is navigable for over 100 m. B. is also the name of a prov. of S. Chile. It has an area of 4158 sq. m., and is divided into 3 depts. The cap. is Los Angeles.

Biochemistry is that section of chem. which investigates the chemical changes and products evolved in the life processes

of plants and animals. It includes the investigation of the nature of living matter and the chemical processes of life and death. Not only is it concerned with the composition of the substances found in the organism, but also with their method of manufacture. In this inquiry into the chemical activity of the organism, B. is intimately connected with the origin of life, and some bio-chemists think that it may be possible to synthesise living organisms.

Physical B. has helped to solve the problem of the entry of food solution into plants and individual cells by osmosis, and has shown the importance of hydrogen ion concentration (P_{H} value) in metabolism, respiration, and in culture media. The action of isotonic solutions in blood transfusion and in the microscopic examination of living cells, and the action of hypertonic solutions in effecting the development of unfertilised eggs of lower plants and animals, are due to the phenomena investigated by this section of B.

Colloidal chem. has ended much controversy on the nature of protoplasm by showing that the theories advanced were not contradictory since, in virtue of its structure as a colloidal medium, protoplasm may pass through different phases affecting its physical appearance. Like most colloids, it is semipermeable, a characteristic absolutely essential to organic structure and nutrition as we know them.

Physiological chem. is concerned with normal metabolism. Foods taken in by living organisms are elaborated into body material or broken down with the liberation of energy. The elaboration (anabolism) and the breaking down (katabolism) together constitute metabolism and proceed at the same time, and intimately connected with it are 2 classes of compounds—enzymes and hormones. Enzymes occur in all the digestive juices and are able to convert certain foods into digestible form. The conversion of proteins, fats, and starches into soluble compounds in both plants and animals is brought about by various enzymes, which resemble catalysts in that they remain unchanged at the end of the reaction. Bacteria and yeast secrete enzymes of industrial importance and the action of many of these has been very extensively investigated (e.g. the fermentation of sugar by yeast).

Hormones are chemical substances liberated into, and circulated in, the blood. Their use seems to be to aid various parts of the body to function normally. The pancreas is unable to secrete pancreatic juice unless it receives from the intestine, in the blood stream, the hormone *secretin* secreted by cells of the intestinal membrane. The secretions of the ductless glands were first regarded as hormones, but the specific term 'endocrine' is now generally applied to them, and the nature and effect of these secretions are the subjects of extensive research. It is known that they may produce marked effects on metabolism and

general health. Under certain conditions, extract of thyroid gland injected into tadpoles will cause precocious metamorphosis, whereas deficiency of thyroid secretion arrests development. The secretion of the pituitary gland also has a marked effect on metabolism. Other endocrine secretions under investigation are those of parathyroid, adrenal, suprarenal, and genital glands; their secretions affect general health to a great extent. Since interference with metabolism will affect at least some organs of the body, it is not surprising that nervous disorders are frequently associated with abnormal endocrine conditions.

Research on foods has shown that disease and premature death occur unless substances called vitamins are included in the normal diet. These are found in living organisms, but in minute quantities, and are so readily destroyed that it was a long and difficult task to isolate any of them. Because of this original inability to isolate and analyse vitamins, those discovered were provisionally named A, B, C, D, E, etc. The constitution of some of the vitamins has been elucidated by Karrer and other workers, and one or two of them have been synthesised in the laboratory.

By its investigation of metabolism, B. is connected with medicine, for abnormal metabolism is pathological, and the determination of deleterious substances during disease has linked B. with chemotherapy—the treatment of disease by the injection of compounds which will procure immunity. Research is being carried out on the effect of compounds of arsenic on the organism (*Trypanosoma gambiense*), which causes sleeping-sickness. Injections of salvarsan kill the Spirochaeta causing syphilis and relapsing fever. The flat worm *Bilharzia* is killed by tartar emetic, and the action of a gold compound, called sanocrysin, has been tested with some success on the tubercle bacillus. Penicillin, a Brit. discovery, is extremely efficacious against staphylococci, and paludrine—another Brit. discovery—shows great promise in not only curing but preventing malaria.

Biogenesis, a term used to express the theory that all forms of life owe their origin to antecedent life ('omni vivum ex vivo'), as opposed to abiogenesis (q.v.), which maintains that it may be possible to produce life from inorganic matter. The terms are used in connection with a biological controversy which recurs from time to time, though Pasteur's refutation of abiogenesis is now usually regarded as conclusive, except perhaps in the case of viruses (q.v.). B. is also expressed by homogenesis, which means that the living organism produces by sexual reproduction, spore-formation, or partition organisms resembling the parent, though the resemblance to the immediate parent may not, of course, be exact. See BIOLOGY.

Biography (Gk. *bios*, life, *graphein*, writing), that branch of literature which deals with the hist. of the lives of individual men. The first known instance

of the use of the word *βιογραφία* is in the work of Damascius, a Gk. writer of the early sixth century. The word does not appear to have been used in England until the seventeenth century. Fuller, in his *Worthies*, 1662, referred to the 'biographers of these saints,' and in 1683 Dryden defined *biographia* as the 'history of particular men's lives,' in all parts of which 'Plutarch equally excelled.' B., in its most rudimentary form, exists in the early literature of all nations. The hist. of the lives of national heroes, coloured by popular imagination, may be traced in the myths of gods and giants and insuperable warriors. Jewish literature abounds in B., as it affects the hist. of the race. The O.T. is full of the lives of patriarchs, kings, prophets, and great women who left their work on the religious and social history of the Jews. The earliest examples of B. written with a conscious effort to narrate the true hist. of particular men, are probably to be found in Gk. literature. In Gk. and Rom. literature B. is generally a mere *curriculum vitæ*; the duty of the writer is to narrate, in strict historical sequence, the chief events of his hero's life. It often took the form of *laudationes funebres*, and the aim of the writer was strictly a moral one. His hero must either be an example or a warning. Every noble action is emphasised with grave eulogy; the consequence of every deed pointed out and if necessary censured. This form of writing gives opportunity for rhetoric, and for the introduction of lengthy dignified speeches, which deprive the work of any dramatic form, but add to its general moral tone. Xenophon's memoir of his master Socrates is one of the earliest Bs. that have come down to us from the Gks. By far the most interesting is the *Parallel Lives* of Plutarch (A.D. 46-120). The lives number 46, and the Gk. and Rom. heroes are arranged alternately as a parallel to each other. Plutarch excels all anc. writers of lives. His rare gift of sympathy with his subject, and his powers of selection and of seeing what is interesting, are only equalled by the best of modern biographers. North's translation appeared in 1579, and had a remarkable influence on the Elizabethan dramatists. Other Bs. of note, belonging to Gk. literature, are Philostratus's *Life of Apollonius of Tyana*, the Neo-Pythagorean saint, and his *Lives of the Sophists*; Diogenes Laertius's *Lives of the Philosophers* (third century); Eusebius's *Lives of the Sophists* (fourth century); and the *Life of Plato*, by Olympiodorus of Alexandria. The Augustan age of Rom. literature contains many fine specimens of B. *De Viribus Illustribus* of Cornelius Nepos (c. A.D. 655-730) is frequently historically inaccurate, but is of great interest. *The Life of Alexander the Great*, by Q. Curtius Rufus, is not so much biographical as historical, and is over-weighted with general reflections and rhetorical speeches. Tacitus's life of his father-in-law (*De vita et moribus Julii Agricolæ*), written c. A.D. 98, is a stately work, and contributes to our knowledge of the hist. of the times.

The *Lives of the Twelve Emperors*, from Cæsar to Domitian, written by Suetonius Tranquillus about A.D. 120, are rhetorical studies. Suetonius shows indifference to chronological exactness, and is by no means an impartial historian. Another B. of note is the monograph by Sallust (c. 668-720) on the conspiracy of Catiline. Saint Jerome's *Lives of the Fathers* belongs to a later period. The Bs. of the Middle Ages were frequently written in the cloister or the cell; and the subjects chosen were saints, martyrs, abbots, bishops, and the like. In England many Bs. of this kind were written in Lat. Bedo (673-735) wrote lives of St. Guthbert (one a metrical version of considerable length, and one in prose), and also *Lives of the Abbots of Wearmouth and Jarrow*, the material for which he found in certain anonymous lives of these saints. Aldhelm, bishop of Sherborne (d. 709), composed a prose treatise in praise of virginity, which he illustrated by the lives of a number of men and women—Scriptural characters, hermits, monks, and saints—examples of chastity. Other lives of interest to the student of Early Eng. literature are: *Vita Sancti Columbæ*, by St. Adamnan (625-704); *Vita Caroli Magni*, a life of Charlemagne, written about 820 by Eginhard; *Lives of the Saints*, by Ælfric; *Wulfstan*, by William of Malmesbury; *Wulfred of York*, by Eddius Stephanus; and *St. Guthlac*, by Felix. *The Life of Alfred*, by Asser, bishop of Sherborne, has the distinction of being the 'earliest B. of an Eng. layman.' During the fifteenth and sixteenth centuries there was a fair output of this species of writing, but the form and the scope of B. did not develop to any great extent. Lat. was frequently chosen as the medium of expression, and the style and form modelled on that of Livy and Sallust. The chief biographies to be noted here are: *Illustrium Majoris Britanniae Scriptorum Summarium*, 1584, by John Bale, 1495-1563; *De Viribus Illustribus*, and *Commentarii de Scriptoribus Britannicis*, by John Leland (d. 1552); a *Life of Sir Thomas More*, by his son-in-law, William Roper (1496-1578); a graceful *Life of Cardinal Wolsey*, by George Cavendish (1500-c. 1561), which remained in manuscript till the seventeenth century; and *History of the Life and Death of King Edward V. and the Usurpation of Richard III.*, by Sir Thomas More, written between 1513 and 1514, and printed in 1557. Bacon's *History of Henry VII.* appeared in 1621. In this an effort is made to analyse the motives and purposes of the chief actor, and everything is subordinated to or explained by his actions. In this analytic handling of his subject Bacon made a clear advance on the methods of his predecessors. All modern Bs., which aim at giving an artistic and truthful presentation of the life and character of an individual, must acknowledge their debt to the admirable *Lives* of Izaak Walton. This series began by the publication in 1640 of the *Life of Donna*, which was followed by the *Life of Sir Henry Wotton* in 1651; *Richard Hooker* in 1665;

George Herbert in 1670; and *Dr. Robert Saunderson* in 1678. Walton had a sympathetic understanding, and his pleasing style and the revelations of his own plans and kindly personality combine to make the *Lives* attractive to modern readers.

So far it will have been noticed that the men chosen as subjects of B. are those whose lives bear directly upon the hist. of the Church and State. Men of letters were not considered to be of such influence and importance as to warrant a B. Even Walton's heroes were not wholly scholars. Drummond of Hawthornden's *Notes on Conversations with Ben Jonson*, 1619, though not strictly speaking a B., revealed the character of a man of letters in conversation, and proved that a man's character may be revealed in his trivial as well as in his serious remarks. From this time the scope of B. began to expand. Anthony à Wood (1629-95) chose the wits of Oxford for the subject of his *Athenæ Oxonienses*; John Aubrey (1629-97) pleasantly sketched the lives of his immediate predecessors and his contemporaries in *Minutes of Lives*; Thomas Fuller (1608-1661) wrote extensively, with numerous digressions, of the notable men of each county in his *Worthies of England*, 1661. Mrs. Hutchinson, in *Memoirs of Colonel John Hutchinson* (1664-70, pub. 1806), wrote a panegyric of her husband, who had taken part in the Civil war. Thomas Sprat, bishop of Rochester (1636-1713), reverted to the old classic models in his *Life of Cowley*, 1668, where he expounded that all familiar anecdote was out of place in a B., and that moral effect was the thing to be aimed at. Before the end of the seventeenth century 2 lives of Milton were in print, one by Edward Phillips, pub. in 1694, and one by Toland, in 1699. Lord Herbert of Cherbury (1583-1648) and Anne Harrison, Lady Fanshawe (1625-80), were the earliest to write lives of themselves. Another early autobiography (1656) is that of Margaret Lucas, duchess of Newcastle, who also wrote a life of her husband in 1667. With these autobiographies must be noted certain diaries, which were, after all, autobiographies not intended for publication. The most important of these is the famous *Diary of Pepys* (1633-1703), written between 1660 and 1669. Its value was unrecognised till the nineteenth century, and an incomplete ed. was first pub. in 1825 by Lord Braybrooke. Notice must be paid to the *Diary of Evelyn*, written between 1641 and 1697; to Roger North's *Life of himself and Memoirs of his 3 brothers*, the Lord Keeper Guilford, Dr. John North, master of Trinity, and Sir Dudley, the Turkey merchant; and to Burnet's *History of his own Times*. B. attained its most perfect form at the end of the eighteenth century in James Boswell's *Life of Dr. Johnson*. The necessities of a good biographical writer are numerous. He must, of course, have a knowledge of the facts and access to authentic documents relating to the life of his hero. This is by no means all. Knowledge of facts and a strong predilection for moral platitudes were often,

as has been shown, the sole qualifications of anct. biographers. But the ideal modern biographer should not merely be in touch, through his own technical knowledge, with the work and ambitions of his hero; he should have a sympathetic understanding of his hero's character. He should be able so to present his hero that the reader is left with the feeling that he himself has known the man. Everything must be subordinated to the central figure; no incident, no person that does not influence the life or the character of the hero should be introduced. The biographer must possess a knowledge of psychology; he must be able to analyse motives, and to arrange his material and group his characters to the best effect. In fact, in order to reveal the personality of his portrait he must create as well as reproduce. *The Life of Dr. Johnson* is thought by many to have no rival in the whole realm of the world's literature. Boswell had an unbounded admiration for his hero; an intimate knowledge that would be hard to surpass; and the happy knack of an artist in selecting and grouping his material. As Carlyle says, the 'loose-flowing, careless-looking work is as a picture by one of Nature's own artists; the best possible resemblance of a Reality; like the image thereof in a clear mirror.' Among the Bs. written by men almost as great as their heroes, are most prominent Boccaccio's *Life of Dante*, Dean Stanley's *Life of Dr. Arnold*, and Lord Morley's *Life of Gladstone*. Excellent Bs. were written in great number during the nineteenth century. The great modern classics in this branch of literature are Southey's *Life of Nelson* and *Life of Wesley*; Lockhart's *Life of Scott*; Forster's *Life of Dickens*; Trevelyan's *Life of Macaulay*, and his *Life of Charles James Fox*; Carlyle's *Lives of John Sterling, Frederick the Great, Schiller, Oliver Cromwell*, etc.; Moore's *Life of Byron*; Mrs. Gaskell's *Life of Charlotte Brontë*; Sir Theodore Martin's *Life of the Prince Consort*, and Lowden's *Life of Shelley*. Cross deviated from the ordinary form of B. in his *Life of George Eliot*, 1884. He arranged her letters in chronological order, headed by brief introductions or explanations, allowing her character to reveal itself in her correspondence. Cross's method has by many writers been adapted and combined with a B. Mason, in his *Life of Grey*, 1744, was the first to insert familiar letters, written to intimate friends, for the purpose of illustrating the character of his hero. A great fault of some Bs. is the lack of the power of selection in the author. A great amount of industrious research and scholarship is put into the work, but the biographer fails to present a living portrait of his subject. An example of this kind of work is Masson's *Life of Milton*. Masson gives a mass of information about the politics and lives of Milton's contemporaries, and introduces in detail many people and incidents which only indirectly bear upon the life and character of the poet. Sidney Lee's *Life of Shakespeare* is one of the finest examples of that type of B. which

of necessity entails careful and scholarly research. During the nineteenth century all manner of men had their interest quickened in different branches of art and science; and numerous Bs., autobiographies, and memoirs, have been pub. Those have dealt with leading men in all walks of life. Bs. have often been written by specialists of specialists; these are of such a kind as to demand a certain amount of technical knowledge of the subject from the reader. Under this heading come lives of painters and artists, such as Jahn's *Life of Mozart*, Karasowski's *Life of Chopin*, and Woltmann's *Life of Hans Holbein*. Autobiographies have been written in great number by all manner of men and women; such as Gibbon, Hume, Franklin, Talleyrand, Harriet Martineau, Oliver Wendell Holmes, Leigh Hunt, Scott (in his *Journal*), Ruskin (*Præterita*), Carlyle (*Reminiscences*), Goethe (*Dichtung und Wahrheit*), Sir Henry Taylor, Edmund Gosse (*Father and Son*), etc. Bunyan's *Grace Abounding*, Thomas Browne's *Religio Medici*, and Newman's *Apologia*, are confessions of faith and revelations of the inward spiritual life of a man. Sometimes an autobiography has almost taken the form of fiction, as in Borrow's *Lavengro*. Halliwell-Phillips has said that the writing of modern Bs. has been 'carried to a wasteful and ridiculous excess.' This is true. Every politician, man of letters, actor, and millionaire has some admirer who goes into print on his behalf. It is now common for Bs. to be written during the life of the subject. Very little denomination has its heroes; and lives and memorials are continually being pub. of philanthropists, preachers, and missionaries. Such works are of purely ephemeral interest, and reach a very limited audience.

In the twentieth century one of the most remarkable Bs. is Monypenny and Buckle's *Benjamin Disraeli, Earl of Beaconsfield*, which appeared in 6 vols., 1910-20; and as a reference book on its subject, Morley's *Gladstone* suffers by comparison. Smaller Bs., however, became the fashion. B. in general has also on the whole been rendered more sincere and more readable by abolition of the conventional frontier between matters to be put in a life and other matters. Two Brit. monarchs have been subjected to candid treatment: in Lytton Strachey's one-vol. *Queen Victoria* (1921); and in Sir Sidney Lee's *Edward VII.*, in 2 vols. (1922-23). Lytton Strachey's *Eminent Victorians* (1918) is probably the most remarkable biographical work of its size; it is one small vol. dealing with 4 lives—Cardinal Manning, Florence Nightingale, Arnold of Rugby, and General Gordon. Bernard M. Allen's *Gordon and the Sudan* (1931) disposes of the malicious picture of Gordon presented by Lytton Strachey, whose conception of Gordon was based on a hasty generalisation from unreliable material. Indeed much of Strachey's work is marred by its straining after effect, as, e.g. in his sketches of Mme. du Deffand, Horace Walpole, and Frederick the Great, and above all in the cloying

study of *Elizabeth and Essex*. It may be said that Lytton Strachey has been the main influence in twentieth-century B., particularly in reaction against the formal official 'Life' of the preceding century, and the writing of biography has been one of the outstanding features of Eng. and Amer. authorship since the First World War. The growth of interest in psychology is one explanation of this, but the pervasive irony of Strachey, the wish to revalue (or 'debunk') the 'great' in the light of modern interpretative psychology, cannot alone account for the popularity of biography. Writers appear to be attracted to B., also perhaps because the central life story of an individual may well serve other interests, such as historical research, literary criticism, social study, and in some instances, no less legitimately, creative and imaginative works of art. B. has therefore gained these interests as ballast against its use for motives of social satire, and the full-length study as against the short and biting pen portrait came into its own again by the third decade of the century. Of the many modern authors of biographical works, it is possible to name only a few. A high reputation in popular esteem was won by Philip Guedalla, particularly for his life of Wellington. Harold Nicolson, Hugh Kingsmill, Hilaire Belloc, Hesketh Pearson, Osbert Burdett, John Fortescue should be mentioned in Eng. literature; Gamaliel Bradford, Van Wyck Brooks, Katherine Anthony, Joseph Krutch, and Matthew Josephson in Amer., and among continental writers with international reputation André Maurois, Stefan Zweig (d. 1942), Emil Ludwig (d. 1948), and Salvador de Madariaga. This brief list does not take into account those many men and women, distinguished in other fields of life and literature who have, among their other works, contributed one or more biographies. A signal example is the monumental life of the duke of Marlborough, *Marlborough, his Life and Times*, written by Winston Churchill, and pub. in 4 vols., 1933-38.

The biographical dictionary dates from the sixteenth century, and first made its appearance at Zürich in Switzerland with the publication of *Bibliotheca Universalis* of Konrad Gesner. It is in effect a catalogue (in Gk., Lat., and Heb.) of past writers with the titles of their works (1545). A second part, *Pandectarium*, was pub. in 1548-49. Other early works of this sort are *Prosopographia* of Verdia de Vauprivas (Lyons, 1573); the Bollandists' *Acta Sanctorum*, 1643-1788; Pierre Bayle's *Dictionnaire historique et critique*, 1696. A dictionary of national B. was pub. in Sweden in 23 vols., 1835-57. Other nations followed; and such dictionaries have appeared in Dutch (1852-1878), Austrian (1856-91), and Ger. (1875-1900). The Brit. *Dictionary of National Biography* was begun in 1882, under the editorship of Leslie Stephen, who was succeeded by Sidney Lee. It was issued in 63 vols., with 2 supplements forming 5 vols. more to bring it down to the end of 1911. Under new auspices and on a

less comprehensive plan, it had a 'Twentieth Century' vol. (1912-21) added in 1927, and since then another vol. has been issued covering the period 1922-1930. *A Dictionary of American Biography*, resembling the D.N.B., was begun in 1928, and completed in 21 vols. in 1937, with a supplementary vol. pub. in 1944. Other biographical dictionaries have been brought out in different countries. Nearly every country has now a *Who's Who*, which gives a brief outline of the life and work of living men who have distinguished themselves in various ways. Many Bs. have been combined with works of criticism. Dr. Johnson was one of the first to use this form in his *Lives of the Poets*. Since then there have been many works of the kind, of which may be mentioned the critical essays of Macaulay, Carlyle, Matthew Arnold, Robert Louis Stevenson, Leslie Stephen, Bagehot, and of many living men of letters. The Eng. Men of Letters series included admirable pieces of critical work by such men as Sir Walter Raleigh, Edmund Gosse, Austin Dobson, etc. There was a similar Amer. series and Fr. men of letters are celebrated in *Les Grands Écrivains français*. One of the earliest publications of a group of Bs. was the famous *Lives of Painters* by Vasari (Florence, 1550). Other examples are Foxe's somewhat untrustworthy *Acts and Monuments of the Church*, or *The Book of Martyrs*, pub. at Basle in 1559, and trans. into Eng. in 1563; Cunningham's *British Painters, Sculptors, and Architects*, 1829-1833; Mrs. Jameson's *Early Italian Painters*, 1845; Bryan's *Dictionary of Painters*, 1879-85; Hamilton's *Poets Laureate of England*, 1888; Bellamy's *Eminent Doctors*; Lord Campbell's *Lives of the Lord Chancellors and Lives of the Chief-Justices*; Doran's *Their Majesties' Servants*, 1864; Grove's *Dictionary of Music and Musicians*, 1878-89; 2nd ed. 1904-7; 3rd 1927; 4th 1938-40 (2nd was ed. by J. Fuller Maitland; 3rd and 4th by H. C. Colles); 5th ed. by Eric Blom, in preparation (1949); Smiles's *Lives of Engineers*; Agnes Strickland's *Lives of the Queens of England, of the Tudor Princesses, and of the Last Four Princesses of the House of Stuart*; H. A. Müller's *Biographisches Künstler-Lexikon der Gegenwart*, 1882. Some are of certain countries only, such as Appleton's *Cyclopedia of American Biography*, 1887-88, and Chambers's *Dictionary of Eminent Scotsmen*, 1835.

bers's *Biographical Dictionary* (latest ed. 1946).

Biology (Gk. βίος life; λόγος, discourse), the science of life. It treats generally of the life of animals and plants, including their morphology, physiology, origin, development, and distribution. It attempts to survey all the phenomena manifested by living matter.

Two Main Aspects of Biology. The hist. of B. from the beginning discovers 2 main types of investigator at work. The first confines himself to simple observations of living things and to accounts of what he sees. The other attempts to systematise the accounts he receives from observers. The discovery of new forms and new species has by no means come to an end, and the invention of new techniques constantly adds to our knowledge of known forms and species. The hist. of B. is thus the twofold hist. of increasingly extensive and intensive observation going on side by side with increasingly comprehensive generalisation. But, since the work done in the field of observation is basic and fundamental, it follows that no finality can be claimed for biological science until the whole field of living matter has been exhaustively surveyed.

History of the Rise of Biology. Men, however primitive their mode of life, are dependent for their sustenance upon a limited number of plants and animals. Whether hunters and herders, or merely collectors, it is essential to them that they shall distinguish a number of animals from one another, and that they shall not confuse useful with harmful plants. The div. of living beings into the 2 great categories of plants and animals was achieved by primitive peoples; and, further, animals were classified into birds, beasts, and fishes, and plants into trees, shrubs, and herbs. To some extent, then, primitive man had already made the distinctions which at a later stage produce the various groups of naturalists. The empirical folk-knowledge thus accumulated in the course of many hundreds of years through the observation of nature becomes classified even whilst it is being collected, and is to be regarded as the foundation of the early stages of the science. The Babylonians possessed knowledge of higher animal forms and of human anatomy, and had developed theories of the functions of the visceral organs. In Egypt, also, the sacred animals were studied with minute care. The development of the scarab was known, the metamorphoses of the frog and the fly had been observed, and observations of various parasitic worms had been made. The Egyptian custom of embalming the dead led to a knowledge of the structure of the human body. However, in spite of the accumulation of facts in Egypt and Babylonia, it is to Greece that we must turn for the earliest attempts to organise such knowledge in systematic form. Hippocrates (460-377 B.C.) discarded magical theories of disease, and Aristotle (b. 384 B.C.) originated scientific classification. He was acquainted with over 500

forms classified by modern zoologists, all Gk. and mainly marine. He was the founder of comparative anatomy, and his chief interests were anatomical and morphological. His disciple, Theophrastus, paid special attention to the botanical side of biology, doing for botany what Aristotle had done for zoology. The influence of Aristotle and his immediate successors led to the development of the school of medical study in Alexandria under the Ptolemies, where B. was studied, with anatomy and physiology, in relation to medicine. In the first century of the Christian era, the Rom., Pliny, compiled his *Natural History* from a number of sources: a work which made

WILLIAM HARVEY

him, after Aristotle, the most influential of the biologists of classical antiquity. Galen (b. A.D. 131) stood on the borderland between antiquity and the Middle Ages. He began the study of the component parts of the living organism. He recognised the difference between sensory and motor nerves, he described the heart and blood-vessels in detail, and studied the process of respiration. Throughout the Middle Ages little or no progress was made with the study of B., and Galen's work remained unquestioned until Harvey estab. the fact of the circulation of the blood. In the sixteenth century, however, fresh work was begun. Vesalius (b. 1514 or 1515 at Brussels) became prof. at Padua, and carried out investigations into anatomy by means of dissections of the human body. In theory he followed Aristotle and Galen, but he corrected a great many false beliefs and made many new discoveries. Gesner (b. 1516 at Zürich) wrote the *Historia Animalium*. Aldrovandi (b. 1522 at Bologna) was also a zoologist, but in connection with his

work in Bologna planted a botanical garden. Rondelet (b. 1507 at Montpellier) wrote *De piscibus marinis*, a work which groups together not merely fishes, but also crustaceans, worms, molluscs, echinoderms, and other aquatic animals. Cæsalpinus developed the work of classifying plants which Gesner had begun, making the first system of plants according to their seeds. He further explained the nature of dioecious plants, i.e. those in which the male and female organs are carried on separate plants. Generally speaking, the pioneers of the Renaissance carried on their researches in specialised fields, so that botany, zoology, and anatomy were developed as distinct sub-sciences of B. On these foundations progress was made more rapidly during the seventeenth century. Fabricius ab Aquapendente (1537-1619) discovered valves in the veins, and Harvey (b. 1578 at Folkestone) made the discovery of the mechanism of the circulation of the blood, and the means by which it was supplied with nutritive materials. Harvey's work was a great incentive to further research and discovery. This was particularly the case in the important fields of morphology and physiology, from this time on to be regarded as the 2 sub-sciences composing B. Morphology concerns itself only with the analysis of a living structure into its parts, and takes no notice of 'life,' as such; whilst physiology concerns itself with the functioning of the parts described by morphology or with living structures in action. Harvey further laid the foundations of embryology by his assertion that all animals are produced from an ovum. Gasparo Aselli (1581-1626) discovered, just before Harvey pub. his account of the circulation of the blood, the lacteal vessels, in the course of a vivisection experiment on a fully fed dog. Bartholin (b. 1616 in Copenhagen), following up Aselli's work, discovered the nature of the lymphatic ducts. This discovery was made independently somewhat earlier by Rudbeck (b. 1630 at Västerås), but Bartholin's account was the first to be pub. Robert Hooke (b. 1635) pub. in 1665 his *Micrographia*, containing a description of the cellular structure to be observed in thin slices of cork, thus having the way for the later generalisations on cells by Schleiden and Schwann. Malpighi (b. 1628 at Cavalcuore) was the founder of microscopical anatomy as a branch of botany and of zoology. He discovered the capillaries of animals and stomata in leaves, and applied the new technique to the study of human anatomy. Nehemiah Grew (b. 1628) independently applied the microscope to problems of plant anatomy. Grew and Malpighi freely exchanged ideas, and worked together, their collaboration resulting in the conception that the structure of organised matter is something unique, a view which remained at the stage where these investigators left it until the development of the cell theory. Leeuwenhoek (b. 1632) at Delft applied himself to improving the microscope, and by its aid studied the spermatozoa of

various animals, and discovered the Infusoria and the Rotifera. He is to be credited with the discovery of bacteria, which he observed in scrapings taken from his teeth; his drawings show clearly the 3 main shapes of bacteria. He made many discoveries in the field of animal histology, and showed the difference of structure between the stems of monocotyledons and dicotyledons. He first questioned the view that any living creatures may be spontaneously generated by the putrefaction of organic substances, but insisted that they are produced by reproductive processes. Swammerdam (b. 1637 at Amsterdam), combining fine dissection with microscopical technique, investigated the anatomy of invertebrate animals, and laid the foundations of modern entomology. He explained the development of the frog and of insects on evolutionary principles, and also made observations on the physiology of muscle; he showed that there was no change in volume when a muscle contracted. Another Dutchman, de Graaf (b. 1641), by his study of the sexual organs, overthrew the Aristotelian doctrine that the embryo is the product of the male semen alone, and gave an account of the true character of fertilisation. John Ray (b. 1627, near Braintree; d. 1705) and Francis Willughby (q.v.) (1635-72) applied themselves to the problem of classification; Ray applying himself at first especially to botany, and Willughby to zoology. Ray's important publication was the *Historia plantarum generalis*, in which he summarises all the botanical knowledge of his time, and lays the foundations of an anatomical classification of plants, which prepared the way for the work of Linnaeus in the following century. Hermann Boerhaave (b. 1668, near Leyden) made a close study of the general structure and functions of the human body, and presented the results of his survey in terms which more closely resemble the conclusions of modern B. than the work of his contemporaries. He sought to explain many biological phenomena in terms of chem. and physics. Albrecht von Haller (b. Berne, 1708; d. 1777) laid out a botanical garden at the univ. of Göttingen, and sought to set up a natural system of plant classification in opposition to the system of Linnaeus: in physiology he investigated muscular irritability, extended knowledge of the circulation of the blood, and began the work in comparative anatomy afterwards extended by John Hunter. Charles Bonnet (b. 1720 at Geneva; d. 1793) applied himself mainly to the study of insect B., but, compelled to give this up through failing sight, applied himself to speculative B. His discovery of parthenogenesis, his observations of the metamorphoses of insects, and contemporary studies of regeneration and reproduction by fission, led him to work out in detail theories of development. He originated the catastrophic theory of creation, according to which the earth has undergone a series of developments, each of which has been cut short by a great

natural catastrophe, which has destroyed the forms of life, though leaving intact the germs from which life was to develop when the catastrophe had ended. For the purposes of his speculations Bonnet was compelled to consider together botany, zoology, anatomy, morphology, physiology, and comparative anatomy, thus unifying those sub-sciences which had been developing independently. De Buffon (b. 1707 at Montbard; d. 1788) pub., in 1749, the first part of his *Histoire naturelle*, which engaged him for the rest of his life. He attempted the task of unifying the study of the earth with the study of living forms by regarding the hist. of the earth as related to the development of living creatures. With

COMTE DE BUFFON

him, the geographical distribution of animals and plants on the surface of the earth becomes significant. Linnaeus (1707-78) pub. the *Systema naturae*, in which he expounds his system of classification. This system laid the basis of classification as we know it to-day; and, through it, the biologist has been able to handle the material which has accumulated as the result of the labours of those engaged in observations and descriptive work. But Linnaeus committed himself to the view that species were immutable, and would ever remain so; each having originated as such through a special act of creation. Jussieu and Cuvier, in the early years of the nineteenth century, developed the classificatory system of Linnaeus in botany and zoology respectively by attending to the comparative anatomy of animals and plants, rather than to the external forms of individuals, and so founded a natural system based on anatomical relationships. Meanwhile, the sub-science of palaeontology had been founded by Palissy the potter, who asserted that fossils are the authentic traces of extinct life; and by John Hutton

(1726-97), who taught that present processes are adequate to explain the formation of stratified rocks and the existence of fossils. Bichat (b. 1771 at Tholrette (Jura); d. 1802) carried out investigations of tissues by means of the microscope, which entitle him to be regarded as the founder of modern histology. Sprenkel (b. 1750 in Brandenburg; d. 1816) pub. in 1793 a general theory of fertilisation in the vegetable kingdom, which in essentials still holds good. Robert Brown (1773-1858) first discovered the cell-nucleus, and his early work on the flora of Australia was a pioneer piece of plant-geography. Lamarck (b. 1744 in Picardy; d. 1829) challenged the fixity of species, arranging animals in series on the basis of the presence or absence of certain organs. The development of these organs and their presence or absence, he ascribes to habits. He is thus the propounder, not merely of a theory of evolution, but of a theory of the evolutionary process. His views in a modified form were later held by an important school of Neo-Lamarckians. Von Baer (1792-1876) made important contributions in the field of embryology. His discovery of the actual mammalian ovum enabled him to follow the successive stages of embryological development. He showed the affinities of vertebrates through study of comparative embryology, and enunciated the principle that the development of the individual is a recapitulation of the development of the group of which it is a member, an idea which was later elaborated by Ernst Haeckel (1824-1919). Schleiden (b. 1804 at Hamburg; d. 1881) first regarded the plant as a community of separate cells. Schwann (1810-82) took up Schleiden's theory, and showed that it applied to animals, arguing that the whole plant or animal organism is composed of cells and the products of cells. Dujardin (1801-60) first used the term 'sarcode', later supplanted by 'protoplasm', to denote the living material of which simple organisms consist. Hugo von Mohl (b. 1805 at Stuttgart; d. 1872) carried this work farther, and is regarded as the founder of modern plant cytology. Virchow (b. 1821 in Pomerania; d. 1902) applied the results of the cell theory to pathology; and Max Schultze (1825-74), estab. the fact that protoplasm is the fundamental substance of the cell, and that the structures formerly supposed to be essential were products of the living protoplasm. Claude Bernard (b. 1813 at Saint-Julien; d. 1878) was a pioneer in the field of experimental biology. To him is due much of our knowledge of the digestive processes in the alimentary canal. He also showed that sugar, formed as a product of digestion, is temporarily stored in the liver as glycogen. In the second half of the nineteenth century, Charles Darwin (1809-82) and Alfred Russel Wallace (1823-1913) simultaneously propounded the theory that species originate as a consequence of 'natural selection' or the 'survival of the fittest'. This theory was based on the observation that individuals vary in

details from each other; it does not attempt to explain how these variations originate, but shows that, since some are advantageous and some disadvantageous, their possession assists or handicaps animals in their struggle for life. The useful variation tends to preserve the animal, and to be handed on, through heredity, to descendants. The theory demands a knowledge of all the various branches of B., and is an attempt to unify all this knowledge into a single comprehensive science. It therefore represents that aspect of B. which seeks to give a unified account of organic nature. Its apparent reasonableness, as an explanation of biological development, has caused it to be regarded as a general theory of evolution, and it has been adopted in other sciences—in sociology particularly—which are to be regarded as dependent upon B. Francis Galton (1822-1911) developed a theory of eugenics which seeks to elucidate all those agencies which affect racial qualities. In connection with the development of the theory of evolution by means of natural selection, the names of Thomas Henry Huxley (1825-95), Ernst Haeckel (1834-1919), and Herbert Spencer (1820-1903) must be mentioned. Carl Gegenbaur (b. 1826 at Würzburg; d. 1903) worked at the confirmation of Darwin's hypothesis by means of comparative anatomy; showing by means of anatomical comparisons the relationships, due to descent, between the various forms of animals. Like Haeckel, Gegenbaur sought to establish genealogical trees for existing species of animals, and gaps in the line of descent were filled with hypothetical ancestors. The discovery of fresh facts has done away with many of these. Under the influence of Darwinism a great deal of specialised work in the various sub-sciences into which B. is subdivided has since been accomplished in the last fifty years. In anatomy, the names of Wiedersheim (1848-1923) and Arnold Lang (1855-1916) must be mentioned; in embryology, Kowalewsky (1844-1901), Oscar Hertwig (1849), Richard Hertwig (1850), Edwin Ray Lankester (1847-1930), Wilhelm His (1831-1904) and Francis Maitland Balfour (1851-82). In cytology, Strasburger (1844-1912) elucidated the problems of nuclear div. in vegetable cells, whilst Flemming (1843-1905), Fol (1845-92), Bütschli (1848-1920), van Beneden (1845-1910) and Boveri (1862-1915) made many advances in cytological technique, and, in the specialised field of the cytology of nervous structure, the names of Golgi (1844-1926), Ramón y Cajal (1852), Ehrlich (1852-1915), Ranvier (1835-1922), and Nissl (d. 1919) are all connected with important discoveries. The advances in technique made by these workers in the cytological field have made possible the researches which have revealed the details of the process of fertilisation, and thus opened up possibilities of experimentally studying the mechanism of heredity. Meanwhile, though the doctrine of natural selection had been accepted by biologists, and an

increasing mass of evidence had been accumulated, controversies arose regarding a number of issues, such as the question of the origin of variations, and the transmissibility of 'acquired' characters. Weismann (1834-1914) worked out a theory of inheritance based upon cell-structure. His theory of the structure of the germinal cell and its material ('germ plasma') is partly speculative and partly based upon contemporary research, and denies the possibility of any transmission of the effect of habit or practice. Semon (1859-1919) elaborated the 'mneme' theory for the purpose of accounting for the transmission of acquired characters: modifications in the soma of an organism leave impressions ('engrams') on the germ cells in the same sort of way as impressions are formed in the brain by outside stimuli. Hugo de Vries (b. 1848 at Haarlem) was a pioneer in the field of modern genetic research, and discovered 'mutations,' i.e. sudden large variations. Mendel (b. 1822 at Heinzendorf; d. 1884) carried out a series of brilliant experiments on the hybridisation of peas, which remained almost unknown till after his death. The rediscovery of his work was practically the beginning of a period of brilliant investigations of the problems of heredity and the transmission of characters, which is still being carried on and developed. The names of Bateson and Punnett (in England), Baur and Correns (Germany), Czermak (Austria), Lang (Switzerland), Cuénot (France), E. B. Wilson and T. H. Morgan (U.S.A.), are outstanding in this field. Another development in modern B. is that of biochemistry (*q.v.*), arising in the first instance from the modern chem. of solutions and of ferments and the study of the composition of the various products of animal glands, it has been widely developed in many directions. At present a great deal of research is being carried on in connection with the chem. of the secretions of the endocrine glands, whilst the work on the analysis, and subsequent synthesis, of the vitamins has also been of outstanding importance. Cytology, the study of the cell, and particularly its nucleus and chromosomes, is yet another branch of B. which has made tremendous progress in recent years, as a result of work by Strasburger, Darlington, Ruggles Gates, and many others. The chromosomes have been shown to be the carriers of hereditary qualities; many observations on the chromosomal number and behaviour in the cells of an organism have been brought into line with its genetical make-up. Experimental embryology, in the capable hands of Spemann, Vogt, de Beer, and C. H. Waddington, has shown the presence of chemical organisers which are responsible for the differentiation of the parts of the embryo from the segmenting egg, and obscurities in the process of gastrulation in Amphibians have also been cleared up.

Logical Evolution of Biology. This brief survey of the hist. of B. makes it clear that, on the whole, this hist. has followed a logical order of development.

If a perfect logical sequence were possible, we should first seek a complete enumeration of all the forms of life and their natural classification into families, orders, classes, sub-kingdoms, and the 2 great kingdoms of plant and animal life. We should seek to know the distribution of the various plants and animals over the earth at the present time and in the past. Analysis of the separate forms would give rise to anatomy, and comparisons of these analyses to comparative anatomy. The attempt to discover underlying unities leads to the generalisations included under morphology, and the analysis of the organism into organ, tissue, cell, and protoplasm; and the attempt to study

CHARLES DARWIN

morphology through observation of the development of the organism from the fertilised ovum leads us to embryology. Meanwhile, the study of the functioning of the organism has given rise to physiology, which must be studied in terms of the organism as a whole, and also in terms of organ, tissue, cell, and protoplasm. This, in turn, will involve studies of the effect of environment, heredity, disease. Variation and reproduction, too, must be studied. In every instance results must be arranged under the categories of organism, organ, tissue, cell, and protoplasm. Final generalisations are only possible as these various studies attain completion, and none has yet reached this stage. When, in the past, it has seemed that finality has been attained, and B. has become dogmatic, the discovery of fresh facts or of a new technique has rendered many of the current generalisations untenable. But any partial generalisation is a gain, provided it subsumes the available facts, since invariably it leads, sooner or later, to fresh investigations and to the further development of one or more of the special

sub-sciences which compose B. The most comprehensive generalisation is the theory of evolution. The great value of Darwin's formulations was that it caused a transition: the attention of workers was transferred from specialised fields of study to the whole of organic nature, and thereby a new impetus was given to special studies themselves. Darwin's views, however, were destined to be modified considerably as a result of the investigations which they initiated. His work gives no explanation of the origin of variations, but points out that variations occur. It likewise gives no account of the mechanism or the laws of heredity, though it assumes that traits are transmitted. Nor does it attempt to explain the problem of the origin of life, though it suggests that the multifarious species of plants and animals have developed from a smaller number of species, and these again in all probability from a still smaller number. Darwin, it is true, made suggestions and speculations regarding some of the problems, but what goes by the name of Darwinism, and is still accepted as such, is the doctrine of the origin of species through the operation of natural selection.

A generalisation so comprehensive as that of Darwin could be made only after many years of work on the part of a large number of investigators. Darwin owed a great deal to the labours of those who had observed and catalogued the facts of plant and animal life, who had surveyed the material available and attempted to arrange it in systematic fashion. Darwin lays under contribution the work of zoologists and botanists, anatomists, embryologists, geologists, and palaeontologists; as well as the experience of practical breeders, and the speculations of Malthus regarding the relation between the increase of pop. and the means of support. One immediate result of Darwin's work, therefore, was the bringing together of a large number of workers in the specialised sub-sciences, through the realisation that these were not separate and independent, but were branches of the science of B.

Nevertheless, Darwinism called imperatively for work in all these various sub-sciences if it was to be firmly established. Exact knowledge had to be gained in regard to (a) the occurrence of variations; (b) the heritability of variations; (c) the role of variations in the struggle for existence. Each of these problems needed to be taken up by specialists.

One of the immediate sources of controversy was the question whether 'acquired' variations could be transmitted, *viz.* variations resulting from habit, accident, disease or education acquired during the lifetime of the individual. Weismann developed, mainly on the basis of embryological and cytological work, his celebrated theory of the germ plasm. According to him, the cells of the developing embryo at a very early stage of development are of 2 kinds—those which are destined to form the bodily tissues of the organism, and those which are destined to form the germ-cells. The body is to be regarded as the guardian

of the germ-cells, organised for the purpose of transmitting the germ plasm from generation to generation. Somatoplasm is not converted into germ plasm, and consequently nothing that happens to the body of the organism has any effect: the results of habits acquired during lifetime, etc., cannot be transmitted. Weismann explained the origin of variations by utilising the newly discovered facts of cell div., though he carried his speculations into fields where confirmation by microscopic research was impossible. He supposed that the chromosomes of the nucleus were composed of minute ultimate elements, each of which corresponded to a unit character of the developed organism. The 'reducing divs.' of the maturing ovum, and the comparable processes during spermatogenesis, were therefore to be regarded as a means of eliminating a number of unit characters and fertilisation as a means of introducing fresh unit characters. In this way, Weismann and his followers maintained, the origin of variations could be explained. Natural selection eliminated those organisms whose variations did not help them in the struggle for existence, and preserved those whose variations were favourable. Nevertheless, some of the further developments of Weismann's theory were tantamount to an admission of the effect of habit on the germ plasm; if an organ was not used, for instance, then its determinants within the germ plasm were weakened, and ultimately perished as a result of the competition for survival which went on within the organism. This is an admission that the germ plasm *may be modified* as a result of a mode of life developed by the individual organism. There are also difficulties in the application of Weismann's theory to plants, where the clear-cut distinction into somatoplasm and germ plasm shown by many animals is entirely absent.

Weismann's theory directed a great deal of attention to the structure of the chromosomes of the nucleus of the germ cells; and many of his speculations regarding the character of this structure were confirmed. The modern theories of heredity conceive the existence of invisible elements termed genes, and justify the assumption by means of numerical and quantitative data. The modern theories differ from those of Weismann in that they do not arbitrarily assign properties to these ultimate elements to suit their views, but endeavour to assert no more about the genes than they are compelled to do by actual evidence. Knowledge of the structure of the chromosomes has been carried far beyond the point at which actual observation is possible, principally through the development of a technique which originated with Gregor Mendel. Mendel's work was carried on largely with peas. By crossing dwarf plants with tall plants, he obtained a large number of hybrids, all tall. By self-fertilising those, he obtained seeds which gave a generation in which there were three times as many tall plants as short ones. He explained his results

by assuming that there was present in the seed an element which determined the character 'shortness' or 'tallness.' Pollen grains and ovules of the pure dwarf parent plants contain only the short element; those of the pure tall plants carry only the tall element. When we cross short and tall together, fertilising 'tall' ovules with 'short' pollen, or vice versa, the offspring are tall, though their cells contain both 'short' and 'tall' elements. However, when the pollen cells and the ovules mature, the maturation processes eliminate one of these elements, so that one-half of the pollen grains carry the 'tall' element and the other half the 'short' element; the same is true of the ovules. Fertilisation brings together the

Cambridge University Press
GREGOR MENDEL

elements in the following ways: SS:ST:TS:TT. That is to say, since the combination of short and tall produces tall hybrids, one-fourth of the total number of plants will be short and three-fourths tall. Mendel's work, which was lost sight of for nearly half a century, led at the beginning of the twentieth century, under Bateson and Punnett in Great Britain, to a great deal of research, confirming and extending the original work of Mendel. In America, T. H. Morgan has carried out a series of researches into unit characters and the structural units of the chromosome, using the small parasitic fruit-fly, *Drosophila*. He, in agreement with Bateson and Punnett, has discovered that the genes are not so free as the early work led the Mendelians to believe, but that some of them tend to function as if they were strongly linked together. In this way, these and other workers have been able to furnish explanations of why certain types of inheritance occur, and why others do not. In the hands of Morgan and his school heredity has become an exact science.

Darwin had regarded variation as

progressive. That is to say, variations began as slight deviations from the normal, and tended to increase in magnitude in successive generations. The Dutch botanist, de Vries, claimed, as a result of his observations of the evening primrose (*Oenothera lamarckiana*) that it was possible for a species to give rise to progeny so markedly different from the parent that they must be regarded as constituting a new species; and asserted that the origin of species must be explained by such gross variations, or 'mutations.' De Vries's theory is still considered to be important as suggesting one factor in the mechanism of evolution. He did B. the service of calling attention to the fact of mutation, and insisting upon the necessity of studying carefully the character of variations, and relating their occurrence to the ultimate structures of the germinal cells.

The charge made against natural selection was that it stressed too strongly the influence of external conditions; seeking to explain the phenomena of living matter by reference less to the organism than to the environment. What was overlooked was that for the biologist the function of the environment was to cause a reaction of the organism, which could be understood only by reference to the organism. Neo-Lamarckianism stresses the importance of form, structure, and functional adaptation, and regards the environment as the stimulus through which what is implicit in the organism becomes explicit as activity; action and then habit. In such or similar terms the transmission of acquired characters is explained; and it at once becomes clear why such experiments as those by which Weismann sought to prove the non-transmissibility of such characters (e.g. cutting off the tails of newly born mice over a series of generations without apparently diminishing the length of the tails of their offspring) are regarded as irrelevant. William McDougall, of Duke Univ., carefully trained rats in specially constructed cages, with the object of discovering where there was marked improvement in 'educability' in later generations. Until his death Prof. MacBride was the leader of the Neo-Lamarckian school in Great Britain.

Morphology. As seen in the historical sketch already given, starting with Gesner, we arrive at the seventeenth century with this sub-science in a rudimentary state. Ray and Willughby then attack it scientifically, and with Buffon it reaches the greatest extension of which it was capable whilst it remained natural hist. He traced out all that was known in the old world with accuracy in his great work on natural hist., and then Linnaeus effected a further improvement by means of his artificial system of classification. This prepared the way for the work of Jussieu in botany; his classification depending not upon external form alone, but resting on a basis of comparative anatomy. Cuvier, taking up the same task in zoology, completed the foundations of the natural system of classification.

cation. Bichat proceeded to the analysis of organs into tissues, Schleiden and Schwann resolved the tissues into cells, and Dujardin and von Mohl the cells into protoplasm. At the same time, the study of embryology, the development of the organism from the ovum, was carried on by von Baer along the lines laid down by Harvey, Wolff, and Robert Brown; so that the elaboration of cells into tissues, and tissues into organs, became exactly known. It became possible to trace the development of an individual organism, knowing its structure and the processes associated with each stage of that development, and to link up the hist. of the individual with that of the race. Any attempt to resolve living matter into something less complex than protoplasm removes the study from the realm of B. to that of physics or of chem. Morphology, then, must be studied in terms of organism, organ, tissue, cell, or protoplasm. Morphology and physiology are the 2 great divs. of the science of B., since between them those cover the whole field of the inquiry into the functioning of organisms.

Physiology. Understanding of physiology is so closely linked to the development of other sciences that it is not at all surprising to find that in the ant. world the knowledge of physiology was practically nil. Hippocrates introduced into medicine the conception that the functioning of the organism was the proper subject of the physician's study; and Harvey, by his demonstration of the circulation of the blood, showed that the processes of life are in some instances bound up with the operations of definite organs, thus stimulating research into the physiology of the various organs of the body. From this, Bichat later developed the study of the functioning of tissue; and Virchow, later, went on to the study of the functioning of the cell. Physiology has to deal ultimately with the processes of growth and waste (metabolism) in the protoplasmic cell, the causes of life and death; so that Bernard's work in relation to these processes of the protoplasm was obviously of very great significance. Morphology and physiology have developed along similar lines, and quite early it was apparent that the two are interdependent, and that each is necessary to the proper interpretation of the other.

Embryology and Evolution. But though morphology and physiology, as the study of the form and functioning of living organisms, are the main branches of B., embryology is capable of linking the two in ways which enable us to look at living matter comprehensively. We begin with the cell, and we observe form changing progressively in close relation to progressively changing function. Haeckel's assertion that all living organisms develop from an ovum was considered of little importance till Wolff reasserted it in the eighteenth century, and it was only after von Baer had developed the science of embryology, and Schleiden and Schwann had estab. the cell theory, that its significance was generally realised. Obser-

vation of the parallels between the facts of palaeontology and those of embryology, and the realisation that the hist. of the individual organism more or less closely resembles the chronologically increasing complexity of organisms, led to the attempt to explain and understand embryological development according to the theory which is termed evolution. Embryology is capable of giving us a historical point of view in the fields of morphology and physiology; enabling us to understand both structure and function by means of their development through progressive stages from simple structure and simple function. This historical study is essential as a supplement to purely descriptive studies if we are to comprehend either structure or form as results of an evolutionary process.

Nature and Origin of Life. Until recently, though the mass of mankind believed that life owed its origin to an act of creation by a divine being, men were nevertheless ready to believe that living organisms could be spontaneously generated from dead or inorganic matter. Vinegar, left alone, might generate eels. Flies and lice might develop from dust. Bees, or rather two-winged flies mimicking bees very closely, might be formed inside the carcass of an animal. Men who hesitated to believe in these alleged phenomena might nevertheless believe that micro-organisms might spontaneously be generated in various infusions—infusoria (as their name implies) from infusions of hay, etc. But, though these beliefs are no longer held, and though it is not seriously doubted that existing organisms are the products of previously existing organisms, two questions constantly arise. The first of these is the question of the origin of the first living matter, from which we may assume all living forms to have been derived. The second is the question of the possibility of making living matter from inorganic materials in our laboratories. The latter query has been raised anew of late years, partly as a consequence of the success of biochemists in synthesising complex compounds hitherto known only in association with living organisms, and partly as a consequence of experiments in the growing of living tissues, severed from the living organism, over long periods of time in appropriate inorganic chemical solutions. It may be urged that the consideration of these problems does not properly fall within the prov. of the biologist, but their results, if not their investigation, are strictly relevant to the study of living matter. It has been estab. that living matter always consists of a complex substance or substances composed of carbon, nitrogen, hydrogen, and oxygen, with traces of other elements and about 70 per cent of water; the components of that primary form of living matter known as protoplasm. Further, living matter is always in a state of physico-chemical change, i.e. it is constantly changing its chemical composition and at the same time liberating or storing energy. One type of change is the

elaboration of chemical substances of more complex character with absorption of energy; whilst the complementary type of change involves the breaking down of complex into simpler substances with liberation of energy. The respiration of air or oxygen causes oxidation of complex substances with production of carbon dioxide, water, and other compounds and liberation of energy, with waste of tissues; whilst the utilisation of food results in reconstruction and storage of energy. The one process (katabolism) is waste and decay; the other (anabolism) is repair, renewal, growth, and storage. The two are included in the single term metabolism. The food taken in by most animal organisms consists of the protoplasm of plants and animals; whilst green plants have the power of building up from carbon dioxide, water, and mineral salts a number of substances, and ultimately protoplasm itself. The condition upon which life depends would seem to be the quantitative relation of anabolism to katabolism. If katabolism is in excess of anabolism, the organism is wasting and decaying; if the reverse, the organism is growing. Should the two exactly balance one another, then the organism is stationary. Nothing comparable to this occurs in non-living matter. A crystal will grow if it be suspended in a saturated solution of matter similar to itself in structure, but there are striking differences between the growth of crystals and that of organisms. In the first place, the crystal will grow only at the expense of matter similar to itself, whilst plants grow through the utilisation of materials widely different from themselves, and even animals absorb materials different from that of which they are made up. Again, crystals grow only by accretion at the surface, while the growth of living matter is always a process of inter-susception between existing molecules in the cells. Further, all living matter decays and dies by resolving itself into products of oxidation, and the life processes can take place only under certain restricted conditions of moisture and temp. All living matter reveals, under the microscope, that its various parts differ chemically and physically; and in most living things these different parts are organised into organs and tissues visibly different. Even the simplest forms of life have the power of reacting to stimuli, which is termed *irritability*. Again, in its mode of propagation, living matter stands in sharp contradistinction to non-living matter; for, all living matter is believed to derive from pre-existent living matter (biogenesis), a portion of which is detached and develops the same power of reproduction by means of div. Nothing is known in the realm of non-living matter which resembles these properties of living matter. These facts seem to imply a div. between the two, but it is nevertheless by no means easy to distinguish simple forms of living matter with certainty from non-living matter, a difficulty well illustrated by the virus particles which cause such diseases

as smallpox and measles, and which are still widely believed to lie on the boundary between the living and the non-living. The criterion may be, after all, not chemical composition, but power of adaptation and functioning. Although a great deal of progress has lately been made in the direction of the synthesis of very complex compounds, chemists are still a long way from the synthesis of anything like protoplasm itself. The actual manuf. of protoplasm, were it achieved, would not necessarily mean that the problem had been solved—since some speculations proceed on the assumption that life is an entity, distinct from, though associated with, living matter, whilst others assume that once the organisation of matter assumes particular types of complexity, the matter is living. It has been suggested, for instance, that in the earth's earlier phases, under different temp. conditions, other forms of life existed, associated with chemical substances, perhaps as complex as protoplasm, but composed of different elements and with different physical properties—but nevertheless irritable, capable of adaptation, of reproduction and of metabolism. Such speculations are based on the view that life and living matter are the same thing. On the other hand, all the 'creation' theories have held that life is something put into matter which, animated by this new principle, becomes living. Some modern vitalists hold what is, in essentials, a similar view, regarding life as an irreducible entity—something unique, which cannot be expressed or explained in terms of anything other than itself. It has a vital spark. Bergson's *élan vital*, which can never be imitated. Others—non-vitalists, materialists, etc.—hold that the entities which the chemist and the physicist consider are adequate to explain life, which is not a separate entity. All that can be said with certainty is that up to the present no success has been achieved as a result of attempts to produce living matter in the laboratories, and that we know of no way in which life is produced except as the result of the reproduction of pre-existing living beings.

Belief in spontaneous generation died hard. As early as 1660 Francesco Redi, of Florence, found that the maggots in decaying meat arose, not from the putrefaction, but from eggs laid on the meat by flies; and that if the meat were covered with a thin cloth, no maggots were found. Nevertheless, he believed that gall-flies and intestinal worms were produced spontaneously. Buffon, Needham, and Lamarck believed that minute life-units were scattered through the universe, and that these spontaneously organised themselves into forms of life. Spallanzani showed that by boiling organic substances and enclosing them in airtight vessels it was possible to prevent living creatures from forming in them. But the greatest blow to the theories of biogenesis, renewed by Pouchet (1800-72), was the series of experiments carried out by Louis Pasteur (1822-95). Since that time

Charlton Bastian is the only man of scientific eminence who has seriously questioned biogenesis. Nevertheless, these experiments merely prove that those living organisms which were believed to have been spontaneously generated were reproduced by pre-existing organisms. They do not touch at all upon the question whether it will be possible to make living organisms, perhaps different from any known species, in the laboratory, from inorganic materials. This is a question which time alone can answer.

Lord Kelvin suggested that life was brought to the earth by meteorites. This is not, however, a speculation about the origin of life, since it deals merely

LORD KELVIN

with its transmission within the universe and says nothing at all about its ultimate origin. Essentially, it merely alters a little the form of the question, from 'How did life originate on the earth?' to 'How did life originate in the universe?' Preyer suggested that the law of the conservation of matter and energy extends also to life, and that it is as reasonable to believe that non-living matter has been evolved from living as to believe the contrary. Ray Lankester took the view that living matter was evolved from non-living matter by gradual stages, and that the first protoplasm fed upon their ancestors. This view fits in well with the general theory of evolution. It assumes that at some time in the earth's hist. the conditions of temp., moisture, etc., were such as to allow the formation of highly complex chemical compounds. Some would break down immediately, whilst perhaps others would—owing to their capacity of being able to use other substances—tend to re-form as fast as they were disintegrated. The theory of the survival of the fittest is applied here. Those compounds best fitted to survive, on account

of their metabolism—their capacity for maintaining a balance between growth and waste—would live on and gradually evolve into protoplasm. Schäfer held a similar view, and believed, in 1912, that the synthesis of the substances akin to protoplasm was on the point of becoming possible, and that before long life would be made artificially in the laboratory. The hope has not yet, however, been realised, nor do we seem measurably nearer the artificial creation of life than we were in 1912. Huxley and Spencer were inclined to believe that biogenesis is now the rule, and that, in all probability, the actual conditions under which life was evolved in the past have disappeared, with no likelihood of reappearance. It may be, of course, that the conditions demanded for the development of life from inorganic materials are so complex, involving so many precisely adjusted factors, that the possibility of the situation occurring twice over, either on the earth or elsewhere in the universe, is an incredibly remote one. Nevertheless, the view is widely held that some form of vegetation, even if not of animal life, occurs on the planet Mars, whilst conditions on Venus resemble those on the Earth at the time when life here first originated. At least one other star besides the Sun has recently been shown to possess a solar system, so that on the ground of probability alone it is unlikely that our own planet is the only one where life is in existence. Perhaps, in so unique a situation, life began. In any case, however, the facts are little further advanced now than they were some years back, in spite of real advances in the field of biochemistry, and we can only say that the origin of life remains a mystery—all forms proceeding, as far as we know, from previous forms; and that we have no evidence that any form of life is being evolved from non-living material.

The Cell Theory. Briefly stated, the cell theory asserts that all plants and animals—in fact, all living matter—consist of one or more cells, composed of protoplasm, and organised into a nucleus and surrounding cell-body. Growth is due to the increase in size of the individual cells, or to their multiplication; or both. Reproduction essentially consists in the div. of these cells into two, so that ultimately each living organism is the product of a single cell. Differentiation is the consequence of a div. of labour amongst the constituent cells of an organism. The vital activities of an organism, therefore, may be regarded as the sum total of the activities of the cells composing it. The cell theory is one of the greatest generalisations of B. The doctrine that every organism is the product of a single cell, which multiplies itself by successive divs. thus forming a group of cells from which the organism is gradually formed, is the basis of the whole study of comparative embryology, which only became possible as a science when Schleiden and Schwann formulated the cell theory.

Embryology. The generalisations of B. have been developed in so great measure

with the help of the study of embryology, that some conception of the general conclusions of embryology is essential to the comprehension of B. As has been already said, the cell theory teaches that all organisms, from the simplest to the most complex, begin life as single cells; embryology studying in detail the whole process of development. It has been discovered that, although the process necessarily varies in the different groups of plants and animals, it is nevertheless possible to generalise extensively regarding the process. The simplest organisms never consist of more than one cell, which, after a time, divides into two parts, each containing a share of the cell-substance, the nucleus and the nuclear contents. There has been a great deal of speculation why this should happen. It has been pointed out that, in a single cell, the power of responding to external stimuli and of taking in food are functions of the external surface, whilst the total needs of the organism are to be regarded as a function of the total bulk, *i.e.* of the volume. We may say that, generally speaking, anabolism is dependent upon the extent of surface, and katabolism upon volume; *i.e.* the one varies as the square of the radius and the other as the cube. In other words, in the growing organism there is a race between growth and renewal on the one hand, and decay and destruction on the other. There is thus, for every cell, an optimum bulk beyond which growth is a handicap, and at this point, it is assumed, the cell safeguards itself by dividing into two smaller ones. Although, when such division has once occurred, the original cell no longer exists, its actual material is part of the new cells. In the simple forms of organisms, consisting of single cells, it is possible to say, therefore, that death never occurs; and that the cells, though not everlasting, are nevertheless immortal. In such forms of life there is no distinction between body and organs. All the functions of a living organism are performed by the one body, and though we speak of the unicellular organism as a simple form of life, physiologically it is very complex, since it performs all the varied functions of nutrition, reproduction, response to external stimuli, excretion, etc., itself. From the metabolic position, as has already been seen, the matter is simpler; all the various activities of the living cell may be summed up under the heads of anabolism and katabolism—or growth and waste. The form of reproduction which has been mentioned in connection with these organisms is known as asexual reproduction, or reproduction by simple fission. A slightly higher, though really hardly different method is that shown by some single cells, such as yeast, which bud off tiny portions of themselves which eventually become separate and grow approximately to the size of the parent cell. Another form of reproduction which can be observed with some unicellular animals results from conjugation. Here two apparently similar cells unite into one,

and then divide to give rise to new individuals; we have here the rudiments of the sexual process which reaches its highest development in the reproduction of the flowering plants and the mammals.

A higher stage of life is reached when a number of similar cells unite together to form a body. We thus have an organism made up of a number of cells (multicellular), and here we see differentiation, certain cells assuming one function preponderantly, and some another. Some cells take on the function of digestion and nutrition, some movement and some reproduction. At a still higher stage, groups of cells become organised, for the purpose of carrying out in common a single function, into aggregates—the tissues; and eventually, in higher forms, tissue aggregates occur—the organs. In these higher forms of life the cell has split up into aggregates of cells of specialised structure, carrying out different functions, but nevertheless all have originated in a single cell, and unitedly they may be termed the organism or body. In the course of the development of the organism, differentiation is constantly going on, and 2 main directions may be distinguished. Some of the cells are differentiated into those which are destined to form the bodily tissues and to be concerned with the functions of nutrition, movement, and response; others are differentiated into the germ cells, which will undertake the function of reproduction. It is clear that for the persistence of the race the function of reproduction is of paramount importance, so that the reproductive cells may be regarded as more important than any others. The reproductive cells are of 2 types, known as ova and sperms (sometimes called spermatozooids in plants and spermatozoa in animals). In dioecious plants and animals, the sperms are carried by certain individuals called males, and the ova by others, termed females. Sometimes a single individual—hermaphrodite—carries both sperms and ova, but in such cases there are, frequently, elaborate mechanisms which ensure the impossibility of union occurring between ova and sperms derived from the same organism. Ova and sperms differ in structure and in function. Ova are normally quiescent and stored with nutriment for the nourishment of the embryo in the early stages of development, whilst sperms are smaller and more active, being provided, in many cases, with structures which enable them to swim about and make their way to the ovum. Sperms which do not unite with an ovum die; and so, in all but exceptional cases, do ova which fail to unite with a sperm. For reproduction to occur a sperm must penetrate an ovum. The nuclei of the two fuse, and the cell material of the sperm is absorbed into the cell material of the ovum. The resulting cell is known as a fertilised ovum, which begins to divide, forming first 2, then 4, 8, 16, etc., cells. In suitable conditions the fertilised ovum will give rise to millions of cells by repeated division and sub-division. The

cells produced by the fertilised ovum have, in very many cases, been observed to be differentiated, very early in division, into germ-cells and somatic cells. No other cells, excepting the germ-cells which are embedded in the reproductive organs till they take their part in reproduction, ever unite to produce a new organism. Somatic cells may increase their number by division, and it is possible for missing parts of organs to be renewed; but repair and regeneration must not be confused with reproduction, a function which is reserved entirely for the germ-cells.

It should be remarked, in passing, that exceptionally it appears to be possible to fertilise an ovum without the aid of a sperm. The eggs laid by the virgin queen bee hatch into drones, and the green fly (*Aphis*) produces large numbers of young from unfertilised eggs. These are cases of parthenogenesis (virgin birth). Still more remarkable is the fact that the unfertilised ova of the sea-urchin may be made to commence development merely by immersing them in inorganic chemical solutions; and that the unfertilised ovum of the frog commences to develop when the egg is merely pricked. Recently a similar claim has been made for eggs of the rabbit (i.e. a mammal), which have been caused to develop as far as the adult stage without any process of natural fertilisation. The only recorded cases of parthenogenesis in humans are those concerning the birth of Christ and the religious leaders of other sects. On such grounds it has been urged that the function of the sperm is purely chemical or mechanical, and that it is not indispensable. But this statement is too sweeping. Geneticists have shown beyond doubt that the sperm carries half of the unit characters which will determine the attributes of the offspring. In some cases of parthenogenesis, observers have seen a part of the ovum, which is normally rejected before fertilisation, returning to the ovum and functioning as a sperm. Again, ova which have been stimulated to development by means of physical or chemical stimuli do not develop normally: even the carefully worked-out methods of Loeb (1859-1924) produced larvae which were not quite normal. What becomes clear from all this is the extremely complex character of the apparently simple process of fertilisation, and the great need of a vast amount of specialised work in many fields before we shall be able to gain a final and comprehensive view of its purpose and the means by which this is achieved.

Closely related to the problems of fertilisation is the problem of death. Weismann regarded the mature organism as the mere guardian of germ-cells destined for reproduction, and death as the nemesis of reproductive acts: once the germ-cells had been brought to maturity and released in sufficient quantity to ensure the perpetuity of the race, the body was of no further use. Death, therefore, appeared to him inevitable. But it is clear that the matter cannot be allowed to rest at this point. If the germ-cell is im-

mortal, and the somatic cell is destined to perish, in what ultimate differences of structure or material does this difference lie. Unicellular organisms, as has already been said, are potentially immortal, and this quality is shared by germ-cells. The somatic cells are formed by the germ-cells; by specialisation they lose their power of reproducing new individuals, though they may divide to produce other cells of their own specialised type. Death seems, then, to be involved in differentiation—the germ-cell *may* die as a result of violence or disease or unfavourable conditions, but the body cell *must* die in any event. However, the various problems raised in this connection have not been solved, and in late years attention was again directed to some of them as a result of experiments in rejuvenation of body tissues.

Perhaps the greatest generalisation in the field of embryology is the recapitulation theory. The embryologists of the earlier half of the nineteenth century had observed that there were interesting resemblances between the early embryonic forms of animals markedly different from each other at maturity. For example, the resemblances between the embryos of sharks and birds and dogs were obvious, in spite of the great differences between adult sharks and birds and dogs. Further, there were resemblances between the very young embryonic forms of creatures so widely different as worms, sea-urchins, frogs, and mammals. Development, that is to say, proceeded on parallel lines up to a point at which divergences began to occur. These phenomena were not intelligible until the theory of evolution had been announced. It was clear to early observers that individual evolution occurred in development, but it was not possible for them to interpret their observations generally until the doctrine of the origin of species came to their aid. It was then realised that individual development became intelligible as a recapitulation of the stages through which the race had passed in its evolution from a simple to a complex organism. Von Baer first enunciated this principle, which is generally named after him, though Haeckel later enunciated it in the form: ontogeny (the development of the individual) recapitulates phylogeny (the evolutionary hist. of the species to which that individual belongs). Further research has shown that often a great deal of omission occurs, and that other complications interfere with the accuracy of the detailed reproduction of the past; but nevertheless the general truth of von Baer's law is admitted. It has, however, been criticised recently by de Beer; the stages in development of the individual are held by him to recapitulate similar stages in the *embryo* of the ancestors, not in the adult form of their ancestors. The principle of Baer's law has been widely used in the fields of sociology, anthropology, etc., and, provided the application is not strained too far, it is capable of illuminating a great many problems. In B., it has been used in the effort to construct genealogical trees of existing species of

animals and plants, and demonstrating their historical relationships; in this way embryology and paleontology have been able to give each other mutual assistance. But it must be remembered that the evolutionary hist. of a single species extends over many millions of years, whilst the process of individual development is a matter of days or weeks, of months at most. Consequently, it is impossible that the development of the embryo from the ovum can do more than retrace the main outlines of the development of the hist. of the race; details must necessarily be omitted, and short cuts often taken. There has been speculation why the ovum must develop into the mature adult by means of this often circuitous route, when greater economy would be secured by more direct means. For example, in the developing human embryo, as in the embryos of the shark and the chick, gill-slits appear. In the shark they are the basis of gills, but in the chick and the human being they simply close again. It has been suggested, however, that such structures provide the necessary stimuli for the development of the structures which subsequently replace them; and this view seems to be borne out by recent work dealing with the hormones, chemical substances generated within the organism and passed into the blood-stream to activate other parts of the body. It seems likely that structures arising in the course of development and disappearing before development is complete may function in this particular way, giving rise to substances necessary for the development of other parts. It has been found that the total removal of embryonic structures interferes very definitely with proper development, whilst their transplantation to other parts of the embryo has quite other effects. Work in this particular field of research is still being carried on at present. Julian Huxley, too, has demonstrated that extracts of endocrine glands may have a marked effect in accelerating development, or even in extending it beyond its usual stage in certain cases, such as axolotl. This creature does not normally pass beyond a tadpole stage of development, but with the use of thyroid extract can be made to develop to the adult amphibian stage.

The Darwinian theory first estab. a scientific explanation of the evolution of living organisms. It differed very greatly from all the evolutionary speculations which had been made before Darwin, some in ant. Greece, inasmuch as it was based on a vast collection of facts and, furthermore, indicated very definitely the direction in which other facts were to be sought. Further it regarded evolution as something which was still going on under the influence of conditions operative at the present day. Darwin asserted that the facts of variation, heredity, and the struggle for existence were completely adequate to explain the multiplicity of species inhabiting the earth as well as the extinct forms revealed by the geologist. A good deal of the evidence upon which

Darwin relied was taken from the practical experience of breeders. These, as Darwin pointed out, constantly improved breeds, evolved new strains, and allowed others to perish, by a process of artificial selection. Certain animals were allowed to survive and to breed; others were killed off. The condition of survival was fitness for the breeder's purpose. In nature, the condition of survival and perpetuation was 'fitness to survive,' viz. the power to compete successfully with other living creatures for the means of subsistence. The simplicity of the Darwinian formula proved misleading to a great many people. It was conceived that the Darwinian theory implied that human beings and animals were mere creatures of environment, and that, through modification of the environment, the aims of philanthropists and social reformers might be achieved. Often enough, too narrow a view of environment was taken, so that an over-simplified doctrine was subjected to still further unjustified simplification, environment being considered as nothing more than an aggregate of material surroundings. It is not necessary to deal with the literature which grew up as a result of confusing the 'fittest to survive' with the morally best? It is merely necessary to point out that in the situations which Darwin conceived as determining survival we are dealing with a totality which involves an object which permits a great variety of activity in respect of it, and a living organism which acts in certain ways. What determines the result is the appropriateness of the organ's reaction for producing those results which mean survival. It is not the mere possession of a structure which counts for so much, but the utilisation of that structure—so that we rapidly pass from the consideration of the material environment to those characters of living matter which are studied by the animal psychologist as 'animal behaviour'. Modern psychology, which stands in very close relation to biology, regards 'behaviour' as a double function, involving at the same time the organism which acts and the objects towards which it acts.

The work which has been done since Darwin's time has not materially affected his theory, though it has modified and amplified the terms he employed. The fundamental fact, first pointed out by Malthus (1766-1834), that the pop. increases at a faster rate than the means of subsistence, remains true, in spite of the opening up of new lands, the improvement of agriculture, and the discovery of new supplies of food. The obvious fact pointed out by Darwin, that far more individuals of every species of living organism are born than can survive, cannot be disputed. The importance of environment is as fully recognised as in Darwin's day, though a great deal of investigation is necessary in every instance before it can be said what is the precise significance of a given object to a given organism. We may exemplify here, perhaps, the detailed studies of

Ross, which revealed exactly what it was within a malaria-infested area which constituted a favourable environment for the mosquito, and made it possible to change it by simple methods into an area in which the mosquito could not survive. Heredity has been a subject of detailed and brilliant research since Darwin's day, and the experimental work in the field promises to make it almost an exact science capable of obtaining results which can be predicted beforehand. Variation, too, has been a subject of careful and detailed study.

The experimental studies of heredity and variation belong, in the main, to the twentieth century. Galton (1822-1911) realised that the question of the tendency of parents to transmit their characteristics to their offspring must be investigated, in part, at least, by a statistical method. Mendel, it will be remembered, working earlier and independently, had arrived at the same conclusion. The difficulties of individual investigation of human heredity were largely caused by the fact that there was no precise knowledge of the history of the feature the inheritance of which was being investigated no matter how thoroughly that feature was known in the individual. Galton's contribution to biological knowledge lies not so much in his actual theories of heredity, as in his discovery of a method which Morgan, Blakeslee, and Riddell have since used successfully.

If environment is regarded as the means of making explicit what is implicit in the individual (*e.g.* the capacity to eat is expressed as behaviour only in the presence of an edible object), variations may be looked upon as being partly inherited and partly acquired. Structures which may be used in certain ways are inherited, but modes of using them are acquired. The environment, though it may stimulate certain organisms to act in certain ways, cannot possibly do so in the case of others. Tempting food at the top of a tree may cause a monkey to climb the tree or a bird to fly to it, may stimulate a dog to frantic and futile efforts: it cannot, however, make the dog, whose limbs are unfitted for climbing, climb. The cause of the effort, in all these cases, is a relation between the animal and the food. If the animal were indifferent to the food, the possession of suitable climbing structures would not induce it to climb the tree. Some such line of criticism as this must be applied to the experiments of Weismann and his followers to show that acquired characters were not transmitted, by the mutilation of successive generations of rats and mice. There was no innate tendency towards taillessness in these animals, and Weismann's attempts to stimulate something which did not exist came to nothing. From results of experiments made by Kammerer, Sumner, and other workers, Neo-Lamarckians believe there is no longer any room for doubt that some acquired characters are transmitted, and the question to be solved has thus become that of which characters are so transmitted, in what

ways and to what extent. It has been pointed out that the results of education are not transmitted in human beings, but, on the other hand, men vary in their capacity to be educated, so that we may post a hypothetical variation, 'educability.' It is not possible to define and measure it in men, and, further, the interval between successive generations makes man an unsuitable subject for experiment of this kind. William McDougall, however, conceived the possibility of educating rats, by training them to learn how to interpret signals which lead them to food, failure to follow the proper signals resulting in punishment by means of a mild electric shock. It is possible here to estimate the speed at which the rats learn by counting the number of trials necessary before the rat has learnt how to reach the food without making mistakes. If the same experiment is repeated through a number of generations, evidence will have been accumulated which will indicate whether the results of training are transmitted to later generations in the form of an increased facility to learn. McDougall (1931) pub. an interim report in which he claimed he had evidence that this was the case.

One of the conclusions from the experiments of Mendel and his successors is that no individual possesses characters which have not been transmitted to him, even though in his individual existence he may develop and use them in ways which are different from those in which his parents made use of them. Thus, if we believe that the Alsatian sheepdog, the bulldog, and the spaniel are descended from a single race of dogs, we must believe that the members of that race possessed the characters which we find, in exaggerated form, perhaps, in their descendants. The origin of all the domestic races of plants and animals is accounted for by the view that selective breeding has resulted in the weakening or loss of factors which were present in the ancestors; and the view is confirmed by such experiments as those of Darwin, who succeeded in breeding the wild rock-pigeon by crossing extreme domestic varieties, or the reproduction of the colour of the wild rabbit by the crossing of a yellow rabbit with a Himalayan variety. In such ways we bring together the factors which have been segregated in the domestic strains. It is not possible to say what these factors are, but they seem not to be corpuscles of living matter, as Darwin and Weismann held. They may be definite chemical compounds which, entering the cell, influence metabolism, and so determine development. Of mutations and their origin little is known except that they occur, and to say that they are 'spontaneous' is merely to admit ignorance of their cause. Darwin held that great and sudden changes in environment increases variability. This appears to be true of *Drosophila* when kept under laboratory conditions; the rate of mutation has been greatly increased by subjecting this insect to X-rays, or to radium emanations. Tower, subjecting

beetles, at certain stages of their development, to heat and dryness, found that their offspring differed considerably from their parents, and were constant stocks, since they transmitted these variations to offspring, and on crossing with members of the normal stock gave rise to hybrids in Mendelian ratios. The question is opened up whether the differences in offspring of the same parents are the result of differences in the germ-cells, or of slight environmental differences affecting the developing embryo: the balance of evidence suggests that most differences are due to differences in the germ plasma

caves lose their eyes, parasites lose their locomotive organs. This return from the complex to the simple by the loss of highly specialised structures is known as degeneration. All along the evolutionary path are found organs which were once required, but are now useless or are adapted to some new function, one which they did not in the first instance serve. These organs are called vestigial, and tend to disappear. Degeneration is evidence in support of the evolutionary theory, according to which variation may be either progressive or regressive, a regressive variation being as likely to be

THE CLASSIFICATION OF ANIMALS, EXPRESSED AS A GENEALOGICAL TREE

B, *Balanoglossus* (*Enteropneusta*), an important connecting link between vertebrates and invertebrates.

However, the view that variations arise within the germ-plasm must not blind us to the fact that the germ-plasm is highly resistant to variation, since, but for this, species would eventually cease to exist.

Phylogeny. Phylogeny is the special study of organisms with a view to establishing their relationships. The earlier problem of classification, before Darwinism, was that of reducing a vast accumulation of material to order for convenience of reference and manipulation. But the Darwinian theory of descent implied that there were relationships existing between the various species of living organisms. With the help of morphology, comparative anatomy, embryology, and paleontology, it should be possible to discover lines of descent connecting the various branches of the genealogical tree. Two interesting facts stand out clearly, viz. degeneration and convergence. Forms which differ widely in their adult forms are found to be closely allied in embryonic stages. Fishes, in

a factor favouring survival in some environments as a progressive one. On the other hand, adult organisms show characters which would lead us to group them with others, were it not that the hist. of their embryonic development shows the two to be quite unrelated. In the process of adaptation to environment they have evolved structures comparable to those of unrelated organisms which have been compelled to adapt themselves to similar environmental conditions. The facts of convergence and degeneration make clear the need of the phylogenist for evidence gathered from every available source before he is in a position to say definitely in what relationship an organism stands to other organisms. The cases of the wormlike *Balanoglossus* and the lancelet (*Amphioxus*) (q.v.) may be cited. Only a full knowledge of their development would lead any one to realise that the place of these organisms is not with the worms, and that they have vertebrate affinities.

Place of Biology among the Sciences. It

is evident that B. considers all matters which throw light on the relationship of life to matter. It touches very closely, at its higher stages, the physical and the mental sciences. The study of morphology or physiology in the light of the cell theory leads to consideration of protoplasm, and it is the endeavour of some biologists to reduce this to chemical and physical formulae. Whether this be possible or not, it is clear that living matter responds in a variety of important ways to physical and chemical stimuli, and the relation of B. to chem. and physics has resulted in the development of special branches of investigation under the names of biochemistry and biophysics. Again, the statistical methods of certain branches of biological research depend upon mathematics. Psychology, too, stands in close relation to B.: if the psychologist turns to B. for definitions of environment, organism, instinct, and the like, it is no less true that the biologist uses terms borrowed from the psychologist in his descriptions of animal behaviour. The science of sociology, too, though it is the study of social aggregates, and must study the individual for the purpose of accumulating data, has to make use of concepts borrowed from B. The studies of social and physical anthropology, also, are related to biology.

Applications of Biology. Although B. is pursued purely as a branch of science, as a contemplation of, and an effort to comprehend the world of life and man's place in it, it is proving itself of utilitarian value. From the first it has stood in definite relation to medicine, the earliest botany being connected with the gathering and cultivation of plants of medicinal value. At the present day pharmaceutical research is directed towards the discovery of new remedial agents in plants and methods of extraction. The discovery and preparation of vaccines, anti-toxins, and medicinal preparations from the glands of animals is a definite application of B. to medicine. Again, the study of many diseases showed that they owed their origin to the presence of living organisms which lived either within the body (parasitic worms, filaria, germs of various kinds, etc.) or upon it (various blood-sucking insects, etc.). The development of successful procedures against the disease demanded study by competent biologists of the hist. of the organism causing the disease. Studies of this kind have made it possible to banish certain diseases—malaria, yellow fever, sleeping sickness, relapsing fever—from areas in which they had formerly been prevalent. Various diseases of plants and animals have been investigated with success, and methods devised for combating the causes of the disease. The study of pests which did damage to crops and to forests has indicated means of exterminating them, or of reducing their numbers. Modern surgery owes the development of antiseptic and aseptic methods to discoveries in the field of B. (See articles on BACTERIA; ANTISEPTICS.)

The modern study of genetics has

enabled breeders to produce new strains of animals and plants of great value. New strains of wheat and of grasses have been obtained which are more productive than the strains from which they were produced. So excellent have been the services rendered by B. in such fields as these, that the assistance of competent biologists—botanists, entomologists, and helminthologists—is a recognised part of agric. research, pest control, and related work.

Another field in which modern work in genetics promises much is the field of eugenics. This is an application of the findings of the study of heredity to human beings. At the moment very little has been done, and this not altogether successfully, to prevent the reproduction of human beings with undesirable variations which they are likely to transmit to their offspring—e.g. feeble-mindedness. Already, in highly civilised communities, there are indications that the birth-rate is lowest amongst the best types, and highest amongst the poorest. As a study, eugenics was founded by Galton. A great deal of work remains to be done before it is possible to draw up practicable schemes for utilising the findings of modern B. with the object of improving the race; and much has to be done before the general public can be educated to the view that something should be done. However, though no application of eugenics to life on any collective scale seems imminent, it is worth bearing in mind as an instance of the wide range of the science. See also ANTHROPOLOGY; EVOLUTION; MAN, etc.

Biology, Marine, see MARINE.

Bion, a Gk. poet, of whose life no record is known to exist. He was b. at Smyrna, or near by, and he lived about 100 B.C., probably in Sicily or Magna Græcia. His poems belong to what is termed the bucolic class. A few only have been preserved and among them the *Lament for Adonis* is the best known. The subjects treated by him were generally the passions of the gods. B.'s poems are usually included with those of Theocritus. Hermann's and Ziegler's separate eds. are the best. A. Lang trans. most of B.'s poems. In 1795 C. F. W. Jacobs pub. his works at Gotha, and in the same year they were pub. in London by Gilbert Wakefield. In 1807 they appeared at Leipzig. According to the legend, B. d. of poison. An elegy was written by his friend Moschus on the event.

Bion, a Gk. scientist, belonged to the family of Democritus. He lived at Abdera, and was famous as a mathematician. It was said that he taught the existence of countries where the year is composed of a day and a night.

Bion of Borysthènes (c. 274-c. 241 B.C.), a Gk. philosopher. He studied at Athens under Crates of the Cynic school, and Theodorus the Atheist. He then began his writings, of which a few fragments merely have descended to us. A typical figure of his age, half philosopher, half *littérateur*—the Greek Voltaire, as he has been called. Epigram, paradox, and antithesis characterise his fragments. He d. at Chalcis in Euboea.

Biondi, Giovanni Francesco (1572-1644), an It. writer, b. in Lesina, one of the Dalmatian Is. Introduced to the court of James I., he won the king's confidence, and a title, by the successful execution of a secret mission to the duke of Savoy. He wrote a *History of the Wars of the Roses* in It., and d. in Berne, leaving a fame based upon the elegance of his prose.

Bionomics, or laws of life, that branch of biological research which deals with the revelations of organisms amongst themselves and to their environment. It thus includes the study of heredity (q.v.), or the tendency of growing organisms to develop a symmetrical arrangement of parts which is characteristic of the species. How this tendency is transmitted is an old and still unsolved problem, though the researches of the followers of Mendel (q.v.) are suggestive. The development of parental characteristics is dependent upon the maintenance of certain conditions in the earliest or pre-natal stages of growth, and these conditions are investigated and generalised in the study of embryology (q.v.). Finally, the species being looked upon as one link in the whole chain of organic life, it is necessary to study how certain structures are affected

by the law of variation (q.v.), which have been directed by the tendencies studied under the name of evolution (q.v.).

Biot, Jean Baptiste (1774-1862), physicist, was b. in Paris. He was educated in the polytechnic school, after which he entered the artillery service. The latter he soon left in order to study natural science and mathematics. He taught physics for some years at Beauvais, after which he became prof. of the same subject in the Collège de France. In 1803 he was elected a member of the Academy of Sciences, and a year later he was appointed to the Observatory of Paris. In 1806 he was made a member of the Bureau des Longitudes, and in 1809 became also prof. of physical astronomy in the univ. of Paris. He pub. sev. excellent textbooks; among them may be mentioned *Essai de géométrie analytique; Traité élémentaire de physique expérimentale*, etc. He also wrote books on the astronomy of the ancients, Egyptians, Chinese, and Indians. Nearly all branches of physics were considerably advanced by his labours. He was one of the most eminent physicists and mathematicians of his time. He d. in Paris.

Biotite, mineral of the mica group. It is a silicate of aluminium and iron with magnesium and potassium. It crystallises into hexagonal prisms. It is often called magnesia mica, as distinct from muscovite or potash mica. The most important variety of B. is merxene, which is found in volcanic deposits. It was from fine crystals of this variety, found near Vesuvius, that mineralogists were able to determine the crystalline form of mica, which was formerly thought to belong to the hexagonal or orthorhombic systems. Other varieties of B. are rubellene, found in many volcanic rocks, voigtite, found in gravel rocks, phlogopite, which has a large proportion of silica, and lepidomelane, which is rich in ferrous and ferric oxides. When ferrous oxide quite replaces magnesia, iron mica results. B. mica is more readily decomposed than muscovite.

Bipinnaria (Lat. *bis*, twice, *penna*, a feather), name given to the larva of a starfish. Its shape is peculiar, and has a tendency to develop long 'arms.' The two ciliated bands, which at first encircle the larva, gradually extend themselves till they enclose nearly the whole of the upper and lower halves of the body.

Biplane, see under AEROPLANE.

Biquadratic (Lat. *biquadratus*, twice squared), an equation which involves the fourth power of the unknown quantity, e.g. $x^4 + ax^3 + bx^2 + cx + d = 0$, where x is unknown.

Bir (Arabic, a well), tn. of Turkey. It is situated on the l. b. of the Euphrates at its nearest approach to the bay of Iskanderun. It is about 80 m. N.E. of Aleppo, on the main route from Syria to Orfa and the Persian frontier. It had formerly a considerable trade with Bagdad by riv. Pop. 10,000.

Birbhum, dist. in Bihar prov., India, with an area of 1752 sq. m. The chief agric. product is rice. Pop. 847,000.

Birch (*Betula*), tree or shrub belonging

to the order Betulaceæ. There are about 25 species of B., and while the majority are trees of medium size, some are shrubs. B. trees are to be found in nearly every country of the N. temperate regions, and in the Arctic. The trunks are round, with slim branches, and the bark is generally in fine, soft, membranous layers. The common B. (*B. alba*) is a graceful tree, silvery white in colour. It grows quickly, but does not live long. It is found in the forests throughout the greater part of Europe, particularly in Russia, and also in Asia Minor and N. America. It is used for charcoal and for firewood. It is manufactured into furniture, used for upholstery, and for carriage building. Thousands of spoons, used in

BIRCH

Russia, are made from it. The bark and also the leaves are utilised medicinally, and for dyeing and tanning; the Russian leather is noticeable for the odour caused by the B. tanning. In N. America the B. tree is as useful. The wood is tough and durable, and is made into canoes, snowshoes, platters, and also used for house roofing. There are sev. kinds of B. in N. America; the white is used in the last-mentioned ways. The black B. (*B. nigra*) and the red B. (*B. lenta*) are other varieties of which the wood is exceptionally hard; hence their value. The leaves may be used for making tea, which has an agreeable flavour. The yellow B. (*B. lutea*) of Nova Scotia, is another species, and the paper B. (*B. papyracea*) is so called because the bark can be thinly peeled into sheets and used in the place of paper. B. oil is manufactured from the outer layers of the bark, and mixed with a fine meal it forms food for pigs. In early spring, when the sap is just beginning to rise, it is drawn from the trunk, and on account of its sugary nature is manufactured into a kind of vinegar. The weeping B. (*B. pendula*) is another species. The dwarf B., a very low shrub, is found almost everywhere in the N. part of the world. The Laplanders used it in stuffing their beds, for fuel, and the seeds for food.

Birch, Charles Bell (1832-93), Eng. sculptor, *b.* in London, the son of Jonathan B. (1783-1847), the translator of *Faust* and the *Nibelungen Lied*. He was a pupil at the school of design, Somerset House, and afterwards he went to Berlin with his father. He then studied at the Berlin Royal Academy. He won £600 in 1864 from the Art Union of London by his life-size group 'A Wood Nymph.' He became an A.R.A. in 1880, and in that year his work of the Griffin, on the Temple Bar memorial in Fleet Street, was accomplished.

Birch, Samuel (1757-1841), Eng. dramatist, *b.* in London. He was the son of a pastrycook in Cornhill. He himself was a pastrycook, the proprietor of 'Birch's,' the oldest shop of the kind in London (Cornhill, c. 1690-1926; Angel Court, from 1927). Lord mayor 1815. He wrote numerous musical dramas and poems, including *The Adopted Child*, *The Smugglers*, *The Manners*, *Fast Asleep*, *A Victim of Romance*, etc. etc.

Birch, Samuel (1813-85), Eng. antiquary and Egyptologist, *b.* in London. He was educated at Merchant Taylors School. In 1861 he was appointed to the keepership of the antiquities department of the Brit. Museum. In 1874 he became president of the London Congress of Orientalists. He trans. many hieroglyphical works, and compiled Egyptian grammars.

Birch, Thomas (1705-66), Eng. historical writer, *b.* of Quaker parents in London. He qualified himself for the ministry, and entered the Church of England. In 1734 he became chaplain to the earl of Kilmarnock. In 1735 he became a member of the Society of Antiquaries. He did a considerable amount of literary work, compiling and editing. He also transcribed a great number of works in the library at Lambeth Palace.

Birch, Walter de Gray (1842-1924), Eng. archæologist, son of Samuel B. His productions include *The Commentaries of Alfonso d'Albuquerque* and *The Cartularium Saxonum*. For 22 years he ed. the Brit. Archæological Association's *Journal*, and he issued many treatises on subjects dealing with archæology and ant. hist.

Birch-Pfeiffer, Charlotte (1800-68), actress and dramatist of Ger. origin, *b.* at Stuttgart. As soon as she was 13 years of age she began her public life at Munich, and from that time she played at Berlin, Hamburg, and other places. She was married when she was 25 to a Dr. Birch of Copenhagen. She played afterwards in Amsterdam, St. Petersburg, and Pest. Later, she became sole manageress of the Zürich theatre, and took to writing plays. She won more popularity for her play-writing than for her acting, though her works reached no very high standard. She dramatised *Jane Eyre*, and her works were pub. in 24 vols. at Leipzig.

Birchington, seaside resort in the Isle of Thanet, Kent, 2 m. from Margate and 71 m. from London on the S. railway. Dante Gabriel Rossetti *d.* and was buried here. There is a good golf course. Pop. 3000.

Bird. According to the definition of Dr. Gadow, birds are 'oviparous, warm-blooded, amniotic (see AMNION) Vertebrates, which have their anterior extremities transformed into wings. Metacarpus and fingers carrying feathers or quills. With an intertarsal joint. Not more than 4 toes, of which the first is a hallux.' This transformation of the forelimbs of Bs. into feathered wings is of the greatest importance, and the modification of the internal structure arising from it form the basis of classification of this group of animals known as Aves. The wing consists of the typical parts of a forelimb, the humerus, radius, and ulna, carpus, metacarpus, and digits. The first digit is the *pollex*, or thumb, to which some feathers, known as *ala spuria*, or bastard wing, are attached; the second digit is the *index*, which bears the large feathers known as the *primaries* or *manuals*, usually 10 in number. The primary feathers, with the *secondaries* or *cubitals*, which are attached to the ulna, form the large wing-quills, called *remiges*, which are used in flight. The sternum, or breast-bone, of Bs., is affected by their powers of flight: those Bs. which are able to fly have a carina, or keel, projecting from the sternum, and serving as the basis of attachment of the great pectoral muscles used in flight. When the Bs. are incapable of flight the keel is absent or greatly reduced. The vertebral column is completed in the caudal region by a flat plate known as the *pygostyle*, which forms a support for the rectrices, or steering tail-feathers, and for the uropygial gland (see below). The legs are composed of a femur, tibia, and fibula, and the bones of the foot; the feet have often 4 toes, but in many cases there are only 3. The proximal tarsal bones are fused with the tibia, and the distal tarsals are joined to the metatarsals; between the 2 sets is the intertarsal joint already mentioned in Gadow's definition. In swimming-birds the legs are placed well back, while in those which have an upright carriage the balance of the body is preserved by the forward position of the legs. The feet are known as *pedes radantes*, or wading feet, and *pedes gradarii*, or walking feet, according to their function, and the latter are much more completely feathered than the former. No existing species of Bs. possess teeth. The uropygial bone on the *pygostyle* is an oil-gland used by Bs. in which it is present when preening their feathers, for their skin is unprovided with sebaceous glands. The eyes are furnished not only with an upper and a lower eyelid, but also with a nictitating membrane, semi-transparent, and covering the eye at the volition of the owner. The vascular system contains warm blood, which is kept usually at a higher temperature than that of mammals; death from cold is rare unless allied with torpidity and starvation. The aortic arch is on the right side of a B., whereas in a mammal it is on the left. The respiratory system is curious, as the lungs themselves are small and are prolonged into air-sacs with which are connected a number of air-spaces in

SOME TYPICAL HEADS OF BIRDS

A, Seed-eating bird. B, One which seeks food in soft mud. C, Eagle. D, d. Duck. E, Bird with wide gape which catches insects on wing, e.g. Swallow, Nightjar. F, Heron.

the bones. These air-spaces are found in the species which are powerful flyers and require the lessening of bodily weight, but in young Bs., small Bs., aquatic and terrestrial Bs. they are either absent or negligible; in addition they increase the efficiency of the respiratory system. The organ of voice is not the larynx, but usually the *syrinx*, a peculiarity of this class formed at the bifurcation of the trachea, and the modulations are effected by adjoining muscles. The heart of a B. is enclosed by pericardium, and consists of a right and a left half; there is no diaphragm between the thoracic and abdominal regions. Digestion takes place in the oesophagus, stomach, and intestines, but it is a highly specialised function. The tongue is the first organ to aid in digestion, then comes the oesophagus, and this has frequently a dilatation known as the crop in which the food is softened; the food then passes into the stomach, in the front part of which, the *proventriculus*, the process is carried out further, then follows the gizzard, or *ventriculus*, which contains small stones and gritty matter for the grinding of the food, especially noticeable in such Bs. as feed on seeds and grain. The duties of building a nest and hatching the young cannot be definitely assigned to either the male or the female B. It is customary for the male to provide the material and for his partner to perform the architectural work, but in many cases the female provides her own material. It usually falls to her lot also to do the sitting, but there are cases in which the pair takes this in turn, and other cases in which it is performed

SOME TYPICAL FEET OF BIRDS

A, Bird that passes much of its life on the ground, e.g. Fowl. B, Percher. C, Hawk, Eagle. D, Duck. E, Coot. F, Woodpecker.

by the male alone. The cuckoo neither builds a nest nor rears its own young, but places the eggs in the nest of another bird and leaves the foster-mother to care for them. The position which Aves hold in the animal kingdom is higher than that of Reptilia, and lower than that of Mammalia; with the former class they have great affinity, but few links have been discovered to trace the transition from one to the other. The discovery of the oldest B. known, the fossil *Archæopteryx*, has been of great value in such research, and Huxley has classed Bs., and reptiles together in his group of Sauropsida. There is a resemblance in the generative organs and oviparous condition of both classes, but Bs. are never viviparous. The scales of reptiles may be compared with the feathers of Bs., but the blood of the Reptilia is cold while the blood of Aves is warm. In the development of brain, memory, and sight the lower class compares unfavourably with the higher, but the chief difference between the two lies in the adaptation of the B.'s fore-limbs to flight. This adaptation, as well as a keeled sternum, is to be found in the reptilian *Pterodactyl*, but in the absence of feathers and in the general structure of the skeleton this fossil differs greatly from a B. Among mammals the bat is also able to fly, but the specialised structures by which it accomplishes this feat are entirely different from those found in Aves.

The main reptilian features of *Archæopteryx* are the presence of teeth, the well-marked tail, with many separate vertebrae, and the claws on the wing digits (claws also occur in the embryo ostrich). This bird is found fossilised in sandstone of the Upper Jurassic period at Solenhofen (Bavaria).

In the classification of Bs. zoologists are agreed in dividing them into two unequal orders, the Archæornithes, or primitive Bs., which includes the single genus *Archæopteryx*; and Neornithes or modern Bs., which is sev. times subdivided, at first into 3 sub-orders known as Ratitæ, Odontolæ, and Carinatae. The Ratitæ receive their name from the resemblance of their breastbone to a flat-bottomed boat; they are flightless Bs., with reduced wings, and include, in addition to extinct species, e.g. the moa, living Bs., such as the ostrich, rhea, cassowary, emu, and kiwi, or apteryx. The Odontolæ are extinct marine flightless Bs. with teeth in grooves in the jaws and no keeled breastbone; an example is the genus *Hesperornis*. The Carinatae is much the largest sub-order of Bs., comprising thousands of species. It receives its name from the resemblance of the sternum to a keel, but in sev. flightless forms, as the extinct dodo and the living parrot—genus *Stringops*, this keel is absent or greatly reduced. The sub-divs. of Carinatae are by most zoologists based on the system of Dr. Gadow, and are 14 in number. The first of these, the Ichthyornithes, or fish-and-bird-like tribe, consisted of toothed species of powerful flight which are now extinct. The tribe of Colymbiformes, or swimmers, consists of divers and grebes, all of which are water Bs. with webbed or lobed feet, upright bodies, and short tail-feathers. The Sphenisciformes, or penguins, are flightless marine Bs. covered with feathers, having the wings without large quill-feathers and using them as paddles when in the water; they are confined to the Antarctic. The Procellariiformes, or petrels, are marine Bs. with webbed feet and capable of powerful flight; the albatross and Mother Carey's chicken belong to this group. The Ciconiiformes, or stork-like Bs., have feet adapted for wading, and inhabit marshes as well as the sea, and inland ponds, e.g. the gannet, tropic B., cormorant, heron, bittern, stork, ibis, spoonbill, and flamingo. The Anseriformes, or goose-like Bs., are aquatic and include all geese, swans, ducks, and screamers. The Falconiformes are Bs. of prey with strongly clawed toes and curved beaks, as the hawk, vulture, eagle, kite, buzzard, falcon, and osprey. The Tinamiformes, or tinamous, are a small tribe of earth-Bs., strong and swift in flight. The Galliformes, or fowl-like Bs., run along the ground, e.g. the brush turkey, curassow, peacock, pheasant, domestic fowl, turkey, grouse, partridge, and quail. The Gruiformes, or crane-like Bs., include the water hen, rail, coot, trumpeter, and bustard. Five groups are placed in the Charadriiformes, or plover-like Bs., which vary in habit; some can both fly and

wade, as the plover, oyster-catcher, avocet, curlew, and snipe; some can swim as well as fly, e.g. the gull, tern, auk, and puffin; others, as the sand grouse, inhabit deserts; while others again are land Bs., feeding on grain and seeds, e.g. the pigeon, dove, and dodo. The Cuculiformes, or cuckoo-like Bs., are arboreal, and are represented by the touraco in one group, and by the parrot in the other. Representatives of the arboreal Coraciiformes, or raven-like Bs., are the kingfisher, hoopoe, owl, goatsucker, swift, mouse-bird, quiscal, toucan, humming birds, and

exist in most countries of Europe and in the U.S.A. These are places set apart for wild Bs., and, in England, the best known is that in Hyde Park. There are others in the royal parks and on the N. coast of Norfolk at Blakeney and Cley-by-the-Sea.

Bs. of Various Countries. Countries especially rich in B. life are Australia and New Guinea; Brazil and other parts of S. America, including the Falkland Is.; Mexico; tropical and sub-tropical Africa; and India. Australia's B. life is particularly rich in song Bs., and not a few Australian Bs. have aroused curiosity in the past, if not in the present day. There are wonderful cockatoos, brilliant-plumaged honey-eaters, emus, lyre-Bs., master mocking-Bs., etc. Notable, too, are the mound-builders or mallee hens and scrub turkeys, of which the former are remarkable for the fact that they do not brood on their eggs, but construct natural incubators filled with decomposing vegetation, which generates the heat necessary for hatching. Other Australian Bs. are the wedge-tailed eagle, the fish-hawk of N. Australia (see OSPREY), numerous species of pigeons—bronzewing, wonga, topknot, and crested being among the most beautiful; the blue wren, the masked wood swallow, and the 'summer bird' or black-faced cuckoo. In the Amazon Valley the numerous varieties of Bs. provide many of the most brilliant plumage; but it is a very rare thing in a Brazilian forest to hear Bs. singing, and nature's artistic energies would seem to have been concentrated in the production of beauty for its own sake. In the place of melodious songsters of more temperate climates are harsh-shrieking parrots and toucans; dry chatters such as the jay, and black and yellow hangnest; melancholy wallers, like doves and goat-suckers. There are, however, some little songsters known as 'dancers' which are the size of tom-tits, with blue plumage, red topknots, and black 'points.' The jacutinga, found in enormous numbers in the middle part of the Ivahy Valley, is a species of penelope, in size and appearance something between the turkey and the pheasant. A B. of a different kind is the suruquá, which is the size of a thrush, and, with the exception of some of the humming Bs., by far the loveliest Brazilian forest B. The plumage of the male B. is resplendent purple and gold on the head, throat, and back, the breast a lovely bullfinch red, and the wings dark slate, varied with delicate white bars. Peru is also rich in B. life, notably in guano-producing species, such as the palmipeds, gaviota, and alcatraz, which at times are to be seen flying in myriads like a darkening cloud low down on the waters. Millions of cormorants, too, haunt these silent expanses of coast; scarlet-feathered flamingoes inhabit the upland lakes, and other wild fowl, some of edible value. Of the other S. Amer. countries, Venezuela boasts the scarlet ibis, eagles, and herons; Chile has but few Bs., and nearly all of sombre plumage, such as hawks, a species of turkey-buzzard, and also the condor.

Huddersfield Museum

RECONSTRUCTION OF THE ARCHÆOPTERYX

woodpecker. The last, and largest, tribe is that of the Passeriformes, or sparrowlike Bs., all of which are perchers and have few variations of internal structure. To them belong the broadbill, cock of the rock, lyre B., bush-shrike, lark, wagtail, flycatcher, thrush, wren, swallow, butcher-B., tit, B. of paradise, rook, starling, weaver-B., Amer. oriole, crossbill, and finch.

In most countries to-day official protection is given to Bs., but more particularly to Bs. useful in agriculture, such as those that counteract the too rapid spread of injurious insects, slugs, snails, mice, and voles. Again, cruelty to captive or domestic Bs. is an offence punishable by fine or imprisonment, and cruelty to wild Bs. is also punishable. There is a Wild Birds Protection Act which prohibits shooting or snaring certain Bs. during close seasons. Bird sanctuaries

The wild turkey of Mexico was the progenitor of the domestic B. which that country gave to Europe; the zenzotti or mocking-B., the humming B., the zopliote or buzzard—known as the scavenger of the plains and cities—the mournful tecolote or night-owl, and the quetzal, of rare and wonderful plumage, are among the best known of the other Bs. of Mexico. The Falkland Is. are a rare haunt of Bs. Frequent violent gales at migration time add to the numbers of the occasional B. visitors, and these numbers are enhanced during the severe droughts that periodically recur in S. America. Hardly any known Antarctic species is missing in these waters; among the most frequent visitors and indigenous species are the violet-eared dove; red-gartered and other kinds of coot; various kinds of grebe; the crane; the penguin—including the king, gentoo, ringed, or Antarctic, jackdaw, macaroni, and rock-hopper. The ringed penguin is very common in the S. Orkneys, S. Shetlands, and Graham Sound. These and the mollymauks are characteristic features. Also there are innumerable species of petrel—notably Wilson's storm petrel—one of the most numerous species of B. in the whole world, the water here being at times literally black with them. Other Bs. of these waters are the wandering, the black-browed, the yellow-nosed, and the sooty albatross; terns; gull; sandpiper; plover; Chilean flamingo; spoonbill; heron; teal; pintail; vulture; snipe; and geese of various kinds. The S. Atlantic penguin differs slightly from the Antarctic. The 'emperor' of the cold regions is the most beautiful of the whole penguin tribe; the 'adelle' is much smaller and, with the exception of its markings, nearly resembles that of the African coast, being about the same size and height. The African penguin, sometimes called by the natives the laughing jackass, is a very useful B. commercially—a fact which would not be true of the Antarctic varieties. Another notable African B. is the gannet of the Malagasy, or, as the natives name these birds, the Malagases, so called because the Bs. congregate in thousands on these is. It may be observed here that in most Bs. the nostrils are on each side of the beak; but in the gannet there is no nostril on the outside, but immediately under the skin on each side of the head close to the eye there is a system of air-cells, and as the B. breathes inwards the cells on each side of the head are inflated with the air which the B. can exhale at will. There is a much smaller species of gannet, the solan goose, *Sula bassana*, which nests in various places round the coasts of Britain. The African continent, particularly W. Africa, possesses a very varied B. life. There are the great crested grebe; storm petrels and shearwaters; tropic Bs.—not unlike large terns but for their long central tail feathers, 15–26 in. long; red-footed and brown boobies; cormorant; shag or red duiker; darter or snake-B.—somewhat like the Brit. or African white-headed cormorant; frigate-Ba. which

wander from Boa Vista, Cape Verde Is., to the W. African coast; pelicans—white, pink-backed, etc.; heron—W. African reef, black-headed, purple, Goliath; squacco; white-crested bittern, etc.; stork—hammerhead, bishop or African woolly-headed, jabiru, marabou—an immense B. weighing as much as 13 lb., and entirely devoid of any charm in appearance; ibis—spotted-breasted, Upper Guinea olive, Bocage's olive, glossy, and many other kinds; spoonbills and flamingo; geese and duck—one remarkable variety is the pigmy or dwarf

F. Whitman Jones

SKELETON OF A BIRD (PIGEON)

R., radius of wing, with the ulna below and alongside it. H., humerus. PG., pelvic girdle. PY., the pygostyle or ploughshare bone, supporting the tail feathers. F., femur of hind limb. T., tibia. TM., tarso-metatarsus. K., the keel of the sternum, to which are attached the pectoral muscles moving the wings. P., bones (phalanges) of second and third digits of wing. PH.1., bone (phalanx) of first digit, to which is attached the bastard wing; CL., clavicle.

goose, which is to be found in the swamps and is an expert diver; secretary B.—this B. is restricted to Africa, where the two races into which it is divided have a wide but local range. It is protected in Cape Colony and Kenya, for it is becoming rare. There is probably no other large B. so graceful in movement when landing or about to fly, for it resembles a miniature aeroplane most realistically, and curiously enough has never been seen to land otherwise than right into the wind. Also in Africa are found the vulture, falcon, and eagle, kite, buzzard, hawk, harrier, francolin—notably the Cameroon mountain francolin discovered in 1909; partidge and quail—the African blue quail is the smallest member of the Phasianidae, being only 5½ in. long but conspicuously coloured; guinea-fowl; land rail, only 5 in. long; African moorhen and Senegal and Cameroon pinfoot; Sudan bustard or paaaw—the cock scales up to 22 lb. and

has an enormous wing expanse in flight—Nubian bustard, Senegal bustard or knobhaan, and others; jacana or lily-trotter—a B. of reddish-brown body of striking appearance to be found over the whole Ethiopian region; snipe, plover, sandpiper, phalarope, gull, tern, pigeon, and dove; and parrots—notably the grey variety so well known to Europeans, the Congo red-crowned, the Gabun, Niam-Niam, and the scarlet and yellow-bellied varieties. (See David Bannerman, *Birds of Tropical West Africa*.)

India is less noted for Bs. of gorgeous plumage than other tropical countries, but there are many curious kinds, and the parrot tribe is known for its beauty. The varieties of parrots are far more numerous than elsewhere in the world. Eagles, gerfalcons, vultures, and other Bs. of prey abound, but mostly are not comparable for size and plumage with those in some other countries. Hawks were long trained for hunting, two of the most suitable varieties being the lagar and shain, both hawks of the peregrine type. The mina (or myna) of the starling tribe are kept as pets by the natives; kingfishers and herons are caught for their feathers. Other Bs. found in India are the pigeon, quail, plover, widgeon, teal, sheldrake, etc., and various kinds of jungle and water fowl.

The following are the prin. Bs. to be found in Canada: grebe, diver, loon—yellow-bellied, Pacific, etc.; puffin, horn-billed and other guillemot, and various kinds of auk and auklet; gull, kittiwake, tern, shearwater, petrel, pelican, mallard, sheldrake, duck, elder, scoter, Canada goose, bean goose, cackling goose; whistling swan—a rare and accidental visitor; whooping swan; heron, egret, coot, crane, woodcock, snipe, sandpiper—many species, especially the least sandpiper, which breeds on Sable Is.; marked godwit, ptarmigan, hawk, golden eagle—breeds in the Ungava dist.—grey sea, bald, and other eagles; owl, woodpecker, night hawk, lark, cowbird, oriole, and snow bunting—an abundant winter and early spring resident in the E. provs.; sparrow, martin, warbler—numerous varieties—shrike, wren—California, Alaska, Kadiak, and numerous other varieties; thrush, wheatear, bluetthroat.

Bird of Paradise, various species of birds of the family Paradisæidæ, which are natives of Australia and the Malay Archipelago. They are closely related to Corvidæ, or crow family, and Sturnidæ, or starlings, but though the females are inconspicuous in appearance, the plumage of the males is gorgeous and varied in colour. They are smallish birds, extremely active, and have compressed beaks, large toes, and strong feet. Their food consists chiefly of fruits, seeds, and the honey taken from flowers, but it may

BIRD OF PARADISE (MALE)

also include insects and small animals, such as worms. The bower-birds (q.v.) of Australia belong to this family, and are noted for their constructive ability. The chief species of the Paradisæidæ are *Paradisæa apoda* of Linnaeus, the great bird of paradise, about 18 in. in length, the males having brilliant plumes of great length springing from beneath their wings; *Cincinurus regius*, king bird of paradise, a native of New Guinea, which has scarlet and green plumage; *Ptilorhis paradisæa*, black rifleman of N. Australia; *Diphyllodes magnifica*, magnificent bird of paradise; *Pteridophora alberti*, common to New Guinea.

Bird, Edward (1772–1819), Eng. genre painter, b. at Wolverhampton, where for some years he was engaged in designing for japanware. In 1809 his 'Good News' was accepted by the Academy, and his reputation became estab. He came under the patronage of Princess Charlotte, and in 1815 he was elected R.A. Well-known paintings of his are 'The Country Auction,' 'Village Politicians,' 'Blacksmith's Shop,' 'The Field of Chevy Chase.'

Bird, Golding (1814–54), Eng. physician, b. in Norfolk; educated privately. His works include *Pathology and Therapeutical Indications*, *The Elements of Natural Philosophy*, etc.

Bird, John (c. 1709-76), Eng. mathematical instrument maker and mechanician of London. He pub. a work entitled *The Method of dividing Astronomical Instruments*.

Bird, Robert Montgomery (1804-54), Amer. author. b. at Newcastle, Delaware, America. He wrote 2 or 3 very successful tragedy plays. *The Gladiator*, *The Broker of Bogota*, and *Oralosa* made him famous. His books, too, were popular; among them were *Calavar*, pub. in 1834, also *A Mexican Romance* in the same year, *The Infidel* in 1835, *Nick of the Woods* in 1837.

Bird, William, see BYRD, WILLIAM.

Birdcage Walk, St. James's Park, connecting Buckingham Gate with Storey's Gate, is named after the aviary estab. there in the reign of James I. The steps known as Cockpit Steps at the Storey's Gate end of the Walk led from Dartmouth Street to the Cockpit. The latter was abolished in 1816, though it had then long ceased to be used for sporting purposes.

Bird-catching Spider, large hairy spider found in many hot countries. It belongs to the genus *Mygale*. When stretched out, it takes up a space from 6 to 9 in. across, although the body is only about 2 in. It lives in trees, or in hollows under rocks, and there it spins its curiously shaped web or nest. It goes out at night to hunt for its food of insects and, as is stated, to ensnare young birds. It has been said that the webs are strong enough to make travelling difficult in the forests.

Bird Cherry (*Prunus padus*), species of cherry tree, a native of the temperate regions of Asia and Europe, being frequently found in Britain. The Scottish name for it is hagberry, which means wood berry. Unlike the wild cherry, the flowers bloom after the leaves have fully appeared in early May. The fruits are black and no bigger than peas. They are bitter in taste, and only fit for birds' food. They are, however, sometimes used for colouring brandy and wine. The wood of the tree is utilised by cabinet-makers.

Bird Lice, or Mallophaga, the name given to a family of insects or parasites which affect birds. These parasites are shaped like lice, but they are not blood-sucking creatures, since their mouths are formed for biting. Their bodies are ringed round the thorax. They feed upon the skin of the birds and eat the feather and sometimes the blood too. It is found that they commonly affect the fowls of the farmyard, and will sometimes be discovered in animals. Where fowls are kept near cats or dogs, the latter are likely to be affected also by these pests, which feed on the hair and fur.

Bird Lime, a sticky substance obtained in various ways. It is got from the bark of the holly tree, and from mistletoe, and boiled with water. It is also prepared from flour; the starch is washed out of the flour, and the gluten left is used for B. L. The substance is frequently utilised for ensnaring birds.

Birdoswald, the site of the Rom. Brit. station of Ambogiana, one of the *Notitia*, 15 m. E. of Carlisle, and a few m. from Greenhead, Cumberland. It is the largest fort in Hadrian's Wall (q.v.). It was originally an earthwork, but no doubt was converted by Severus into a stone fort with ramparts.

Bird's-eye Limestone, limestone found in the Trentin group of N. America. It is named from the white cross-sections that appear in the stone.

Bird's Eye, the name of sev. plants, more particularly the bird's eye primrose (*Primula farinosa*). It has pale lilac flowers, and a yellow eye, and the whole plant is powdered with a substance smelling like musk. It grows in the N. of England, but rarely in Scotland. The name is also given to the *Adonis autumnalis* and, indeed, to the entire genus of *Adonis*, more usually called pheasant's eye.

Bird's-eye View, term used to describe drawings made in a manner of perspective where the eye is supposed to look down from above on to the land illustrated. The difficulty naturally is to show the relative vertical heights accurately so as to give a correct impression.

Bird's Foot (*Ornithopus perpusillus*), wild plant belonging to the order Leguminosæ. Its name is derived from its pod clusters resembling the foot of a bird. It grows in sandy soil, and is sometimes cultivated on the continent as food for sheep. The bird's-foot trefoil, or lady's slipper (*Lotus corniculatus*), also a leguminous herb, is a perennial, valuable in meadow and pasture.

Bird's-foot Trefoil (*Lotus corniculatus*), plant of the order Leguminosæ, which is common in Brit. meadows, and is noted for its beaked carina or keel and nearly straight legume. It affords good pasturage, and received its name from the resemblance of a group of pods to a bird's foot.

Bird's Nest, either the popular or book-name of sev. plants: the wild carrot (*Daucus carota*); the common parsnip (*Pastinaca sativa*); yellow bird's nest (*Monotropa hypopitys*); the fern, *Asplenium (Thamnopteris) nidus*; bird's nest orchis, one of the Orchidaceæ, *Neottia* or *Listera nidus-avis*—a plant with dingy brown flowers growing in spikes and found in N. countries.

Bird's Tongue, name given to sev. plants, but more especially to the common maple (*Acer campestre*); the green fen Ragwort (*Senecio paludosus*); and the scarlet pimpernel (*Anagallis arvensis*).

Birdwood, Sir George (1832-1917), Anglo-Indian civil servant, b. at Belgaum, in the Deccan, eldest son of General Christopher B., commissary of the Bombay Army. Educated for the Indian medical services which he entered in 1854 on the Bombay staff. Later, appointed to the frigate *Ajdaha* for service in the Persian Gulf, during the Indian Mutiny. After the bombardment of Mohammerah, in which this ship took part, B., rendered valuable service in the city of Bombay in

tranquillising the people during a difficult period. In this he owed much to his great personal influence and popularity with the Indian people, between whom and the Indian Gov. he was the intermediary. Subsequently he became sheriff of Bombay, and did much to promote education there. Left India in 1868 for reasons of health and was appointed to supervise Indian exhibits at the Paris Exposition of 1869, and in 1871 was appointed by the India Office in permanent control of Indian exhibits at S. Kensington, which collection he reorganised. Will be remembered as the man who initiated 'Primrose Day' in memory of Lord Beaconsfield. Wrote voluminously on Indian topics.

Birdwood, Field Marshal William Riddell Birdwood, first Baron, Eng. soldier, b. Sept. 13, 1865; educated at Clifton College and the Royal Military College, Sandhurst. He entered the Royal Scots Fusiliers in 1883; transferred to the 12th Royal Lancers, 1885; captain 11th Bengal Lancers, 1896; promoted to colonel 1905, general 1917, field marshal 1925. His earlier campaigns were the Hazara expedition, 1891, Isazal expedition, 1892, and the Tirah expedition, 1897-98. He was at actions at Chagra Kotal and Dargai, the capture of Samagha, and operations in Bazar Valley. In the S. African war, 1899-1902, was brigade-major to Mounted Brigade in Natal, later military secretary to commander-in-chief (Lord Kitchener); and was at the battles of Colenso, Spion Kop, Vaal Krantz, Tugela Heights, Laing's Nek, and the relief of Ladysmith. In the Mohmand expedition, 1908, he was chief of staff; awarded the D.S.O. in that year. In the First World War he was with the Mediterranean Expeditionary Force, first as G.O.C. Australian and New Zealand Army Corps, and then as commander-in-chief of the whole force. Commanded the Dardanelles Army during the evacuation of the Gallipoli Peninsula, 1915-16, and subsequently commanded Australian and New Zealand troops, and, later, the Fifth Army in France. By his fine handling of the Australian and New Zealand forces he gained a great military reputation, and the confidence of his men which conduced in no small measure to their renown on the W. front, besides winning for him the sobriquet of 'Soul of Anzac' (see ANZAC). At the close of the war he received a baronetcy and a grant of £10,000. In 1920 he was appointed G.O.C., N. Army in India, and from 1925 to 1930 he was commander-in-chief of the Indian Army. G.C.M.G. 1919; G.C.B. 1923; G.C.S.I. 1930; G.C.V.O. 1937; raised to the peerage in 1938 as Baron B. of Anzac and Totnes. He is colonel of the 12th Lancers (1920), of the Royal Horse Guards (1933), and of other Indian, Australian, and New Zealand regiments. He became an honorary Fellow of Peterhouse, Cambridge, in 1921, and was master of that college, 1931-33; also president of Clifton College, 1936; captain of Deal Castle, 1935. He is a holder of the Grand Cross of the Legion of Honour,

France, the Croix de Guerre, and numerous other foreign orders.

Biretta, a cap which is worn by Rom. Catholic priests. Its shape is square, with edges standing up. The B. of a bishop is purple, while that of an ordinary priest is black.

Birgus, the generic name of some decapod crustaceans of the family Cenobiridae which are chiefly terrestrial. They are hermit-crabs, dwelling in a hole by day, and coming out at night to seek for food, which consists largely of the fruit of the coco-nut tree. *B. latro*, the robber-crab or purse-crab, is a common species which inhabits the Indo-Pacific region.

Birjand, tn. of Persia, in the Khorassan prov., about 210 m. N.E. from Kerman, and 240 m. S. from Meshed.

Birkbeck, George (1776-1841), Eng. doctor, b. at Settle in Yorkshire. He showed at an early age the attraction which science had for him, and in 1799 he became a doctor. He practised first at Leeds and then in Edinburgh, later accepting the chair of natural philosophy at Glasgow. He later came to London, where he took up the work he had already begun at Glasgow and distinguished himself as a philanthropist. He helped very largely to form the Mechanics' Institute, of which he was the first president. (See B. COLLEGE.) He d. in London.

Birkbeck College, a college of the univ. of London, which provides full courses for various internal degrees for students of both sexes. It was founded by Dr. George Birkbeck, with the assistance of Bentham, Brougham, and Cobbett, as the London Mechanics' Institute in 1823. The original idea of the founders was to instruct mechanics fully in their own trades. In 1884 it moved to its present site, 20 Bream's Buildings, Fetter Lane. The period immediately after 1918 was for B. C. one of great activity and expansion. Lord Haldane of Cloan became president of the college in Mar. 1919, and gave much assistance in advancing the college's interests. In 1920 B. C. became a constituent college of London Univ. The new status involved the abandonment of full-time univ. students, all students being now part-time or evening students. See *A Short History of Birkbeck College*, by C. Delisle Burns, 1924.

Birkdale, part of Southport, England. Pop. 22,000.

Birkebeiner, the name of a political party which existed in Norway in the twelfth and thirteenth centuries; the name arising from the birch-bark footwear which the poverty of the members compelled them to substitute for boots. The party arose in opposition to Erling Skakke and his heir Magnus, and fought for the descendants of Sigurd Mund, i.e. for King Sverre and his heirs, being

BIRETTA

successful in 1218 in having Hakon Hakonsson elected king of Norway.

Birkenfeld, tn. and dist. in Germany. The dist. was once a principality of Oldenburg, but situated at a distance of 300 m. from that place and entirely surrounded by Prussian ter. It had also a system of gov. separate from that of Oldenburg but responsible to it, but is now a *Landkreis* in Rhine prov. It has an area of about 195 sq. m., and is mountainous and well wooded. Its chief products are cattle, flax, hemp, and iron. Pop. (1939) 56,000. The tn. is the cap. of the above-named dist. and has a pop. of 3000. It is situated on the Lahn, an affluent of the Rhine, and is distant from Trier about 25 m. in an E.S.E. direction. It is the centre of the cattle trade. B. was overrun by the Amer. Third Army early in 1945.

Birkenhead, municipal, co., and parl. bor. and seaport of Cheshire, England, situated at the mouth of the R. Mersey. It is 13 m. N.N.W. of Chester, and 194 m. from London by rail. It has an area of 5898 ac., and its pop. by the census of 1931 was 147,803, estimated in 1946 at 120,000. It is a tn. of purely modern growth, owing its increase to the construction of its docks, having a meagre hist. previous to the year 1820, when it was a small hamlet. It is situated on the E. coast of the Wirral peninsula. The railway station is the most northerly of the former G.W.R., connecting the W. of England with the N., and is the terminus for the sea journey to the Isle of Man.

A Benedictine priory of Byrkhed, of which the ruins may still be seen, was founded there in the twelfth century by a Norman baron, and to this priory was granted the monopoly of ferries by Edward II. Previous to about the year 1820 it had a pop. of less than 50, and in 1822 this pop. had not risen to more than 300. In 1843 parl. powers were obtained for the erection of a dock, which was first planned by William Laird, and opened in 1847. Eleven years later, this dock was handed over to the Mersey Docks and Harbour Board, a corporation created especially to control the harbourage of the Mersey. The tn. itself had also during this time grown and improved. In 1836 it received the grant of a market; in 1861 was made a parl. bor. In 1877 it received a municipal charter which included in the tn. the dists. of Transmere, Cloughton, Oxtan, and Higher Rebington, and in 1927 further extensions were granted. It contains at the present time many fine buildings, including a market hall, a tn. hall, a self-equipped municipal hospital and art school, both of which were given to the tn. by Sir John Laird. The main architectural feature is Hamilton Square, one of the finest and largest squares in England. In 1909 a new covered market was opened, and also a large central and 2 smaller branch libraries, which were the gift of Sir Andrew Carnegie. In Dec. 1928 a new art gallery and museum were added to the municipal buildings. There are also technical and theological colleges.

The communications of the tn. with Liverpool are good. An electric railway connects the 2 tns. through the Mersey railway tunnel, opened in 1886, and road transport is carried through the Queenway traffic tunnel, opened in 1934. The tn. is also connected with Liverpool by the corporation fleet of ferry boats, the monopoly of which was bought from the lord of the manor in 1842. B. has a large export trade in coal and manuf. articles. On the dock side are the flour mills which make B. the centre of the milling industry in Europe, and second only in the world to Minneapolis. Its prin. docks are the Egerton, Morpeth, Morpeth Branch, and Wallasey Docks, their total area being about 160 ac., and it has about 94 m. of quays. Huge storage warehouses and abattoirs are erected along the quays, and the ship-building yards of Cammell, Laird & Co. are situated at B. This firm has launched over a thousand ships from the B. yards. The tn. has its town gas, water, and electric lighting undertakings, electric tramways, and motor-bus services. It is a quarter sessions and parl. bor., returning 2 members to the House of Commons. During the war of 1939-45 the tn. suffered severely from enemy air attack from Sept. 1940 to June 1941, and much damage was done to residential dists. Fortunately, the prin. buildings in the tn. were not affected.

Birkenhead, Brit. troopship, wrecked off Point Danger, Simon's Bay, Feb. 26, 1852. The soldiers were mustered on deck and remained steadily in their ranks while the boats took off the women and children; 436 men were drowned. King William I. of Prussia ordered the story to be read out to each of his regiments on parade, as an example of disciplined heroism.

Birkenhead, Frederick Edwin Smith, first Earl of (and of Charlton, Northamptonshire) (1872-1930), Eng. statesman and lawyer, b. at Birkenhead, Cheshire, July 12, eldest son of Frederick Smith, barrister; educated at Birkenhead Grammar School and Wadham College, Oxford. The death of his father in 1887 left him largely to choose his own career. He took a classical scholarship at Wadham, was president of the union, 1893; gained first-class honours, School of Jurisprudence, 1894; was Vinerian Law scholar, 1895; fellow and lecturer of Merton, 1896; lecturer of Oriel, 1897; Univ. Extension lecturer in Modern Hist., 1898; examiner in Final Schools, 1899-1900. He was called to the Bar at Gray's Inn in 1899, went on the N. circuit, and obtained a good practice in Liverpool. But his reputation was merely a local one until 1902, when he appeared at the Old Bailey in defence of one Goudie, charged with frauds on the Bank of Liverpool. This case at once brought recognition in London of his qualities as an advocate and he soon estab. in the cap. a rapidly growing practice. In the 'Tariff Reform' election of 1906 he was elected as Conservative member for the Walton div. of Liverpool, and his maiden

speech in the House on Mar. 12 of that year, which was an unrestrained attack on the Gov. and 'Free Trade,' had the effect of lifting the depression from which the Conservative party was suffering after its crushing defeat at the polls and establishing B. as a brilliant speaker. When Home Rule for Ireland was the foremost issue, B. joined Sir Edward (afterwards Lord) Carson, who was organising armed resistance in N.E. Ulster. In 1911, while still under 40, he had become a privy councillor and a leader of his party, but these added responsibilities did not tempt him to alter his attitude to the cause of Ulster. At the outbreak of the war in 1914 he offered his services to the Gov., and for a short time was head of the Press Bureau. Afterwards he went to France as historian to the Indian Corps, and when the first Coalition Ministry was formed in May 1915 he became solicitor-general, and in the following Nov. attorney-general with a seat in the Cabinet. He was knighted in this year. The latter office he again held in the second Coalition of Dec. 1916, and was created a baronet in Jan. 1918. In Jan. 1919, at the age of 46, he became lord chancellor, and was raised to the peerage as Viscount B. On the Wool-sack his originality and strong personality were felt throughout the Lords, and he showed a generosity and breadth of view which compelled those who had thought of him merely as a combatant lawyer to change their views. The Zinoviev letter and the withdrawal of the Campbell prosecution which contributed largely to the fall of the Labour Gov. in the autumn of 1924 aroused Lord B.'s deepest feelings both as a lawyer and patriot; and in his speeches for his party he subjected the Ministerialists to a merciless criticism which did much to gain the Unionist victory at the polls. In Mr. Baldwin's second Gov. which followed, Lord B. became secretary of state for India. He was fully alive to the scrutiny which his speeches would undergo in India, and he therefore adopted the practice of reading the more important of his parl. pronouncements, his speeches losing thereby much of their attraction. He studied Indian affairs with his usual thoroughness, but was not disposed to keep his knowledge up to date by personal contacts with both Indian and Brit. visitors from the E. which are an important part of the duties of the office. He had other interests, political, personal, and journalistic, and to some extent he began to relax his departmental ties. In May 1925 it was complained in the House of Commons and in *The Times* that he was making his secretaryship of state a mere part-time job. He had been supplementing his official income by means of highly paid journalism, and Mr. Baldwin gave it as his opinion that this ought not to be continued. As secretary of state for India, B. showed steadfast consistency in his condemnation of non-co-operation, and in his recognition that, if that obstacle were overcome, we must further implement the pledges of 1917 and 1919. His

challenge to the politicians to produce a Constitution on which they could agree was the goad to the left-wing collection of 'All Parties' to draft in 1928 what became known as the Nehru Constitution. The failure of authority to prepare the way by prior suggestion and statement for a strictly parl. and, therefore, non-Indian, *personnel* opened the way for the boycott of Sir John Simon's commission by large sections of Indian public life; but the unpopularity of the secretary of state was also a factor in that unfortunate decision. He resigned in Oct. 1928, not, apparently, owing to any disagreement with his Cabinet colleagues, but in order to enter business life. He became chairman of the Greater London and Counties Trust, Ltd., and a director of Imperial Chemical Industries, Ltd., of Tate & Lyle, Ltd., and of Johannesburg Consolidated Investment Co., Ltd. Lord B. was taken ill in Apr. 1930, when he broke a blood-vessel while spending a golfing holiday at Biarritz, but recovered sufficiently to return home. In the following Aug. he developed pneumonia, from which he d. on Sept. 30. His greatest achievement as a lawyer was the Law of Property Act, 1922, which greatly simplified the conveyance of land. He was a most able and upright judge. Pub.: *International Law*, 6th ed., 1927 (Dent); *My American Visit*, 1918; *Points of View*, 1922; *America Revisited*, 1924; *Contemporary Personalities*, 1924; *Famous Trials of History*, 1926; *Fourteen English Judges*, 1926; *Law Life, and Letters*, 1927; *More Famous Trials*, 1928.

Birkenhead, Sir John (1616-79), Eng. writer; secretary to Laud, and a leading spirit during the sojourn of the king and court at Oxford at the time of the Civil war. He originated the *Mercurius Aulicus*, a publication devoted to the Royalist cause, and wrote practically all of it himself. Among other works he wrote *Paul's Churchyard: Libri Theologici, Politici, Historici, and The Assembly Man*.

Birket-el-Keroun, or el Qurun (lake of horns), lake of Middle Egypt, 50 m. S.W. of Cairo. It has an area of over 100 sq. m., and is situated 141 ft. below sea level, having a depth at its deepest parts of about 60 ft.

Birket-el-Mariut, or Mareotis, a lake in the N.W. portion of Lower Egypt, to the S.E. of Alexandria. It was almost dried up when the Eng., in the course of their operations against the Fr. in 1801, cut across the isthmus separating the lake from that of Aboukir. The sea-water flowed in and covered a space of land measuring 30 m. by 15 m. When the Nile water is high the lake covers some 100 sq. m., and it is kept from rising above a certain limit by means of pumps.

Birkett, Sir Norman, Eng. lawyer and politician, b. at Ulverston, Lancashire, Sept. 6, 1883; educated at Emmanuel College, Cambridge. He was called to the Bar, Inner Temple, in 1913, and took silk in 1924. He had meanwhile turned his attention to politics, having in 1918 unsuccessfully contested the King's Norton div. of Birmingham, and in 1923 he

entered Parliament as Liberal M.P. for the E. div. of Nottingham. He lost his seat in 1924, but was again M.P. from 1929 to 1931. During the Second World War he was chairman of the Advisory Committee for Defence Regulation 18B, and has been a judge of the King's Bench Div. since 1941, in which year he was knighted. In 1945 he was appointed a deputy member of the International War Criminal Court.

Birmingham, city and municipal co. and parl. bor. of England, situated in the N.W. of Warwickshire with suburbs extending into Staffordshire and Worcestershire; 113 m. from London by rail

brass-working industry. Next in importance come industries concerned with jewellery, gold, silver, gilt, and iron. Extensive manufs. are those of pins, buttons, and other dress accessories, nails, screws, steel pens, tools, cycles, motor-cars and accessories, steam and gas engines, and machinery. Other industries are railway-carriage building, glass-making, electro-plating, plastics, and chemicals. In all it is estimated that there are some 1500 dist. trades, and the city consequently possesses a large pop. of skilled artisans.

The city has many fine streets and notable buildings. Mention must be

Valentine & Sons Ltd., Dundee

THE CIVIC CENTRE, BIRMINGHAM

and 85 m. from Manchester. The municipal area is about 80 sq. m. (over 51,000 ac.), with a pop. of 1,076,230. In 1911 the boundaries were extended to include the bor. of Aston Manor and other dists. In 1927 part of the urb. dist. of Perry Barr was incorporated. The tn. was enfranchised in 1832, and now returns 13 members to Parliament. It became a bor. in 1838, and a city in 1889. The corporation consists of the lord mayor (created in 1936), 34 aldermen, and 102 councillors.

With Wolverhampton, Walsall, Wednesbury, and other tns. of the 'Black Country' dist., B. forms one of the most important of industrial areas. It is the second city of Gt. Britain, and the chief hardware centre of the world, being the largest manufacturing city in England. It is famous for its metal industries, which have been important since the latter half of the seventeenth century. The most outstanding is the

made of the thoroughfares of New Street, Corporation Street, Broad Street, and Colmore Row, and amongst the chief buildings, of the council house and art gallery (1874-81), containing a fine collection of pictures by Burne-Jones, Millais, Hunt, David Cox, and others, in addition to valuable collections of arms, oriental metal-work, and pottery; the town hall, completed in 1834, with a hall capable of seating 2000 people; the Central free library; the Victoria law courts; the exchange and the chamber of commerce; and the Hall of Memory, opened in 1925 as a memorial to the men and women of B., numbering some 13,000, who fell in the First World War. B. is the seat of a bishopric, and the present cathedral was formerly St. Philip's Church, built in the early eighteenth century by Thomas Archer. Until 1715 there was only one par. church, St. Martin's, dedicated in the thirteenth century but wholly rebuilt in 1873-75. Other churches are St. Mary's

(1774) and St. Paul's (1779). A large number of the churchgoers of B. are non-conformist. The Unitarians are an old-established body in B., as also are the Wesleyan Methodists, who were estab. by John Wesley himself, in 1745; and the Baptists, whose original chapel in Cannon Street was built in 1738. The chapel known as the New Meeting, in Moor Street, was notable as having been the scene of Joseph Priestley's ministerial labours from 1780. There is also the Rom. Catholic Cathedral of St. Chad, and the Methodist Central Hall. The city possesses a univ. (see B. UNIV.). The oldest educational establishment is the King Edward VI. Grammar School, founded in 1552. Other educational institutions are the Midland Institute, the Municipal Technical College, the Municipal College of Art, Selly Oak Colleges, and Queen's College. The prin. libraries are the Birmingham Library, founded in 1779 and greatly enlarged in 1798 by Dr. Priestley; the Central Municipal Reference and Lending Libraries and other municipal libraries in different parts of the city. Amongst the many charitable institutions of B. should be noticed the Queen Elizabeth Hospital at Edgbaston, the General Hospital in Steelhouse Lane, the accident hospital, the children's, women's, and homeopathic hospitals, the Blackwell Sanatorium, and the blind institution. The chief open spaces are the Lickey Hills, Warley Woods and Park, Aston Park, Cannon Hill Park, Victoria Park at Small Heath, and Handsworth Park. The gas and water supplies are in the hands of the corporation (the electric supply was nationalised in 1948). The Welsh water-supply scheme, with its chain of reservoirs in the Elan Valley in Radnorshire, supplies B. with water, and the works, which were formally opened by King Edward VII. in 1904, cost approximately £8,000,000. A reservoir is under construction in the Claerwen valley. B., having a central position in the United Kingdom, is an important railway centre, being served by two regions of the Brit. railways. A municipal airport was opened in 1939. Within the city the transport system includes the largest municipal fleet of omnibuses in the country.

Much of B.'s municipal enterprise is due to the efforts of Joseph Chamberlain, who, as mayor of the city in 1873-75, was responsible for many undertakings. B. claims to be the 'best-governed city in the world.' Though essentially a modern tn., B. has a hist. that can be traced back to a period before the Conquest, the place having been a settlement of the Anglo-Saxons. It is mentioned in Domesday Book, and there valued at 20s. After the Conquest it passed into the possession of the Bermingham family. The owner, William de Bermingham, was killed on the side of Simon de Montfort at the battle of Evesham in 1265. By the end of the thirteenth century a fair-sized mkt. tn. had grown up at the focal point of roads at the Bull Ring. In the sixteenth century it was visited by Camden and the antiquary, John Leland. The latter states that there

were many 'smiths in the town that use to make knives and all manner of cuttyngge tools.' It remained in the hands of the family until 1527, when the duke of Northumberland managed to transfer it himself by preferring a false charge against Edward de Bermingham. After the attainder of Northumberland the property passed through various hands. In the Civil war B. evinced strong parliamentary sympathies, for which it paid by being sacked by Prince Rupert in 1643. Subsequent outstanding events were the devastating plague of 1665, the 'church-and-king' riots of 1791, in which the famous Dr. Priestley was an important figure, and the Chartist riots of 1839. Among a number of public monuments are those of Joseph Priestley, Robert Peel, Thomas Attwood (banker and politician), James Watt, and Nelson. In its political hist. B. did much to win for the nation the enfranchisement of the middle classes during the days of the Reform Bill agitation. Amongst the distinguished men closely connected with B., in addition to those already mentioned, have been James Watt, who, with Boulton, perfected the steam engine here; William Murdock, the inventor of gas lighting; William Hutton, the historian; John Baskerville, the printer; Joseph Parkes, and John Bright.

In both the World Wars of 1914-18 and 1939-45 B. became a centre of munition manuf. and received influxes of pop. for that reason. During the air assault on Great Britain in the Second World War, B. was a foremost objective of the enemy. An air raid in Aug. 1940 was the first of nearly 100 attacks, many during the winter of 1940-41. There were serious fire raids during Oct. The heaviest raid took place on the night of Apr. 9-10, 1941, having been preceded by a number of raids, particularly that of Dec. 11-12, 1940, lasting over 13 hrs. The civil defenders of the city were both numerous and determined, and, indeed, their mortality rate was threefold that of the general pop. All the city's medium-sized metal industries had been adapted to war uses and naturally these attracted the Ger. bombers. Particularly heavy damage occurred in the vicinity of New Street and High Street. But the city's well-managed gas, electricity, transport, and water undertakings showed themselves more than a match for the considerable damage the bombs inflicted. At one time four-fifths of the city was without mains water, but only for a very short time. Other more serious raids were on the following dates: Nov. 1, 1940; Nov. 19-20 (350 planes); Nov. 22-23 (200 planes); Dec. 11-12; Apr. 9-10, 1941 (250 planes). The casualty list reached the total of 2241 persons killed and 3010 seriously injured. Some 155,000 buildings were either destroyed or damaged, and nearly all the main buildings of the city received damage in greater or less degree. The market hall, built in 1835, was burnt down in one of the early raids on Aug. 25, 1940. In later raids the council house extension was damaged,

also the art gallery. The B. Empire, one of the oldest music-halls in England, was destroyed in the raid of Apr. 9-10, 1941; as was also the Prince of Wales Theatre. The toll among churches was heavy. Of Church of England buildings 6 were totally demolished, while nearly 100 others sustained damage. The cathedral was largely gutted by fire on Oct. 27, 1940, and the Rom. Catholic cathedral was hit by incendiary bombs on 3 occasions. Other Rom. Catholic buildings were damaged, as also those of the Free Churches.

Birmingham, city in the co. of Jefferson, Alabama, U.S.A., 86 m. N.N.W. of Montgomery. It is the most important seat of the iron industry of the S. states, having numerous factories, mills, and foundries. This has accounted for its rapid growth from a tn. of 3000 inhab. in 1880 to a city of 261,000 inhab.

Birmingham, G. A., see HANNAY, JAMES OWEN.

Birmingham Daily Post, a newspaper estab. in 1857 by John Feeney and Sir John Jaffray, being ed. till 1898 by J. Thackray, who was then succeeded by A. H. Poultney. It was the first penny provincial paper. At its foundation the politics of the paper were Radical, and after the Home Rule split of 1886 it supported the Liberal Unionist party. Later it was associated with Joseph Chamberlain's propaganda, and is now Conservative in its views. Following the death, in 1943, of Sir Charles Hyde, who was at that time proprietor of the paper, the *B. P.*, together with the *Birmingham Mail* and the *Birmingham Weekly Post*, were bought by Lord Iliffe, who was Conservative M.P. for Tamworth, Warwickshire, 1923-29, and formerly part proprietor of the *Daily Telegraph*. The offices of the *B. P.* are in New Street, Birmingham, and Fleet Street, London.

Birmingham University obtained its charter in 1900, largely owing to the endeavours of Joseph Chamberlain, who became its first chancellor. Its predecessor was Mason College, a univ. college, which had superseded Queen's College, founded as a medical school in 1828. The faculties of Arts, Medicine, and Law are still housed in the buildings of the old Mason College in the centre of the city; other buildings have been erected at Bournbrook and Edgbaston. Residence for men is at Chancellor's Hall, Edgbaston, and for women at Univ. House, Edgbaston. An appeal fund, launched in 1930, realised over £600,000 in a few months, and new Students' Union buildings, at a cost of £50,000, were completed in the same year. The univ. has a highly efficient faculty of commerce; it awards a degree in brewing and a diploma for social study, and provides excellent courses in medicine and applied sciences, especially engineering and mining. Women are admitted to all degrees. Its library contains about 150,000 vols. Sir Oliver Lodge was the first prin., and his successor was Sir Charles Grant Robertson, 1920-38 (q.v.).

Birnam, a hill in Perthshire, Scotland,

about 12 m. N.W. of Perth and near the tn. of Dunkeld. It was anciently included in a royal forest, and has been immortalised by the reference to it in Shakespeare's *Macbeth*. Near Dunkeld also there is a small vil. called B.

Birobidjan, an autonomous region of the R.S.F.S.R., in Siberia, situated in a region of the Far E. watered by the Amur. Land was set aside in 1928 for the settlement of Jews on the banks of the riva. Bira and Bidjan. Some 7000 pioneers began the colonisation of an area twice the size of Palestine. Much primeval forest land had to be cleared. All that existed at that time was the 'town' of Birobidjan, merely a small railway station, and a few wooden shacks for railway workers and trappers. But by 1934, when the first five-year plan was completed, B., the tn. after which the whole region is now named, had become a cap. city with four-storeyed stone buildings and paved roads, and all the amenities of a flourishing tn. Mines are now in operation, producing coal, magnesite, and graphite. Near the tns. of Brakan and Kimkan are said to be what may prove to be the biggest deposits of high-grade iron ore yet discovered anywhere in the world. There are gold deposits round Obluchye, the second tn. of the region. There are collective farms and at sev. centres in the area there are tractor stations from which the collectives draw their mechanical equipment. The pop. of the region grew between 1928 and 1933 to 50,000; and by 1939 to 108,000, of whom 75 per cent lived in the cap.

Biron, title of the family of Gontaut, to which a number of distinguished marshals of France belonged.

Armand de Gontaut, Baron de Biron (1524-92), Fr. marshal. He saw service with Brissac in Italy, and although wounded and made permanently lame in early life, he continued an active career as a soldier. He distinguished himself in the Catholic causes at Dreux, St. Denis, and Montcontour, and commanded the royal forces at the siege of La Rochelle, as a reward for which he was made a marshal of France. After 1589 he supported the interests of Henry of Navarre, and was killed at the siege of Epemay in 1592. He was a man of some literary attainment, and some of his letters are in existence at the present day.

Charles de Gontaut, Duc de Biron (1562-1602), son of the above, distinguished himself by his bravery. He was made admiral of France, and in 1594 a marshal of France. He fought for Henry IV., and was employed by him on diplomatic missions, but in 1602, accused of treasonable correspondence with the Spaniards, he was executed in the Bastille. His life was the subject of 2 plays by George Chapman, entitled *The Conspiracy and Tragedy of Charles, Duke of Byron* (1608).

Armand Louis de Gontaut, Duc de Biron (1747-93), a descendant of the above. He fought during the war of Amer. Independence under Lafayette, and on his return was made a marshal. On the outbreak of the revolution he joined the

revolutionaries, and was appointed to a high command. He fought in La Vendée, and he was commander of the army of Flanders. Accused in 1793 by 2 generals, principally, it seems of, leniency, he was executed in Dec. 1793.

Biron, Ernst Johann de, Duke of Courland (1690-1772), Russian nobleman, the son of a landed proprietor in Courland. He won the favour of the niece of Peter the Great, and adopted the style de B. from the Fr. line of dukes. When his mistress, Anna Ivanovna (q.v.), became empress of Russia, he was created duke of Courland, and for some considerable time ruled Russia. He was a thorough autocrat, and could not brook opposition, his period of power being marked by many executions and exiles. On the death of the empress, he assumed the regency, and displayed great power as an administrator. He was, however, exiled to Siberia, from which exile he was called by the Empress Elizabeth in 1741, and on his return he retired into private life. He d. in 1772.

Biostrites, name given by Lamarck to the fossil shell of a mollusc of the order Teleodermacea and family Radiolitida. It occurs in the Middle and Upper Cretaceous.

Birr, see PARSONSTOWN.

Birrell, Augustine (1850-1933), Eng. politician and man of letters, b. near Liverpool, the son of a nonconformist minister. He was educated at Amersham Hall School and Trinity Hall, Cambridge, where he graduated in 1872. He subsequently studied law, became a barrister in 1875, and a bencher of the Inner Temple in 1903. He was Quain prof. of law at Univ. College, London 1896-99. He entered Parliament as Liberal member for W. Fife in 1889, and made a name as a graceful and witty orator, his efforts in this direction giving rise to the expression 'birrelling.' He was defeated in N.E. Manchester at the 1900 election, but re-entered Parliament in 1906 as member for N. Bristol, and minister of education in the Liberal Cabinet. The failure of his Education Bill to pass the House of Lords led to his resignation in 1907, when he was appointed chief secretary for Ireland. In that capacity he introduced (May 1907) the Irish Councils Bill—which failed for want of Nationalist support. In 1911 he prepared the third 'Home Rule' Bill, which Asquith introduced in Apr. 1912. Relying on the assurances of John Redmond as to the state of Ireland, he was taken unawares by the Dublin revolt of Easter 1916. He resigned his office in May; and in 1918 he retired from public life. The first series of his *Obiter Dicta*, 1884, revealed him as an accomplished essayist with a delightful style, and was followed by a *Life of Charlotte Brontë*, 1887; the second series of *Obiter Dicta*, 1887; *Res Judicata*, 1892; *Men, Women, and Books*, 1894; *William Hazlitt*, 1902; *In the Name of the Bodleian*, 1905; and other books on subjects connected with belles lettres and law. Later publications: *Frederick Locker-Lampson* (character sketch), 1920; *More Obiter Dicta*,

1924; *Some Early Recollections of Liverpool*, 1924. He ed. *Home Letters of the Earl of Beaconsfield*, 1928. B. d. at Chelsea, Nov. 20, 1933.

Birs, a small riv. of Switzerland, in the canton of Berne. Near it was fought the battle of St. Jacob's against the Fr. in 1444, when 1600 Swiss were annihilated in opposing 30,000 Fr., the Fr. losing 10,000 men. It was also the scene of a victory of the Swiss over the Austrians in the year 1499, after which the Emperor Maximilian I. recognised the independence of Switzerland.

Birs Nimrud, see BABYLON.

Birstall, manuf. tn. in the W. Riding of Yorkshire, England, 7 m. from Leeds. It has collieries and iron foundries, and manufs. of woollens, worsteds, cotton, and silk. Pop. 7200.

Birth, see CHILD. For statistics of births see REGISTRATION OF BIRTHS, DEATHS, AND MARRIAGES.

Birth Concealment, in Eng. law, a misdemeanour, punishable by a maximum penalty of 2 years' imprisonment with hard labour, for any person, including the mother, to conceal or attempt to conceal the birth of a child by any secret disposition of its body, whether the child d. before, after, or at the time of its birth. Avail is taken of this offence as an alternative charge in cases of persons charged with murder or manslaughter of infants, owing to the frequent difficulty of proving that the child has been, in the legal sense, a living human being. In Scots law, a woman is liable to a maximum penalty of 2 years' imprisonment if she conceals her pregnancy during the whole period, does not call for, nor has assistance at the birth, and subsequently the child is found dead or is missing. Till 1803 such concealment was considered presumptive of murder and punished with death.

Birth Control, term applied to the practice of preventing conception by chemical, mechanical, or other means. In its wider application, the term may be employed to mean any method of restricting or regulating the pop., such as infanticide, abortion, enforced celibacy, or what Malthus named 'moral restraint.' Infanticide and abortion were practised among primitive peoples. B. C. in the sense of the mechanical contrivance of contraception was known to the people of early civilisations, notably the Gks. and Roms., the Hebs., the Arabians, and among Ger. and African tribes. Although such knowledge was available in Europe from the Middle Ages, no effort was made to draw public attention to it until the nineteenth century. The first book on B. C. in Eng. is said to be *Every Woman's Book*; or, *What is Love?* by Richard Carlile, pub. in 1825. Similar publications followed from time to time in both the United Kingdom and the U.S.A.; until wider publicity was given to the subject by the trial of Charles Bradlaugh and Mrs. Besant in 1877 for the offence of selling a pamphlet inculcating what were then known as 'Neo-Malthusian' practices. The foundation of the Malthusian League followed the same

year, Bradlaugh being president and Mrs. Besant secretary. The movement rapidly became world-wide. A parallel legal stimulus was given to the movement in the U.S.A. by the trial of Mrs. Margaret Sanger, in 1914, as the author of the pamphlet *Family Limitation*. From these events the National Birth Control League was formed, and 10 years later the first B. C. clinic was opened in New York. In Great Britain during the corresponding period the person most associated in the public mind with the dissemination of B. C. information was an Eng. woman scientist, Dr. Marie Stopes. A B. C. clinic was opened in London in 1921 largely as a result of her efforts, and clinics were subsequently opened in most cities and tns. in the United Kingdom. Both Mrs. Sanger and Dr. Stopes gained world-wide reputations as serious propagandists in the campaign for making B. C. information generally accessible, and the movement was further stimulated by the effects of the war of 1914-18, which brought this, among other social subjects, into the open as matters of general interest and discussion. The movement has encountered some official opposition, amounting in some countries, as in Italy in 1925 and in Japan, to legal prohibition. In the United Kingdom and the U.S.A. no legal impediment was placed in the way of the movement, except by very strict interpretation of the laws relating to obscenity, and from time to time these have been invoked. The movement aroused irreconcilable opinions. The subject touches biology, medicine, psychology, economics, ethics, and religion; and as vital statistics concern the community as well as the individual, B. C. is becoming a question with which politicians may have to deal. The Rom. Catholic Church is foremost among Christian denominations in denouncing as sinful the practice of all artificial contraceptive methods. A medical committee of the National Birth-rate Commission (not an official body), set up in 1924, was of opinion, *inter alia*, that no entirely successful contraceptive method has yet been found, and that no impediment should be put in the way of married persons obtaining knowledge of contraceptive methods. See Dr. Stopes's treatise, in favour, *Contraception: its Theory, History and Practice* (1933, 1937); Dr. Halliday Sutherland's *Birth Control* (1922) for a Catholic doctor's views against; A. M. Carr-Saunders's *The Population Problem* (1936), for the wider social and economic aspects; J. G. H. Holt's *Marriage and Periodic Abstinence* (1937); and the Amer. Birth Control League's *One Hundred Years of Birth Control*.

Birth, Registration of, see REGISTRATION OF BIRTHS, DEATHS, AND MARRIAGES.

Birth Palsy, Infantile Diplegia, or **Little's Disease**, a paralytic affection caused by injury at birth, through protracted labour, the use of instruments, or other causes. The condition is often not observed during the early years of childhood, but manifests itself when the child

might ordinarily be expected to support itself on its own limbs.

Birtley, mining dist. of Durham, England, 5 m. from Gateshead. Pop. 11,500.

Bisaccia, tn. of Italy, anciently called *Ranula*. It is about 60 m. from Naples, is a bishop's see, and has a pop. of 8000.

Bisacquino, tn. of Sicily situated 27 m. S. of Palermo. It has a pop. of 8000, and trades in oil and grain.

Bisalnagar, tn. in the state of Baroda, India. It is a fairly important manufacturing tn. with a pop. of about 20,000. It manufs. cotton cloths.

Bisalpur, tn. of India, situated in the United Provs., about 25 m. S.E. from Bareilly.

Bisbee, tn. of Arizona, U.S.A., in Cochise co., about 45 m. S.E. from Tombstone. It is the centre of a lead, silver, gold, and copper mining region. Pop. 5800.

Biscay, Bay of (Fr. *Golfe de Gascogne*, Sp. *Golfo de Vizcaya*), an inlet of the Atlantic Ocean; it sweeps in practically a straight line along the N. coast of Spain to the foot of the Pyrenees. On the W. and N. it is bounded by the coast of France, its most northerly point being the ls. of Ushant, and its most southerly point Cape Ortegal. By the Romans the bay was called the *Sinus Aquitanicus*, or the *Sinus Cantabricus*. It forms a fairly regular curve, but has some inlets on the W. coast of France, the chief being the estuaries of the Loire and the Garonne. Its width is roughly about 400 m., and its length is approximately the same. Its S. shore, i.e. the N. coast of Spain, is bold and rocky, and differs very essentially from that of the Fr. coast, which is in most places low and sandy. The bay is noted for the diversity of its currents and for the storms so frequently encountered there; its danger is increased by the prevalence of westerly gales which make navigation very precarious. Its Eng. name is a corruption of the Sp. *Vizcaya*.

Bisceglie, seaport tn. and episcopal see of Italy on the Adriatic. Its pop. is 33,000. It has many fine buildings, including a cathedral, many churches, and a hospital. The port does only a small trade, but stands in a good wine-producing dist.

Bischof, Karl Gustav (1792-1870), Ger. chemist and geologist, b. at Wirl, near Nuremberg. His most important work was a *Manual of Chemical and Physical Geology*.

Bischoff, Mount, tn. in Tasmania, situated 60 m. from Launceston. It is a mining dist., being specially noted for the rich yield of tin ore, which was discovered in 1872. In the short space of 2 years (1884-86) there was an output of more than 2000 tons.

Bischofswerda, tn. in Saxony, 20 m. E. of Dresden, in the political div. of Bautzen. The tn. has cloth factories, glass-works, and potteries, and, in the vicinity, are granite quarries. It was the scene of a battle between the Fr. and the Allies in May 1813. Pop. 9000.

Bischwiller, tn. in the dept. of Bas-Rhin, France, situated on the R. Moder.

It was formerly an episcopal tn., and had a castle, which was dismantled in 1706. A celebrated fair was also held here. It has manufs. of cartridges, carpets, and jute-cloth; hop-growing is also carried on. Pop. 8000.

Biscuit: (1) (Fr., twice-cooked). A kind of hard, dry bread which has not risen, so made in order to be preserved without deterioration for a long time.

A YOUNG BISHAR

E.N.A

Common sea Bs., or ship bread, are totally unfermented, whilst captain's Bs. are partly fermented. All the other forms of B. are fermented. Various machines have been invented for B.-making, and in a modern factory the Bs. are never touched by hand. The various ingredients for hard Bs. are kneaded into a stiff dough by a machine, 'braked' or rolled out between rollers, then cut up into squares by a machine which has a pair of rollers to compress it to the required thickness. The dough is then carried along on a web which takes it under a block, whose cutters cut into the shape required. The cut Bs. then travel slowly through an oven for about a quarter of an hr., on a wire frame; they are then finished and are packed in tins. There are innumerable varieties of Bs., and B.-making is a rapidly increasing industry.

(2) The name given to stone-ware, earthenware, porcelain, etc., when they have undergone the first firing, and before they are finished. When in a B. state the articles are porous, and ready to take any glaze or other decoration. In the case of ordinary drain-pipes and sanitary ware the articles are glazed without being removed from the kiln or oven; common salt is thrown on the fires when the highest temp. is reached, and a glaze is thus formed. When a design is desired to be put on, the design is printed on

transfer paper and applied to the biscuit-ware whilst wet. In the case of porcelain, the decoration is not put on till after the articles have been completely baked. See under POTTERY.

Bish, see BIKH.

Bisharin, the name of a people of E. Africa, to whose stock belong tribes dwelling between the Blue Nile and the Abyssinian highlands. They belong to the Mohammedan religion. See further under BEJA.

Bishop (Gk. *ἐπίσκοπος*, A.-S. *biscop*), an overseer or overlooker. A term that in the early apostolic Church was closely allied with the word elder. The word is used in the N.T. on sev. occasions, as synonymous with the word elder. There is no clear difference made between these two ranks in the Church, such, for example, as is made between bishops and deacons. The duties of Bs., as traced in the N.T., are general superintendence of the churches, pastoral duties which are specially emphasised, and teaching. Within the Catholic Church the B. was recognised as the highest order of the hierarchy of the church, with certain special spiritual functions and with certain rights of oversight over the lower orders of the clergy. By the end of the second century A.D. the claims of the Bs. were estab. much on the lines of the present day, and the theory of the apostolic succession was put forward. By the same time the limitation of the authority of the B. to the diocese had also been put forward and was generally accepted. In the early Church this was probably necessary, since the frequent attacks upon the Christian religion made it necessary that some definite order and ruling should be given to it. The power and the duties of the B. remained much the same during the Middle Ages, from the time of their conception during the third century. The Council of Trent laid down that the B. must be a man of approved learning, of at least 30 years of age, and legitimate. The method of election of Bs. in the Rom. Church has altered considerably since the period of the early Christian Church. Bs. were originally chosen by the people, the remaining Bs. of the prov. having the right of veto. Gradually this power departed from the people and fell into the hands of the provincial Bs., who were subject to a veto from the metropolitan. Next the power passed into the hands of the cathedral chapter, still subject to the veto of the metropolitan and later of the papacy. Gradually the sole power of confirmation passed into the hands of the pope in the W. Church, and with this right of confirmation there came also the demand for the sole right of nomination. This claim was made by the papacy from the early days of the twelfth century, and in Eng. hist. we have the instance of Pope Innocent III. refusing to ratify the appointment either of the nominee of the cathedral chapter or of the king himself, but taking the full right of nomination into his own hands and placing Stephen Langton in the archiepiscopal throne of the prov. of Canterbury. At the present

time in the Rom. Church the pope claims the right to nominate the Bs. in a number of countries, but in most the appointment has to a large extent passed into the hands of the political authorities. Spain, Austria, and France may be taken as instances where the nomination of the Bs. rests nominally in the hands of the head of the State. The pope, however, claims the right of excluding unworthy nominees, he being the sole judge of ecclesiastical unworthiness. The Council of Trent prescribed a formal examination before the cardinals in Rome, but this is now obsolete, academic degrees or equivalent testimonials being accepted as evidence of theological knowledge, evidence of neighbouring ecclesiastics, etc., being received as regards other qualities. In other countries the pope nominates the B. after considering a list submitted by the cathedral chapter, as in England, or the Bs. of the prov., as in Ireland, or the apostolic delegate, as in the U.S.A. Very few cathedral chapters have the right of *electing*, in the strict sense. After election the new B. must be consecrated within three months. On taking possession of his see, he becomes the immediate and ordinary pastor of his diocese, subject to the pope, or in missionary countries, to the Congregation of Propaganda. Even if assisted by a coadjutor B., he is bound to residence, nor may he be absent for more than three months in the year without very grave cause. A metropolitan, usually an archbishop, has little power in the dioceses of his suffragans, except by special delegation or by the Holy See. Oriental Bs. are subject to their own patriarchs and through them to the pope. But as far as the 'power of order' goes, a B. is inferior to none. He has, in the Rom. Church, full and sole authority to confer holy orders, to consecrate, to confirm, to give benediction, and to anoint kings. There are also titular Bs., that is, Bs. who have received the episcopal consecration but have no diocese, and hence are used chiefly to assist other Bs. of the Church, and to represent the pope. The Rom. B. ranks next to a cardinal, is styled in England the Right Reverend, and receives in conversation the courtesy title of My Lord B. The *Catholic Directory* gives the number of archiepiscopal sees throughout the world as 260, the number of episcopal sees as 970, and the number of titular sees as 700. There are 9 archiepiscopal sees in Great Britain and Ireland, divided into 14 dioceses in England and Wales, 4 in Scotland, and 25 in Ireland. The insignia of the Rom. B. are the ring, the pectoral cross, the pastoral staff, the vestments, the mitre, and the throne. In the Reformed or Lutheran Church of the Continent the title of B. remained after the Reformation. In many cases the spiritual duties of the B. ceased, and the title was used purely as a secular and political one. In these cases, however, where the title was used in the spiritual sense, the holder of the title did not claim unbroken apostolic succession. The general term used at the

present time is that of superintendent. The title also still survives in other churches, e.g. in the Moravian.

Anglican Bishops. When due allowance is made for the doctrinal changes of the Reformation, the position and functions of the Anglican Bs. are similar to those of the Rom. Bs. They only have the right of confirmation and the ordination of priests. The method of election, however, differs from that of the Rom. Church, since the nomination of Bs. has been firmly vested in the Crown since 1534, by a statute of Henry VIII., which was re-enacted during the reign of Queen Elizabeth. The nomination, however, is still nominally in the hands of the cathedral chapter, and in the disestablished Church of Ireland in the hands of a synod of the Church. In England, however, the Crown is notified of the vacancy, and a *congé d'être* is given, accompanied by a letter which nominates the choice of the Crown. The chapter is bound by law to elect this nominee, and failing such election the B. can be declared elected by royal letters patent under the Great Seal. The archbishop of the prov. is then notified and proceeds to the consecration of the B. elect. This consecration is usually carried out by the archbishop in person assisted by some or all of the provincial Bs. But a bishopric in England is also a barony, and the B. has to pay homage and take the oath of allegiance to the king in person, according to the old rites of the feudal baronage. In the prov. of Canterbury there are 30 dioceses and in the prov. of York 13. The Church of Wales is divided into 6 dioceses, the Church of Ireland into 12, and the Episcopal Church of Scotland into 7. In England a certain number of seats are allotted to the Bs. in the House of Lords. At an earlier period all Bs. sat in the House of Lords, but since the growth of the Church has led to the appointment of a great number of Bs., it has since been decided that the 2 archbishops, together with the Bs. of London, Winchester, and Durham, should always sit in the House of Lords, the remaining 25 seats being filled by the Bs. in the order of the seniority of their consecration. In addition to the powers which Bs. have of ordination, consecration, and confirmation, they have also a certain jurisdiction over the clergy of their diocese, a jurisdiction which is regulated by the Clergy Discipline Act and the Public Worship Regulation Act. The Bs. of the Church of England are ranked just above the barons of the kingdom, and are addressed by the title of Right Reverend. They have also the legal style of My Lord; they are allowed to marry, but their wives have no title or precedence. The insignia of the Anglican B. are the rochet and chimere, the episcopal throne, the mitre, the pastoral staff, and the pectoral cross.

Suffragan Bishops. Suffragan Bs. are those appointed by the Crown to assist the B. of a diocese who is prevented from performing his duties properly either by physical infirmities or owing to the extent of the diocese. In the Eng. Church he is

appointed by the Crown on the recommendation of the B. of the diocese. There are 31 suffragan Bs. in the Church of England.

The Greek Church. The spiritual functions of the B. of the E. or Orthodox Church are the same as those of the B. of the Rom. Church. The Bs., however, are all chosen from the monastic orders, since the secular clergy are compelled to marry and the B. must be unmarried. The insignia of the B. of this church are much the same as those of the W. Church.

Bishop, a beverage made of wine poured upon oranges, the whole being sweetened and spiced. It can be drunk either hot or cold.

Bishop, Sir Henry Rowley (1786-1855), Eng. musical composer, b. in London. He was trained by Francesco Bianchi, who was at this time settled in London. B.'s first composition performed publicly was the music to a one-act piece called *Angelina*. In 1809 he produced his first opera, the *Circassian Bride*, the scenery of which perished the day after the first performance in the great fire at Drury Lane. In 1810 he was appointed composer to the Covent Garden Theatre. In 1825 he transferred himself from Covent Garden to Drury Lane. He was already one of the directors of the Philharmonic Society, which had been founded in 1813. *Maid Marian and Clari*, or the *Maid of Milan* were produced in 1822; in the latter occurs the famous air *Home, Sweet Home*. In 1830 he was appointed musical director at Vauxhall. In 1841 he became a prof. at Edinburgh Univ.; in 1842 he was knighted, being the first musician who ever received that honour, and in 1848 he succeeded to the chair of music at Oxford. His chief works are *Tamerlan et Bajazet* (a ballet), 1806; *The Circassian Bride*, 1809; *The Maniac*, 1810; *The Virgin of the Sun*, 1812; *The Miller and his Men*, 1813; *Guy Mannering* and *The Slave*, 1816; *Maid Marian and Clari*, 1822; *The Seventh Day* (a sacred cantata), 1833. Two of his best-known songs, *Should he upbraid and Lo, here the Gentle Lark* are settings of Shakespeare's words. His glees are also favourites, but his incidental music to Shakespeare's plays is in great part forgotten. He died in impoverished circumstances, though up to his time few composers ever made more by their work.

Bishop, Isabella (1832-1904), Eng. traveller and author, daughter of the Rev. Edward Bird. *The Englishwoman in America*, her first book, consists of letters written during a visit to Canada at the age of 22. Among many journeys the most important was one she undertook into the interior of China. She wrote many books descriptive of her travels. The following were pub. between 1880 and 1889: *Unbeaten Tracks in Japan*, *Journeys in Persia and Kurdistan*, *Among the Tibetans, Korea and her Neighbours*, *The Yangtze Valley and Beyond*, *Chinese Pictures*. She was married in 1881 to Dr. John B., an Edinburgh physician. In 1901 she rode 1000 m. in Morocco and the Atlas Mts. She was the first woman

to become a fellow of the Royal Geographical Society.

Bishop, William (1554-1624), bishop of Chalcedon, studied theology at Rheims and Rome. In 1583, having been ordained priest, he was sent to the Eng. mission, but unfortunately for his cause, Walsingham kept him some months in Marshalsea prison. Later he was again imprisoned, this time at the Eng. college, Rome, as leader of 'a factious party.' Difficulties arising out of the new oath of allegiance required by James I. led to his third incarceration. In 1622 he was appointed vicar apostolic with ordinary jurisdiction over the Catholics of Great Britain, but d. before he could achieve anything in his new capacity.

Bishop, William Avery, Canadian airman, b. Owen Sound, Canada, in 1894. In the First World War he joined the Canadian cavalry, and later was seconded to the Royal Flying Corps. On the W. front he brought down no fewer than 72 Ger. machines, and then in 1917 he was sent on training work to Canada, returning to France in 1918. He was awarded the M.C., D.S.O., with bar, V.C. (on Aug. 13, 1917), and the D.F.C. At the end of the war he was a member of the Canadian General Staff with the rank of lieutenant-col., and his military career continued in the Canadian Air Force: Gr. Capt., 1931; Air Vice-Marshal, 1936; Air Marshal, 1938. In 1940 he was appointed director of recruiting for the Canadian Air Force. C.B., 1944.

Bishop Auckland, tn. in the par. div. of that name in the co. of Durham, Eng. It is situated about 10 m. S.W. of the city of Durham. Its area is about 651 ac., and its pop. 12,000. At the N.E. end of the tn. stands the bishop's palace, which was originally built by Anthony Beck in the time of Edward I. It has in addition a number of other fine buildings, amongst which may be mentioned the par. church and the tn. hall. It is a railway centre and its pop. is chiefly employed in the mills and collieries which surround the tn.

Bishops, the Seven, the bishops who, called together by Sanctori the primate, signed at Lambeth a protest against the fresh Declaration of Indulgence issued by James II. in 1687. This declaration, proclaiming universal liberty of conscience, was directed against the Church, and was part of the king's 'great design,' that is, the furtherance of his popish policy. The Ecclesiastical Commissioners were ordered to deprive the bishops of their sees, but this they shrank from doing through fear of the people at large, who were opposed to the king's action. The 7 bishops were committed to the Tower on a charge of seditious libel, having denounced the Declaration as illegal. On June 29 they appeared at the bar of the king's bench. In spite of the fact that everything had been done to secure a committal, the packed jury, overawed by public opinion, passed a verdict of 'not guilty.'

Bishop's Castle, mrkt. tn. of Shropshire, Eng., situated some 20 m. S.W. of Shrewsbury, and about 10 m. N.W. of Craven Arms, to which it is connected

by a branch railway. Formerly an important tn. of the marches of Wales, it returned 2 members to Parliament until the passing of the Reform Act of 1832. It is now included in the S. parl. div. of Shropshire. It has lost its former importance, and the anct. castle of the bishops of Hereford, from which it originally derived its name, has fallen into ruins. Area 1867 ac. Pop. 1500.

Bishop's Hatfield, see HATFIELD.

Bishop's Ring, name given to a peculiar tinge in the heavens, a corona or halo near the sun, called after its first observer, Bishop, who noticed it at Honolulu in the autumn of 1883, after the great volcanic eruptions at Krakatoa (Malay Archipelago). Its colour is bluish-white in the centre, shading off to reddish-brown. The diameter of the inner part was about 21°, of the outer 45°. The ring was oval in shape, the phenomenon, associated with the twilight glows and coloured suns (blue, green, silvery, and coppery) that were visible in tropical parts after the eruption, being a diffraction corona due to the dust haze or tiny dust particles ejected from the volcano. All heavier particles were sifted out by gravitation, leaving the rest so nearly of a size as to be able to produce coloured diffraction. The B. R. was most intensely brilliant in the spring of 1884, then it declined gradually, disappearing entirely in June 1886. The same phenomena were visible again, however, after Mt. Pelée's eruption in Martinique (W. Indies), 1902. See Symons, *Eruption of Krakatoa and Subsequent Phenomena*, 1888.

Bishopstoke, see EASTLEIGH.

Bishop's Stortford, mkt. tn. of Hertfordshire, Eng., about 30 m. N.E. of London. In the late Saxon and early Norman days it was the property of the bishop of London; the ruins of the so-called Bishop's Prison are still to be seen. It has an old grammar school (Elizabethan), now the High School. It is chiefly employed in brewing and malting, and holds important horse and cattle fairs. Pop. 10,000.

Bishop's Waltham, tn. of Hampshire, Eng., about 10 m. S.S.E. of Winchester. From the beginning of its hist. it has been the possession of the see of Winchester, and its castle built by Henry de Blois was completely ruined during the Civil wars. Pop. 2600.

Bishop Wearmouth, par. in the co. of Durham, Eng., in reality a suburb of Sunderland, forming the S. dist. of that tn.

Bishop-weed (*Ægopodium podagraria*), species of Umbelliferae common to Britain. It is also called gout-weed, goat-weed, and herb Gerard.

Bitun, see BEHISTUN.

Bisk, or **Blisk**, see BISK.

Biskra, tn. of Algiers about 150 m. S.W. of Constantine. It lies in the Sahara about 360 ft. above the level of the sea, and is on the bank of the Wady B. It is protected by the Fort St. Germain. The climate in the winter months is delightful, and the tn. is a favourite winter resort. The pop. of the tn. is 12,000.

Bisley, par. in the co. of Surrey, England, in the Chertsey parl. div., 7 m.

N.N.W. of Guildford, and 2 m. N. by W. of Brookwood station. The pop. of the par. is about 1000, and B. is chiefly remarkable for the fact that since 1890 the National Rifle Association have held their ann. meeting, in July, lasting for a fortnight, at the ranges on B. Common. The competitions were formerly held at Wimbledon, but the introduction of the small-bore rifle rendered it necessary for the ranges to be longer and safer, and B. was therefore chosen. The competitions are for individual members and teams of the Brit. Empire fighting forces and for civilian members of the National Rifle Association. The most important of the competitions are as follows: The King's Prize, formerly the Queen's Prize, which was founded by Queen Victoria in 1860, is of the value of £250, and carries with it the gold medal of the National Rifle Association. The competitors shoot 7 shots at 200, 500, and 600 yds.; the best 300 are thus selected, who shoot 10 times at 600 and 800 yds.; the best 100 of these shoot 10 times at 800, 900, and 1000 yds. In 1930 the King's Prize was won by a woman for the first time in the hist. of the competition, the winner being Miss Marjorie Elaine Foster of Frimley, Surrey. Other competitions open to 'volunteers' only are the St. George's Prize, and the Prince of Wales's Prize. There are various prizes for teams of riflemen—the Elcho Challenge Shield, for the best 4 'eights' of the different nationalities of the Brit. Isles; for this 15 shots at 800, 900, and 1000 yds. are fired. The Ashburton Challenge Shield is for the best 8 of public school volunteer corps; 7 shots at 200 and 500 yds. are fired. For the Humphrey Challenge Cup, open to univ. teams, 15 shots at 800, 900, and 1000 yds. Teams from the mother country and the dominions and colonies compete for the Kolapore Cup, firing 7 shots at 200, 400, and 600 yds. The experience gained in the field during the First World War confirmed the opinion that the rifle was the chief weapon of the infantry and Cavalry and that efficiency in its use was essential to success. Light and medium machine guns are regarded as powerful auxiliaries, and the degree of assistance they render the other arms is relative to their efficient tactical application. To develop this aspect of small-arm training, special competitions at B. were included in the programmes. The competitions were discontinued during the Second World War, and resumed in 1946, when, however, Army teams were unable to take part owing to the Army's commitments overseas.

Bismarck, tn. in the Land of Lower Saxony, situated 37 m. to the N. of Magdeburg. Pop. 2600.

Bismarck, co. seat of Bureleigh co., and cap. of the state of N. Dakota, U.S.A. It is situated on the l. b. of the Missouri, on the N. Pacific railway. Has an alt. of 1660 ft. above sea-level, and is the head of the navigation of the Upper Missouri. Pop. 15,400.

Bismarck, Otto Eduard Leopold, Prince von, Duke of Lauenburg (1815-98), Ger.

statesman. He was b. on Apr. 1, being the son of a gentleman of good family in Brandenburg. His mother's influence was strong, and was centred in the career of her children. He was educated at a private school in Berlin, and later at the gymnasium of the Grey Friars in the same town. On leaving school he attended the univ. of Göttingen, and after spending a year there he returned to Berlin and passed the examinations necessary for his entrance upon a career in the diplomatic service. He did not, however, enter this at once, but spent the early years of his youth in travelling, and in residence on his home estates. He early took a great interest in public affairs, and his wide reading and extensive travelling at one time seemed likely to allow of his having liberal views, but his religious convictions and the influence of religious revival led him to adopt the opinions in favour of monarchical gov. for which he became so famous. In 1847 he married Johanna von Puttkamer. During the 5 years which followed his marriage he took part in the politics of Prussia. He distinguished himself by the originality and zest with which he defended his position, and he showed by his bitter opposition to various proposed constitutions that he regarded revolutionary movements as tending to reduce to a very great extent the power and influence of Prussia as a Ger. state. In 1851 he was appointed Prussian representative at the Diet of Frankfurt, and during the years which he spent in this position he gained a knowledge of Ger. politics which served him well in the zenith of his career. He was frequently employed on embassies, and he completed sev. difficult negotiations with various princes. The chief result of this 8 years' diplomatic service, however, was to open his eyes to the true position of Austria with regard to Prussia. Up to this time he had regarded alliance with Austria as not only probable, but desirable, since Austria would support the Conservative principles of Christian monarchy. But he learnt now that Austria desired only the abasement of Prussia, and henceforth his policy changed and he saw that the greatness of Prussia could come only after the downfall of Austria. In 1858 he went to St. Petersburg as the Ger. ambas., and for some years remained there with little influence over the home gov. which was Liberal, and distrusted him. But gradually he grew more powerful, the details of events at home were sent him, and at last he was made minister in Paris. Here he renewed his previous good understanding with Napoleon, and finally from here he was recalled in Sept. 1862, and appointed by the king minister president and foreign minister. His appointment as minister president was unpopular. His duty was to carry on the gov. of the country in the face of the opposition of the Lower House. It seemed impossible that he should succeed, and that he could do anything but resign at an early date. But it was necessary to the king that he should succeed and allow time for the reorgani-

sation of the army, and in the face of violent and often personal opposition, in spite of lack of budgets, he was able to perform his work for the king. He soon began to make his power felt. The policy of Prussia had long lacked resolution, now it was to be noted for its absolute resoluteness. To the meeting of Ger. princes at Frankfurt Bismarck refused to allow the king of Prussia to go. Then came the rising of the Poles, and B. earned the gratitude of Russia and the contempt of Europe by offering Ger. aid in its suppression. Finally came the question

BISMARCK

of Schleswig-Holstein, when B. refused to support the Augustenburg claim, but in alliance with Austria defeated Denmark and prepared the way for the ultimate annexation of the prov. by Prussia. The next step was war with Austria. B. saw that the destruction of Austrian power was the only means of Prussian greatness. He waited until everything was in his favour, until he had gained the support of France and Italy, and then in 1866 he struck and was successful. The war of 1866 was in a greater degree than the war of 1870 the turning-point in the development of modern Germany, since it decided that Prussia should be the dominant and unifying power of Germany. He was moderate in his settlement, and required no ter. from Austria, but made a confederation of N. Germany, and refrained from attempting the unity of the whole of Germany lest he should alarm France. The greatness of Prussia was not to be disturbed by lack of calculation — when the time was ripe unity would come by the sword of Prussia, but there were to be no chances of failure. The Austrian war created a new position for B., and he became sole responsible

minister, his title being changed to chancellor in 1871. His political enemies began to be reconciled to him, and from being regarded as the opponent of national unity of Germany, he became its recognised leader. The struggle with Austria led almost of necessity to war with France. At one period armed intervention by the Fr. seemed inevitable, but this was avoided. France now demanded ter. on the left of the Rhine, and being refused proposed, as a return for acquiescence in the unity of Germany, the support of the Prussians in the annexation of Luxemburg and Belgium. War was inevitable, and as in the case of Austria, Prussia bided her time. During the years which followed there were many causes of quarrel, which culminated in the opposition of France to the candidature of a prince of Hohenzollern to the Sp. throne and the publication of the Ems telegram, which made war inevitable. During the Franco-Prussian war B. accompanied the army and conducted negotiations with the Fr., and completed the arrangements for the entrance of the S. states into the federation. His work after 1871 was occupied with the domestic policy of Germany. He had a long and strenuous quarrel with the Rom. Catholic Church, and also presided over the Congress of Berlin of 1878. The death of the Emperor William in 1888 was a grave blow to him, and in 1890 he was dismissed by the Emperor William II. A reconciliation took place in 1893, and his eightieth birthday in 1895 was regarded as a national event.

Bibliography. There are a great many works on B. Among the better known earlier works are: Bismarck's *Gedanken und Erinnerungen* (Eng. trans. *Bismarck: his Reflections and Reminiscences*, 1898); Lowe's *Bismarck*, 1895; Headlam's *Bismarck and the Foundation of the German Empire*, 1899; *The Love Letters of Prince Bismarck* (Eng. trans., 1901); Sybel's *Die Begründung des deutschen Reichs*, 1889-1894; Kohl's *Fürst Bismarck*, 1891-92; Blum's *Bismarck und seine Zeit*, 1894-95; and for bibliography, Schulze and Koller's *Bismarck-Literatur*, 1896. Among other works, including the more recent, are: R. von Keudel, *Fürst und Fürstin Bismarck* (Berlin), 1902; O. Klein-Hattungen, *Bismarck und seine Welt*, 2 vols. (Berlin), 1902-4; M. Lenz, *Geschichte Bismarcks* (Leipzig), 1902; P. von Roel and G. Epstein, *Bismarcks Staatsrecht* (Berlin), 1903; S. Whitman, *Personal Reminiscences of Prince Bismarck* (London), 1902; *Bismarcks Briefe an seine Braut und Gattin*, pub. by Prince Herbert Bismarck (Stuttgart), 1900; *Bismarck's Letters to his Wife*, 1870-71, trans. into Eng. by A. Harter (New York), 1903; G. Wolf, *Bismarcks Lehrjahre* (Leipzig), 1907; A. Roethlisberg, *Bismarck als Nationalökonomisch-Wirtschafts- u. sozialpolitiker* (Leipzig), 1908; E. Marcks, *Bismarck, Eine Biographie* (Stuttgart), 1907; Sir C. Grant Robertson, *Bismarck*, 1918; J. V. Fuller, *Bismarck's Diplomacy at its Zenith*, 1922; O. Graudenwitz, *Bismarcks letzter Kampf*, 1888-98,

'**Bismarck, The.**' Ger. battleship, given officially as of 35,000 tons, and said to have been a 50,000-ton boat, and, in 1941, the largest and newest of Ger. warships; centrally controlled; said by the Gers. to be unsinkable; carrying a great armament and over 2000 men; sunk on May 27, 1941, by units of the Royal Navy after a pursuit lasting nearly 5 days over a distance of 1750 m. The *B.* was first sighted in the Denmark Strait between Iceland and Greenland on May 23, and was sunk about 400 m. due W. of Brest. The only damage to the Brit. ships apart from the loss of the *Hood* (q.v.) was slight damage to the *Prince of Wales*. During the pursuit successive torpedo attacks were made both by aircraft of the Fleet Air Arm and by destroyers. These succeeded in slowing up and finally crippling the *B.* Naval units taking part included forces from the Home Fleet, from Gibraltar, and ships engaged on convoy duties in the Atlantic. She was eventually sunk after being hit by 8 or 9 torpedoes, and there were only about 100 survivors, further rescue work being abandoned owing to the presence of a Ger. submarine. Had the *B.*—which was accompanied for some time by a 10,000-ton cruiser, *Prinz Eugen*—escaped, her raiding potentialities would have been a very grave menace to allied shipping, the losses of which at this time were already nearly 500,000 tons monthly. Following the loss of the *Hood*, it was imperative to restore the balance, and the pursuit and sinking of the great Ger. battleship, which was on its first ocean voyage, was a triumph of Brit. sea and air power. Precisely why the *B.* had sailed into the Atlantic is not certainly estab., but the mere presence of so powerful a ship in the Atlantic, where it might, at any moment, make its appearance off Iceland, Greenland, or the West Indies, would have profoundly altered Brit. naval dispositions in all oceans. The pursuit demonstrated not only the importance of sea-power, but the value of reconnaissance aircraft, without whose co-operation the *B.* would not have been located. The *B.* and attendant cruiser—which latter succeeded in escaping to Brest—were first located by Brit. aircraft in Bergen harbour. After they had reported her departure the *Norfolk* and *Suffolk* (cruisers) took up positions in the Denmark Strait, but, owing to snow, sleet, and mist it was difficult to keep her in sight. The 2 Brit. cruisers successfully shadowed her during the night of May 23. Other ships now took up dispositions at high speed in order to intercept the *B.* and bring her to action. Early on May 24 the *Hood* made contact and in the ensuing engagement the *B.* was at one time seen

to be on fire. The *Hood* then received an unlucky hit in the magazine at 13 m. range, and blew up. Despite the efforts of the *B.* to shake off the *Norfolk* and *Suffolk* those ships maintained touch. On the evening of the 24th the *Prince of Wales* (battleship) joined action for a short time, but the Ger. ships turned away and swung round on a southerly course. Other Brit. naval forces were now coming up, and during the night naval torpedo-bombing aircraft from the *Victorious* delivered an attack from a considerable distance, one torpedo being seen to hit the *B.* After 3 a.m. on May 25, the Brit. ships lost touch with the enemy owing to low visibility, the *B.* being then 350 m. S.S.E. of S. Greenland. The main body of the Home Fleet, including the new battleship *King George V.* (q.r.), was now steaming at a high speed in a south-westerly direction from N. waters, while another force, including the *Rodney* (battleship) and *Ramillies* (battleship), which were escorting convoys, proceeded also to converge in the direction taken by the *B.* Extensive air searches were organised by the Coastal Command aircraft, and by the Canadian Air Force stationed at Newfoundland; and at about 10.30 a.m. on May 26 the *B.* was again located, by a Catalina flying-boat, about 550 m. W. of Land's End. The Catalina was attacked by the *B.* and lost touch, but at 11.15 a.m. the *B.* was again spotted by naval aircraft from the *Ark Royal* carrier. The *Prinz Eugen* had, however, parted company, and was not seen again. The cruiser *Sheffield* was now detached to shadow the *B.* Another force of naval aircraft now attacked, and torpedoes were seen to hit the *B.* amidships, and on the starboard quarter. The *B.* now slowed round in 2 complete circles, with her speed much reduced. Between 1.20 and 1.50 a.m. on May 27 the *B.* was attacked with torpedoes striking the ship and causing a fire on the forecastle. She now appeared to be stopped, having sailed 1750 m., and being 400 m. due W. of Brest—where but for the skill and persistence of Brit. aircraft she might soon have joined the *Gneisenau* and *Scharnhorst*. For the greater part of May 25 and 26 the *B.* had been lost to the Brit. fleet, and they were afraid they had lost her altogether. It was only in the teeth of a howling gale and with the flight deck wet with flying and treacherous spume and the ship plunging and rearing in tremendous seas that Swordfish torpedo-bombers took off from the *Ark Royal* and hit the *B.* with 2 vital torpedoes that sensibly reduced her speed; and but for the urgent need of crippling the battleship to enable the Brit. capital ships to close and bring her to action not a single aircraft would have been allowed to take off. During the night of May 26, and in the early hours of the following day Brit. warships were all round the doomed Ger. ship, the courage and tenacity of whose crew, who went on fighting when their position was hopeless, cannot be gainsaid. At dawn the Brit. ships closed in in squalls of rain to within

13 m. The *B.* was now yawing from side to side, and scarcely under control; but she was still capable of fairly accurate salvos. After 15 min. of terrible punishment her fore turret went out of action with the guns cocked up uselessly in the air. There was a great fire raging amidships. With bombs and torpedoes from the air and torpedoes and gun-fire from the ships, the Brit. fleet closed in still nearer on the *B.*, which, with her steering-gear destroyed, was now circling at 12 knots out of control. But she would not strike her colours, and, finally, the capital ships having sailed away, the *Dorsetshire* was detailed to dispatch her. The cruiser, creeping cautiously across the *B.*'s bows, 2 m. distant, passed down the port side, and fired her torpedo. The *B.* was now hidden in huge clouds of smoke, through which, amidships, was the glare of flames. The torpedoes took her. There was a tremendous explosion under water, and the *B.* listed to an angle of 45 degrees, steadied for a moment, then heeled right over and slid beneath the waters.

Bismarck Archipelago, group of is., which lie to the N.W. of the Solomon Is., and to the N. of the E. extremity of New Guinea. Their former name was New Britain Is., and they were discovered by Dampier in 1699, but in 1885 Great Britain came to an agreement with Germany, by which they were assigned to the Ger. sphere of influence, and their names were then changed. In Sept. 1914 they were occupied by an Australian force, and were temporarily under military rule. Since then they have formed part of the Australian mandated ter. of New Guinea. On Feb. 11, 1942, civil administration was suspended, and the ter. came under military control. An Act of 1945 provided for the gradual reinstatement of the civil administration. The prin. is. of the archipelago are New Britain, formerly called Neu Pommern (area 10,000 sq. m.), and New Ireland, formerly called Neu Mecklenburg (area 3000 sq. m.), which are separated from each other by St. George's Channel, in which the currents are of great violence and subject to no fixed rules; Dampier Strait separates New Britain from New Guinea, and another important is., Lavongal, formerly Neu Hannover (area 530 sq. m.), lies off the north-western extremity of New Ireland, from which a tortuous system of reefs separates it; Duke of York Is. (area 22 sq. m.) and the Admiralty Is. (area 600 sq. m.) are also important. The archipelago, which is of coral and volcanic formation, is mountainous and well wooded. In New Britain, the interior of which is but little known, there are sev. active volcanoes. It is practically undeveloped, the only plantations being around the coasts. Coco-nuts are the chief crop, but coffee and cocoa have recently been planted. The is. has many fine but little used harbours, the chief being Simpson Harbour on Blanche Bay. Rabaul, the seat of gov., has an anchorage for all ships and a fine new jetty. It was damaged by volcanic eruptions on May 29, 1937, and frequently bombed by allied aircraft in

the Second World War. Under Ger. rule the cap. was Herbertshöhe (now Kokopo), 14 m. to the S.E. New Ireland has been more thoroughly explored than New Britain. It is no longer actively volcanic, but in other respects is similar to the larger is. The chief tn. is Kavieng, on the N. coast of Nusa Harbour. The climate of the archipelago is, on the whole, healthy, and the soil is very fertile. Cotton plantations were started by the Gers. with native labourers. The inhab. of the is., mostly Papuans, are skilled in agriculture. Coco-nut fibre, copra, cotton, rubber, coffee, tortoise-shell, trepang, mother-of-pearl, and fruit are the chief articles of trade. Shells threaded on long strips of split cane form the money used by the natives. Total area 19,200 sq. m. The native pop. is about 155,000. In the first few months of the war (1941) the Jap. invading forces swept over New Britain and New Ireland. In Apr. 1943 the Jap. suffered much from allied air attack over New Britain. In May and June Raboul was repeatedly bombed. There was a record destruction on Oct. 25 of Jap. aircraft at Rabaul. On Dec. 16 Amer. troops landed on Aravo Peninsula in S.W. New Britain, and secured a firm foothold. In the earlier part of 1944 the Jap. Seventeenth Army, having failed to overcome the Amer. beach-heads, retired to Rabaul. For details of operations see PACIFIC CAMPAIGNS, or FAR EASTERN FRONT, IN SECOND WORLD WAR.

Bismarck-Schönhausen, Herbert Nikolaus, Prince von (1849-1904), eldest son of Prince Otto von Bismarck. He served in the army, 1870-71, then entered upon a diplomatic career, becoming secretary to his father. He was secretary to the embassies in turn of Rome, London, St. Petersburg, and was sev. times charged with important negotiations, including a mission to London in 1881. In 1885 he was made secretary of state for foreign affairs. He married Countess Margarete Hôvos.
